USP 36

**THE UNITED STATES PHARMACOPEIA**

NF 31

**THE NATIONAL FORMULARY**

Volume 2

*By authority of the United States Pharmacopeial Convention  
Prepared by the Council of Experts and its Expert Committees*

*Official from May 1, 2013*

The designation on the cover of this publication, "USP NF 2013," is for ease of identification only. The publication contains two separate compendia: *The United States Pharmacopeia*, Thirty-Sixth Revision, and *The National Formulary*, Thirty-First Edition.

THE UNITED STATES PHARMACOPEIAL CONVENTION  
12601 Twinbrook Parkway, Rockville, MD 20852

## SIX-MONTH IMPLEMENTATION GUIDELINE

The *United States Pharmacopeia–National Formulary* and its supplements become official **six months** after being released to the public. The *USP–NF*, which is released on November 1 of each year, becomes official on May 1 of the following year. This six-month implementation timing gives users more time to bring their methods and procedures into compliance with new and revised *USP–NF* requirements.

The table below describes the official dates of the *USP–NF* and its supplements. The 2011 *USP 35–NF 30*, and its supplements, *Interim Revision Announcements (IRAs)* and *Revision Bulletins* to that edition, will be official until May 1, 2013, at which time the *USP 36–NF 31* becomes official.

Publication	Release Date	Official Date	Official Until
<i>USP 36–NF 31</i>	November 1, 2012	May 1, 2013	May 1, 2014 (except as superseded by supplements, <i>IRAs</i> , and <i>Revision Bulletins</i> )
<i>First Supplement to the USP 36–NF 31</i>	February 1, 2013	August 1, 2013	May 1, 2014 (except as superseded by <i>Second Supplement</i> , <i>IRAs</i> , and <i>Revision Bulletins</i> )
<i>Second Supplement to the USP 36–NF 31</i>	June 1, 2013	December 1, 2013	May 1, 2014 (except as superseded by <i>IRAs</i> and <i>Revision Bulletins</i> )
<i>USP 37–NF 32</i>	November 1, 2013	May 1, 2014	May 1, 2015 (except as superseded by supplements, <i>IRAs</i> , and <i>Revision Bulletins</i> )

The table below gives the details of the *IRAs* that will apply to *USP 36–NF 31*.

IRA	PF Posting Date	Comment Due Date	IRA Posting Date	IRA Official Date
39(1)	January 2, 2013	March 31, 2013	May 31, 2013	July 1, 2013
39(2)	March 1, 2013	May 31, 2013	July 26, 2013	September 1, 2013
39(3)	May 1, 2013	July 31, 2013	September 27, 2013	November 1, 2013
39(4)	July 2, 2013	September 30, 2013	November 29, 2013	January 1, 2014
39(5)	September 4, 2013	November 30, 2013	January 31, 2014	March 1, 2014
39(6)	November 1, 2013	January 31, 2014	March 28, 2014	May 1, 2014

*Revision Bulletins* published on the USP website become official on the date specified in the *Revision Bulletin*.

## NOTICE AND WARNING

**Concerning U.S. Patent or Trademark Rights**—The inclusion in *The United States Pharmacopeia* or in the *National Formulary* of a monograph on any drug in respect to which patent or trademark rights may exist shall not be deemed, and is not intended as, a grant of, or authority to exercise, any right or privilege protected by such patent or trademark. All such rights and privileges are vested in the patent or trademark owner, and no other person may exercise the same without express permission, authority, or license secured from such patent or trademark owner.

**Concerning Use of USP or NF Text**—Attention is called to the fact that *USP* and *NF* text is fully copyrighted. Authors and others wishing to use portions of the text should request permission to do so from the Secretary of the USPC Board of Trustees.

# Guide to General Chapters

(For complete alphabetical list of all general chapters in this Pharmacopeia, see under “General chapters” in the index.)

## GENERAL TESTS AND ASSAYS

### General Requirements for Tests and Assays

<1> Injections	33
<3> Topical and Transdermal Drug Products— Product Quality Tests	37
<11> USP Reference Standards	41

### Apparatus for Tests and Assays

<16> Automated Methods of Analysis	43
<17> Prescription Container Labeling	51
<21> Thermometers	52
<31> Volumetric Apparatus	53
<41> Weights and Balances	53

### Microbiological Tests

<51> Antimicrobial Effectiveness Testing	54
<55> Biological Indicators—Resistance Performance Tests	56
<61> Microbiological Examination of Nonsterile Products: Microbial Enumeration Tests	58
<62> Microbiological Examination of Nonsterile Products: Tests for Specified Microorganisms	62
<63> Mycoplasma Tests	67
<71> Sterility Tests	71

### Biological Tests and Assays

<81> Antibiotics—Microbial Assays	76
<85> Bacterial Endotoxins Test	90
<87> Biological Reactivity Tests, In Vitro	94
<88> Biological Reactivity Tests, In Vivo	95
<90> Fetal Bovine Serum—Quality Attributes and Functionality Tests	100
<91> Calcium Pantothenate Assay	102
<92> Growth Factors and Cytokines Used in Cell Therapy Manufacturing	105
<111> Design and Analysis of Biological Assays	108
<115> Dexpantenol Assay	119
<121> Insulin Assays	121
<123> Glucagon Bioidentity Tests	123
<130> Protein A Quality Attributes	125
<151> Pyrogen Test	130
<161> Transfusion and Infusion Assemblies and Similar Medical Devices	131
<171> Vitamin B <sub>12</sub> Activity Assay	132

## Chemical Tests and Assays

### Identification Tests

<181> Identification—Organic Nitrogenous Bases	135
<191> Identification Tests—General	136
<193> Identification—Tetracyclines	138
<197> Spectrophotometric Identification Tests	139
<201> Thin-Layer Chromatographic Identification Test	139

### Limit Tests

<206> Aluminum	140
<207> Test for 1,6-Anhydro Derivative for Enoxaparin Sodium	141
<211> Arsenic	145
<221> Chloride and Sulfate	146
<223> Dimethylaniline	147
<226> 4-Epianhydrotetracycline	147
<228> Ethylene Oxide and Dioxane	148
<231> Heavy Metals	150
<232> Elemental Impurities—Limits	151
<233> Elemental Impurities—Procedures	153
<241> Iron	156
<251> Lead	156
<261> Mercury	157
<267> Porosimetry by Mercury Intrusion	159
<271> Readily Carbonizable Substances Test	161
<281> Residue on Ignition	161
<291> Selenium	161

### Other Tests and Assays

<301> Acid-Neutralizing Capacity	162
<311> Alginate Assay	163
<341> Antimicrobial Agents—Content	164
<345> Assay for Citric Acid/Citrate and Phosphate	166
<351> Assay for Steroids	167
<361> Barbiturate Assay	167
<371> Cobalamin Radiotracer Assay	167
<381> Elastomeric Closures for Injections	168
<391> Epinephrine Assay	172
<401> Fats and Fixed Oils	173
<411> Folic Acid Assay	182
<413> Impurities Testing in Medical Gases	182
<415> Medical Gases Assay	183
<425> Iodometric Assay—Antibiotics	184
<429> Light Diffraction Measurement of Particle Size	185
<431> Methoxy Determination	189
<441> Niacin or Niacinamide Assay	191
<451> Nitrite Titration	193
<461> Nitrogen Determination	193
<466> Ordinary Impurities	194
<467> Residual Solvents	195

(471) Oxygen Flask Combustion . . . . .	207
(481) Riboflavin Assay . . . . .	207
(501) Salts of Organic Nitrogenous Bases . . . . .	208
(503) Acetic Acid in Peptides . . . . .	208
(511) Single-Steroid Assay . . . . .	209
(525) Sulfur Dioxide . . . . .	209
(531) Thiamine Assay . . . . .	212
(541) Titrimetry . . . . .	213
(551) Alpha Tocopherol Assay . . . . .	216
(561) Articles of Botanical Origin . . . . .	216
(563) Identification of Articles of Botanical Origin . . . . .	226
(565) Botanical Extracts . . . . .	234
(571) Vitamin A Assay . . . . .	236
(581) Vitamin D Assay . . . . .	237
(591) Zinc Determination . . . . .	241

## Physical Tests and Determinations

(601) Aerosols, Nasal Sprays, Metered-Dose Inhalers, and Dry Powder Inhalers . . . . .	242
(610) Alternative Microbiological Sampling Methods for Nonsterile Inhaled and Nasal Products . . . . .	263
(611) Alcohol Determination . . . . .	264
(616) Bulk Density and Tapped Density of Powders . . . . .	265
(621) Chromatography . . . . .	268
(631) Color and Achromicity . . . . .	275
(641) Completeness of Solution . . . . .	276
(643) Total Organic Carbon . . . . .	276
(645) Water Conductivity . . . . .	277
(651) Congealing Temperature . . . . .	279
(659) Packaging and Storage Requirements . . . . .	280
(660) Containers—Glass . . . . .	282
(661) Containers—Plastics . . . . .	286
(670) Auxiliary Packaging Components . . . . .	291
(671) Containers—Performance Testing . . . . .	292
(681) Repackaging into Single-Unit Containers and Unit-Dose Containers for Nonsterile Solid and Liquid Dosage Forms . . . . .	295
(691) Cotton . . . . .	297
(695) Crystallinity . . . . .	298
(696) Characterization of Crystalline Solids by Microcalorimetry and Solution Calorimetry . . . . .	298
(698) Deliverable Volume . . . . .	300
(699) Density of Solids . . . . .	304
(701) Disintegration . . . . .	305
(711) Dissolution . . . . .	307
(721) Distilling Range . . . . .	313
(724) Drug Release . . . . .	314
(726) Electrophoresis . . . . .	318
(729) Globule Size Distribution in Lipid Injectable Emulsions . . . . .	321
(730) Plasma Spectrochemistry . . . . .	323
(731) Loss on Drying . . . . .	328
(733) Loss on Ignition . . . . .	329
(736) Mass Spectrometry . . . . .	329
(741) Melting Range or Temperature . . . . .	333
(751) Metal Particles in Ophthalmic Ointments . . . . .	334
(755) Minimum Fill . . . . .	335
(761) Nuclear Magnetic Resonance Spectroscopy . . . . .	335
(771) Ophthalmic Ointments . . . . .	342
(776) Optical Microscopy . . . . .	343
(781) Optical Rotation . . . . .	344
(785) Osmolality and Osmolarity . . . . .	345
(786) Particle Size Distribution Estimation by Analytical Sieving . . . . .	347
(788) Particulate Matter in Injections . . . . .	350
(789) Particulate Matter in Ophthalmic Solutions . . . . .	353
(791) pH . . . . .	354
(795) Pharmaceutical Compounding—Nonsterile Preparations . . . . .	355
(797) Pharmaceutical Compounding—Sterile Preparations . . . . .	361
(801) Polarography . . . . .	398

(811) Powder Fineness . . . . .	401
(821) Radioactivity . . . . .	402
(823) Positron Emission Tomography Drugs for Compounding, Investigational, and Research Uses . . . . .	409
(831) Refractive Index . . . . .	416
(841) Specific Gravity . . . . .	417
(846) Specific Surface Area . . . . .	417
(851) Spectrophotometry and Light-Scattering . . . . .	420
(861) Sutures—Diameter . . . . .	426
(871) Sutures—Needle Attachment . . . . .	426
(881) Tensile Strength . . . . .	428
(891) Thermal Analysis . . . . .	428
(905) Uniformity of Dosage Units . . . . .	431
(911) Viscosity—Capillary Viscometer Methods . . . . .	434
(912) Rotational Rheometer Methods . . . . .	435
(913) Rolling Ball Viscometer Method . . . . .	439
(921) Water Determination . . . . .	439
(941) Characterization of Crystalline and Partially Crystalline Solids by X-Ray Powder Diffraction (XRPD) . . . . .	443

# GENERAL NOTICES AND REQUIREMENTS

The *General Notices and Requirements* section (the *General Notices*) presents the basic assumptions, definitions, and default conditions for the interpretation and application of the *United States Pharmacopeia* (USP) and the *National Formulary* (NF).

Requirements stated in these *General Notices* apply to all articles recognized in the USP and NF (the “compendia”) and to all general chapters unless specifically stated otherwise. Where the requirements of an individual monograph differ from the *General Notices* or a general chapter, the monograph requirements apply and supersede the requirements of the *General Notices* or the general chapter, whether or not the monograph explicitly states the difference.

## 1. TITLE AND REVISION

The full title of this publication (consisting of three volumes and including its *Supplements*), is *The Pharmacopeia of the United States of America*, Thirty-Sixth Revision and the *National Formulary*, Thirty-First Edition. These titles may be abbreviated to USP 36, to NF 31, and to USP 36–NF 31. The *United States Pharmacopeia*, Thirty-Sixth Revision, and the *National Formulary*, Thirty-First Edition, supersede all earlier revisions. Where the terms “USP,” “NF,” or “USP–NF” are used without further qualification during the period in which these compendia are official, they refer only to USP 36, NF 31, and any *Supplement(s)* thereto. The same titles, with no further distinction, apply equally to print or electronic presentation of these contents. Although USP and NF are published under one cover and share these *General Notices*, they are separate compendia.

This revision is official beginning May 1, 2013, unless otherwise indicated in specific text.

*Supplements* to USP and NF are published periodically. *Interim Revision Announcements* are revisions to USP and NF that are published on the USP website. *Interim Revision Announcements* contain official revisions and their effective dates. Announcements of the availability of new USP Reference Standards and announcements of tests or procedures that are held in abeyance pending availability of required USP Reference Standards are also available on the “New Official Text” tab of USP’s website.

*Revision Bulletins* are revisions to official text or postponements that require expedited publication. They are published on the USP website and generally are official immediately unless otherwise specified in the *Revision Bulletin*.

*Errata* are corrections to items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirements. *Errata* are effective upon publication.

## 2. OFFICIAL STATUS AND LEGAL RECOGNITION

### 2.10. Official Text

*Official text* is text contained in USP and NF, including monographs, general chapters, and these *General Notices*. Revisions to official text are provided in *Supplements*, *Interim Revision Announcements*, and *Revision Bulletins*. General chapters numbered from 1000 to 1999 are considered interpretive and are intended to provide information on, give definition to, or describe a particular subject. They contain no mandatory requirements applicable to any official article unless specifically referenced in *General Notices*, a monograph, or a general chapter numbered below 1000. General chapters numbered above 2000 apply only to articles that are

intended for use as dietary ingredients and dietary supplements.

### 2.20. Official Articles

An *official article* is an article that is recognized in USP or NF. An article is deemed to be recognized and included in a compendium when a monograph for the article is published in the compendium and an official date is generally or specifically assigned to the monograph.

The title specified in a monograph is the *official title* for such article. Other names considered to be synonyms of the official titles may not be used as substitutes for official titles.

*Official articles* include both *official substances* and *official products*. An *official substance* is a drug substance, excipient, dietary ingredient, other ingredient, or component of a finished device for which the monograph title includes no indication of the nature of the finished form.

An *official product* is a drug product, dietary supplement, compounded preparation, or finished device for which a monograph is provided.

### 2.30. Legal Recognition

The USP and NF are recognized in the laws and regulations of many countries throughout the world. Regulatory authorities may enforce the standards presented in the USP and NF, but because recognition of the USP and NF may vary by country, users should understand applicable laws and regulations. In the United States under the Federal Food, Drug, and Cosmetic Act (FDCA), both USP and NF are recognized as official compendia. A drug with a name recognized in USP–NF must comply with compendial identity standards or be deemed adulterated, misbranded, or both. See, e.g., FDCA § 501(b) and 502(e)(3)(b); also FDA regulations, 21 CFR § 299.5(a&b). To avoid being deemed adulterated, such drugs must also comply with compendial standards for strength, quality, and purity, unless labeled to show all respects in which the drug differs. See, e.g., FDCA § 501(b) and 21 CFR § 299.5(c). In addition, to avoid being deemed misbranded, drugs recognized in USP–NF must also be packaged and labeled in compliance with compendial standards. See FDCA § 502(g).

A dietary supplement represented as conforming to specifications in USP will be deemed a misbranded food if it fails to so conform. See FDCA § 403(s)(2)(D).

Enforcement of USP standards is the responsibility of FDA and other government authorities in the U.S. and elsewhere. USP has no role in enforcement.

## 3. CONFORMANCE TO STANDARDS

### 3.10. Applicability of Standards

Standards for an article recognized in a USP compendium are expressed in the article’s monograph, applicable general chapters, and *General Notices*. Unless specifically exempted elsewhere in a compendium, the identity, strength, quality, and purity of an article are determined by the official tests, procedures, and acceptance criteria, whether incorporated in the monograph itself, in the *General Notices*, or in the applicable general chapters. Early adoption of revised standards is allowed. Where revised standards for an existing article have been published as final approved “official text” (as approved in section 2.10) but are not yet official (six months after publication, unless otherwise specified; see “official date,” section 2.20) compliance with the revised standard shall not preclude a finding or indication of conformance with USP official standards, unless USP specifies

otherwise by prohibiting early adoption in a particular standard.

The standards in the relevant monograph, general chapter(s), and *General Notices* apply at all times in the life of the article from production to expiration. The manufacturer's specifications, and good manufacturing practices generally (including, e.g., Quality by Design initiatives), are developed and followed to ensure that the article will comply with compendial standards until its expiration date, when stored as directed. Thus, any official article is expected to meet the compendial standards if tested, and any official article actually tested as directed in the relevant monograph must meet such standards to demonstrate compliance.

At times, compendial standards take on the character of statistical procedures, with multiple units involved and perhaps a sequential procedural design to allow the user to determine that the tested article meets or does not meet the standard. The similarity to statistical procedures may seem to suggest an intent to make inference to some larger group of units, but in all cases, statements about whether the compendial standard is met apply only to the units tested. Repeats, replicates, statistical rejection of outliers, or extrapolations of results to larger populations, as well as the necessity and appropriate frequency of batch testing, are neither specified nor proscribed by the compendia. Frequency of testing and sampling are left to the preferences or direction of those performing compliance testing, and other users of *USP-NF*, including manufacturers, buyers, or regulatory authorities.

Official products are prepared according to recognized principles of good manufacturing practice and from ingredients that meet *USP* or *NF* standards, where standards for such ingredients exist (for dietary supplements, see section 3.10.20).

Official substances are prepared according to recognized principles of good manufacturing practice and from ingredients complying with specifications designed to ensure that the resultant substances meet the requirements of the compendial monographs.

### **3.10.10. Applicability of Standards to Drug Products, Drug Substances, and Excipients**

The applicable *USP* or *NF* standard applies to any article marketed in the United States that (1) is recognized in the compendium and (2) is intended or labeled for use as a drug or as an ingredient in a drug. The applicable standard applies to such articles whether or not the added designation "*USP*" or "*NF*" is used. The standards apply equally to articles bearing the official titles or names derived by transposition of the definitive words of official titles or transposition in the order of the names of two or more active ingredients in official titles, or where there is use of synonyms with the intent or effect of suggesting a significant degree of identity with the official title or name.

### **3.10.20. Applicability of Standards to Medical Devices, Dietary Supplements, and Their Components and Ingredients**

An article recognized in *USP* or *NF* shall comply with the compendial standards if the article is a medical device, component intended for a medical device, dietary supplement, dietary ingredient, or other ingredient that is intended for incorporation into a dietary supplement, and is labeled as conforming to the *USP* or *NF*.

Generally, dietary supplements are prepared from ingredients that meet *USP*, *NF*, or *Food Chemicals Codex* standards. Where such standards do not exist, substances may be used in dietary supplements if they have been shown to be of acceptable food grade quality using other suitable procedures.

### **3.20. Indicating Conformance**

A drug product, drug substance, or excipient may use the designation "*USP*" or "*NF*" in conjunction with its official title or elsewhere on the label only when (1) a monograph is provided in the specified compendium and (2) the article

complies with the identity prescribed in the specified compendium.

When a drug product, drug substance, or excipient differs from the relevant *USP* or *NF* standard of strength, quality, or purity, as determined by the application of the tests, procedures, and acceptance criteria set forth in the relevant compendium, its difference shall be plainly stated on its label.

When a drug product, drug substance, or excipient fails to comply with the identity prescribed in *USP* or *NF* or contains an added substance that interferes with the prescribed tests and procedures, the article shall be designated by a name that is clearly distinguishing and differentiating from any name recognized in *USP* or *NF*.

A medical device, dietary supplement, or ingredient or component of a medical device or dietary supplement may use the designation "*USP*" or "*NF*" in conjunction with its official title or elsewhere on the label only when (1) a monograph is provided in the specified compendium and (2) the article complies with the monograph standards and other applicable standards in the compendium.

The designation "*USP*" or "*NF*" on the label may not and does not constitute an endorsement by *USP* and does not represent assurance by *USP* that the article is known to comply with the relevant standards. *USP* may seek legal redress if an article purports to be or is represented as an official article in one of *USP*'s compendia and such claim is determined by *USP* not to be made in good faith.

The designation "*USP-NF*" may be used on the label of an article provided that the label also bears a statement such as "*Meets NF standards as published by USP,*" indicating the particular compendium to which the article purports to apply.

When the letters "*USP*," "*NF*," or "*USP-NF*" are used on the label of an article to indicate compliance with compendial standards, the letters shall appear in conjunction with the official title of the article. The letters are not to be enclosed in any symbol such as a circle, square, etc., and shall appear in capital letters.

If a dietary supplement does not comply with all applicable compendial requirements but contains one or more dietary ingredients or other ingredients that are recognized in *USP* or *NF*, the individual ingredient(s) may be designated as complying with *USP* or *NF* standards or being of *USP* or *NF* quality provided that the designation is limited to the individual ingredient(s) and does not suggest that the dietary supplement complies with *USP* standards.

## **4. MONOGRAPHS AND GENERAL CHAPTERS**

### **4.10. Monographs**

Monographs set forth the article's name, definition, specification, and other requirements related to packaging, storage, and labeling. The specification consists of tests, procedures, and acceptance criteria that help ensure the identity, strength, quality, and purity of the article. For general requirements relating to specific monograph sections, see section 5, *Monograph Components*.

Because monographs may not provide standards for all relevant characteristics, some official substances may conform to the *USP* or *NF* standard but differ with regard to nonstandardized properties that are relevant to their use in specific preparations. To assure interchangeability in such instances, users may wish to ascertain functional equivalence or determine such characteristics before use.

### **4.10.10. Applicability of Test Procedures**

A single monograph may include several different tests, procedures, and/or acceptance criteria that reflect attributes of different manufacturers' articles. Such alternatives may be presented for different polymorphic forms, impurities, hydrates, and dissolution cases. Monographs indicate the tests, procedures, and/or acceptance criteria to be used and the required labeling.

A test in a monograph may contain and require multiple procedures. However, multiple procedures may be included in particular monographs specifically for the purpose of assuring the availability of an appropriate procedure for a par-

ticular product. In such cases, a labeling statement to indicate the appropriate application of the procedure(s) will be included in the monograph. A labeling statement is not required if Test 1 is used.

#### 4.10.20. Acceptance Criteria

The acceptance criteria allow for analytical error, for unavoidable variations in manufacturing and compounding, and for deterioration to an extent considered acceptable under practical conditions. The existence of compendial acceptance criteria does not constitute a basis for a claim that an official substance that more nearly approaches 100 percent purity "exceeds" compendial quality. Similarly, the fact that an article has been prepared to tighter criteria than those specified in the monograph does not constitute a basis for a claim that the article "exceeds" the compendial requirements.

An official product shall be formulated with the intent to provide 100 percent of the quantity of each ingredient declared on the label. Where the minimum amount of a substance present in a dietary supplement is required by law to be higher than the lower acceptance criterion allowed for in the monograph, the upper acceptance criterion contained in the monograph may be increased by a corresponding amount.

The acceptance criteria specified in individual monographs and in the general chapters for compounded preparations are based on such attributes of quality as might be expected to characterize an article compounded from suitable bulk drug substances and ingredients, using the procedures provided or recognized principles of good compounding practice, as described in these compendia.

#### 4.20. General Chapters

Each general chapter is assigned a number that appears in angle brackets adjacent to the chapter name (e.g., *Chromatography* (621)). General chapters may contain the following:

- Descriptions of tests and procedures for application through individual monographs,
- Descriptions and specifications of conditions and practices for pharmaceutical compounding,
- General information for the interpretation of the compendial requirements,
- Descriptions of general pharmaceutical storage, dispensing, and packaging practices, or
- General guidance to manufacturers of official substances or official products.

When a general chapter is referenced in a monograph, acceptance criteria may be presented after a colon.

Some chapters may serve as introductory overviews of a test or of analytical techniques. They may reference other general chapters that contain techniques, details of the procedures, and, at times, acceptance criteria.

### 5. MONOGRAPH COMPONENTS

#### 5.10. Molecular Formula

The use of the molecular formula for the active ingredient(s) named in defining the required strength of a compendial article is intended to designate the chemical entity or entities, as given in the complete chemical name of the article, having absolute (100 percent) purity.

#### 5.20. Added Substances

Added substances are presumed to be unsuitable for inclusion in an official article and therefore prohibited, if: (1) they exceed the minimum quantity required for providing their intended effect; (2) their presence impairs the bioavailability, therapeutic efficacy, or safety of the official article; or (3) they interfere with the assays and tests prescribed for determining compliance with the compendial standards.

The air in a container of an official article may, where appropriate, be evacuated or be replaced by carbon dioxide, helium, argon, or nitrogen, or by a mixture of these gases. The use of such gas need not be declared in the labeling.

#### 5.20.10. Added Substances, Excipients, and Ingredients in Official Substances

Official substances may contain only the specific added substances that are permitted by the individual monograph. Where such addition is permitted, the label shall indicate the name(s) and amount(s) of any added substance(s).

#### 5.20.20. Added Substances, Excipients, and Ingredients in Official Products

Suitable substances and excipients such as antimicrobial agents, pharmaceutical bases, carriers, coatings, flavors, preservatives, stabilizers, and vehicles may be added to an official product to enhance its stability, usefulness, or elegance, or to facilitate its preparation, unless otherwise specified in the individual monograph.

Added substances and excipients employed solely to impart color may be incorporated into official products other than those intended for parenteral or ophthalmic use, in accordance with the regulations pertaining to the use of colors issued by the U.S. Food and Drug Administration (FDA), provided such added substances or excipients are otherwise appropriate in all respects. (See also *Added Substances under Injections* (1).)

The proportions of the substances constituting the base in ointment and suppository products and preparations may be varied to maintain a suitable consistency under different climatic conditions, provided that the concentrations of active ingredients are not varied and provided that the bioavailability, therapeutic efficacy, and safety of the preparation are not impaired.

#### 5.20.20.1. In Compounded Preparations

Compounded preparations for which a complete composition is given shall contain only the ingredients named in the formulas unless specifically exempted herein or in the individual monograph. Deviation from the specified processes or methods of compounding, although not from the ingredients or proportions thereof, may occur provided that the finished preparation conforms to the relevant standards and to preparations produced by following the specified process.

Where a monograph for a compounded preparation calls for an ingredient in an amount expressed on the dried basis, the ingredient need not be dried before use if due allowance is made for the water or other volatile substances present in the quantity taken.

Specially denatured alcohol formulas are available for use in accordance with federal statutes and regulations of the Internal Revenue Service. A suitable formula of specially denatured alcohol may be substituted for Alcohol in the manufacture of official preparations intended for internal or topical use, provided that the denaturant is volatile and does not remain in the finished product. A preparation that is intended for topical application to the skin may contain specially denatured alcohol, provided that the denaturant is either a usual ingredient in the preparation or a permissible added substance; in either case the denaturant shall be identified on the label of the topical preparation. Where a process is given in the individual monograph, any preparation compounded using denatured alcohol shall be identical to that prepared by the monograph process.

#### 5.20.20.2. In Dietary Supplements

Additional ingredients may be added to dietary supplement products provided that the additional ingredients: (1) comply with applicable regulatory requirements; and (2) do not interfere with the assays and tests prescribed for determining compliance with compendial standards.

#### 5.30. Description and Solubility

Only where a quantitative solubility test is given in a monograph and is designated as such is it a test for purity.

A monograph may include information regarding the article's description. Information about an article's "description and solubility" also is provided in the reference table *Description and Relative Solubility of USP and NF Articles*. The reference table merely denotes the properties of articles that comply with monograph standards. The reference table is

intended primarily for those who use, prepare, and dispense drugs and/or related articles. Although the information provided in monographs and the information in the reference table may indirectly assist in the preliminary evaluation of an article, it is not intended to serve as a standard or test for purity.

The approximate solubility of a compendial substance is indicated by one of the following descriptive terms:

Descriptive Term	Parts of Solvent Required for 1 Part of Solute
Very soluble	Less than 1
Freely soluble	From 1 to 10
Soluble	From 10 to 30
Sparingly soluble	From 30 to 100
Slightly soluble	From 100 to 1,000
Very slightly soluble	From 1,000 to 10,000
Practically insoluble, or Insoluble	Greater than or equal to 10,000

#### 5.40. Identity

A compendial test titled *Identity* or *Identification* is provided as an aid in verifying the identity of articles as they are purported to be, e.g., those taken from labeled containers, and to establish whether it is the article named in *USP–NF*. The *Identity* or *Identification* test for a particular article may consist of one or more procedures. When a compendial test for *Identity* or *Identification* is undertaken, all requirements of all specified procedures in the test must be met to satisfy the requirements of the test. Failure of an article to meet all the requirements of a prescribed *Identity* or *Identification* test (i.e., failure to meet the requirements of all of the specified procedures that are components of that test) indicates that the article is mislabeled and/or adulterated.

#### 5.50. Assay

Assay tests for compounded preparations are not intended for evaluating a compounded preparation before dispensing, but instead are intended to serve as the official test in the event of a question or dispute regarding the preparation's conformance to official standards.

##### 5.50.10. Units of Potency (Biological)

For substances that cannot be completely characterized by chemical and physical means, it may be necessary to express quantities of activity in biological units of potency, each defined by an authoritative, designated reference standard.

Units of biological potency defined by the World Health Organization (WHO) for International Biological Standards and International Biological Reference Preparations are termed International Units (IU). Monographs refer to the units defined by USP Reference Standards as "USP Units." For biological products, units of potency are defined by the corresponding U.S. Standard established by FDA, whether or not International Units or USP Units have been defined (see *Biologics* <1041>).

#### 5.60. Impurities and Foreign Substances

Tests for the presence of impurities and foreign substances are provided to limit such substances to amounts that are unobjectionable under conditions in which the article is customarily employed (see also *Impurities in Official Articles* <1086>).

Nonmonograph tests and acceptance criteria suitable for detecting and controlling impurities that may result from a change in the processing methods or that may be introduced from external sources should be employed in addition to the tests provided in the individual monograph, where the presence of the impurity is inconsistent with applicable good manufacturing practices or good pharmaceutical practice.

#### 5.60.10. Other Impurities in USP and NF Articles

If a *USP* or *NF* monograph includes an assay or organic impurity test based on chromatography, other than a test for residual solvents, and that monograph procedure does not detect an impurity present in the substance, the amount and identity of the impurity, where both are known, shall be stated in the labeling (certificate of analysis) of the official substance, under the heading *Other Impurity(ies)*.

The presence of any unlabeled other impurity in an official substance is a variance from the standard if the content is 0.1% or greater. The sum of all *Other Impurities* combined with the monograph-detected impurities may not exceed 2.0% (see *Ordinary Impurities* <466>), unless otherwise stated in the monograph.

The following categories of drug substances are excluded from *Other Impurities* requirements:

- fermentation products and semi-synthetics derived therefrom,
- radiopharmaceuticals,
- biologics,
- biotechnology-derived products,
- peptides,
- herbals, and
- crude products of animal or plant origin.

Any substance known to be toxic shall not be listed under *Other Impurities*.

#### 5.60.20. Residual Solvents in USP and NF Articles

All *USP* and *NF* articles are subject to relevant control of residual solvents, even when no test is specified in the individual monograph. If solvents are used during production, they must be of suitable quality. In addition, the toxicity and residual level of each solvent shall be taken into consideration, and the solvents limited according to the principles defined and the requirements specified in *Residual Solvents* <467>, using the general methods presented therein or other suitable methods.

#### 5.70. Performance Tests

Where content uniformity determinations have been made using the same analytical methodology specified in the Assay, with appropriate allowances made for differences in sample preparation, the average of all of the individual content uniformity determinations may be used as the Assay value.

#### 5.80. USP Reference Standards

USP Reference Standards are authentic specimens that have been approved as suitable for use as comparison standards in *USP* or *NF* tests and assays. (See *USP Reference Standards* <11>.) Where a procedure calls for the use of a compendial article rather than for a USP Reference Standard as a material standard of reference, a substance meeting all of the compendial monograph requirements for that article shall be used. If any new *USP* or *NF* standard requires the use of a new USP Reference Standard that is not yet available, that portion of the standard containing the requirement shall not be official until the specified USP reference material is available.

Unless a reference standard label bears a specific potency or content, assume the reference standard is 100.0% pure in the official application. Unless otherwise directed in the procedure in the individual monograph or in a general chapter, USP Reference Standards are to be used in accordance with the instructions on the label of the Reference Standard.

### 6. TESTING PRACTICES AND PROCEDURES

#### 6.10. Safe Laboratory Practices

In performing compendial procedures, safe laboratory practices shall be followed, including precautionary measures, protective equipment, and work practices consistent with the chemicals and procedures used. Before undertaking any procedure described in the compendia, the analyst should be aware of the hazards associated with the chemicals and the techniques and means of protecting against them. These compendia are not designed to describe such hazards or protective measures.

## 6.20. Automated Procedures

Automated and manual procedures employing the same basic chemistry are considered equivalent.

## 6.30. Alternative and Harmonized Methods and Procedures

Alternative methods and/or procedures may be used if they provide advantages in terms of accuracy, sensitivity, precision, selectivity, or adaptability to automation or computerized data reduction, or in other special circumstances. Such alternative procedures and methods shall be validated as described in the general chapter *Validation of Compendial Procedures* (1225) and must be shown to give equivalent or better results. Only those results obtained by the methods and procedures given in the compendium are conclusive.

Alternative procedures should be submitted to USP for evaluation as a potential replacement or addition to the standard (see section 4.10, *Monographs*).

Certain general chapters contain a statement that the text in question is harmonized with the corresponding text of the *European Pharmacopoeia* and/or the *Japanese Pharmacopoeia* and that these texts are interchangeable. Therefore, if a substance or preparation is found to comply with a requirement using an interchangeable method or procedure from one of these pharmacopoeias, it should comply with the requirements of the *USP*. When a difference appears, or in the event of dispute, only the result obtained by the method and/or procedure given in the *USP* is conclusive.

## 6.40. Dried, Anhydrous, Ignited, or Solvent-Free Basis

All calculations in the compendia assume an "as-is" basis unless otherwise specified.

Test procedures may be performed on the undried or unignited substance and the results calculated on the dried, anhydrous, or ignited basis, provided a test for *Loss on Drying*, or *Water*, or *Loss on Ignition*, respectively, is given in the monograph. Where the presence of moisture or other volatile material may interfere with the procedure, previous drying of the substance is specified in the individual monograph and is obligatory.

The term "solvent-free" signifies that the calculation shall be corrected for the presence of known solvents as determined using the methods described in *Residual Solvents* (467) unless a test for limit of organic solvents is provided in the monograph.

The term "previously dried" without qualification signifies that the substance shall be dried as directed under *Loss on Drying* (731) or *Water Determination* (921) (gravimetric determination).

Where drying in vacuum over a desiccant is directed, a vacuum desiccator, a vacuum drying pistol, or other suitable vacuum drying apparatus shall be used.

### 6.40.10. Ignite To Constant Weight

"Ignite to constant weight" means that ignition shall be continued at  $800 \pm 25^\circ$ , unless otherwise indicated, until two consecutive weighings, the second of which is taken after an additional period appropriate to the nature and quantity of the residue, do not differ by more than 0.50 mg per g of substance taken.

### 6.40.20. Dried To Constant Weight

"Dried to constant weight" means that drying shall be continued until two consecutive weighings, the second of which is taken after an additional drying period appropriate to the nature and quantity of the residue, do not differ by more than 0.50 mg per g of substance taken.

## 6.50. Preparation of Solutions

### 6.50.10. Filtration

Where a procedure gives direction to "filter" without further qualification, the liquid shall be passed through suitable filter paper or equivalent device until the filtrate is clear. Due to the possibility of filter effects, the initial volumes of a filtrate may be discarded.

### 6.50.20. Solutions

Unless otherwise specified, all solutions shall be prepared with Purified Water. Solutions for quantitative measures shall

be prepared using accurately weighed or accurately measured analytes (see section 8.20, *About*).

An expression such as "(1 in 10)" means that 1 part *by volume* of a liquid shall be diluted with, or 1 part *by weight* of a solid shall be dissolved in, a sufficient quantity of the diluent or solvent to make the volume of the finished solution 10 parts *by volume*. An expression such as "(20:5:2)" means that the respective numbers of parts, by volume, of the designated liquids shall be mixed, unless otherwise indicated.

### 6.50.20.1. Adjustments to Solutions

When a specified concentration is called for in a procedure, a solution of other normality or molarity may be used, provided that allowance is made for the difference in concentration and that the change does not increase the error of measurement.

Unless otherwise indicated, analyte concentrations shall be prepared to within ten percent (10%) of the indicated value. In the special case in which a procedure is adapted to the working range of an instrument, solution concentrations may differ from the indicated value by more than ten percent (10%), with appropriate changes in associated calculations. Any changes shall fall within the validated range of the instrument.

When adjustment of pH is indicated with either an acid or base and the concentration is not indicated, appropriate concentrations of that acid or base may be used.

### 6.50.20.2. Test Solutions

Information on Test Solutions (TS) is provided in the *Test Solutions* portion of the *Reagents, Indicators, and Solutions* section of the *USP-NF*. Use of an alternative Test Solution or a change in the Test Solution used may require validation.

### 6.50.20.3. Indicator Solutions

Where a procedure specifies the use of an indicator TS, approximately 0.2 mL, or 3 drops, of the solution shall be added unless otherwise directed.

## 6.60. Units Necessary to Complete a Test

Unless otherwise specified, a sufficient number of units to ensure a suitable analytical result shall be taken.

### 6.60.10. Tablets

Where the procedure of a Tablet monograph directs to weigh and finely powder not fewer than a given number of Tablets, a counted number of Tablets shall be weighed and reduced to a powder. The portion of the powdered Tablets taken shall be representative of the whole Tablets and shall, in turn, be weighed accurately.

### 6.60.20. Capsules

Where the procedure of a Capsule monograph gives direction to remove, as completely as possible, the contents of not fewer than a given number of the Capsules, a counted number of Capsules shall be carefully opened and the contents quantitatively removed, combined, mixed, and weighed accurately. The portion of mixed Capsules contents taken shall be representative of the contents of the Capsules and shall, in turn, be weighed accurately.

## 6.70. Reagents

The proper conduct of the compendial procedures and the reliability of the results depend, in part, upon the quality of the reagents used in the performance of the procedures. Unless otherwise specified, reagents conforming to the specifications set forth in the current edition of *Reagent Chemicals* published by the American Chemical Society (ACS) shall be used. Where such ACS reagent specifications are not available or where the required purity differs, compendial specifications for reagents of acceptable quality are provided (see the *Reagents, Indicators, and Solutions* section of the *USP-NF*). Reagents not covered by any of these specifications should be of a grade suitable to the proper performance of the method of assay or test involved.

Listing of these reagents, including the indicators and solutions employed as reagents, in no way implies that they have therapeutic utility; furthermore, any reference to *USP* or *NF* in their labeling shall include also the term "reagent"

or “reagent grade.” USP may supply reagents if they otherwise may not be generally commercially available.

#### 6.80. Equipment

Unless otherwise specified, a specification for a definite size or type of container or apparatus in a procedure is given solely as a recommendation. Other dimensions or types may be used if they are suitable for the intended use.

##### 6.80.10. Apparatus for Measurement

Where volumetric flasks or other exact measuring, weighing, or sorting devices are specified, this or other equipment of at least equivalent accuracy shall be employed.

##### 6.80.10.1. Pipet

Where a pipet is specified, a suitable buret may be substituted. Where a “to contain” pipet is specified, a suitable volumetric flask may be substituted.

##### 6.80.10.2. Light Protection

Where low-actinic or light-resistant containers are specified, either containers specially treated to protect contents from light or clear containers that have been rendered opaque by application of a suitable coating or wrapping may be used.

##### 6.80.20. Instrumental Apparatus

An instrument may be substituted for the specified instrument if the substitute uses the same fundamental principles of operation and is of equivalent or greater sensitivity and accuracy. These characteristics shall be qualified as appropriate. Where a particular brand or source of a material, instrument, or piece of equipment, or the name and address of a manufacturer or distributor, is mentioned (ordinarily in a footnote), this identification is furnished solely for informational purposes as a matter of convenience, without implication of approval, endorsement, or certification.

##### 6.80.20.1. Chromatographic Tubes and Columns

The term “diameter” refers to internal diameter (ID).

##### 6.80.20.2. Tubing

The term “diameter” refers to outside diameter (OD).

##### 6.80.20.3. Steam Bath

Where use of a steam bath is directed, use actively flowing steam or another regulated heat source controlled at an equivalent temperature.

##### 6.80.20.4. Water Bath

A water bath requires vigorously boiling water unless otherwise specified.

### 7. TEST RESULTS

#### 7.10. Interpretation of Requirements

Analytical results observed in the laboratory (or calculated from experimental measurements) are compared with stated acceptance criteria to determine whether the article conforms to compendial requirements.

The reportable value, which often is a summary value for several individual determinations, is compared with the acceptance criteria. The reportable value is the end result of a completed measurement procedure, as documented.

Where acceptance criteria are expressed numerically herein through specification of an upper and/or lower limit, permitted values include the specified values themselves, but no values outside the limit(s). Acceptance criteria are considered significant to the last digit shown.

#### 7.10.5. Nominal Concentrations in Equations

Where a “nominal concentration” is specified, calculate the concentration based on the label claim. In assay procedures, water correction is typically stated in the Definition and on the label of the USP Reference Standard. For other procedures, correction for assayed content, potency, or both is made prior to using the concentration in the equation provided in the monograph.

#### 7.10.10. Equivalence Statements in Titrimetric Procedures

The directions for titrimetric procedures conclude with a statement of the weight of the analyte that is equivalent to each mL of the standardized titrant. In such an equivalence statement, the number of significant figures in the concentration of the titrant should be understood to correspond to the number of significant figures in the weight of the analyte. Corrections to calculations based on the blank determination are to be made for all titrimetric assays where appropriate (see *Titrimetry* (541)).

#### 7.20. Rounding Rules

The observed or calculated values shall be rounded off to the number of decimal places that is in agreement with the limit expression. Numbers should not be rounded until the final calculations for the reportable value have been completed. Intermediate calculations (e.g., slope for linearity) may be rounded for reporting purposes, but the original (not rounded) value should be used for any additional required calculations. Acceptance criteria are fixed numbers and are not rounded.

When rounding is required, consider only one digit in the decimal place to the right of the last place in the limit expression. If this digit is smaller than 5, it is eliminated and the preceding digit is unchanged. If this digit is equal to or greater than 5, it is eliminated and the preceding digit is increased by 1.

### 8. TERMS AND DEFINITIONS

#### 8.10. Abbreviations

- RS refers to a USP Reference Standard.
- CS refers to a Colorimetric Solution.
- TS refers to a Test Solution.
- VS refers to a Volumetric Solution that is standardized in accordance with directions given in the individual monograph or in the *Reagents, Indicators, and Solutions* section of USP–NF.

#### 8.20. About

“About” indicates a quantity within 10%.

If the measurement is stated to be “accurately measured” or “accurately weighed,” follow the statements in the gen-

Illustration of Rounding Numerical Values for Comparison with Requirements			
Compendial Requirement	Unrounded Value	Rounded Result	Conforms
Assay limit $\geq 98.0\%$	97.96%	98.0%	Yes
	97.92%	97.9%	No
	97.95%	98.0%	Yes
Assay limit $\leq 101.5\%$	101.55%	101.6%	No
	101.46%	101.5%	Yes
	101.45%	101.5%	Yes
Limit test $\leq 0.02\%$	0.025%	0.03%	No
	0.015%	0.02%	Yes
	0.027%	0.03%	No
Limit test $\leq 3$ ppm	3.5 ppm	4 ppm	No
	3.4 ppm	3 ppm	Yes
	2.5 ppm	3 ppm	Yes

eral chapters *Volumetric Apparatus* (31) and *Weights and Balances* (41), respectively.

### 8.30. Alcohol Content

Percentages of alcohol, such as those under the heading *Alcohol Content*, refer to percentage by volume of  $C_2H_5OH$  at 15.56°. Where a formula, test, or assay calls for alcohol, ethyl alcohol, or ethanol, the *USP* monograph article Alcohol shall be used. Where reference is made to " $C_2H_5OH$ ," absolute (100 percent) ethanol is intended. Where a procedure calls for dehydrated alcohol, alcohol absolute, or anhydrous alcohol, the *USP* monograph article Dehydrated Alcohol shall be used.

### 8.40. Atomic Weights

Atomic weights used in computing molecular weights and the factors in the assays and elsewhere are those established by the IUPAC Commission on Atomic Weights and Isotopic Abundances.

### 8.50. Blank Determinations

Where it is directed that "any necessary correction" be made by a blank determination, the determination shall be conducted using the same quantities of the same reagents treated in the same manner as the solution or mixture containing the portion of the substance under assay or test, but with the substance itself omitted.

### 8.60. Concomitantly

"Concomitantly" denotes that the determinations or measurements are to be performed in immediate succession.

### 8.70. Desiccator

The instruction "in a desiccator" indicates use of a tightly closed container of suitable size and design that maintains an atmosphere of low moisture content by means of a suitable desiccant such as anhydrous calcium chloride, magnesium perchlorate, phosphorus pentoxide, or silica gel. See also section 8.220, *Vacuum Desiccator*.

### 8.80. Logarithms

Logarithms are to the base 10.

### 8.90. Microbial Strain

A microbial strain cited and identified by its ATCC catalog number shall be used directly or, if subcultured, shall be used not more than five passages removed from the original strain.

### 8.100. Negligible

"Negligible" indicates a quantity not exceeding 0.50 mg.

### 8.110. NLT/NMT

"NLT" means "not less than." "NMT" means "not more than."

### 8.120. Odor

"Odorless," "practically odorless," "a faint characteristic odor," and variations thereof indicate evaluation of a suitable quantity of freshly opened material after exposure to the air for 15 minutes. An odor designation is descriptive only and should not be regarded as a standard of purity for a particular lot of an article.

### 8.130. Percent

"Percent" used without qualification means:

- For mixtures of solids and semisolids, percent weight in weight;
- For solutions or suspensions of solids in liquids, percent weight in volume;
- For solutions of liquids in liquids, percent volume in volume;
- For solutions of gases in liquids, percent weight in volume.

For example, a 1 percent solution is prepared by dissolving 1 g of a solid or semisolid, or 1 mL of a liquid, in sufficient solvent to make 100 mL of the solution.

### 8.140. Percentage Concentrations

Percentage concentrations are expressed as follows:

- *Percent Weight in Weight (w/w)* is defined as the number of g of a solute in 100 g of solution.

- *Percent Weight in Volume (w/v)* is defined as number of g of a solute in 100 mL of solution.
- *Percent Volume in Volume (v/v)* is defined as the number of mL of a solute in 100 mL of solution.

### 8.150. Pressure

Pressure is determined by use of a suitable manometer or barometer calibrated in terms of the pressure exerted by a column of mercury of the stated height.

### 8.160. Reaction Time

Reaction time is 5 minutes unless otherwise specified.

### 8.170. Specific Gravity

Specific gravity is the weight of a substance in air at 25° divided by the weight of an equal volume of water at the same temperature.

### 8.180. Temperatures

Temperatures are expressed in centigrade (Celsius) degrees, and all measurements are made at 25° unless otherwise indicated. Where moderate heat is specified, any temperature not higher than 45° (113° F) is indicated.

### 8.190. Time

Unless otherwise specified, rounding rules, as described in section 7.20, *Rounding Rules*, apply to any time specified.

### 8.200. Transfer

"Transfer" indicates a quantitative manipulation.

### 8.210. Vacuum

"Vacuum" denotes exposure to a pressure of less than 20 mm of mercury (2.67 kPa), unless otherwise indicated.

### 8.220. Vacuum Desiccator

"Vacuum desiccator" indicates a desiccator that maintains a low-moisture atmosphere at a reduced pressure of not more than 20 mm of mercury (2.67 kPa) or at the pressure designated in the individual monograph.

### 8.230. Water

#### 8.230.10. Water as an Ingredient in an Official Product

As an ingredient in an official product, water meets the requirements of the appropriate water monograph in *USP* or *NF*.

#### 8.230.20. Water in the Manufacture of Official Substances

When used in the manufacture of official substances, water may meet the requirements for drinking water as set forth in the regulations of the U.S. Environmental Protection Agency (potable water).

#### 8.230.30. Water in a Compendial Procedure

When water is called for in a compendial procedure, the *USP* article Purified Water shall be used unless otherwise specified. Definitions for *High-Purity Water* and *Carbon Dioxide-Free Water* are provided in *Containers—Glass* (660). Definitions of other types of water are provided in *Water for Pharmaceutical Purposes* (1231).

### 8.240. Weights and Measures

In general, weights and measures are expressed in the International System of Units (SI) as established and revised by the *Conférence générale des poids et mesures*. For compendial purposes, the term "weight" is considered to be synonymous with "mass."

Molality is designated by the symbol *m* preceded by a number that represents the number of moles of the designated solute contained in 1 kilogram of the designated solvent.

Molarity is designated by the symbol *M* preceded by a number that represents the number of moles of the designated solute contained in an amount of the designated solvent that is sufficient to prepare 1 liter of solution.

Normality is designated by the symbol *N* preceded by a number that represents the number of equivalents of the designated solute contained in an amount of the designated solvent that is sufficient to prepare 1 liter of solution.

Symbols commonly employed for SI metric units and other units are as follows:

Bq = becquerel	dL = deciliter
kBq = kilobecquerel	L = liter
MBq = megabecquerel	mL = milliliter <sup>c</sup>
GBq = gigabecquerel	μL = microliter
Ci = curie	Eq = gram-equivalent weight
mCi = millicurie	mEq = milliequivalent
μCi = microcurie	mol = gram-molecular weight (mole)
nCi = nanocurie	Da = dalton (relative molecular mass)
Gy = gray	mmol = millimole
mGy = milligray	Osmol = osmole
m = meter	mOsmol = milliosmole
dm = decimeter	Hz = hertz
cm = centimeter	kHz = kilohertz
mm = millimeter	MHz = megahertz
μm = micrometer (0.001 mm)	V = volts
nm = nanometer <sup>a</sup>	MeV = million electron volts
kg = kilogram	keV = kilo-electron volt
g = gram	mV = millivolt
mg = milligram	psi = pounds per square inch
μg; mcg = microgram <sup>b</sup>	Pa = pascal
ng = nanogram	kPa = kilopascal
pg = picogram	g = gravity (in centrifugation)
fg = femtogram	

<sup>a</sup> Previously the symbol mμ (for millimicron) was used.

<sup>b</sup> The symbol μg is used in the *USP* and *NF* to represent micrograms, but micrograms may be represented as "mcg" for labeling and prescribing purposes. The term "gamma," symbolized by γ, frequently is used to represent micrograms in biochemical literature.

<sup>c</sup> One milliliter (mL) is used herein as the equivalent of one cubic centimeter (cc).

## 9. PRESCRIBING AND DISPENSING

### 9.10 Use of Metric Units

Prescriptions for compendial articles shall be written to state the quantity and/or strength desired in metric units unless otherwise indicated in the individual monograph (see also *Units of Potency*, section 5.50.10 above). If an amount is prescribed by any other system of measurement, only an amount that is the metric equivalent of the prescribed amount shall be dispensed. Apothecary unit designations on labels and labeling shall not be used.

### 9.20 Changes in Volume

In the dispensing of prescription medications, slight changes in volume owing to variations in room temperatures may be disregarded.

## 10. PRESERVATION, PACKAGING, STORAGE, AND LABELING

### 10.10. Storage Under Nonspecific Conditions

If no specific directions or limitations are provided in the *Packaging and Storage* section of an individual *USP* monograph or in the labeling of an article recognized in *USP*, the conditions of storage shall include storage at controlled room temperature, protection from moisture, and, where necessary, protection from light. Such articles shall be protected from moisture, freezing, and excessive heat, and, where necessary, from light during shipping and distribution. Drug substances are exempt from the requirements in this paragraph.

Regardless of quantity, where no specific storage directions or limitations are provided in an individual *NF* monograph or stated in the labeling of an article recognized in *NF*, the conditions of storage and distribution shall include protection from moisture, freezing, excessive heat, and, where necessary, from light.

### 10.20. Containers

The container is that which holds the article and is or may be in direct contact with the article. The immediate container is that which is in direct contact with the article at all times. The closure is a part of the container.

Before being filled, the container should be clean. Special precautions and cleaning procedures may be necessary to ensure that each container is clean and that extraneous matter is not introduced into or onto the article.

The container does not interact physically or chemically with the article placed in it so as to alter the strength, quality, or purity of the article beyond the official requirements.

The compendial requirements for the use of specified containers apply also to articles as packaged by the pharmacist or other dispenser, unless otherwise indicated in the individual monograph.

#### 10.20.10. Tamper-Evident Packaging

The container or individual carton of a sterile article intended for ophthalmic or otic use, except where extemporaneously compounded for immediate dispensing on prescription, shall be so sealed that the contents cannot be used without obvious destruction of the seal.

Articles intended for sale without prescription are also required to comply with the tamper-evident packaging and labeling requirements of the FDA where applicable.

Preferably, the immediate container and/or the outer container or protective packaging used by a manufacturer or distributor for all dosage forms that are not specifically exempt is designed so as to show evidence of any tampering with the contents.

#### 10.20.20. Light-Resistant Container

A light-resistant container (see *Light Transmission Test* under *Containers—Performance Testing* (671)) protects the contents from the effects of light by virtue of the specific properties of the material of which it is composed, including any coating applied to it. Alternatively, a clear and colorless or a translucent container may be made light-resistant by means of an opaque covering, in which case the label of the container bears a statement that the opaque covering is needed until the contents are to be used or administered. Where it is directed to "protect from light" in an individual monograph, preservation in a light-resistant container is intended.

Where an article is required to be packaged in a light-resistant container, and if the container is made light-resistant by means of an opaque covering, a single-use, unit-dose container or mnemonic pack for dispensing may not be removed from the outer opaque covering before dispensing.

#### 10.20.30. Well-Closed Container

A well-closed container protects the contents from extraneous solids and from loss of the article under the ordinary or customary conditions of handling, shipment, storage, and distribution.

#### 10.20.40. Tight Container

A tight container protects the contents from contamination by extraneous liquids, solids, or vapors; from loss of the article; and from efflorescence, deliquescence, or evaporation under the ordinary or customary conditions of handling, shipment, storage, and distribution; and is capable of tight reclosure. Where a tight container is specified, it may be replaced by a hermetic container for a single dose of an article.

A gas cylinder is a metallic container designed to hold a gas under pressure. As a safety measure, for carbon dioxide, cyclopropane, helium, nitrous oxide, and oxygen, the Pin-Index Safety System of matched fittings is recommended for cylinders of Size E or smaller.

[NOTE—Where packaging and storage in a *tight container* or a *well-closed container* is specified in the individual monograph, the container used for an article when dispensed on prescription meets the requirements under *Containers—Performance Testing* (671).]

**10.20.50. Hermetic Container**

A hermetic container is impervious to air or any other gas under the ordinary or customary conditions of handling, shipment, storage, and distribution.

**10.20.60. Single-Unit Container**

A single-unit container is one that is designed to hold a quantity of drug product intended for administration as a single dose or a single finished device intended for use promptly after the container is opened. Preferably, the immediate container and/or the outer container or protective packaging shall be so designed as to show evidence of any tampering with the contents. Each single-unit container shall be labeled to indicate the identity, quantity and/or strength, name of the manufacturer, lot number, and expiration date of the article.

**10.20.70. Single-Dose Container**

A single-dose container is a single-unit container for articles intended for parenteral administration only. A single-dose container is labeled as such. Examples of single-dose containers include prefilled syringes, cartridges, fusion-sealed containers, and closure-sealed containers when so labeled. (See also *Containers for Injections* under *Injections* (1).)

**10.20.80. Unit-Dose Container**

A unit-dose container is a single-unit container for articles intended for administration by other than the parenteral route as a single dose, direct from the container.

**10.20.90. Unit-of-Use Container**

A unit-of-use container is one that contains a specific quantity of a drug product and that is intended to be dispensed as such without further modification except for the addition of appropriate labeling. A unit-of-use container is labeled as such.

**10.20.100. Multiple-Unit Container**

A multiple-unit container is a container that permits withdrawal of successive portions of the contents without changing the strength, quality, or purity of the remaining portion.

**10.20.110. Multiple-Dose Container**

A multiple-dose container is a multiple-unit container for articles intended for parenteral administration only. (See also *Containers for Injections* under *Injections* (1).)

**10.20.120. Requirements under the Poison Prevention Packaging Act (PPPA)**

This act (see the website, [www.cpsc.gov/businfo/pppa.html](http://www.cpsc.gov/businfo/pppa.html)) requires special packaging of most human oral prescription drugs, oral controlled drugs, certain non-oral prescription drugs, certain dietary supplements, and many over-the-counter (OTC) drug preparations in order to protect the public from personal injury or illness from misuse of these preparations (16 CFR § 1700.14).

The immediate packaging of substances regulated under the PPPA shall comply with the special packaging standards (16 CFR § 1700.15 and 16 CFR § 1700.20). The PPPA regulations for special packaging apply to all packaging types including reclosable, nonclosable, and unit-dose types.

Special packaging is not required for drugs dispensed within a hospital setting for inpatient administration. Manufacturers and packagers of bulk-packaged prescription drugs do not have to use special packaging if the drug will be repackaged by the pharmacist. PPPA-regulated prescription drugs may be dispensed in non-child-resistant packaging upon the request of the purchaser or when directed in a legitimate prescription (15 U.S.C. § 1473).

Manufacturers or packagers of PPPA-regulated OTC preparations are allowed to package one size in non-child-resistant packaging as long as popular-size, special packages are also supplied. The non-child-resistant package requires special labeling (16 CFR § 1700.5).

Various types of child-resistant packages are covered in ASTM International Standard D-3475, *Standard Classification of Child-Resistant Packaging*. Examples are included as an aid in the understanding and comprehension of each type of classification.

**10.30. Storage Temperature and Humidity**

Specific directions are stated in some monographs with respect to the temperatures and humidity at which official articles shall be stored and distributed (including the shipment of articles to the consumer) when stability data indicate that storage and distribution at a lower or a higher temperature and a higher humidity produce undesirable results. Such directions apply except where the label on an article states a different storage temperature on the basis of stability studies of that particular formulation. Where no specific storage directions or limitations are provided in the individual monograph, but the label of an article states a storage temperature that is based on stability studies of that particular formulation, such labeled storage directions apply. The conditions are defined by the following terms.

**10.30.10. Freezer**

"Freezer" indicates a place in which the temperature is maintained thermostatically between  $-25^{\circ}$  and  $-10^{\circ}$  ( $-13^{\circ}$  and  $14^{\circ}$ F).

**10.30.20. Cold**

Any temperature not exceeding  $8^{\circ}$  ( $46^{\circ}$ F) is "cold." A "refrigerator" is a cold place in which the temperature is maintained thermostatically between  $2^{\circ}$  and  $8^{\circ}$  ( $36^{\circ}$  and  $46^{\circ}$ F).

**10.30.30. Cool**

Any temperature between  $8^{\circ}$  and  $15^{\circ}$  ( $46^{\circ}$  and  $59^{\circ}$ F) is "cool." An article for which storage in a *cool place* is directed may, alternatively, be stored and distributed in a *refrigerator*, unless otherwise specified by the individual monograph.

**10.30.40. Controlled Cold Temperature**

"Controlled cold temperature" is defined as temperature maintained thermostatically between  $2^{\circ}$  and  $8^{\circ}$  ( $36^{\circ}$  and  $46^{\circ}$  F), that allows for excursions in temperature between  $0^{\circ}$  and  $15^{\circ}$  ( $32^{\circ}$  and  $59^{\circ}$  F) that may be experienced during storage, shipping, and distribution such that the allowable calculated mean kinetic temperature is not more than  $8^{\circ}$  ( $46^{\circ}$  F). Transient spikes up to  $25^{\circ}$  ( $77^{\circ}$  F) may be permitted if the manufacturer so instructs and provided that such spikes do not exceed 24 hours unless supported by stability data or the manufacturer instructs otherwise.

**10.30.50. Room Temperature**

"Room temperature" indicates the temperature prevailing in a working area.

**10.30.60. Controlled Room Temperature**

"Controlled room temperature" indicates a temperature maintained thermostatically that encompasses the usual and customary working environment of  $20^{\circ}$  to  $25^{\circ}$  ( $68^{\circ}$  to  $77^{\circ}$ F); that results in a mean kinetic temperature calculated to be not more than  $25^{\circ}$ ; and that allows for excursions between  $15^{\circ}$  and  $30^{\circ}$  ( $59^{\circ}$  and  $86^{\circ}$ F) that are experienced in pharmacies, hospitals, and warehouses. Provided the mean kinetic temperature remains in the allowed range, transient spikes up to  $40^{\circ}$  are permitted as long as they do not exceed 24 hours. Spikes above  $40^{\circ}$  may be permitted if the manufacturer so instructs. Articles may be labeled for storage at "controlled room temperature" or at "up to  $25^{\circ}$ ", or other wording based on the same mean kinetic temperature. The mean kinetic temperature is a calculated value that may be used as an isothermal storage temperature that simulates the nonisothermal effects of storage temperature variations.

An article for which storage at *controlled room temperature* is directed may, alternatively, be stored and distributed in a *cool place*, unless otherwise specified in the individual monograph or on the label.

**10.30.70. Warm**

Any temperature between  $30^{\circ}$  and  $40^{\circ}$  ( $86^{\circ}$  and  $104^{\circ}$ F) is "warm."

**10.30.80. Excessive Heat**

"Excessive heat" means any temperature above  $40^{\circ}$  ( $104^{\circ}$ F).

**10.30.90. Protection From Freezing**

Where, in addition to the risk of breakage of the container, freezing subjects an article to loss of strength or potency, or to destructive alteration of its characteristics, the container label bears an appropriate instruction to protect the article from freezing.

**10.30.100. Dry Place**

The term "dry place" denotes a place that does not exceed 40% average relative humidity at *Controlled Room Temperature* or the equivalent water vapor pressure at other temperatures. The determination may be made by direct measurement at the place or may be based on reported climatic conditions. Determination is based on not less than 12 equally spaced measurements that encompass either a season, a year, or, where recorded data demonstrate, the storage period of the article. There may be values of up to 45% relative humidity provided that the average value is 40% relative humidity.

Storage in a container validated to protect the article from moisture vapor, including storage in bulk, is considered storage in a dry place.

**10.40. Labeling**

The term "labeling" designates all labels and other written, printed, or graphic matter upon an immediate container of an article or upon, or in, any package or wrapper in which it is enclosed, except any outer shipping container. The term "label" designates that part of the labeling upon the immediate container.

A shipping container containing a single article, unless such container is also essentially the immediate container or the outside of the consumer package, is labeled with a minimum of product identification (except for controlled articles), lot number, expiration date, and conditions for storage and distribution.

Articles in these compendia are subject to compliance with such labeling requirements as may be promulgated by governmental bodies in addition to the compendial requirements set forth for the articles.

**10.40.10. Amount of Ingredient Per Dosage Unit**

The strength of a drug product is expressed on the container label in terms of micrograms or milligrams or grams or percentage of the therapeutically active moiety or drug substance, whichever form is used in the title, unless otherwise indicated in an individual monograph. Both the active moiety and drug substance names and their equivalent amounts are then provided in the labeling.

Official articles in capsule, tablet, or other unit dosage form shall be labeled to express the quantity of each active ingredient or recognized nutrient contained in each such unit; except that, in the case of unit-dose oral solutions or suspensions, whether supplied as liquid preparations or as liquid preparations that are constituted from solids upon addition of a designated volume of a specific diluent, the label shall express the quantity of each active ingredient or recognized nutrient delivered under the conditions prescribed in *Deliverable Volume* (698). Official drug products not in unit dosage form shall be labeled to express the quantity of each active ingredient in each milliliter or in each gram, or to express the percentage of each such ingredient (see 8.140., *Percentage Concentrations*), except that oral liquids or solids intended to be constituted to yield oral liquids may, alternatively, be labeled in terms of each 5-mL portion of the liquid or resulting liquid. Unless otherwise indicated in a monograph or chapter, such declarations of strength or quantity shall be stated only in metric units. See also 5.50.10., *Units of Potency (Biological)*.

**10.40.20. Use of Leading and Terminal Zeros**

To help minimize the possibility of errors in the dispensing and administration of drugs, the quantity of active ingredient when expressed in whole numbers shall be shown without a decimal point that is followed by a terminal zero (e.g., express as 4 mg [not 4.0 mg]). The quantity of active ingredient when expressed as a decimal number smaller than 1

shall be shown with a zero preceding the decimal point (e.g., express as 0.2 mg [not .2 mg]).

**10.40.30. Labeling of Salts of Drugs**

It is an established principle that official articles shall have only one official title. For purposes of saving space on labels, and because chemical symbols for the most common inorganic salts of drugs are well known to practitioners as synonymous with the written forms, the following alternatives are permitted in labeling official articles that are salts: HCl for hydrochloride; HBr for hydrobromide; Na for sodium; and K for potassium. The symbols Na and K are intended for use in abbreviating names of the salts of organic acids, but these symbols are not used where the word Sodium or Potassium appears at the beginning of an official title (e.g., Phenobarbital Na is acceptable, but Na Salicylate is not to be written).

**10.40.40. Labeling Vitamin-Containing Products**

The vitamin content of an official drug product shall be stated on the label in metric units per dosage unit. The amounts of vitamins A, D, and E may be stated also in USP Units. Quantities of vitamin A declared in metric units refer to the equivalent amounts of retinol (vitamin A alcohol). The label of a nutritional supplement shall bear an identifying lot number, control number, or batch number.

**10.40.50. Labeling Botanical-Containing Products**

The label of an herb or other botanical intended for use as a dietary supplement bears the statement, "If you are pregnant or nursing a baby, seek the advice of a health professional before using this product."

**10.40.60. Labeling Parenteral And Topical Preparations**

The label of a preparation intended for parenteral or topical use states the names of all added substances (see 5.20., *Added Substances, Excipients, and Ingredients* and see *Labeling* under *Injections* (1)), and, in the case of parenteral preparations, also their amounts or proportions, except that for substances added for adjustment of pH or to achieve isotonicity, the label may indicate only their presence and the reason for their addition.

**10.40.70. Labeling Electrolytes**

The concentration and dosage of electrolytes for replacement therapy (e.g., sodium chloride or potassium chloride) shall be stated on the label in milliequivalents (mEq). The label of the product shall indicate also the quantity of ingredient(s) in terms of weight or percentage concentration.

**10.40.80. Labeling Alcohol**

The content of alcohol in a liquid preparation shall be stated on the label as a percentage (v/v) of C<sub>2</sub>H<sub>5</sub>OH.

**10.40.90. Special Capsules and Tablets**

The label of any form of Capsule or Tablet intended for administration other than by swallowing intact bears a prominent indication of the manner in which it shall be used.

**10.40.100. Expiration Date and Beyond-Use Date**

The label of an official drug product or nutritional or dietary supplement product shall bear an expiration date. All articles shall display the expiration date so that it can be read by an ordinary individual under customary conditions of purchase and use. The expiration date shall be prominently displayed in high contrast to the background or sharply embossed, and easily understood (e.g., "EXP 6/08," "Exp. June 08," or "Expires 6/08"). [NOTE—For additional information and guidance, refer to the Consumer Healthcare Products Association's *Voluntary Codes and Guidelines of the Self-Medication Industry*.]

The monographs for some preparations state how the expiration date that shall appear on the label shall be determined. In the absence of a specific requirement in the individual monograph for a drug product or nutritional supplement, the label shall bear an expiration date assigned for the particular formulation and package of the article, with the following exception: the label need not show an expiration date in the case of a drug product or nutritional supplement packaged in a container that is intended for sale

without prescription and the labeling of which states no dosage limitations, and which is stable for not less than 3 years when stored under the prescribed conditions.

Where an official article is required to bear an expiration date, such article shall be dispensed solely in, or from, a container labeled with an expiration date, and the date on which the article is dispensed shall be within the labeled expiry period. The expiration date identifies the time during which the article may be expected to meet the requirements of the compendial monograph, provided it is kept under the prescribed storage conditions. The expiration date limits the time during which the article may be dispensed or used. Where an expiration date is stated only in terms of the month and the year, it is a representation that the intended expiration date is the last day of the stated month. The beyond-use date is the date after which an article shall not be used. The dispenser shall place on the label of the prescription container a suitable beyond-use date to limit the patient's use of the article based on any information supplied by the manufacturer and the *General Notices*. The beyond-use date placed on the label shall not be later than the expiration date on the manufacturer's container.

For articles requiring constitution before use, a suitable beyond-use date for the constituted product shall be identified in the labeling.

For all other dosage forms, in determining an appropriate period of time during which a prescription drug may be retained by a patient after its dispensing, the dispenser shall take into account, in addition to any other relevant factors, the nature of the drug; the container in which it was packaged by the manufacturer and the expiration date thereon; the characteristics of the patient's container, if the article is repackaged for dispensing; the expected storage conditions to which the article may be exposed; any unusual storage conditions to which the article may be exposed; and the expected length of time of the course of therapy. The dispenser shall, on taking into account the foregoing, place on the label of a multiple-unit container a suitable beyond-use date to limit the patient's use of the article. Unless otherwise specified in the individual monograph, or in the absence of stability data to the contrary, such beyond-use date shall be not later than (a) the expiration date on the manufacturer's container, or (b) 1 year from the date the drug is dispensed, whichever is earlier. For nonsterile solid and liquid dosage forms that are packaged in single-unit and unit-dose containers, the beyond-use date shall be 1 year from the date the drug is packaged into the single-unit or unit-dose container or the expiration date on the manufacturer's container, whichever is earlier, unless stability data or the manufacturer's labeling indicates otherwise.

The dispenser shall maintain the facility where the dosage forms are packaged and stored, at a temperature such that the mean kinetic temperature is not greater than 25°. The

plastic material used in packaging the dosage forms shall afford better protection than polyvinyl chloride, which does not provide adequate protection against moisture permeation. Records shall be kept of the temperature of the facility where the dosage forms are stored, and of the plastic materials used in packaging.

#### 10.40.100.1. Compounded Preparations

The label on the container or package of an official compounded preparation shall bear a beyond-use date. The beyond-use date is the date after which a compounded preparation is not to be used. Because compounded preparations are intended for administration immediately or following short-term storage, their beyond-use dates may be assigned based on criteria different from those applied to assigning expiration dates to manufactured drug products.

The monograph for an official compounded preparation typically includes a beyond-use requirement that states the time period following the date of compounding during which the preparation, properly stored, may be used. In the absence of stability information that is applicable to a specific drug and preparation, recommendations for maximum beyond-use dates have been devised for nonsterile compounded drug preparations that are packaged in tight, light-resistant containers and stored at controlled room temperature unless otherwise indicated (see *Stability Criteria and Beyond-Use Dating under Stability of Compounded Preparations* in the general test chapter *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

#### 10.50. Guidelines for Packaging and Storage Statements in USP–NF Monographs

In order to provide users of the *USP* and *NF* with proper guidance on how to package and store official articles, every monograph in the *USP* and *NF* shall have a packaging and storage specification.

For the packaging portion of the statement, the choice of containers is given in this section 10, *Preservation, Packaging, Storage, and Labeling*, and includes *Light-Resistant Container*, *Well-Closed Container*, *Tight Container*, *Hermetic Container*, *Single-Unit Container*, *Single-Dose Container*, *Unit-Dose Container*, and *Unit-of-Use Container*. For most preparations, the choice is determined by the container in which it shall be dispensed (e.g., tight, well-closed, hermetic, unit-of-use, etc.). For drug substances, the choice would appear to be tight, well-closed, or, where needed, a light-resistant container. For excipients, given their typical nature as large-volume commodity items, with containers ranging from drums to tank cars, a well-closed container is an appropriate default. Therefore, in the absence of data indicating a need for a more protective class of container, the phrase "Preserve in well-closed containers" should be used as a default for excipients.

# Official Monographs for USP 36

## Abacavir Sulfate

$(C_{14}H_{18}N_6O)_2 \cdot H_2SO_4$  670.74  
2-Cyclopentene-1-methanol, 4-[2-amino-6-(cyclopropylamino)-9H-purin-9-yl]-, (1S-cis)-, sulfate (salt) (2:1);  
(1S,4R)-4-[2-Amino-6-(cyclopropylamino)-9H-purin-9-yl]-2-cyclopentene-1-methanol sulfate (salt) (2:1)  
[188062-50-2].

### DEFINITION

Abacavir Sulfate contains NLT 97.0% and NMT 102.0% of  $(C_{14}H_{18}N_6O)_2 \cdot H_2SO_4$ , calculated on the anhydrous and solvent-free basis.

### IDENTIFICATION

- A. INFRARED ABSORPTION** <197K>
- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *System suitability solution*, obtained as directed in the test for *Organic Impurities*, Procedure 2.
- C. IDENTIFICATION TESTS—GENERAL**, Sulfate <191>  
Sample solution: 5 mg/mL

### ASSAY

- PROCEDURE**  
Mobile phase: Acetonitrile, phosphoric acid, and water (20:1:180)  
Standard solution: 0.04 mg/mL of USP Abacavir Sulfate RS in water  
Sample solution: 0.04 mg/mL of Abacavir Sulfate in water  
Chromatographic system  
(See *Chromatography* <621>, *System Suitability*.)  
Mode: LC  
Detector: UV 254 nm  
Column: 4.6-mm × 5-cm; 5-μm packing L1  
Column temperature: 30°  
Flow rate: 1 mL/min  
Injection size: 20 μL  
System suitability  
Sample: *Standard solution*  
Suitability requirements  
Relative standard deviation: NMT 1.5%  
Analysis  
Samples: *Standard solution* and *Sample solution*  
Calculate the percentage of  $(C_{14}H_{18}N_6O)_2 \cdot H_2SO_4$  in the portion of Abacavir Sulfate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area of abacavir from the *Sample solution*  
 $r_S$  = peak area of abacavir from the *Standard solution*  
 $C_S$  = concentration of USP Abacavir Sulfate RS in the *Standard solution* (mg/mL)  
 $C_U$  = concentration of Abacavir Sulfate in the *Sample solution* (mg/mL)  
Acceptance criteria: 97.0%–102.0% on the anhydrous and solvent-free basis

### IMPURITIES

#### Inorganic Impurities

- RESIDUE ON IGNITION** <281>: NMT 0.2%

#### Organic Impurities

- PROCEDURE 1: RELATED COMPOUNDS**

Solution A: Trifluoroacetic acid and water (0.05:99.95)

Solution B: Methanol and water (17:3)

Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	95	5
20	70	30
35	10	90
35.1	95	5
50	95	5

**Relative standard deviation:** NMT 2.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of abacavir (C<sub>14</sub>H<sub>18</sub>N<sub>6</sub>O) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$r_U$  = peak response of abacavir from the *Sample solution*

$r_S$  = peak response of abacavir from the *Standard solution*

$C_S$  = concentration of abacavir sulfate in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of abacavir in the *Sample solution* (mg/mL)

$M_{r1}$  = molecular weight of abacavir multiplied by 2, 572.66

$M_{r2}$  = molecular weight of abacavir sulfate, 670.74

**Acceptance criteria:** 90.0%–110.0%

#### PERFORMANCE TESTS

##### • DISSOLUTION <711>

**Medium:** 0.1 N hydrochloric acid; 900 mL

**Apparatus 2:** 75 rpm

**Time:** 15 min

**Standard solution:** 0.39 mg/mL of USP Abacavir Sulfate RS in *Medium*

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45- $\mu$ m pore size.

#### Instrumental conditions

**Mode:** UV

**Analytical wavelength:** 254 nm

**Blank:** *Medium*

Calculate the percentage of the labeled amount of abacavir (C<sub>14</sub>H<sub>18</sub>N<sub>6</sub>O) dissolved:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times (M_{r1}/M_{r2}) \times V \times 100$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$L$  = label claim (mg/Tablet)

$M_{r1}$  = molecular weight of abacavir multiplied by 2, 572.66

$M_{r2}$  = molecular weight of abacavir sulfate, 670.74

$V$  = volume of *Medium*, 900 mL

**Tolerances:** NLT 80% (Q) of the labeled amount of abacavir (C<sub>14</sub>H<sub>18</sub>N<sub>6</sub>O) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

#### IMPURITIES

##### Change to read:

##### • ORGANIC IMPURITIES

**Diluent, Solution A, Solution B, Mobile phase, System suitability solution, Standard solution, Sample solution, and Chromatographic system:** Proceed as directed in the *Assay*.

#### Analysis

[NOTE—Record the chromatograms for 2.5 times the retention time of abacavir.]

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times (M_{r1}/M_{r2}) \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_S$  = peak response of abacavir from the *Standard solution*

$C_S$  = concentration of USP Abacavir Sulfate RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of abacavir in the *Sample solution* (mg/mL)

$F$  = relative response factor for each impurity (see *Table 2*)

$M_{r1}$  = molecular weight of abacavir multiplied by 2, 572.66

$M_{r2}$  = molecular weight of abacavir sulfate, 670.74

**Acceptance criteria:** See *Table 2*.

▲ **Table 2**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Cyclopropyldiaminopurine abacavir <sup>a</sup>	0.57	1.4	0.2

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at room temperature.

##### • USP REFERENCE STANDARDS <11>

USP Abacavir Sulfate RS

USP Abacavir System Suitability Mixture RS

A mixture of abacavir sulfate and *trans*-abacavir.

## Acarbose

$C_{25}H_{43}NO_{18}$  645.60

D-Glucose, O-4,6-dideoxy-4-[[[1S-(1 $\alpha$ ,4 $\alpha$ ,5 $\beta$ ,6 $\alpha$ )]-4,5,6-trihydroxy-3-(hydroxymethyl)-2-cyclohexen-1-yl]amino]- $\alpha$ -D-glucopyranosyl-(1 $\rightarrow$ 4)-O- $\alpha$ -D-glucopyranosyl-(1 $\rightarrow$ 4)-O-4,6-Dideoxy-4-[[[1S,4R,5S,6S)-4,5,6-trihydroxy-3-(hydroxymethyl)-2-cyclohexen-1-yl]amino]- $\alpha$ -D-glucopyranosyl-(1 $\rightarrow$ 4)-O- $\alpha$ -D-glucopyranosyl-(1 $\rightarrow$ 4)-D-glucose [56180-94-0].

» Acarbose is produced by certain strains of *Actinoplanes utahensis*. It contains not less than 95.0 percent and not more than 102.0 percent of  $C_{25}H_{43}NO_{18}$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Acarbose RS

USP Acarbose System Suitability Mixture RS

**Identification**—

**A:** *Infrared Absorption* (197K).

**B:** The retention time of the acarbose peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Specific rotation** (781S): between +168° and +183°.

*Test solution:* 10 mg per mL, in water.

**pH** (791): between 5.5 and 7.5, in a solution containing 50 mg per mL.

**Water**, *Method 1c* (921): not more than 4.0%.

**Residue on ignition** (281): not more than 0.2% determined on 1.0 g.

**Heavy metals**, *Method II* (231): 0.002%.

**Chromatographic purity**—

*Mobile phase*, *System suitability solution*, and *Chromatographic system*—Proceed as directed in the *Assay*.

*Test solution*—Use the *Assay preparation*.

*Diluted test solution*—Transfer 1.0 mL of the *Test solution* to a 100-mL volumetric flask, dilute with water to volume, and mix.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Test solution* and the *Diluted test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Acarbose taken by the formula:

$$(1/F)(r_i / r_A)$$

in which *F* is the relative response factor for each impurity, as listed in *Table 1*; *r<sub>i</sub>* is the individual peak response for each impurity; and *r<sub>A</sub>* is the response of the main acarbose peak in the chromatogram obtained from the *Diluted test solution*. In addition to not exceeding the limits for each impurity in *Table 1*, not more than 3.0% of total impurities is found.

**Assay**—

*Phosphate buffer*—Dissolve 0.6 g of monobasic potassium phosphate and 0.35 g of dibasic sodium phosphate in 900 mL of water, dilute with water to 1 L, and mix.

*Mobile phase*—Prepare a mixture of acetonitrile and *Phosphate buffer* (750:250). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Reconstitute a vial of USP Acarbose RS in 5.0 mL of water.

*System suitability solution*—Reconstitute a vial of USP Acarbose System Suitability Mixture RS in 1 mL of water.

**Table 1**

Name	Approximate Relative Retention Time	Relative Response Factor ( <i>F</i> )	Limit (%)
Impurity A <sup>1</sup>	0.9	1	0.6
Impurity B <sup>2</sup>	0.8	1.6	0.5
Impurity C <sup>3</sup>	1.2	1	1.5
Impurity D <sup>4</sup>	0.5	1.33	1.0
Impurity E <sup>5</sup>	1.7	0.8	0.2
Impurity F <sup>6</sup>	1.9	0.8	0.3
Impurity G <sup>7</sup>	2.2	0.8	0.3
Impurity H <sup>8</sup>	0.6	1	0.2
Any individual unknown impurity			0.2

<sup>1</sup>O-4,6-Dideoxy-4-[[[1S,4R,5S,6S)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]- $\alpha$ -D-glucopyranosyl-(1 $\rightarrow$ 4)-O- $\alpha$ -D-glucopyranosyl-(1 $\rightarrow$ 4)-D-arabino-hex-2-ulopyranose.

<sup>2</sup>(1R,4R,5S,6R)-4,5,6-Trihydroxy-2-(hydroxymethyl)cyclohex-2-enyl 4-O-[4,6-dideoxy-4-[[[1S,4R,5S,6S)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]- $\alpha$ -D-glucopyranosyl]- $\alpha$ -D-glucopyranoside.

<sup>3</sup> $\alpha$ -D-Glucopyranosyl 4-O-[4,6-dideoxy-4-[[[1S,4R,5S,6S)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]- $\alpha$ -D-glucopyranosyl]- $\alpha$ -D-glucopyranoside.

<sup>4</sup>4-O-[4,6-Dideoxy-4-[[[1S,4R,5S,6S)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]- $\alpha$ -D-glucopyranosyl]-D-glucopyranose.

<sup>5</sup>O-4,6-Dideoxy-4-[[[1S,4R,5S,6S)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]- $\alpha$ -D-glucopyranosyl-(1 $\rightarrow$ 4)-O- $\alpha$ -D-glucopyranosyl-(1 $\rightarrow$ 4)-D-arabino-hex-2-ulopyranose (4-O- $\alpha$ -acarboseyl-D-fructopyranose).

<sup>6</sup>O-4,6-Dideoxy-4-[[[1S,4R,5S,6S)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]- $\alpha$ -D-glucopyranosyl-(1 $\rightarrow$ 4)-O- $\alpha$ -D-glucopyranosyl-(1 $\rightarrow$ 4)-O- $\alpha$ -D-glucopyranosyl-(1 $\rightarrow$ 4)-D-glucopyranose (4-O- $\alpha$ -acarboseyl-D-glucopyranose).

<sup>7</sup> $\alpha$ -D-Glucopyranosyl O-4,6-dideoxy-4-[[[1S,4R,5S,6S)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]- $\alpha$ -D-glucopyranosyl-(1 $\rightarrow$ 4)-O- $\alpha$ -D-glucopyranosyl-(1 $\rightarrow$ 4)-O- $\alpha$ -D-glucopyranoside ( $\alpha$ -D-glucopyranosyl  $\alpha$ -acarbose).

<sup>8</sup>O-4,6-Dideoxy-4-[[[1S,4R,5S,6S)-4,5,6-trihydroxy-3-(hydroxymethyl)cyclohex-2-enyl]amino]- $\alpha$ -D-glucopyranosyl-(1 $\rightarrow$ 4)-O-6-deoxy- $\alpha$ -D-glucopyranosyl-(1 $\rightarrow$ 4)-D-glucopyranose.

**Assay preparation**—Transfer about 200 mg of Acarbose, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 210-nm detector and a 4-mm × 25-cm column that contains packing L8. The flow rate is about 2 mL per minute. The column temperature is maintained at 35°. Chromatograph the *System suitability solution*, and identify the acarbose peak and the peaks due to the impurities listed in *Table 1*. Record the peak responses as directed for *Procedure*: the ratio of the height of the impurity A peak to the height of the valley between the impurity A peak and the acarbose peak is not less than 1.2. The chromatogram obtained is similar to the chromatogram supplied with USP Acarbose System Suitability Mixture RS.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for all the peaks. Calculate the quantity, in mg, of C<sub>25</sub>H<sub>43</sub>NO<sub>18</sub> in the portion of Acarbose taken by the formula:

$$10C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Acarbose RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the acarbose peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Acebutolol Hydrochloride

C<sub>18</sub>H<sub>28</sub>N<sub>2</sub>O<sub>4</sub> · HCl 372.89

Butanamide, N-[3-acetyl-4-[2-hydroxy-3-[(1-methylethyl)amino]propoxy]phenyl]-, monohydrochloride, (±)-. (±)-3'-Acetyl-4'-[2-hydroxy-3-(isopropylamino)propoxy]-butyranilide monohydrochloride [34381-68-5].

» Acebutolol Hydrochloride contains not less than 98.0 percent and not more than 102.0 percent of C<sub>18</sub>H<sub>28</sub>N<sub>2</sub>O<sub>4</sub> · HCl, calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

**USP Reference standards** <11>—

USP Acebutolol Hydrochloride RS

**Identification**—

**A:** *Infrared Absorption* <197K>.

**B:** Prepare a mixture of the *Standard preparation* and the *Assay preparation* (1:1), and chromatograph the mixture as directed in the *Assay*: the chromatogram thus obtained exhibits a single major peak due to acebutolol.

**C:** It responds to the tests for *Chloride* <191>, when tested as directed for alkaloidal hydrochlorides.

**pH** <791>: between 4.5 and 7.0, in a solution (1 in 100).

**Melting range** <741>: between 140° and 144°.

**Loss on drying** <731>—Dry it at 105° for 3 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** <281>: not more than 0.1%.

**Heavy metals, Method II** <231>: 0.002%.

**Chromatographic purity**—

**Standard solution**—Prepare a solution of USP Acebutolol Hydrochloride RS in methanol containing 1.0 mg per mL.

**Test solution 1**—Prepare a solution of Acebutolol Hydrochloride in methanol containing 10 mg per mL.

**Test solution 2**—Mix 1 mL of *Test solution 1* and 9 mL of methanol.

**Reference solution 1**—Transfer 3.0 mL of the *Standard solution* to a 100-mL volumetric flask, dilute with methanol to volume, and mix.

**Reference solution 2**—Mix 5.0 mL of *Reference solution 1* and 10.0 mL of methanol.

**Procedure**—Apply separate 20-µL portions of the *Standard solution*, *Test solution 1*, *Test Solution 2*, *Reference solution 1*, and *Reference solution 2* to a suitable thin-layer chromatographic plate (see *Thin-Layer Chromatography* under *Chromatography* <621>) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatograms in a solvent system consisting of the upper layer of a mixture of water, butyl alcohol, and glacial acetic acid (50:40:10) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the plate to air-dry. Examine the plate under short-wavelength UV light: the chromatograms from *Test solution 2* and the *Standard solution* show principal spots at about the same  $R_f$  value. No secondary spot in the chromatogram from *Test solution 1*, excluding the area at the point of application, is more intense than the principal spot obtained from *Reference solution 1* (0.3%), and not more than two secondary spots in the chromatogram from *Test solution 1* are more intense than the principal spot obtained from *Reference solution 2* (0.1%), and the total of all impurities detected in the chromatogram of *Test solution 1* is not more than 0.5%.

**Assay**—

**Mobile phase**—Prepare a filtered and degassed mixture of methanol, a 0.3% aqueous solution of sodium dodecyl sulfate, and glacial acetic acid (675:325:20). Make adjustments if necessary to achieve a retention time for acebutolol of between 4 minutes and 7 minutes (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Quantitatively dissolve an accurately weighed quantity of USP Acebutolol Hydrochloride RS in water to obtain a solution having a known concentration of about 0.14 mg per mL.

**Assay preparation**—Transfer about 35 mg of Acebutolol Hydrochloride, accurately weighed, to a 250-mL volumetric flask, dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 1500 theoretical plates; the tailing factor is not more than 2.5; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of C<sub>18</sub>H<sub>28</sub>N<sub>2</sub>O<sub>4</sub> · HCl in the portion of Acebutolol Hydrochloride taken by the formula:

$$250C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Acebutolol Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the acebutolol peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Acebutolol Hydrochloride Capsules

» Acebutolol Hydrochloride Capsules contain the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled amount of acebutolol ( $C_{18}H_{28}N_2O_4$ ).

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

### USP Reference standards (11)—

USP Acebutolol Hydrochloride RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

### Dissolution (711)—

*Medium*: water; 900 mL.

*Apparatus 2*: 50 rpm.

*Time*: 30 minutes.

**Procedure**—Determine the amount of  $C_{18}H_{28}N_2O_4$  dissolved by employing UV absorption at the wavelength of maximum absorbance at about 232 nm on filtered portions of the solution under test in comparison with a Standard solution having a known concentration of USP Acebutolol Hydrochloride RS in the same *Medium*.

**Tolerances**—Not less than 80% (Q) of the labeled amount of acebutolol ( $C_{18}H_{28}N_2O_4$ ) is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

### Chromatographic purity—

#### TEST 1—

**Buffer solution**—Prepare as directed in the *Assay*.

**Mobile phase**—Prepare a filtered and degassed mixture of *Buffer solution* and methanol (56:44). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Diluent**—Prepare a mixture of *Buffer solution* and methanol (50:50).

**Standard solution**—Transfer about 30 mg of USP Acebutolol Hydrochloride RS, accurately weighed, to a 50-mL volumetric flask. Add about 12 mL of methanol, swirl to dissolve, dilute with *Diluent* to volume, and mix. Dilute an accurately measured volume of this solution quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 1.4 µg of USP Acebutolol Hydrochloride RS per mL.

**Test solution**—Transfer an accurately weighed portion of the contents of 20 opened Capsules, equivalent to about 250 mg of acebutolol, to a 100-mL volumetric flask, add about 25 mL of methanol, and shake by mechanical means for about 15 minutes. Dilute with *Diluent* to volume, and mix. Centrifuge a portion of this solution, and transfer 10.0 mL of the clear supernatant to a 100-mL volumetric flask. Dilute with *Diluent* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 240-nm detector and a 3.9-mm × 15-cm column that contains 4-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 6.0%.

**Procedure**—Separately inject equal volumes (about 35 µL) of the *Standard solution*, *Test solution*, and *Diluent* into the chromatograph, record the chromatograms for about two times the retention time of acebutolol, and measure the responses for all the peaks, disregarding any peaks corresponding to those obtained from the *Diluent*. Calculate the

percentage of each impurity eluting prior to the acebutolol peak in the portion of Capsules taken by the formula:

$$(336.44/372.89)(0.4C)(r_i / r_s)$$

in which 336.44 and 372.89 are the molecular weights of acebutolol and acebutolol hydrochloride, respectively; C is the concentration, in µg per mL, of USP Acebutolol Hydrochloride RS in the *Standard solution*;  $r_i$  is the peak response of any individual impurity obtained from the *Test solution*; and  $r_s$  is the peak response of acebutolol obtained from the *Standard solution*: not more than 0.5% of any individual impurity is found.

#### TEST 2—

**Buffer solution**—Prepare as directed in the *Assay*.

**Mobile phase**—Prepare a filtered and degassed mixture of *Buffer solution* and methanol (50:50). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard solution**—Transfer about 30 mg of USP Acebutolol Hydrochloride RS, accurately weighed, to a 50-mL volumetric flask. Add about 12 mL of methanol, swirl to dissolve, dilute with *Mobile phase* to volume, and mix. Dilute an accurately measured volume of this stock solution quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 1.4 µg of USP Acebutolol Hydrochloride RS per mL.

**Test solution**—Transfer an accurately weighed portion of the contents of 20 opened Capsules, equivalent to about 250 mg of acebutolol, to a 100-mL volumetric flask, add about 25 mL of methanol, and shake by mechanical means for about 15 minutes. Dilute with *Mobile phase* to volume, and mix. Centrifuge a portion of this solution, and transfer 10.0 mL of the clear supernatant to a 100-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 240-nm detector and a 3.9-mm × 15-cm column that contains 4-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 6.0%.

**Procedure**—Separately inject equal volumes (about 70 µL) of the *Standard solution*, *Test solution*, and *Mobile phase* into the chromatograph, record the chromatograms for about three times the retention time of acebutolol, and measure the responses for all the peaks, disregarding any peaks corresponding to those obtained from the *Mobile phase*. Calculate the percentage of each impurity eluting after the acebutolol peak in the portion of Capsules taken by the formula:

$$(336.44/372.89)(0.4C)(r_i / r_s)$$

in which 336.44 and 372.89 are the molecular weights of acebutolol and acebutolol hydrochloride, respectively; C is the concentration, in µg per mL, of USP Acebutolol Hydrochloride RS in the *Standard solution*;  $r_i$  is the peak response of any individual impurity obtained from the *Test solution*; and  $r_s$  is the peak response of acebutolol obtained from the *Standard solution*: not more than 0.5% of any individual impurity is found. The sum of all individual impurities found in *Test 1* and *Test 2* is not more than 1.0%.

### Assay—

**Buffer solution**—Dissolve about 2.4 g of sodium 1-decanesulfonate in 1000 mL of water. Adjust with glacial acetic acid to a pH of 3.5.

**Mobile phase**—Prepare a filtered and degassed mixture of methanol and *Buffer solution* (60:40). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Acebutolol Hydrochloride RS quantitatively in methanol to obtain a solution having a known concentration of about 0.22 mg per mL. This is equivalent to about 0.2 mg of acebutolol per mL.

**Assay preparation**—Weigh and mix, as completely as possible, the contents of not fewer than 20 Capsules. Transfer an accurately weighed portion of the powder, equivalent to about 200 mg of acebutolol, to a 200-mL volumetric flask. Add about 180 mL of methanol, and stir by mechanical means for about 30 minutes. Dilute with methanol to volume, and mix. Transfer 5.0 mL of this solution to a 25-mL volumetric flask, dilute with methanol to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm × 15-cm column that contains 5-μm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of acebutolol (C<sub>18</sub>H<sub>28</sub>N<sub>2</sub>O<sub>4</sub>) in the portion of Capsules taken by the formula:

$$(336.44/372.89)(1000C)(r_U / r_S)$$

in which 336.44 and 372.89 are the molecular weights of acebutolol and acebutolol hydrochloride, respectively; C is the concentration, in mg per mL, of USP Acebutolol Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the acebutolol peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Acepromazine Maleate

C<sub>19</sub>H<sub>22</sub>N<sub>2</sub>OS · C<sub>4</sub>H<sub>4</sub>O<sub>4</sub> 442.53  
 Ethanone, 1-[10-[3-(dimethylamino)propyl]-10H-phenothiazin-2-yl]-, (Z)-2-butenedioate (1:1);  
 10-[3-(Dimethylamino)propyl]phenothiazin-2-yl methyl ketone maleate (1:1) [3598-37-6].

### DEFINITION

Acepromazine Maleate contains NLT 98.0% and NMT 101.0% of acepromazine maleate (C<sub>19</sub>H<sub>22</sub>N<sub>2</sub>OS · C<sub>4</sub>H<sub>4</sub>O<sub>4</sub>), calculated on the anhydrous basis.

Throughout the following procedures, protect samples, the USP Reference Standard, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.

### IDENTIFICATION

- A. INFRARED ABSORPTION** <197K>
- B.** The retention time of the major peak for acepromazine of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

**Buffer:** Add 6 mL of triethylamine to 700 mL of water, and adjust with phosphoric acid to a pH of 2.5.

**Mobile phase:** Acetonitrile and *Buffer* (300:700)

**Standard stock solution:** 1 mg/mL of USP

Acepromazine Maleate RS in 0.05 N hydrochloric acid

**Standard solution:** 0.1 mg/mL of USP Acepromazine

Maleate RS in water from *Standard stock solution*

**Sample stock solution:** 1 mg/mL of Acepromazine

Maleate in 0.05 N hydrochloric acid

**Sample solution:** 0.1 mg/mL of Acepromazine Maleate

in water from *Sample stock solution*

### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 280 nm

**Column:** 4-mm × 15-cm; 5-μm packing L7

**Flow rate:** 1 mL/min

**Injection volume:** 10 μL

### System suitability

**Sample:** *Standard solution*

### Suitability requirements

**Column efficiency:** NLT 1500 theoretical plates

**Tailing factor:** NMT 2.5

**Relative standard deviation:** NMT 2.0%

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of acepromazine maleate

(C<sub>19</sub>H<sub>22</sub>N<sub>2</sub>OS · C<sub>4</sub>H<sub>4</sub>O<sub>4</sub>) in the portion of Acepromazine Maleate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area response from the *Sample solution*

$r_S$  = peak area response from the *Standard solution*

$C_S$  = concentration of USP Acepromazine Maleate RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–101.0% on the anhydrous basis

### IMPURITIES

- RESIDUE ON IGNITION** <281>: NMT 0.2%

#### ORGANIC IMPURITIES

Conduct this test without exposure to daylight, and with the minimum necessary exposure to artificial light.

**Diluent:** Methanol and diethylamine (19:1)

**Sample solution:** 20.0 mg/mL of Acepromazine Maleate in *Diluent*

**Standard solution:** 0.1 mg/mL of Acepromazine

Maleate in *Diluent* from the *Sample solution*

### Chromatographic system

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

**Mode:** TLC

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture

**Application volume:** 10 μL

**Developing solvent system:** *n*-Heptane, isobutyl alcohol, and diethylamine (75:17:8)

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Develop the chromatogram in the *Developing solvent system* until the solvent front has moved three-fourths the length of the plate. Remove the plate from the chamber and allow to air dry. Examine the plate under short-wavelength UV light.

**Acceptance criteria:** 0.5%; no spot, other than the principal acepromazine spot and any at the origin, observed in the chromatogram of the *Sample solution* is more intense than the principal spot observed in the chromatogram of the *Standard solution*.

### SPECIFIC TESTS

- MELTING RANGE OR TEMPERATURE** <741>: 136°–139°

#### PH <791>

**Sample solution:** 10 mg/mL of Acepromazine Maleate in water

- Acceptance criteria: 4.0–5.5
- **WATER DETERMINATION, Method I** (921): NMT 1.0%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light. Store at room temperature.
- **LABELING:** Label it to indicate that it is for veterinary use only.
- **USP REFERENCE STANDARDS** (11)  
USP Acepromazine Maleate RS

**Acepromazine Maleate Injection****DEFINITION**

Acepromazine Maleate Injection is a sterile solution of Acepromazine Maleate in Water for Injection. It contains NLT 90.0% and NMT 110.0% of the labeled amount of acepromazine maleate ( $C_{19}H_{22}N_2OS \cdot C_4H_4O_4$ ). Throughout the following procedures, protect samples, the USP Reference Standard, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.

**IDENTIFICATION**

- **A. INFRARED ABSORPTION** (197K)  
**Sample:** To a volume of Injection, equivalent to 20 mg of acepromazine maleate, add 2 mL of water and 3 mL of 2 N sodium hydroxide, and extract with two 5-mL portions of cyclohexane. Combine the cyclohexane extracts, and evaporate to dryness under vacuum, using gentle heat if necessary.  
**Acceptance criteria:** Meets the requirements
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY**

- **PROCEDURE**  
**Buffer:** Add 6 mL of triethylamine to 700 mL of water, and adjust with phosphoric acid to a pH of 2.5.  
**Mobile phase:** Acetonitrile and *Buffer* (300:700)  
**Standard stock solution:** 1 mg/mL of USP Acepromazine Maleate RS in 0.05 N hydrochloric acid  
**Standard solution:** 0.1 mg/mL of USP Acepromazine Maleate RS in water from *Standard stock solution*  
**Sample stock solution:** 1 mg/mL of Acepromazine Maleate in 0.05 N hydrochloric acid from an appropriately diluted volume of Injection  
**Sample solution:** Nominally 0.1 mg/mL of Acepromazine Maleate in water from *Sample stock solution*  
**Chromatographic system**  
(See *Chromatography* (621), *System Suitability*.)  
**Mode:** LC  
**Detector:** UV 280 nm  
**Column:** 4-mm  $\times$  15-cm; 5- $\mu$ m packing L7  
**Flow rate:** 1 mL/min  
**Injection volume:** 10  $\mu$ L  
**System suitability**  
**Sample:** *Standard solution*  
**Suitability requirements**  
**Column efficiency:** NLT 1500 theoretical plates  
**Tailing factor:** NMT 2.5  
**Relative standard deviation:** NMT 2.0%
- Analysis**  
**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of acepromazine maleate ( $C_{19}H_{22}N_2OS \cdot C_4H_4O_4$ ) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area from the *Sample solution*

$r_S$  = peak area from the *Standard solution*  
 $C_S$  = concentration of USP Acepromazine Maleate RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

**SPECIFIC TESTS**

- **pH** (791): 4.5–5.8
- **BACTERIAL ENDOTOXINS TEST** (85): NMT 4.5 USP Endotoxin Units/mg of acepromazine maleate
- **STERILITY TESTS** (71): It meets the requirements when tested as directed for *Test for Sterility of the Product to Be Examined, Membrane Filtration*.
- **OTHER REQUIREMENTS:** It meets the requirements in *Injections* (1).

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant, single-dose or multiple-dose containers for injections as described in *Injections* (1), *Containers for Injections*, preferably of Type I glass, and store at controlled room temperature.
- **LABELING:** Label it to indicate that it is for veterinary use only.
- **USP REFERENCE STANDARDS** (11)  
USP Acepromazine Maleate RS  
USP Endotoxin RS

**Acepromazine Maleate Tablets****DEFINITION**

Acepromazine Maleate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of acepromazine maleate ( $C_{19}H_{22}N_2OS \cdot C_4H_4O_4$ ). Throughout the following procedures, protect samples, the USP Reference Standard, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.

**IDENTIFICATION**

- **A. INFRARED ABSORPTION** (197K)  
**Sample:** To a quantity of powdered Tablets, equivalent to 20 mg of acepromazine maleate, add 2 mL of water and 3 mL of 2 N sodium hydroxide, and extract with two 5-mL portions of cyclohexane. Combine the cyclohexane extracts, and evaporate to dryness under vacuum, using gentle heat if necessary.  
**Acceptance criteria:** Meet the requirements
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY**

- **PROCEDURE**  
**Buffer:** Add 6 mL of triethylamine to 700 mL of water, and adjust with phosphoric acid to a pH of 2.5.  
**Mobile phase:** Acetonitrile and *Buffer* (300:700)  
**Standard stock solution:** 1 mg/mL of USP Acepromazine Maleate RS in 0.05 N hydrochloric acid  
**Standard solution:** 0.1 mg/mL of USP Acepromazine Maleate RS in water from *Standard stock solution*  
**Sample stock solution:** Transfer NLT 10 Tablets to a 200-mL volumetric flask, add 100 mL of 0.05 N hydrochloric acid, and sonicate for 10 min. Shake by mechanical means for 30 min, and dilute with 0.05 N hydrochloric acid to volume.  
**Sample solution:** Nominally 0.1 mg/mL of Acepromazine Maleate in water from *Sample stock solution*. Pass a portion of this solution through a filter of 0.5- $\mu$ m or finer pore size.

**Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** UV 280 nm**Column:** 4-mm × 15-cm; 5-μm packing L7**Flow rate:** 1 mL/min**Injection volume:** 10 μL**System suitability****Sample:** *Standard solution***Suitability requirements****Column efficiency:** NLT 1500 theoretical plates**Tailing factor:** NMT 2.5**Relative standard deviation:** NMT 2.0%**Analysis****Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of acepromazine maleate

(C<sub>19</sub>H<sub>22</sub>N<sub>2</sub>OS · C<sub>4</sub>H<sub>4</sub>O<sub>4</sub>) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 $r_U$  = peak area from the *Sample solution* $r_S$  = peak area from the *Standard solution* $C_S$  = concentration of USP Acepromazine MaleateRS in the *Standard solution* (mg/mL) $C_U$  = nominal concentration of the *Sample solution* (mg/mL)**Acceptance criteria:** 90.0%–110.0%**ADDITIONAL REQUIREMENTS**

---

**Acetaminophen**

---

C<sub>8</sub>H<sub>9</sub>NO<sub>2</sub> 151.16Acetamide, *N*-(4-hydroxyphenyl)-.

4'-Hydroxyacetanilide [103-90-2].

» Acetaminophen contains not less than 98.0 percent and not more than 101.0 percent of C<sub>8</sub>H<sub>9</sub>NO<sub>2</sub>, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight, light-resistant containers, and store at room temperature. Protect from moisture and heat.

**USP Reference standards** <11>—

USP Acetaminophen RS

**Identification**—**A:** *Infrared Absorption* <197K>.**B:** *Ultraviolet Absorption* <197U>—*Solution:* 5 μg per mL.*Medium:* 0.1 N hydrochloric acid in methanol (1 in 100).

**C:** It responds to the *Thin-layer Chromatographic Identification Test* <201>, a test solution in methanol containing about 1 mg per mL and a solvent system consisting of a mixture of methylene chloride and methanol (4:1) being used.

**Melting range** <741>: between 168° and 172°.**Water, Method I** <921>: not more than 0.5%.**Residue on ignition** <281>: not more than 0.1%.

**Chloride** <221>—Shake 1.0 g with 25 mL of water, filter, and add 1 mL of 2 N nitric acid and 1 mL of silver nitrate TS: the filtrate shows no more chloride than corresponds to 0.20 mL of 0.020 N hydrochloric acid (0.014%).

**Sulfate** <221>—Shake 1.0 g with 25 mL of water, filter, add 2 mL of 1 N acetic acid, then add 2 mL of barium chloride TS: the mixture shows no more sulfate than corresponds to 0.20 mL of 0.020 N sulfuric acid (0.02%).

**Sulfide**—Place about 2.5 g in a 50-mL beaker. Add 5 mL of alcohol and 1 mL of 3 N hydrochloric acid. Moisten a piece of lead acetate test paper with water, and fix to the underside of a watch glass. Cover the beaker with the watch glass so that part of the lead acetate paper hangs down near the pouring spout of the beaker. Heat the contents of the beaker on a hot plate just to boiling: no coloration or spotting of the test paper occurs.

**Heavy metals, Method II** <231>: 0.001%.

**Free *p*-aminophenol**—Transfer 5.0 g to a 100-mL volumetric flask, and dissolve in about 75 mL of a mixture of equal volumes of methanol and water. Add 5.0 mL of alkaline nitroferricyanide solution (prepared by dissolving 1 g of sodium nitroferricyanide and 1 g of anhydrous sodium carbonate in 100 mL of water), dilute with a mixture of equal volumes of methanol and water to volume, mix, and allow to stand for 30 minutes. Concomitantly determine the absorbances of this solution and of a freshly prepared solution of *p*-aminophenol, similarly prepared at a concentration of 2.5 μg per mL, using the same quantities of the same reagents, in 1-cm cells, at the maximum at about 710 nm, with a suitable spectrophotometer, using 5.0 mL of alkaline nitroferricyanide solution diluted with a mixture of equal volumes of methanol and water to 100 mL as the blank: the absorbance of the test solution does not exceed that of the standard solution, corresponding to not more than 0.005% of *p*-aminophenol.

**Limit of *p*-chloroacetanilide**—Transfer 1.0 g to a glass-stoppered, 15-mL centrifuge tube, add 5.0 mL of ether, shake by mechanical means for 30 minutes, and centrifuge at 1000 rpm for 15 minutes or until a clean separation is obtained. Apply 200 μL of the supernatant, in 40-μL portions, to obtain a single spot not more than 10 mm in diameter to a suitable thin-layer chromatographic plate (see *Chromatography* <621>) coated with a 0.25-mm layer of chromatographic silica gel mixture. Similarly apply 40 μL of a Standard solution in ether containing 10 μg of *p*-chloroacetanilide per mL, and allow the spots to dry. Develop the chromatogram in an unsaturated chamber, with a solvent system consisting of a mixture of solvent hexane and acetone (75:25), until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots in the chromatogram by examination under short-wavelength UV light: any spot obtained from the solution under test, at an  $R_f$  value corresponding to the principal spot from the Standard solution, is not greater in size or intensity than the principal spot obtained from the Standard solution, corresponding to not more than 0.001% of *p*-chloroacetanilide.

**Readily carbonizable substances** <271>—Dissolve 0.50 g in 5 mL of sulfuric acid: the solution has no more color than *Matching Fluid A*.

**Assay**—Dissolve about 120 mg of Acetaminophen, accurately weighed, in 10 mL of methanol in a 500-mL volumetric flask, dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix. Concomitantly determine the absorbances of this solution and of a Standard solution of USP Acetaminophen RS, in the same medium, at a concentration of about 12 μg per mL in 1-cm cells, at the

wavelength of maximum absorbance at about 244 nm, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg, of  $C_8H_9NO_2$  in the Acetaminophen taken by the formula:

$$10C(A_U / A_S)$$

in which C is the concentration, in  $\mu\text{g}$  per mL, of USP Acetaminophen RS in the Standard solution; and  $A_U$  and  $A_S$  are the absorbances of the solution of Acetaminophen and the Standard solution, respectively.

## Acetaminophen Capsules

» Acetaminophen Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ).

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

**USP Reference standards** (11)—

USP Acetaminophen RS

**Identification**—

**A:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**B:** Triturate an amount of the contents of the Capsules, equivalent to about 50 mg of acetaminophen, with 50 mL of methanol, and filter: the clear filtrate (test solution) responds to the *Thin-layer Chromatographic Identification Test* (201), a solvent system consisting of a mixture of methylene chloride and methanol (4:1) being used.

**Dissolution** (711)—

*Medium:* water; 900 mL.

*Apparatus 2:* 50 rpm.

*Time:* 45 minutes.

**Procedure**—Determine the amount of  $C_8H_9NO_2$  dissolved from UV absorption at the wavelength of maximum absorbance at about 249 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Acetaminophen RS in the same *Medium*.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_8H_9NO_2$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—

**Mobile phase**—Prepare a suitable degassed mixture of water and methanol (3:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Acetaminophen RS in *Mobile phase* to obtain a solution having a known concentration of about 0.01 mg per mL.

**Assay preparation**—Weigh the contents of not fewer than 20 Capsules, and calculate the average weight of the contents of each Capsule. Mix the combined contents of the Capsules, and transfer an accurately weighed portion, equivalent to about 100 mg of acetaminophen, to a 200-mL volumetric flask. Add about 100 mL of *Mobile phase*, and shake by mechanical means for 10 minutes. Dilute with *Mobile phase* to volume, and mix. Transfer 5.0 mL of this solution to a 250-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Pass a portion of this solution through a

filter having a 0.5- $\mu\text{m}$  or finer porosity, discarding the first 10 mL of the filtrate. Use the clear filtrate as the *Assay preparation*.

**Chromatographic system**—The liquid chromatograph is equipped with a 243-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the responses as directed for *Procedure*: the column efficiency is not less than 1000 theoretical plates; the tailing factor is not more than 2; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu\text{L}$ ) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of acetaminophen ( $C_8H_9NO_2$ ) in the portion of Capsules taken by the formula:

$$10,000C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Acetaminophen RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the acetaminophen peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Acetaminophen Oral Solution

» Acetaminophen Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ).

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

**USP Reference standards** (11)—

USP Acetaminophen RS

**Identification**—

**A:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**B:** Dilute a portion of Oral Solution with methanol to obtain a solution containing about 1 mg of acetaminophen per mL. This test solution responds to the *Thin-Layer Chromatographic Identification Test* (201), a solvent system consisting of a mixture of methylene chloride and methanol (4:1) being used.

**Uniformity of dosage units** (905)—

FOR ORAL SOLUTION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** (698)—

FOR ORAL SOLUTION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

**pH** (791): between 3.8 and 6.1.

**Alcohol content** (if present), *Method II* (611): between 90.0% and 115.0% of the labeled amount of  $C_2H_5OH$ , determined by the gas-liquid chromatographic procedure, acetone being used as the internal standard.

**Assay**—

**Mobile phase**, **Standard preparation**, and **Chromatographic system**—Proceed as directed in the *Assay* under *Acetaminophen Capsules*.

**Assay preparation**—Transfer an accurately measured volume of Oral Solution, equivalent to about 500 mg of acetaminophen, to a 250-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Transfer 5.0 mL of this solution

to a second 250-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Transfer 25.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Pass a portion of this solution through a filter having a 0.5- $\mu$ m or finer porosity, discarding the first 10 mL of the filtrate. Use the clear filtrate as the *Assay preparation*.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Acetaminophen Capsules*. Calculate the quantity, in mg, of acetaminophen ( $C_8H_9NO_2$ ) in each mL of the Oral Solution taken by the formula:

$$50,000(C/V)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Acetaminophen RS in the *Standard preparation*; V is the volume, in mL, of Oral Solution taken; and  $r_U$  and  $r_S$  are the acetaminophen peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

### Acetaminophen for Effervescent Oral Solution

» Acetaminophen for Effervescent Oral Solution contains, in each 100 g, not less than 5.63 g and not more than 6.88 g of acetaminophen ( $C_8H_9NO_2$ ).

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

**USP Reference standards** (11)—

USP Acetaminophen RS

**Identification**—

**A:** A 10-g portion dissolves, with effervescence, in 200 mL of water when performed as directed for the *Assay preparation* in the *Assay*.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**C:** Triturate about 0.4 g of the powder with 25 mL of methanol, and filter: this test solution responds to the *Thin-layer Chromatographic Identification Test* (201), a solvent system consisting of a mixture of methylene chloride and methanol (4:1) being used.

**Minimum fill** (755)—

FOR SOLID PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

**Uniformity of dosage units** (905)—

FOR SOLID PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Assay**—

*Mobile phase*, *Standard preparation*, and *Chromatographic system*—Proceed as directed in the *Assay* under *Acetaminophen Capsules*.

*Assay preparation*—Dissolve about 10 g of Acetaminophen for Effervescent Oral Solution, accurately weighed, in about 200 mL of water in a 1000-mL volumetric flask, using gentle heat if necessary, until effervescence subsides, then dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 8.0 mL of this solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Pass a portion of this solution through a filter having a 0.5- $\mu$ m or finer porosity, discarding the first 10 mL of the filtrate. Use the clear filtrate as the *Assay preparation*.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Acetaminophen Capsules*. Calculate the quantity, in g, of acetaminophen ( $C_8H_9NO_2$ ) in the portion of Acetaminophen for Effervescent Oral Solution taken by the formula:

$$62.5C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Acetaminophen RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the acetaminophen peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

### Acetaminophen Suppositories

» Acetaminophen Suppositories contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ).

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature or in a cool place.

**USP Reference standards** (11)—

USP Acetaminophen RS

**Identification**—

**A:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**B:** Transfer a portion of Suppositories, equivalent to about 20 mg of acetaminophen, to a beaker, add 20 mL of methanol, and heat on a steam bath until melted. Remove the beaker from the steam bath, allow to cool with occasional stirring, and filter: the clear filtrate (test solution) responds to the *Thin-layer Chromatographic Identification Test* (201), a solvent system consisting of a mixture of methylene chloride and methanol (4:1) being used.

**Assay**—

*Mobile phase*, *Standard preparation*, and *Chromatographic system*—Proceed as directed in the *Assay* under *Acetaminophen Capsules*.

*Assay preparation*—Tare a small dish and a glass rod, place in the dish not fewer than 5 Suppositories, heat gently on a steam bath until melted, then stir, cool while stirring, and weigh. Transfer an accurately weighed portion of the mass, equivalent to about 100 mg of acetaminophen, to a separator, add 30 mL of solvent hexane, and mix to dissolve. Add 30 mL of water, shake gently, and allow the phases to separate. [NOTE—If an emulsion forms, allow sufficient time for it to separate.] Transfer the aqueous layer to a 200-mL volumetric flask, wash the solvent hexane in the separator with three 30-mL portions of water, adding the washings to the volumetric flask, dilute with *Mobile phase* to volume, and mix. Transfer 5.0 mL of this solution to a 250-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Pass a portion of this solution through a filter having a 0.5- $\mu$ m or finer porosity, discarding the first 10 mL of the filtrate. Use the clear filtrate as the *Assay preparation*.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Acetaminophen Capsules*. Calculate the quantity, in mg, of acetaminophen ( $C_8H_9NO_2$ ) in each Suppository taken by the formula:

$$10,000C(A/W)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Acetaminophen RS in the *Standard preparation*; A is the average weight, in mg, of each Suppository taken; W is the weight, in mg, of the Suppository mass taken; and  $r_U$  and  $r_S$  are the

acetaminophen peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Acetaminophen Oral Suspension

» Acetaminophen Oral Suspension is a suspension of Acetaminophen in a suitable aqueous vehicle. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ).

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

**USP Reference standards** (11)—

USP Acetaminophen RS

USP 4-Aminophenol RS

**Identification**—Transfer a volume of Oral Suspension, equivalent to about 240 mg of acetaminophen, to a separator, add 50 mL of ethyl acetate, and shake. Filter the ethyl acetate extract through a funnel containing glass wool and about 10 g of anhydrous sodium sulfate. Collect the filtrate in a beaker, and evaporate on a steam bath to dryness. Dry the residue in vacuum over silica gel: the crystals so obtained respond to *Identification test A* under *Acetaminophen*.

**Uniformity of dosage units** (905)—

FOR ORAL SUSPENSION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** (698)—

FOR ORAL SUSPENSION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

**Limit of 4-aminophenol**—

*Diluent*—Prepare a mixture of water, methanol, and formic acid (425:75:2).

*Mobile phase*—Prepare a filtered and degassed mixture of 0.01 M sodium butanesulfonate in *Diluent*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard solution*—Dissolve an accurately weighed quantity of USP 4-Aminophenol RS, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 24 µg per mL.

*Test solution*—Transfer an accurately measured portion of Oral Suspension, equivalent to about 120 mg of acetaminophen, to a 25-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 272-nm detector and a 4.6-mm × 20-cm column that contains 10-µm packing L1. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard solution* and the *Test solution*, and record the peak areas as directed for *Procedure*.

*Procedure*—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks: the peak area of 4-aminophenol obtained from the *Test solution* is not greater than the corresponding peak area obtained from the *Standard solution*.

**pH** (791): between 4.0 and 6.9.

**Assay**—

*Mobile phase*, *Standard preparation*, and *Chromatographic system*—Proceed as directed in the *Assay* under *Acetaminophen Capsules*.

*Assay preparation*—Transfer an accurately measured volume of Oral Suspension, previously well-shaken, equivalent to about 100 mg of acetaminophen, to a 200-mL volumet-

ric flask, add about 100 mL of *Mobile phase*, and shake by mechanical means for 10 minutes. Dilute with *Mobile phase* to volume, and mix. Transfer 5.0 mL of this solution to a 250-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Pass a portion of this solution through a filter having a 0.5-µm or finer porosity, discarding the first 10 mL of the filtrate. Use the clear filtrate as the *Assay preparation*.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Acetaminophen Capsules*. Calculate the quantity, in mg, of acetaminophen ( $C_8H_9NO_2$ ) in each mL of the Oral Suspension taken by the formula:

$$10,000(C/V)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Acetaminophen RS in the *Standard preparation*; V is the volume, in mL, of Oral Suspension taken; and  $r_U$  and  $r_S$  are the acetaminophen peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Acetaminophen Tablets

» Acetaminophen Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ).

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

**Labeling**—Label Tablets that must be chewed to indicate that they are to be chewed before swallowing.

**USP Reference standards** (11)—

USP Acetaminophen RS

**Identification**—

**A:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**B:** Triturate an amount of powdered Tablets, equivalent to about 50 mg of acetaminophen, with 50 mL of methanol, and filter: the clear filtrate (test solution) responds to the *Thin-layer Chromatographic Identification Test* (201), a solvent system consisting of a mixture of methylene chloride and methanol (4:1) being used.

**Dissolution** (711)—

*Medium:* pH 5.8 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*); 900 mL.

*Apparatus 2:* 50 rpm.

*Time:* 30 minutes.

*Procedure*—Determine the amount of  $C_8H_9NO_2$  dissolved by employing UV absorption at the wavelength of maximum absorbance at about 243 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a *Standard solution* having a known concentration of USP Acetaminophen RS in the same *Medium*.

*Tolerances*—Not less than 80% (Q) of the labeled amount of  $C_8H_9NO_2$  is dissolved in 30 minutes.

FOR TABLETS LABELED AS CHEWABLE—

*Medium:* pH 5.8 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*); 900 mL.

*Apparatus 2:* 75 rpm.

*Time:* 45 minutes.

*Procedure*—Proceed as directed for *Procedure* for *Acetaminophen Tablets*.

*Tolerances*—Not less than 75% (Q) of the labeled amount of  $C_8H_9NO_2$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay—**

*Mobile phase, Standard preparation, and Chromatographic system*—Proceed as directed in the Assay under *Acetaminophen Capsules*.

*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of acetaminophen, to a 200-mL volumetric flask, add about 100 mL of *Mobile phase*, shake by mechanical means for 10 minutes, sonicate for about 5 minutes, dilute with *Mobile phase* to volume, and mix. Transfer 5.0 mL of this solution to a 250-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Pass a portion of this solution through a filter having a 0.5- $\mu$ m or finer porosity, discarding the first 10 mL of the filtrate. Use the clear filtrate as the *Assay preparation*.

*Procedure*—Proceed as directed for *Procedure* in the Assay under *Acetaminophen Capsules*. Calculate the quantity, in mg, of acetaminophen ( $C_8H_9NO_2$ ) in the portion of Tablets taken by the formula:

$$10,000C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Acetaminophen RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the acetaminophen peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Acetaminophen Extended-Release Tablets

» Acetaminophen Extended-Release Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ).

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Where the Tablets are gelatin-coated, the label so states. When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.

**USP Reference standards** (11)—

USP Acetaminophen RS

**Identification—**

**A: Infrared Absorption** (197K)—Use a portion of powdered Tablets.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the Assay.

**Dissolution** (711)—

TEST 1—

*Medium:* simulated gastric fluid TS (without enzyme); 900 mL.

*Apparatus 2:* 50 rpm.

*Times:* 15 minutes, 1 hour, and 3 hours.

*Procedure*—Determine the amount of  $C_8H_9NO_2$  dissolved from UV absorbances at 280 nm, using a filtered portion of the solution under test in comparison with a *Standard solution* having a known concentration of USP Acetaminophen RS in the same *Medium*.

*Tolerances*—The percentages of the labeled amount of  $C_8H_9NO_2$  dissolved at the times specified conform to *Acceptance Table 2*.

Time	Amount dissolved
15 minutes	between 45% and 65%
1 hour	between 60% and 85%
3 hours	not less than 85%

FOR GELATIN-COATED TABLETS—

*Medium, Apparatus, and Procedure*—Proceed as directed above.

*Times:* 30 minutes, 90 minutes, and 4 hours.

*Tolerances*—The percentage of the labeled amount of  $C_8H_9NO_2$  dissolved at the times specified conform to *Acceptance Table 2*.

Time	Amount dissolved
30 minutes	between 40% and 60%
90 minutes	between 55% and 85%
4 hours	not less than 80%

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

*Medium, Apparatus, and Procedure*—Proceed as directed for *Test 1*.

*Tolerances*—The percentages of the labeled amount of  $C_8H_9NO_2$  dissolved at the times specified conform to *Acceptance Table 2*.

Time	Amount dissolved
15 minutes	between 40% and 60%
1 hour	between 55% and 75%
3 hours	not less than 80%

**Uniformity of dosage units** (905): meet the requirements.

**Assay—**

*Mobile phase*—Prepare a mixture of water and phosphoric acid (9:1). Combine 1 mL of this solution with a mixture of water and methanol (700:300). Filter and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Acetaminophen RS in methanol, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.65 mg per mL.

*Assay preparation*—Transfer 10 Tablets into a 250-mL volumetric flask containing 50 mL of water and a magnetic stir bar. Stir at least 30 minutes or until the coating has dissolved. Add 150 mL of methanol, and stir for 45 minutes. Tablet cores should be disintegrated at least 15 minutes prior to ending the stirring. Remove the magnetic stir bar and rinse into the flask with methanol. Dilute with methanol to volume, mix well, and centrifuge. Transfer 5 mL of the clear supernatant to a 200-mL volumetric flask, dilute with *Mobile phase* to volume, and mix well.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 295-nm detector and a 3.9-mm  $\times$  15-cm column that contains packing L1. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 3.0, and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quan-

tity, in mg, of acetaminophen ( $C_8H_9NO_2$ ) in each Tablet taken by the formula:

$$1000C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Acetaminophen RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the acetaminophen peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Acetaminophen and Aspirin Tablets

» Acetaminophen and Aspirin Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of acetaminophen ( $C_8H_9NO_2$ ) and aspirin ( $C_9H_8O_4$ ).

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

### USP Reference standards (11)—

USP Acetaminophen RS

USP Aspirin RS

USP Salicylic Acid RS

**Identification**—The relative retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

### Dissolution, Procedure for a Pooled Sample (711)—

Medium: water; 900 mL.

Apparatus 2: 50 rpm.

Time: 45 minutes.

Mobile phase—Prepare as directed under *Assay*.

Solvent mixture—Prepare as directed under *Assay*.

Internal standard solution—Prepare a solution of benzoic acid in methanol having a concentration of about 1 mg per mL.

*Standard preparation I*—Dissolve an accurately weighed quantity of USP Salicylic Acid RS in the *Solvent mixture* to obtain a solution having a known concentration of about 70 µg per mL. Combine 4.0 mL of this solution and 1.0 mL of the *Internal standard solution*, and mix.

*Standard preparation II*—Dissolve accurately weighed quantities of USP Acetaminophen RS and USP Aspirin RS in the *Solvent mixture* to obtain a solution having known concentrations of about 360 µg of acetaminophen and about 360 µg of aspirin per mL. Combine 4.0 mL of this solution and 1.0 mL of the *Internal standard solution*, and mix.

*Test preparation*—Combine 4.0 mL of a filtered portion of the solution under test and 1.0 mL of the *Internal standard solution*, and mix.

Chromatographic system—Proceed as directed under *Assay*.

*Procedure*—Separately inject equal volumes (about 20 µL) of the two *Standard preparations* and the *Test preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.3 for acetaminophen, 0.4 for salicylic acid, 0.6 for aspirin, and 1.0 for benzoic acid. Determine the amount of acetaminophen ( $C_8H_9NO_2$ ) dissolved by the formula:

$$90(C/W)(R_U / R_S)$$

in which  $C$  is the concentration, in µg per mL, of USP Acetaminophen RS in *Standard preparation II*;  $R_U$  and  $R_S$  are the relative peak response ratios obtained from the *Test preparation* and *Standard preparation II*, respectively; and  $W$  is the

labeled amount, in mg, of acetaminophen. Determine the amount of aspirin ( $C_9H_8O_4$ ) dissolved by the formula:

$$[90C_1(R_{U1} / R_{S1})] + [90C_2(R_{U2} / R_{S2})(1.3044)] / W$$

in which  $C_1$  and  $C_2$  are the concentrations, in µg per mL, of USP Aspirin RS in *Standard preparation II* and USP Salicylic Acid RS in *Standard preparation I*, respectively;  $R_{U1}$  and  $R_{S1}$  are the relative peak response ratios for the aspirin peak and the internal standard peak obtained from the *Test preparation* and *Standard preparation II*, respectively;  $R_{U2}$  and  $R_{S2}$  are the relative peak response ratios for the salicylic acid peak and the internal standard peak obtained from the *Test preparation* and *Standard preparation I*, respectively; and  $W$  is the labeled amount, in mg, of aspirin.

**Tolerances**—Not less than 75% (Q) of the labeled amounts of  $C_8H_9NO_2$  and  $C_9H_8O_4$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements for *Content Uniformity* with respect to acetaminophen and to aspirin.

### Limit of salicylic acid—

*Solvent mixture, Mobile phase, Internal standard solution, and Chromatographic system*—Prepare as directed in the *Assay*.

*Procedure*—Dissolve a suitable quantity of USP Salicylic Acid RS, accurately weighed, in *Solvent mixture* to obtain a solution having a known concentration of about 1.0 mg per mL. Transfer 1.0-mL, 5.0-mL, and 10.0-mL portions, respectively, of this solution to separate 100-mL volumetric flasks, add 10.0 mL of *Internal standard solution* to each flask, dilute with *Solvent mixture* to volume, and mix. Chromatograph these three *Standard solutions* as directed in the *Assay*. Plot the ratios of the peak responses for salicylic acid and benzoic acid for each of the *Standard solutions* versus concentrations, in mg per mL, of salicylic acid, and draw the straight line best fitting the three plotted points. From the graph so obtained, and from the ratio of the peak responses for salicylic acid and benzoic acid in the chromatogram of the *Assay preparation* as obtained in the *Assay*, determine the concentration, in mg per mL, of salicylic acid ( $C_7H_6O_3$ ) in the *Assay preparation*, and calculate the percentage of salicylic acid in relation to the concentration of aspirin in the *Assay preparation*, as determined in the *Assay*. Not more than 3.0% is found.

**Assay**—[NOTE—Use clean, dry glassware. Inject the *Standard preparation* and the *Assay preparation* promptly after preparation.]

*Solvent mixture*—Prepare a mixture of chloroform, methanol, and glacial acetic acid (78:20:2).

*Mobile phase*—Transfer 225 mg of tetramethylammonium hydroxide pentahydrate to a 1000-mL flask, and add 750 mL of water, 125 mL of methanol, 125 mL of acetonitrile, and 1.0 mL of glacial acetic acid. Stir for 3 minutes, pass through a membrane filter having a 0.5-µm or finer porosity, and degas.

*Internal standard solution*—Dissolve benzoic acid in *Solvent mixture* to obtain a solution having a concentration of about 20 mg per mL.

*Standard preparation*—Transfer about 325 mg of USP Acetaminophen RS and about 325 mg of USP Aspirin RS, each accurately weighed, to a 100-mL volumetric flask, add 10.0 mL of *Internal standard solution*, dilute with *Solvent mixture* to volume, and mix.

*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 325 mg of acetaminophen, to a 100-mL volumetric flask, add 10.0 mL of *Internal standard solution* and about 50 mL of *Solvent mixture*, and sonicate for about 3 minutes. Dilute with *Solvent mixture* to volume, and mix. Pass a portion of this solution through a filter having a 2.5-µm or finer porosity, and use the filtrate as the *Assay preparation*.

**Chromatographic system**—The liquid chromatograph is equipped with a 280-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph four replicate injections of the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for either analyte is not more than 3.0%.

**Procedure**—Separately inject equal volumes (about 5 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The retention times are about 2, 3, 5, and 8 minutes for acetaminophen, salicylic acid (if present), aspirin, and benzoic acid, respectively. Calculate the quantity, in mg, of acetaminophen ( $C_8H_9NO_2$ ) in the portion of Tablets taken by the formula:

$$100C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of USP Acetaminophen RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the ratios of the peak responses of acetaminophen and benzoic acid obtained from the *Assay preparation* and the *Standard preparation*, respectively. Calculate the quantity, in mg, of aspirin ( $C_9H_8O_4$ ) in the portion of Tablets taken by the same formula, except to read "USP Aspirin RS" where "USP Acetaminophen RS" is specified, and "aspirin" where "acetaminophen" is specified.

## Acetaminophen, Aspirin, and Caffeine Tablets

» Acetaminophen, Aspirin, and Caffeine Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of acetaminophen ( $C_8H_9NO_2$ ), aspirin ( $C_9H_8O_4$ ), and caffeine ( $C_8H_{10}N_4O_2$ ).

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

### USP Reference standards (11)—

USP Acetaminophen RS  
USP Aspirin RS  
USP Caffeine RS  
USP Salicylic Acid RS

**Identification**—The relative retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

### Dissolution (711)—

Medium: water; 900 mL.

Apparatus 2: 100 rpm.

Time: 60 minutes.

**Mobile phase, Internal standard solution, Solvent mixture, Standard stock solution, and Chromatographic system**—Proceed as directed in the *Assay*.

**Standard preparation**—Transfer 20.0 mL of *Standard stock solution*, 3.0 mL of *Internal standard solution*, and 20 mL of water to a 50-mL volumetric flask, mix, and allow to stand for about 30 seconds. Dilute with *Solvent mixture* to volume, and mix. Use within 8 hours.

**Test preparation**—Transfer 20.0 mL of a filtered portion of the solution under test to a 50-mL volumetric flask, add 3.0 mL of *Internal standard solution* and 20 mL of *Solvent mixture*, mix, and allow to stand for 30 seconds. Dilute with *Solvent mixture* to volume, and mix.

**Procedure**—Proceed as directed for *Procedure* in the *Assay*. Calculate the quantities, in mg, of acetaminophen

( $C_8H_9NO_2$ ), aspirin ( $C_9H_8O_4$ ), and caffeine ( $C_8H_{10}N_4O_2$ ) dissolved by the formula:

$$2250C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard preparation*; and  $R_U$  and  $R_S$  are the ratios of the peak responses of the corresponding analyte and internal standard peaks of the solution under test and the *Standard preparation*, respectively.

**Tolerances**—Not less than 75% (Q) of the labeled amounts of  $C_8H_9NO_2$ ,  $C_9H_8O_4$ , and  $C_8H_{10}N_4O_2$  is dissolved in 60 minutes.

**Uniformity of dosage units (905)**: meet the requirements for *Content Uniformity* with respect to acetaminophen, aspirin, and caffeine.

### Limit of salicylic acid—

**Mobile phase and Solvent mixture**—Prepare as directed in the *Assay*.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Salicylic Acid RS in *Solvent mixture* to obtain a solution having a known concentration of about 1 mg per mL. Transfer 2.0 mL of the resulting solution to a 100-mL volumetric flask, dilute with *Solvent mixture* to volume, and mix. This solution contains about 0.02 mg of USP Salicylic Acid RS per mL.

**Test preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 250 mg of aspirin, to a 100-mL volumetric flask. Add about 75 mL of *Solvent mixture*, and shake by mechanical means for 30 minutes. Dilute with *Solvent mixture* to volume, and mix.

**Chromatographic system**—Proceed as directed for *Chromatographic system* in the *Assay*, except to use a 302-nm detector. Chromatograph the *Standard preparation*, and record the responses as directed for *Procedure*: the tailing factor is not more than 1.6; and the relative standard deviation for replicate injections is not more than 3.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Test preparation* into the chromatograph, record the chromatograms, and measure the responses for the salicylic acid peaks. Calculate the percentage of salicylic acid in the portion of Tablets taken by the formula:

$$10,000(C/a)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Salicylic Acid RS in the *Standard preparation*; a is the quantity, in mg, of aspirin in the portion of Tablets taken, based on the labeled amount; and  $r_U$  and  $r_S$  are the salicylic acid peak responses of the *Test preparation* and the *Standard preparation*, respectively: not more than 3.0% is found.

### Assay—

**Mobile phase**—Prepare a suitable mixture of water, methanol, and glacial acetic acid (69:28:3). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Internal standard solution**—Prepare a solution of benzoic acid in methanol containing about 6 mg per mL.

**Solvent mixture**—Prepare a mixture of methanol and glacial acetic acid (95:5).

**Standard stock solution**—Dissolve accurately weighed quantities of USP Acetaminophen RS, USP Aspirin RS, and USP Caffeine RS in *Solvent mixture* to obtain a solution having known concentrations of about 0.25 mg of USP Acetaminophen RS per mL, 0.25 mg of USP Aspirin RS per mL, and 0.25 mg of USP Caffeine RS per mL, / being the ratio of the labeled amount, in mg, of aspirin to the labeled amount, in mg, of acetaminophen per Tablet; and /' being

the ratio of the labeled amount, in mg, of caffeine to the labeled amount, in mg, of acetaminophen per Tablet.

**Standard preparation**—Transfer 20.0 mL of *Standard stock solution* and 3.0 mL of *Internal standard solution* to a 50-mL volumetric flask, dilute with *Solvent mixture* to volume, and mix. This solution contains about 0.1 mg of USP Acetaminophen RS, 0.1/ mg of USP Aspirin RS, and 0.1/ mg of USP Caffeine RS per mL.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 250 mg of acetaminophen, to a 100-mL volumetric flask. Add about 75 mL of *Solvent mixture*, and shake by mechanical means for 30 minutes. Dilute with *Solvent mixture* to volume, and mix. Transfer 2.0 mL of this solution and 3.0 mL of *Internal standard solution* to a 50-mL volumetric flask, dilute with *Solvent mixture* to volume, and mix.

**Chromatographic system**—The liquid chromatograph is equipped with a 275-nm detector and a 4.6-mm × 10-cm column that contains 5-μm packing L1, and is maintained at 45 ± 1°. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the responses as directed for *Procedure*: the tailing factor for each analyte peak is not more than 1.2; the resolution, *R*, between any of the analyte and internal standard peaks is not less than 1.4; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.3 for acetaminophen, 0.5 for caffeine, 0.8 for aspirin, 1.0 for benzoic acid, and 1.2 for salicylic acid. Calculate the quantities, in mg, of acetaminophen (C<sub>8</sub>H<sub>9</sub>NO<sub>2</sub>), aspirin (C<sub>9</sub>H<sub>8</sub>O<sub>4</sub>), and caffeine (C<sub>8</sub>H<sub>10</sub>N<sub>4</sub>O<sub>2</sub>) in the portion of Tablets taken by the formula:

$$2500C(R_U / R_S)$$

in which *C* is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard preparation*; and *R<sub>U</sub>* and *R<sub>S</sub>* are the ratios of the peak responses of the corresponding analyte and internal standard peaks of the *Assay preparation* and the *Standard preparation*, respectively.

## Acetaminophen and Caffeine Tablets

» Acetaminophen and Caffeine Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of acetaminophen (C<sub>8</sub>H<sub>9</sub>NO<sub>2</sub>) and caffeine (C<sub>8</sub>H<sub>10</sub>N<sub>4</sub>O<sub>2</sub>).

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

### USP Reference standards (11)—

USP Acetaminophen RS

USP Caffeine RS

**Identification**—The retention times of the major peaks for acetaminophen and caffeine in the chromatogram of the *Assay preparation* correspond to those of the *Standard preparation*, relative to the internal standard, obtained as directed in the *Assay*.

### Dissolution (711)—

*Medium*: water; 900 mL.

*Apparatus 2*: 100 rpm.

*Time*: 60 minutes.

*Mobile phase*, *Internal standard solution*, *Solvent mixture*, *Standard stock solution*, and *Chromatographic system*—Prepare as directed in the *Assay*.

**Standard solution**—Transfer 20.0 mL of *Standard stock solution*, 3.0 mL of *Internal standard solution*, and 20 mL of water to a 50-mL volumetric flask, mix, and allow to stand for about 30 seconds. Dilute with *Solvent mixture* to volume, and mix. Use within 8 hours.

**Test solution**—Transfer an aliquot of a filtered portion of the solution under test to a 50-mL volumetric flask in order to obtain an expected concentration of about 0.1 mg per mL of acetaminophen and 0.1/ mg per mL of caffeine, where *J* is defined for the *Standard stock solution*. Add 3.0 mL of *Internal standard solution* and 20 mL of *Solvent mixture*, mix, and allow to stand for 30 seconds. Dilute with *Solvent mixture* to volume, and mix.

**Procedure**—Proceed as directed for *Procedure* in the *Assay*, except to inject the *Standard solution* and the *Test solution*. Calculate the quantities, in mg, of acetaminophen (C<sub>8</sub>H<sub>9</sub>NO<sub>2</sub>) and caffeine (C<sub>8</sub>H<sub>10</sub>N<sub>4</sub>O<sub>2</sub>) dissolved by the formula:

$$(45,000/V_d)C(R_U / R_S)$$

in which *V<sub>d</sub>* is the volume, in mL, of *Test solution* that is transferred to the volumetric flask; *C* is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard solution*; and *R<sub>U</sub>* and *R<sub>S</sub>* are the ratios of the peak responses of the corresponding analyte and internal standard peaks obtained from the *Test solution* and the *Standard solution*, respectively.

**Tolerances**—Not less than 75% (*Q*) of the labeled amounts of acetaminophen (C<sub>8</sub>H<sub>9</sub>NO<sub>2</sub>) and caffeine (C<sub>8</sub>H<sub>10</sub>N<sub>4</sub>O<sub>2</sub>) is dissolved in 60 minutes.

**Uniformity of dosage units** (905): meet the requirements.

### Assay—

**Mobile phase**—Prepare a suitable mixture of water, methanol, and glacial acetic acid (69:28:3). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Internal standard solution**—Prepare a solution of benzoic acid in methanol containing about 6 mg per mL.

**Solvent mixture**—Prepare a mixture of methanol and glacial acetic acid (95:5).

**Standard stock solution**—Dissolve accurately weighed quantities of USP Acetaminophen RS and USP Caffeine RS in *Solvent mixture* to obtain a solution having known concentrations of about 0.25 mg of USP Acetaminophen RS per mL and 0.25/ mg of USP Caffeine RS per mL, *J* being the ratio of the labeled amount, in mg, of caffeine to the labeled amount, in mg, of acetaminophen per Tablet.

**Standard preparation**—Transfer 20.0 mL of *Standard stock solution* and 3.0 mL of *Internal standard solution* to a 50-mL volumetric flask, dilute with *Solvent mixture* to volume, and mix. This solution contains about 0.1 mg of USP Acetaminophen RS and 0.1/ mg of USP Caffeine RS per mL.

**Assay preparation**—Weigh and finely powder not fewer than 20 Acetaminophen and Caffeine Tablets. Transfer an accurately weighed quantity of the well-mixed powder, equivalent to about 250 mg of acetaminophen, to a 100-mL volumetric flask. Add about 75 mL of *Solvent mixture*, and shake by mechanical means for 30 minutes. Dilute with *Solvent mixture* to volume, and mix. Transfer 2.0 mL of this solution and 3.0 mL of *Internal standard solution* to a 50-mL volumetric flask, dilute with *Solvent mixture* to volume, and mix.

**Chromatographic system**—The liquid chromatograph is equipped with a 275-nm detector and a 4.6-mm × 10-cm column that contains 5-μm packing L1, and is maintained at 45 ± 1°. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the responses as directed for *Procedure*: the tailing factor for each analyte peak is not more than 1.2; the resolution, *R*, between any of the analyte and internal standard peaks is not less than 1.4; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.3 for acetaminophen, 0.5 for caffeine, and 1.0 for benzoic acid. Calculate the quantities, in mg, of acetaminophen (C<sub>8</sub>H<sub>9</sub>NO<sub>2</sub>) and caffeine (C<sub>8</sub>H<sub>10</sub>N<sub>4</sub>O<sub>2</sub>) in the portion of Tablets taken by the formula:

$$2500C(R_U/R_S)$$

in which *C* is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard preparation*; and *R<sub>U</sub>* and *R<sub>S</sub>* are the ratios of the peak responses of the corresponding analyte and internal standard peaks obtained from the *Assay preparation* and the *Standard preparation*, respectively.

### Capsules Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Phenylpropanolamine

» Capsules Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Phenylpropanolamine contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of acetaminophen (C<sub>8</sub>H<sub>9</sub>NO<sub>2</sub>), chlorpheniramine maleate (C<sub>16</sub>H<sub>19</sub>ClN<sub>2</sub> · C<sub>4</sub>H<sub>4</sub>O<sub>4</sub>), dextromethorphan hydrobromide (C<sub>18</sub>H<sub>25</sub>NO · HBr · H<sub>2</sub>O), and phenylpropanolamine hydrochloride (C<sub>9</sub>H<sub>13</sub>NO · HCl).

NOTE—The heading of this monograph does not constitute the official title. It is not intended that the name described herein be recognized as the official title or the common or usual name. The name for each article encompassed by this monograph shall be composed of the names of the active ingredients contained therein, as well as the quantitative amount of each active ingredient, and a statement of the function (or purpose) of the ingredient in the article.

**Packaging and storage**—Preserve in tight containers.

#### USP Reference standards (11)—

USP Acetaminophen RS

USP Chlorpheniramine Maleate RS

USP Dextromethorphan Hydrobromide RS

USP Phenylpropanolamine Hydrochloride RS

**Labeling**—The label for each article encompassed by this monograph bears a name composed of the active ingredients. The label states the name and quantity of each active

ingredient and indicates its function (or purpose) in the article.

#### Identification—

**A:** If phenylpropanolamine hydrochloride is claimed in the labeling to be present, the chromatogram of the *Assay preparation*, obtained as directed in the *Assay for phenylpropanolamine hydrochloride*, exhibits a major peak for phenylpropanolamine, the retention time of which corresponds to that exhibited by the *Standard preparation*.

**B:** If acetaminophen is claimed in the labeling to be present, the chromatogram of the *Assay preparation*, obtained as directed in the *Assay for acetaminophen*, exhibits a major peak for acetaminophen, the retention time of which corresponds to that exhibited by the *Standard preparation*.

**C:** If chlorpheniramine maleate is claimed in the labeling to be present, the chromatogram of the *Assay preparation*, obtained as directed in the *Assay for chlorpheniramine maleate*, exhibits a major peak for chlorpheniramine, the retention time of which corresponds to that exhibited by the *Standard preparation*.

**D:** If dextromethorphan hydrobromide is claimed in the labeling to be present, the chromatogram of the *Assay preparation*, obtained as directed in the *Assay for dextromethorphan hydrobromide*, exhibits a major peak for dextromethorphan, the retention time of which corresponds to that exhibited by the *Standard preparation*.

#### Dissolution, Procedure for a Pooled Sample (711)—

**Medium:** water; 900 mL.

**Apparatus 1:** 50 rpm.

**Time:** 45 minutes.

**Test solution**—Mix 9.0 mL of a filtered portion of the solution under test with 1.0 mL of 1% phosphoric acid solution.

**Procedure**—Determine the amounts of phenylpropanolamine hydrochloride, acetaminophen, chlorpheniramine maleate, and dextromethorphan hydrobromide dissolved, employing the procedures set forth in the *Assay for phenylpropanolamine hydrochloride*, *Assay for acetaminophen*, *Assay for chlorpheniramine maleate*, and *Assay for dextromethorphan hydrobromide*, respectively, making any necessary volumetric adjustments.

**Tolerances**—Not less than 75% (Q) of the labeled amounts of phenylpropanolamine hydrochloride (C<sub>9</sub>H<sub>13</sub>NO · HCl), acetaminophen (C<sub>8</sub>H<sub>9</sub>NO<sub>2</sub>), chlorpheniramine maleate (C<sub>16</sub>H<sub>19</sub>ClN<sub>2</sub> · C<sub>4</sub>H<sub>4</sub>O<sub>4</sub>), and dextromethorphan hydrobromide (C<sub>18</sub>H<sub>25</sub>NO · HBr · H<sub>2</sub>O) are dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

#### Assay for phenylpropanolamine hydrochloride (if present)—

**Mobile phase, Standard preparation, and Chromatographic system**—Proceed as directed in the *Assay for phenylpropanolamine hydrochloride* under *Oral Solution Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Phenylpropanolamine*.

**Chlorpheniramine standard preparation**—Prepare as directed for *Standard preparation* in the *Assay for chlorpheniramine maleate*.

**Dextromethorphan standard preparation**—Prepare as directed for *Standard preparation* in the *Assay for dextromethorphan hydrobromide*.

**System suitability solution 1** (for Capsules that contain either all four ingredients or a combination of three including chlorpheniramine salt)—Mix equal volumes of the *Standard preparation* and the *Chlorpheniramine standard preparation*.

**System suitability solution 2** (for Capsules that contain no chlorpheniramine salt)—Mix equal volumes of the *Standard preparation* and the *Dextromethorphan standard preparation*.

**Assay preparation**—Transfer not less than 10 Capsules, accurately counted, to a 500-mL volumetric flask. Add about 100 mL of water and 10 mL of 5% phosphoric acid, and

gently heat until the Capsules are fully dispersed. Cool the solution to room temperature, dilute with water to volume, mix, and filter. Quantitatively dilute a portion of this solution, if necessary, with water to obtain a solution having a concentration of about 0.05 mg of phenylpropanolamine hydrochloride per mL.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the phenylpropanolamine peaks. Calculate the quantity, in mg, of phenylpropanolamine hydrochloride ( $C_9H_{13}NO \cdot HCl$ ) in the Capsules taken by the formula:

$$(CL/D)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Phenylpropanolamine Hydrochloride RS in the *Standard preparation*; *L* is the labeled quantity, in mg, of phenylpropanolamine hydrochloride in each Capsule; *D* is the concentration, in mg per mL, of phenylpropanolamine hydrochloride in the *Assay preparation*, based on the number of Capsules taken, the labeled quantity, in mg, of phenylpropanolamine hydrochloride in each Capsule, and the extent of dilution; and  $r_U$  and  $r_S$  are the phenylpropanolamine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for acetaminophen (if present)**—

**Mobile phase**—Prepare a filtered and degassed mixture of water, methanol, and glacial acetic acid (79:20:1). Make adjustments, if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Transfer about 25 mg of USP Acetaminophen RS, accurately weighed, to a 100-mL volumetric flask. Add 4 mL of methanol, and mix until solution is complete. Add 0.2 mL of phosphoric acid, dilute with water to volume, and mix to obtain a solution having a known concentration of about 0.25 mg per mL.

**Assay preparation**—Transfer not fewer than 10 Capsules, accurately counted, to a 500-mL volumetric flask. Add about 100 mL of water and 10 mL of 5% phosphoric acid, and gently heat until the Capsules are fully dispersed. Cool the solution to room temperature, dilute with water to volume, and mix. Quantitatively dilute a portion of this solution, if necessary, with 0.1% phosphoric acid to obtain a solution having a concentration of about 0.25 mg of acetaminophen per mL.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm  $\times$  15-cm column that contains packing L7. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor for the acetaminophen peak is not greater than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 5  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the acetaminophen peaks. Calculate the quantity, in mg, of acetaminophen ( $C_8H_9NO_2$ ) in each Capsule taken by the formula:

$$(CL/D)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Acetaminophen RS in the *Standard preparation*; *L* is the labeled quantity, in mg, of acetaminophen in each Capsule; *D* is the concentration, in mg per mL, of acetaminophen in each mL of the *Assay preparation*, based on the number of Capsules taken, the labeled quantity, in mg, of acetaminophen in each Capsule, and the extent of dilution; and  $r_U$  and  $r_S$  are

the acetaminophen peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for chlorpheniramine maleate (if present)**—

**Mobile phase and Chromatographic system**—Proceed as directed in the *Assay for phenylpropanolamine hydrochloride* under *Oral Solution Containing at Least Three of the Following*—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Phenylpropanolamine.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Chlorpheniramine Maleate RS in water to obtain a solution having a known concentration of about 0.8 mg per mL. Quantitatively dilute a portion of this solution with 0.1% phosphoric acid to obtain a solution having a known concentration of about 8  $\mu$ g per mL.

**Assay preparation**—Transfer not fewer than 10 Capsules, accurately counted, to a 500-mL volumetric flask. Add about 100 mL of water and 10 mL of 5% phosphoric acid, and gently heat until the Capsules are fully dispersed. Cool the solution to room temperature, dilute with water to volume, mix, and filter. Quantitatively dilute a portion of this solution, if necessary, with 0.1% phosphoric acid to obtain a solution having a concentration of about 8  $\mu$ g of chlorpheniramine maleate per mL.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the chlorpheniramine peaks. Calculate the quantity, in mg, of chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ) in each Capsule taken by the formula:

$$(CL/D)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Chlorpheniramine Maleate RS in the *Standard preparation*; *L* is the labeled quantity, in mg, of chlorpheniramine maleate in each Capsule; *D* is the concentration, in mg per mL, of chlorpheniramine maleate in each mL of the *Assay preparation*, based on the number of Capsules taken, the labeled quantity, in mg, of chlorpheniramine maleate in each Capsule, and the extent of dilution; and  $r_U$  and  $r_S$  are the chlorpheniramine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for dextromethorphan hydrobromide (if present)**—

**Mobile phase and Chromatographic system**—Proceed as directed in the *Assay for phenylpropanolamine hydrochloride* under *Oral Solution Containing at Least Three of the Following*—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Phenylpropanolamine.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Dextromethorphan Hydrobromide RS in water to obtain a solution having a known concentration of about 0.6 mg per mL. Quantitatively dilute a portion of this solution with 0.1% phosphoric acid to obtain a solution having a known concentration of about 0.06 mg per mL.

**Assay preparation**—Transfer not fewer than 10 Capsules, accurately counted, to a 500-mL volumetric flask. Add about 100 mL of water and 10 mL of 5% phosphoric acid, and gently heat until the Capsules are fully dispersed. Cool the solution to room temperature, dilute with water to volume, mix, and filter. Quantitatively dilute a portion of this solution, if necessary, with 0.1% phosphoric acid to obtain a solution having a concentration of about 0.06 mg of dextromethorphan hydrobromide per mL.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the dextromethorphan peaks. Calculate the quantity, in mg, of dextromethorphan

hydrobromide ( $C_{18}H_{25}NO \cdot HBr \cdot H_2O$ ) in each Capsule taken by the formula:

$$(370.33/352.32)(CL/D)(r_U / r_S)$$

in which 370.33 and 352.32 are the molecular weights of dextromethorphan hydrobromide monohydrate and anhydrous dextromethorphan hydrobromide, respectively;  $C$  is the concentration, in mg per mL, of USP Dextromethorphan Hydrobromide RS in the *Standard preparation*;  $L$  is the labeled quantity, in mg, of dextromethorphan hydrobromide in each Capsule;  $D$  is the concentration, in mg per mL, of dextromethorphan hydrobromide in each mL of the *Assay preparation*, based on the number of Capsules taken, the labeled quantity, in mg, of dextromethorphan hydrobromide in each Capsule, and the extent of dilution; and  $r_U$  and  $r_S$  are the dextromethorphan peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

### Oral Solution Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Phenylpropanolamine

» Oral Solution Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Phenylpropanolamine contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of acetaminophen ( $C_8H_9NO_2$ ), chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ), dextromethorphan hydrobromide ( $C_{18}H_{25}NO \cdot HBr \cdot H_2O$ ), and phenylpropanolamine hydrochloride ( $C_9H_{13}NO \cdot HCl$ ).

NOTE—The heading of this monograph does not constitute the official title. It is not intended that the name described herein be recognized as the official title or the common or usual name. The name for each article encompassed by this monograph shall be composed of the names of the active ingredients contained therein, as well as the quantitative amount of each active ingredient, and a statement of the function (or purpose) of the ingredient in the article.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Acetaminophen RS

USP Chlorpheniramine Maleate RS

USP Dextromethorphan Hydrobromide RS

USP Phenylpropanolamine Hydrochloride RS

**Labeling**—The label for each article encompassed by this monograph bears a name composed of the active ingredients. The label states the name and quantity of each active ingredient and indicates its function (or purpose) in the article.

**Identification**—

A: If phenylpropanolamine hydrochloride is claimed in the labeling to be present, the chromatogram of the *Assay preparation*, obtained as directed in the *Assay for phenylpropanolamine hydrochloride*, exhibits a major peak for phenylpropanolamine, the retention time of which corresponds to that exhibited by the *Standard preparation*.

B: If acetaminophen is claimed in the labeling to be present, the chromatogram of the *Assay preparation*, obtained as directed in the *Assay for acetaminophen*, exhibits a major peak for acetaminophen, the retention time of which corresponds to that exhibited by the *Standard preparation*.

C: If chlorpheniramine maleate is claimed in the labeling to be present, the chromatogram of the *Assay preparation*, obtained as directed in the *Assay for chlorpheniramine maleate*, exhibits a major peak for chlorpheniramine, the retention time of which corresponds to that exhibited by the *Standard preparation*.

D: If dextromethorphan hydrobromide is claimed in the labeling to be present, the chromatogram of the *Assay preparation*, obtained as directed in the *Assay for dextromethorphan hydrobromide*, exhibits a major peak for dextromethorphan, the retention time of which corresponds to that exhibited by the *Standard preparation*.

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*. The total aerobic microbial count does not exceed 100 cfu per g, and the total combined molds and yeast count does not exceed 10 cfu per g.

**pH** (791): between 2.6 and 7.5.

**Alcohol content** (if present), *Method II* (611): between 90.0% and 110.0% of the labeled amount of  $C_2H_5OH$ .

**Assay for phenylpropanolamine hydrochloride**—

*Mobile phase*—Prepare a filtered and degassed mixture of methanol and water (60:40) containing 0.34 g of monobasic potassium phosphate, 0.15 g of triethylamine hydrochloride, 0.25 g of sodium lauryl sulfate, and 0.1 mL of phosphoric acid in each 100 mL of solution. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Phenylpropanolamine Hydrochloride RS in water to obtain a solution having a known concentration of about 0.5 mg per mL. Transfer 1.0 mL of this solution to a 10-mL volumetric flask, add 8.0 mL of *Mobile phase*, dilute with water to volume, and mix.

*Chlorpheniramine standard preparation*—Prepare as directed for *Standard preparation* in the *Assay for chlorpheniramine maleate*.

*Dextromethorphan standard preparation*—Prepare as directed for *Standard preparation* in the *Assay for dextromethorphan hydrobromide*.

*System suitability solution 1* (for Oral Solution that contains either all the four ingredients or a combination of three containing chlorpheniramine salt)—Mix equal volumes of the *Standard preparation* and the *Chlorpheniramine standard preparation*.

*System suitability solution 2* (for Oral Solution that contains no chlorpheniramine salt)—Mix equal volumes of the *Standard preparation* and the *Dextromethorphan standard preparation*.

*Assay preparation*—Transfer an accurately measured volume of the Oral Solution, equivalent to 2.5 mg of phenylpropanolamine hydrochloride, to a 50-mL volumetric flask, add about 40 mL of *Mobile phase*, dilute with water to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 214-nm detector and a 4.6-mm  $\times$  15-cm column that contains packing L11. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor for the phenylpropanolamine peak is not greater than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%. Separately inject about 10  $\mu$ L of *System suitability solution 1* or *System suitability solution 2*, as appropriate. The resolution,  $R$ , between phenylpropanolamine and chlorphen-

iramine or between phenylpropanolamine and dextromethorphan is not less than 2.0.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the phenylpropanolamine peaks. Calculate the quantity, in mg per mL, of phenylpropanolamine hydrochloride ( $C_9H_{13}NO \cdot HCl$ ), in the volume of Oral Solution taken by the formula:

$$50(C/V)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Phenylpropanolamine Hydrochloride RS in the *Standard preparation*; V is the volume, in mL, of the Oral Solution taken; and  $r_U$  and  $r_S$  are the phenylpropanolamine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for acetaminophen (if present)**—

**Mobile phase**—Prepare a suitable degassed and filtered mixture of water, methanol, and glacial acetic acid (79:20:1). Make any necessary adjustments (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Transfer about 16.5 mg of USP Acetaminophen RS, accurately weighed, to a 100-mL volumetric flask. Add 2.5 mL of methanol, and mix until solution is complete. Dilute with water to volume, and mix to obtain a solution having a known concentration of about 0.165 mg per mL.

**Assay preparation**—Transfer an accurately measured volume of Oral Solution, equivalent to about 33 mg of acetaminophen, to a 200-mL volumetric flask, add 5 mL of methanol, and mix. Dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm  $\times$  15-cm column that contains packing L7. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor for the acetaminophen peak is not greater than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 5  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the acetaminophen peaks. Calculate the quantity, in mg per mL, of acetaminophen ( $C_8H_9NO_2$ ) in the volume of Oral Solution taken by the formula:

$$200(C/V)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Acetaminophen RS in the *Standard preparation*; V is the volume, in mL, of the Oral Solution taken; and  $r_U$  and  $r_S$  are the acetaminophen peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for chlorpheniramine maleate (if present)**—

**Mobile phase and Chromatographic system**—Proceed as directed in the *Assay for phenylpropanolamine hydrochloride*.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Chlorpheniramine Maleate RS in water to obtain a solution having a known concentration of about 0.08 mg per mL. Transfer 1.0 mL of this solution to a 10-mL volumetric flask, add 8 mL of *Mobile phase*, dilute with water to volume, and mix.

**Assay preparation**—Transfer an accurately measured volume of Oral Solution, equivalent to about 0.4 mg of chlorpheniramine maleate, to a 50-mL volumetric flask. Add 40 mL of *Mobile phase*, dilute with water to volume, and mix.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure

the responses for the chlorpheniramine peaks. Calculate the quantity, in mg per mL, of chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ) in the volume of Oral Solution taken by the formula:

$$50(C/V)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Chlorpheniramine Maleate RS in the *Standard preparation*; V is the volume, in mL, of the Oral Solution taken; and  $r_U$  and  $r_S$  are the chlorpheniramine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for dextromethorphan hydrobromide (if present)**—

**Mobile phase and Chromatographic system**—Proceed as directed in the *Assay for phenylpropanolamine hydrochloride*.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Dextromethorphan Hydrobromide RS in water to obtain a solution having a known concentration of about 0.4 mg per mL. Transfer 1.0 mL of this solution to a 10-mL volumetric flask, add 8 mL of *Mobile phase*, dilute with water to volume, and mix.

**Assay preparation**—Transfer an accurately measured volume of Oral Solution, equivalent to about 2 mg of dextromethorphan hydrobromide, to a 50-mL volumetric flask, add 40 mL of *Mobile phase*, dilute with water to volume, and mix.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the dextromethorphan peaks. Calculate the quantity, in mg per mL, of dextromethorphan hydrobromide ( $C_{18}H_{25}NO \cdot HBr \cdot H_2O$ ) in the volume of Oral Solution taken by the formula:

$$(370.33/352.32)50(C/V)(r_U / r_S)$$

in which 370.33 and 352.32 are the molecular weights of dextromethorphan hydrobromide monohydrate and anhydrous dextromethorphan hydrobromide, respectively; C is the concentration, in mg per mL, of USP Dextromethorphan Hydrobromide RS in the *Standard preparation*; V is the volume, in mL, of Oral Solution taken; and  $r_U$  and  $r_S$  are the dextromethorphan peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Tablets Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Phenylpropanolamine

» Tablets Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Phenylpropanolamine contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of acetaminophen ( $C_8H_9NO_2$ ), chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ), dextromethorphan hydrobromide ( $C_{18}H_{25}NO \cdot HBr \cdot H_2O$ ), and phenylpropanolamine hydrochloride ( $C_9H_{13}NO \cdot HCl$ ).

NOTE—The heading of this monograph does not constitute the official title. It is not intended that the name described herein be recognized as the

official title or the common or usual name. The name for each article encompassed by this monograph shall be composed of the names of the active ingredients contained therein as well as the quantitative amount of each active ingredient, and a statement of the function (or purpose) of the ingredient in the article.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Acetaminophen RS

USP Chlorpheniramine Maleate RS

USP Dextromethorphan Hydrobromide RS

USP Phenylpropanolamine Hydrochloride RS

**Labeling**—The label for each article encompassed by this monograph bears a name composed of the active ingredients. The label states the name and quantity of each active ingredient and indicates its function (or purpose) in the article.

**Identification**—

**A:** If phenylpropanolamine hydrochloride is claimed in the labeling to be present, the retention time of the major peak for phenylpropanolamine in the chromatogram of the *Phenylpropanolamine assay preparation* corresponds to that in the chromatogram of the *Phenylpropanolamine standard preparation*, as obtained in the *Assay for phenylpropanolamine hydrochloride*.

**B:** If acetaminophen is claimed in the labeling to be present, the retention time of the major peak for acetaminophen in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for acetaminophen*.

**C:** If chlorpheniramine maleate is claimed in the labeling to be present, the retention time of the major peak for chlorpheniramine in the chromatogram of the *Chlorpheniramine assay preparation* corresponds to that in the chromatogram of the *Chlorpheniramine standard preparation*, as obtained in the *Assay for chlorpheniramine maleate*.

**D:** If dextromethorphan hydrobromide is claimed in the labeling to be present, the retention time of the major peak for dextromethorphan in the chromatogram of the *Dextromethorphan assay preparation* corresponds to that in the chromatogram of the *Dextromethorphan standard preparation*, as obtained in the *Assay for dextromethorphan hydrobromide*.

**Dissolution, Procedure for a Pooled Sample** (711)—

**Medium:** 0.1 M hydrochloric acid; 900 mL.

**Apparatus 2:** 50 rpm.

**Time:** 45 minutes.

**Test solution**—Mix 9.0 mL of a filtered portion of the solution under test with 1.0 mL of 1% phosphoric acid solution.

**Procedure**—Determine the amounts of phenylpropanolamine hydrochloride, acetaminophen, chlorpheniramine maleate, and dextromethorphan hydrobromide dissolved, employing the procedures set forth in the *Assay for phenylpropanolamine hydrochloride*, *Assay for acetaminophen*, *Assay for chlorpheniramine maleate*, and *Assay for dextromethorphan hydrobromide*, respectively, making any necessary volumetric adjustments.

**Tolerances**—Not less than 75% (Q) of the labeled amounts of phenylpropanolamine hydrochloride ( $C_9H_{13}NO \cdot HCl$ ), acetaminophen ( $C_8H_9NO_2$ ), chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ), and dextromethorphan hydrobromide ( $C_{18}H_{25}NO \cdot HBr \cdot H_2O$ ) is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay for phenylpropanolamine hydrochloride**—

**Mobile phase**—Prepare a filtered and degassed mixture of methanol and water (60:40) containing 0.34 g of monoba-

sic potassium phosphate, 0.05 g of triethylamine hydrochloride, 0.25 g of sodium lauryl sulfate, and 0.1 mL of phosphoric acid in each 100 mL of solution. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Phenylpropanolamine standard preparation**—Dissolve an accurately weighed quantity of USP Phenylpropanolamine Hydrochloride RS in water to obtain a solution having a known concentration of about 2.5 mg per mL. Transfer 1.0 mL of this solution to a 50-mL volumetric flask, add 5 mL of methanol, dilute with 0.1% phosphoric acid to volume, and mix.

**Chlorpheniramine standard preparation**—Prepare as directed in the *Assay for chlorpheniramine maleate*.

**Dextromethorphan standard preparation**—Prepare as directed in the *Assay for dextromethorphan hydrobromide*.

**System suitability solution 1** (for Tablets that contain either all the four ingredients or a combination of three containing chlorpheniramine salt)—Mix equal volumes of the *Phenylpropanolamine standard preparation* and the *Chlorpheniramine standard preparation*.

**System suitability solution 2** (for Tablets that contain no chlorpheniramine salt)—Mix equal volumes of the *Phenylpropanolamine standard preparation* and the *Dextromethorphan standard preparation*.

**Phenylpropanolamine assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed quantity of the powder, equivalent to about 2.5 mg of phenylpropanolamine hydrochloride, to a 50-mL volumetric flask. Add 5 mL of methanol, and sonicate to disperse the powder. Dilute with 0.1% phosphoric acid to volume, mix, and filter.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 214-nm detector and a 4.6-mm  $\times$  15-cm column that contains packing L11. The flow rate is about 2 mL per minute. Chromatograph the *Phenylpropanolamine standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor for the phenylpropanolamine peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%. Separately inject about 20  $\mu$ L of *System suitability solution 1* or *System suitability solution 2*, as appropriate: the resolution, *R*, between phenylpropanolamine and chlorpheniramine or between phenylpropanolamine and dextromethorphan is not less than 2.0.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Phenylpropanolamine standard preparation* and the *Phenylpropanolamine assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the phenylpropanolamine peaks. Calculate the quantity, in mg, of phenylpropanolamine hydrochloride ( $C_9H_{13}NO \cdot HCl$ ) in the portion of Tablets taken by the formula:

$$50C(r_u / r_s)$$

in which *C* is the concentration, in mg per mL, of USP Phenylpropanolamine Hydrochloride RS in the *Phenylpropanolamine standard preparation*; and *r<sub>u</sub>* and *r<sub>s</sub>* are the peak responses obtained from the *Phenylpropanolamine assay preparation* and the *Phenylpropanolamine standard preparation*, respectively.

**Assay for acetaminophen** (if present)—

**Mobile phase**—Prepare a filtered and degassed mixture of water, methanol, and glacial acetic acid (79:20:1). Make adjustments, if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Transfer about 50 mg of USP Acetaminophen RS, accurately weighed, to a 100-mL volumetric flask. Add 4 mL of methanol, and mix until dissolved. Dilute with 0.1% phosphoric acid to volume, and mix.

**Assay preparation**—Weigh and powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of acetaminophen, to a 50-mL volumetric flask. Add about 7.5 mL of methanol, and sonicate to disperse the powder. Add 0.5 mL of phosphoric acid, dilute with water to volume, mix, and filter. Transfer 25.0 mL of the filtered solution to a 100-mL volumetric flask, dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm × 15-cm column that contains packing L7. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor for the acetaminophen peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 5  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the acetaminophen peaks. Calculate the quantity, in mg, of acetaminophen ( $C_8H_9NO_2$ ) in the portion of Tablets taken by the formula:

$$200C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Acetaminophen RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for chlorpheniramine maleate** (if present)—

*Mobile phase*, *Phenylpropanolamine standard preparation*, *System suitability solution 1*, and *Chromatographic system*—Proceed as directed in the *Assay for phenylpropanolamine hydrochloride*.

**Chlorpheniramine standard preparation**—Dissolve an accurately weighed quantity of USP Chlorpheniramine Maleate RS in water to obtain a solution having a known concentration of about 0.8 mg per mL. Quantitatively dilute a portion of this solution with 0.1% phosphoric acid to obtain a solution having a known concentration of about 8  $\mu$ g per mL.

**Chlorpheniramine assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 0.4 mg of chlorpheniramine maleate, to a 50-mL volumetric flask. Add 5 mL of methanol, and sonicate to disperse the powder. Add 0.2 mL of phosphoric acid, dilute with water to volume, mix, and filter.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Chlorpheniramine standard preparation* and the *Chlorpheniramine assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the chlorpheniramine peaks. Calculate the quantity, in mg, of chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ) in the portion of Tablets taken by the formula:

$$50C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Chlorpheniramine Maleate RS in the *Chlorpheniramine standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Chlorpheniramine assay preparation* and the *Chlorpheniramine standard preparation*, respectively.

**Assay for dextromethorphan hydrobromide** (if present)—

*Mobile phase*, *Phenylpropanolamine standard preparation*, and *Chromatographic system*—Proceed as directed in the *Assay for phenylpropanolamine hydrochloride*.

*System suitability solution 1* or *System suitability solution 2* (as appropriate)—Proceed as directed in the *Assay for phenylpropanolamine hydrochloride*.

**Dextromethorphan standard preparation**—Dissolve an accurately weighed quantity of USP Dextromethorphan

Hydrobromide RS in water to obtain a solution having a known concentration of about 0.6 mg per mL. Quantitatively dilute a portion of this solution with 0.1% phosphoric acid to obtain a solution having a known concentration of about 0.06 mg per mL.

**Dextromethorphan assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 3 mg of dextromethorphan hydrobromide, to a 50-mL volumetric flask. Add 5 mL of methanol, and sonicate to disperse the powder. Add 0.2 mL of phosphoric acid, dilute with water to volume, mix, and filter.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the dextromethorphan peaks. Calculate the quantity, in mg, of dextromethorphan hydrobromide ( $C_{18}H_{25}NO \cdot HBr \cdot H_2O$ ) in the portion of Tablets taken by the formula:

$$(370.33/352.32)50C(r_U / r_S)$$

in which 370.33 and 352.32 are the molecular weights of dextromethorphan hydrobromide monohydrate and anhydrous dextromethorphan hydrobromide, respectively; C is the concentration, in mg per mL, of USP Dextromethorphan Hydrobromide RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the dextromethorphan peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

---

### Capsules Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine

---

» Capsules Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of acetaminophen ( $C_8H_9NO_2$ ), chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ), dextromethorphan hydrobromide ( $C_{18}H_{25}NO \cdot HBr \cdot H_2O$ ), and pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ) or pseudoephedrine sulfate [ $(C_{10}H_{15}NO)_2 \cdot H_2SO_4$ ]. NOTE—The heading of this monograph does not constitute the official title. It is not intended that the name described herein be recognized as the official title or the common or usual name. The name for each article encompassed by this monograph shall be composed of the names of the active ingredients contained therein, as well as the quantitative amount of each active ingredient, and a statement of the function (or purpose) of the ingredient in the article.

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

**USP Reference standards** <11>—

USP Acetaminophen RS

USP Chlorpheniramine Maleate RS

USP Dextromethorphan Hydrobromide RS

USP Pseudoephedrine Hydrochloride RS  
USP Pseudoephedrine Sulfate RS

**Labeling**—The label for each article encompassed by this monograph bears a name composed of the active ingredients contained in the article. The label states the name and quantity of each active ingredient and indicates its function (or purpose) in the article.

**Identification**—

**A:** If pseudoephedrine hydrochloride or pseudoephedrine sulfate is purported to be present, the retention time of the major peak for pseudoephedrine in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for pseudoephedrine hydrochloride* or the *Assay for pseudoephedrine sulfate*.

**B:** If acetaminophen is claimed in the labeling to be present, the retention time of the major peak for acetaminophen in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for acetaminophen*.

**C:** If chlorpheniramine maleate is claimed in the labeling to be present, the retention time of the major peak for chlorpheniramine in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for chlorpheniramine maleate*.

**D:** If dextromethorphan hydrobromide is claimed in the labeling to be present, the retention time of the major peak for dextromethorphan in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for dextromethorphan hydrobromide*.

**Dissolution**, Procedure for a Pooled Sample (711)—

Medium: water; 900 mL.

Apparatus 1: 100 rpm.

Time: 45 minutes.

*Test preparation*—Mix 9.0 mL of a filtered portion of the solution under test with 1.0 mL of 1% phosphoric acid solution.

*Procedure*—Determine the amounts of pseudoephedrine hydrochloride or pseudoephedrine sulfate (as appropriate), acetaminophen, chlorpheniramine maleate, and dextromethorphan hydrobromide dissolved, employing the procedures set forth in the *Assay for pseudoephedrine hydrochloride* or *Assay for pseudoephedrine sulfate*, *Assay for acetaminophen*, *Assay for chlorpheniramine maleate*, and *Assay for dextromethorphan hydrobromide*, respectively, making any necessary volumetric adjustments.

**Tolerances**—Not less than 75% (Q) of the labeled amounts of pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ) or pseudoephedrine sulfate [ $(C_{10}H_{15}NO)_2 \cdot H_2SO_4$ ], acetaminophen ( $C_8H_9NO_2$ ), chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ), and dextromethorphan hydrobromide ( $C_{18}H_{25}NO \cdot HBr \cdot H_2O$ ) are dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay for pseudoephedrine hydrochloride** (where pseudoephedrine hydrochloride is the salt form used, if present in the formulation)—

*Mobile phase*, *Standard preparation*, and *Chromatographic system*—Proceed as directed in the *Assay for pseudoephedrine hydrochloride* under *Tablets Containing at Least Three of the Following*—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine.

*Chlorpheniramine standard preparation*—Prepare as directed for *Standard preparation* in the *Assay for chlorpheniramine maleate*.

*Dextromethorphan standard preparation*—Prepare as directed for *Standard preparation* in the *Assay for dextromethorphan hydrobromide*.

*System suitability solution 1* (for Capsules that contain either all four ingredients or a combination of three containing chlorpheniramine salt)—Mix equal volumes of the *Standard preparation* and the *Chlorpheniramine standard preparation*.

*System suitability solution 2* (for Capsules that contain no chlorpheniramine)—Mix equal volumes of the *Standard preparation* and the *Dextromethorphan standard preparation*.

*Assay preparation*—Transfer not fewer than 10 Capsules, accurately counted, to a 500-mL volumetric flask. Add about 100 mL of water and 10 mL of 5% phosphoric acid, and gently heat until the Capsules are fully dispersed. Cool the solution to room temperature, dilute with water to volume, mix, and filter. Quantitatively dilute a portion of this solution, if necessary, with water to obtain a solution having a concentration of about 0.12 mg of pseudoephedrine hydrochloride per mL.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the pseudoephedrine peaks. Calculate the quantity, in mg, of pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ) in the Capsules taken by the formula:

$$(CL/D)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Pseudoephedrine Hydrochloride RS in the *Standard preparation*; L is the labeled quantity, in mg, of pseudoephedrine hydrochloride in each Capsule; D is the concentration, in mg per mL, of pseudoephedrine hydrochloride in the *Assay preparation*, based on the number of Capsules taken, the labeled quantity, in mg, of pseudoephedrine hydrochloride in each Capsule and the extent of dilution; and  $r_U$  and  $r_S$  are the pseudoephedrine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for pseudoephedrine sulfate** (where pseudoephedrine sulfate is the salt form used, if present in the formulation)—

*Mobile phase*, *System suitability solutions*, and *Chromatographic system*—Proceed as directed in the *Assay for pseudoephedrine hydrochloride* under *Tablets Containing at Least Three of the Following*—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine.

*Chlorpheniramine standard preparation*—Prepare as directed for *Standard preparation* in the *Assay for chlorpheniramine maleate*.

*Dextromethorphan standard preparation*—Prepare as directed for *Standard preparation* in the *Assay for dextromethorphan hydrobromide*.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Pseudoephedrine Sulfate RS in water to obtain a solution having a known concentration of about 3.0 mg per mL. Transfer 2.0 mL of this solution to a 25-mL volumetric flask, add 2.5 mL of methanol, dilute with 0.1% phosphoric acid to volume, and mix.

*Assay preparation*—Proceed as directed for the *Assay preparation* in the *Assay for pseudoephedrine hydrochloride* to obtain a solution having a concentration of about 0.24 mg of pseudoephedrine sulfate per mL.

*Procedure*—Proceed as directed for *Procedure* in the *Assay for pseudoephedrine hydrochloride*. Calculate the quantity, in mg, of pseudoephedrine sulfate [ $(C_{10}H_{15}NO)_2 \cdot H_2SO_4$ ] in each Capsule taken by the formula:

$$(CL/D)(r_U / r_S)$$

in which the terms are as defined therein, pseudoephedrine sulfate being substituted for pseudoephedrine hydrochloride.

**Assay for acetaminophen (if present)—**

**Mobile phase**—Prepare a filtered and degassed mixture of water, methanol, and glacial acetic acid (79:20:1). Make adjustments, if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Transfer about 25 mg of USP Acetaminophen RS, accurately weighed, to a 100-mL volumetric flask. Add 4 mL of methanol, and mix until solution is complete. Add 0.2 mL of phosphoric acid, dilute with water to volume, and mix to obtain a solution having a known concentration of about 0.25 mg per mL.

**Assay preparation**—Transfer not fewer than 10 Capsules, accurately counted, to a 500-mL volumetric flask. Add about 100 mL of water and 10 mL of 5% phosphoric acid, and gently heat until the Capsules are fully dispersed. Cool the solution to room temperature, dilute with water to volume, and mix. Quantitatively dilute a portion of this solution, if necessary, with 0.1% phosphoric acid to obtain a solution having a concentration of about 0.25 mg of acetaminophen per mL.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm × 15-cm column that contains packing L7. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for Procedure: the tailing factor for the acetaminophen peak is not greater than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the acetaminophen peaks. Calculate the quantity, in mg, of acetaminophen ( $C_8H_9NO_2$ ) in each Capsule taken by the formula:

$$(CL/D)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Acetaminophen RS in the *Standard preparation*;  $L$  is the labeled quantity, in mg, of acetaminophen in each Capsule;  $D$  is the concentration, in mg per mL, of acetaminophen in each mL of the *Assay preparation*, based on the number of Capsules taken, the labeled quantity, in mg, of acetaminophen in each Capsule, and the extent of dilution; and  $r_U$  and  $r_S$  are the acetaminophen peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for chlorpheniramine maleate (if present)—**

**Mobile phase and Chromatographic system**—Proceed as directed in the *Assay for pseudoephedrine hydrochloride* under *Tablets Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine*.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Chlorpheniramine Maleate RS in water to obtain a solution having a known concentration of about 0.8 mg per mL. Quantitatively dilute a portion of this solution with 0.1% phosphoric acid to obtain a solution having a known concentration of about 8 µg per mL.

**Assay preparation**—Transfer not fewer than 10 Capsules, accurately counted, to a 500-mL volumetric flask. Add about 100 mL of water and 10 mL of 5% phosphoric acid, and gently heat until the Capsules are fully dispersed. Cool the solution to room temperature, dilute with water to volume, mix, and filter. Quantitatively dilute a portion of this solution, if necessary, with 0.1% phosphoric acid to obtain a solution having a concentration of about 8 µg of chlorpheniramine maleate per mL.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms and measure the responses for the chlorpheniramine peaks. Calculate the quantity, in mg, of chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ) in each Capsule taken by the formula:

$$(CL/D)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Chlorpheniramine Maleate RS in the *Standard preparation*;  $L$  is the labeled quantity, in mg, of chlorpheniramine maleate in each Capsule;  $D$  is the concentration, in mg per mL, of chlorpheniramine maleate in each mL of the *Assay preparation*, based on the number of Capsules taken, the labeled quantity, in mg, of chlorpheniramine maleate in each Capsule, and the extent of dilution; and  $r_U$  and  $r_S$  are the chlorpheniramine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for dextromethorphan hydrobromide (if present)—**

**Mobile phase and Chromatographic system**—Proceed as directed in the *Assay for pseudoephedrine hydrochloride* under *Tablets Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine*.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Dextromethorphan Hydrobromide RS in water to obtain a solution having a known concentration of about 0.4 mg per mL. Quantitatively dilute a portion of this solution with 0.1% phosphoric acid to obtain a solution having a known concentration of about 0.04 mg per mL.

**Assay preparation**—Transfer not fewer than 10 Capsules, accurately counted, to a 500-mL volumetric flask. Add about 100 mL of water and 10 mL of 5% phosphoric acid, and gently heat until the Capsules are fully dispersed. Cool the solution to room temperature, dilute with water to volume, mix, and filter. Quantitatively dilute a portion of this solution, if necessary, with 0.1% phosphoric acid to obtain a solution having a concentration of about 0.04 mg of dextromethorphan hydrobromide per mL.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses for the dextromethorphan peaks. Calculate the quantity, in mg, of dextromethorphan hydrobromide ( $C_{18}H_{25}NO \cdot HBr \cdot H_2O$ ) in each Capsule taken by the formula:

$$(370.33/352.32)(CL/D)(r_U / r_S)$$

in which 370.33 and 352.32 are the molecular weights of dextromethorphan hydrobromide monohydrate and anhydrous dextromethorphan hydrobromide, respectively;  $C$  is the concentration, in mg per mL, of USP Dextromethorphan Hydrobromide RS in the *Standard preparation*;  $L$  is the labeled quantity, in mg, of dextromethorphan hydrobromide in each Capsule;  $D$  is the concentration, in mg per mL, of dextromethorphan hydrobromide in each mL of the *Assay preparation*, based on the number of Capsules taken, the labeled quantity, in mg, of dextromethorphan hydrobromide in each Capsule, and the extent of dilution; and  $r_U$  and  $r_S$  are the dextromethorphan peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Oral Powder Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine

» Oral Powder Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of acetaminophen ( $C_8H_9NO_2$ ), chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ), dextromethorphan hydrobromide ( $C_{18}H_{25}NO \cdot HBr \cdot H_2O$ ), and pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ) or pseudoephedrine sulfate [ $(C_{10}H_{15}NO)_2 \cdot H_2SO_4$ ].

NOTE—The heading of this monograph does not constitute the official title. It is not intended that the name described herein be recognized as the official title or the common or usual name. The name for each article encompassed by this monograph shall be composed of the names of the active ingredients contained therein, as well as the quantitative amount of each active ingredient, and a statement of the function (or purpose) of the ingredient in the article.

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

### USP Reference standards (11)—

USP Acetaminophen RS

USP Chlorpheniramine Maleate RS

USP Dextromethorphan Hydrobromide RS

USP Pseudoephedrine Hydrochloride RS

USP Pseudoephedrine Sulfate RS

**Labeling**—The label for each article encompassed by this monograph bears a name composed of the active ingredients. The label states the name and quantity of each active ingredient and indicates its function (or purpose) in the article.

### Identification—

**A:** If pseudoephedrine hydrochloride or pseudoephedrine sulfate is claimed in the labeling to be present, the retention time of the major peak for pseudoephedrine in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for pseudoephedrine hydrochloride* or the *Assay for pseudoephedrine sulfate*.

**B:** If acetaminophen is claimed in the labeling to be present, the retention time of the major peak for acetaminophen in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for acetaminophen*.

**C:** If chlorpheniramine maleate is claimed in the labeling to be present, the retention time of the major peak for chlorpheniramine in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for chlorpheniramine maleate*.

**D:** If dextromethorphan hydrobromide is claimed in the labeling to be present, the retention time of the major peak for dextromethorphan in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for dextromethorphan hydrobromide*.

**Minimum fill** (755): meets the requirements.

### Uniformity of dosage units (905)—

FOR ORAL POWDER PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Assay for pseudoephedrine hydrochloride** (where pseudoephedrine hydrochloride is the salt form used, if present in the formulation)—

*Mobile phase and Chromatographic system*—Proceed as directed in the *Assay for pseudoephedrine hydrochloride* under *Tablets Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine*.

*Chlorpheniramine standard preparation*—Prepare as directed for *Standard preparation* in the *Assay for chlorpheniramine maleate*.

*Dextromethorphan standard preparation*—Prepare as directed for *Standard preparation* in the *Assay for dextromethorphan hydrobromide*.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Pseudoephedrine Hydrochloride RS in water to obtain a solution having a known concentration of about 3.0 mg per mL. Transfer 2.0 mL of this solution to a 25-mL volumetric flask, dilute with 0.1% phosphoric acid to volume, and mix.

*System suitability solution 1* (for Oral Powder that contains either all four ingredients or a combination of three containing chlorpheniramine salt)—Mix equal volumes of the *Standard preparation* and the *Chlorpheniramine standard preparation*.

*System suitability solution 2* (for Oral Powder that contains no chlorpheniramine salt)—Mix equal volumes of the *Standard preparation* and the *Dextromethorphan standard preparation*.

*Assay preparation*—Transfer the contents of 10 unit-dose containers of the Oral Powder to a 2000-mL volumetric flask. Add 1000 mL of water and 2.0 mL of phosphoric acid. Gently heat to about 60° until the powder is fully dispersed. Cool the flask to room temperature, add 40 mL of methanol, dilute with water to volume, and mix. Quantitatively dilute a portion of this solution, if necessary, with 0.1% phosphoric acid to obtain a solution having a concentration of about 0.24 mg of pseudoephedrine hydrochloride per mL.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the pseudoephedrine peaks. Calculate the quantity, in mg, of pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ), in each unit-dose container of Oral Powder taken by the formula:

$$(CL/D)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Pseudoephedrine Hydrochloride RS in the *Standard preparation*; *L* is the labeled quantity, in mg, of pseudoephedrine hydrochloride in each unit-dose container; *D* is the concentration, in mg per mL, of pseudoephedrine hydrochloride in each mL of the *Assay preparation*, based on the number of unit-dose containers taken, the labeled quantity, in mg, of pseudoephedrine hydrochloride in each unit-dose container, and the extent of dilution; and *r<sub>U</sub>* and *r<sub>S</sub>* are the pseudoephedrine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for pseudoephedrine sulfate** (where pseudoephedrine sulfate is the salt form used, if present in the formulation)—

*Mobile phase and Chromatographic system*—Proceed as directed in the *Assay for pseudoephedrine hydrochloride* under *Tablets Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine*.

**Chlorpheniramine standard preparation**—Prepare as directed for *Standard preparation* in the Assay for chlorpheniramine maleate.

**Dextromethorphan standard preparation**—Prepare as directed for *Standard preparation* in the Assay for dextromethorphan hydrobromide.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Pseudoephedrine Sulfate RS in water to obtain a solution having a known concentration of about 6.0 mg per mL. Transfer 2.0 mL of this solution to a 25-mL volumetric flask, dilute with 0.1% phosphoric acid to volume, and mix.

**System suitability solution 1** (for Oral Powder that contains either all four ingredients or a combination of three containing chlorpheniramine salt)—Mix equal volumes of the *Standard preparation* and the *Chlorpheniramine standard preparation*.

**System suitability solution 2** (for Oral Powder that contains no chlorpheniramine salt)—Mix equal volumes of the *Standard preparation* and the *Dextromethorphan standard preparation*.

**Assay preparation**—Proceed as directed for the Assay preparation in the Assay for pseudoephedrine hydrochloride to obtain a solution having a concentration of about 0.48 mg of pseudoephedrine sulfate per mL.

**Procedure**—Proceed as directed for Procedure in the Assay for pseudoephedrine hydrochloride. Calculate the quantity, in mg, of pseudoephedrine sulfate  $[(C_{10}H_{15}NO)_2 \cdot H_2SO_4]$  in each unit-dose container of Oral Powder taken by the formula:

$$(CL/D)(r_U / r_S)$$

in which the terms are as defined therein, pseudoephedrine sulfate being substituted for pseudoephedrine hydrochloride.

**Assay for acetaminophen (if present)**—

**Mobile phase, Standard preparation, and Chromatographic system**—Proceed as directed in the Assay for pseudoephedrine hydrochloride under *Tablets Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine*.

**Assay preparation**—Transfer the contents of 10 unit-dose containers of the Oral Powder to a 2000-mL volumetric flask. Add 1000 mL of water and 2 mL of phosphoric acid. Gently heat to about 60° until the powder is fully dispersed. Cool the flask to room temperature, add 40 mL of methanol, dilute with water to volume, and mix. Quantitatively dilute a portion of this solution, if necessary, with 0.1% phosphoric acid to obtain a solution having a concentration of about 0.50 mg of acetaminophen per mL.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the acetaminophen peaks. Calculate the quantity, in mg, of acetaminophen ( $C_8H_9NO_2$ ) in each unit-dose container of Oral Powder taken by the formula:

$$(CL/D)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Acetaminophen RS in the *Standard preparation*; L is the labeled quantity, in mg, of acetaminophen in each unit-dose container; D is the concentration, in mg per mL, of acetaminophen in the *Assay preparation*, based on the number of unit-dose containers taken, the labeled quantity, in mg, of acetaminophen in each unit-dose container, and the extent of dilution; and  $r_U$  and  $r_S$  are the acetaminophen peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for chlorpheniramine maleate (if present)**—

**Mobile phase and Chromatographic system**—Proceed as directed in the Assay for pseudoephedrine hydrochloride under *Tablets Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine*.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Chlorpheniramine Maleate RS in water to obtain a solution having a known concentration of about 0.8 mg per mL. Quantitatively dilute a portion of this solution with 0.1% phosphoric acid to obtain a solution having a known concentration of about 8  $\mu$ g per mL.

**Assay preparation**—Transfer the contents of 10 unit-dose containers of Oral Powder to a 2000-mL volumetric flask. Add 1000 mL of water and 2 mL of phosphoric acid. Gently heat to about 60° until the powder is fully dispersed. Cool the flask to room temperature, add 40 mL of methanol, dilute with water to volume, and mix. Quantitatively dilute a portion of this solution, if necessary, with 0.1% phosphoric acid to obtain a solution having a concentration of 8  $\mu$ g of chlorpheniramine maleate per mL.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the chlorpheniramine peaks. Calculate the quantity, in mg, of chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ) in each unit-dose container of Oral Powder taken by the formula:

$$(CL/D)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Chlorpheniramine Maleate RS in the *Standard preparation*; L is the labeled quantity, in mg, of chlorpheniramine maleate in each unit-dose container; D is the concentration, in mg per mL, of chlorpheniramine maleate in each mL of the *Assay preparation*, based on the number of unit-dose containers taken, the labeled quantity, in mg, of chlorpheniramine maleate in each unit-dose container, and the extent of dilution; and  $r_U$  and  $r_S$  are the chlorpheniramine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for dextromethorphan hydrobromide (if present)**—

**Mobile phase and Chromatographic system**—Proceed as directed in the Assay for pseudoephedrine hydrochloride under *Tablets Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine*.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Dextromethorphan Hydrobromide RS in water to obtain a solution having a known concentration of about 0.8 mg per mL. Quantitatively dilute a portion of this solution with 0.1% phosphoric acid to obtain a solution having a known concentration of 0.08 mg per mL.

**Assay preparation**—Transfer the contents of 10 unit-dose containers of Oral Powder to a 2000-mL volumetric flask. Add 1000 mL of water and 2 mL of phosphoric acid. Gently heat to about 60° until the powder is fully dispersed. Cool the flask to room temperature, add 40 mL of methanol, dilute with water to volume, and mix. If necessary, quantitatively dilute a portion of this solution with 0.1% phosphoric acid to obtain a solution having a concentration of 0.08 mg of dextromethorphan hydrobromide per mL.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the dextromethorphan peaks. Calculate the quantity, in mg, of dextromethorphan

hydrobromide ( $C_{18}H_{25}NO \cdot HBr \cdot H_2O$ ) in each unit-dose container of Oral Powder taken by the formula:

$$(370.33/352.32)(CL/D)(r_U / r_S)$$

in which 370.33 and 352.32 are the molecular weights of dextromethorphan hydrobromide monohydrate and anhydrous dextromethorphan hydrobromide, respectively;  $C$  is the concentration, in mg per mL, of USP Dextromethorphan Hydrobromide RS in the *Standard preparation*;  $L$  is the labeled quantity, in mg, of dextromethorphan hydrobromide in each unit-dose container;  $D$  is the concentration, in mg per mL, of dextromethorphan hydrobromide in each mL of the *Assay preparation*, based on the number of unit-dose containers taken, the labeled quantity, in mg, of dextromethorphan hydrobromide in each unit-dose container, and the extent of dilution; and  $r_U$  and  $r_S$  are the dextromethorphan peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

### Oral Solution Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine

» Oral Solution Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of acetaminophen ( $C_8H_9NO_2$ ), chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ), dextromethorphan hydrobromide ( $C_{18}H_{25}NO \cdot HBr \cdot H_2O$ ), and pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ) or pseudoephedrine sulfate [ $(C_{10}H_{15}NO)_2 \cdot H_2SO_4$ ].

NOTE—The heading of this monograph does not constitute the official title. It is not intended that the name described herein be recognized as the official title or the common or usual name. The name for each article encompassed by this monograph shall be composed of the names of the active ingredients contained therein, as well as the quantitative amount of each active ingredient, and a statement of the function (or purpose) of the ingredient in the article.

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

#### USP Reference standards (11)—

USP Acetaminophen RS  
USP Chlorpheniramine Maleate RS  
USP Dextromethorphan Hydrobromide RS  
USP Pseudoephedrine Hydrochloride RS  
USP Pseudoephedrine Sulfate RS

**Labeling**—The label for each article encompassed by this monograph bears a name composed of the active ingredients. The label states the name and quantity of each active ingredient and indicates its function (or purpose) in the article.

#### Identification—

**A:** If pseudoephedrine hydrochloride or pseudoephedrine sulfate is claimed in the labeling to be present, the retention time of the major peak for pseudoephedrine in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for pseudoephedrine hydrochloride* or the *Assay for pseudoephedrine sulfate*.

**B:** If acetaminophen is claimed in the labeling to be present, the retention time of the major peak for acetaminophen in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for acetaminophen*.

**C:** If chlorpheniramine maleate is claimed in the labeling to be present, the retention time of the major peak for chlorpheniramine in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for chlorpheniramine maleate*.

**D:** If dextromethorphan hydrobromide is claimed in the labeling to be present, the retention time of the major peak for dextromethorphan in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for dextromethorphan hydrobromide*.

**Uniformity of dosage units (905)**—

FOR ORAL SOLUTION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

#### Deliverable volume (698)—

FOR ORAL SOLUTION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

**pH (791):** between 3.7 and 7.5.

**Alcohol content (if present), Method II (611):** between 90.0% and 110.0% of the labeled amount of  $C_2H_5OH$ .

**Microbial enumeration tests (61) and Absence of specified microorganisms (62)**—The total bacterial count does not exceed 100 cfu per g, the total combined molds and yeasts count does not exceed 10 cfu per g, and it meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

**Assay for pseudoephedrine hydrochloride** (where pseudoephedrine hydrochloride is the salt form used, if present in the formulation)—

**Mobile phase**—Prepare a filtered and degassed mixture of methanol and water (60:40) containing 0.34 g of monobasic potassium phosphate, 0.15 g of triethylamine hydrochloride, 0.25 g of sodium lauryl sulfate, and 0.1 mL of phosphoric acid in each 100 mL of solution. Make adjustments if necessary (see *System Suitability* under *Chromatography (621)*).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Pseudoephedrine Hydrochloride RS in water to obtain a solution having a known concentration of about 1.5 mg per mL. Transfer 1.0 mL of this solution to a 10-mL volumetric flask, add 8.0 mL of *Mobile phase*, dilute with water to volume, and mix.

**Chlorpheniramine standard preparation**—Prepare as directed for *Standard preparation* in the *Assay for chlorpheniramine maleate*.

**Dextromethorphan standard preparation**—Prepare as directed for *Standard preparation* in the *Assay for dextromethorphan hydrobromide*.

**System suitability solution 1** (for Oral Solution that contains either all the four ingredients or a combination of three containing chlorpheniramine salt)—Mix equal volumes of the *Standard preparation* and the *Chlorpheniramine standard preparation*.

**System suitability solution 2** (for Oral Solution that contains no chlorpheniramine salt)—Mix equal volumes of the *Standard preparation* and the *Dextromethorphan standard preparation*.

**Assay preparation**—Transfer an accurately measured volume of the Oral Solution, equivalent to 15 mg of pseudoephedrine hydrochloride, to a 100-mL volumetric flask, add

80.0 mL of *Mobile phase*, dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 214-nm detector and a 4.6-mm × 15-cm column that contains packing L11. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor for the pseudoephedrine peak is not greater than 2.5; and the relative standard deviation for replicate injections is not more than 2.0%. Separately inject about 10 µL of *System suitability solution 1* or *System suitability solution 2*, as appropriate. The resolution, *R*, between pseudoephedrine and chlorpheniramine or between pseudoephedrine and dextromethorphan is not less than 2.0.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the pseudoephedrine peaks. Calculate the quantity, in mg, of pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ) in each mL of the Oral Solution taken by the formula:

$$100(C/V)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Pseudoephedrine Hydrochloride RS in the *Standard preparation*; *V* is the volume, in mL, of the Oral Solution taken; and *r<sub>U</sub>* and *r<sub>S</sub>* are the pseudoephedrine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for pseudoephedrine sulfate** (where pseudoephedrine sulfate is the salt form used, if present in the formulation)—

**Mobile phase, System suitability solutions, and Chromatographic system**—Proceed as directed in the *Assay for pseudoephedrine hydrochloride*.

**Chlorpheniramine standard preparation**—Prepare as directed for *Standard preparation* in the *Assay for chlorpheniramine maleate*.

**Dextromethorphan standard preparation**—Prepare as directed for *Standard preparation* in the *Assay for dextromethorphan hydrobromide*.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Pseudoephedrine Sulfate RS in water to obtain a solution having a known concentration of about 3.0 mg per mL. Transfer 1.0 mL of this solution to a 10-mL volumetric flask, add 4.0 mL of *Mobile phase*, dilute with water to volume, and mix.

**Assay preparation**—Transfer an accurately measured volume of Oral Solution, equivalent to 30 mg of pseudoephedrine sulfate, to a 100-mL volumetric flask, add 80.0 mL of *Mobile phase*, dilute with water to volume, and mix.

**Procedure**—Proceed as directed for *Procedure* in the *Assay for pseudoephedrine hydrochloride*. Calculate the quantity, in mg, of pseudoephedrine sulfate [ $(C_{10}H_{15}NO)_2 \cdot H_2SO_4$ ] in each mL of the Oral Solution taken by the formula:

$$100(C/V)(r_U / r_S)$$

in which the terms are as defined therein, pseudoephedrine sulfate being substituted for pseudoephedrine hydrochloride.

**Assay for acetaminophen (if present)**—

**Mobile phase**—Prepare a suitable degassed and filtered mixture of water, methanol, and glacial acetic acid (79:20:1). Make any necessary adjustments (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Transfer about 16.5 mg of USP Acetaminophen RS, accurately weighed, to a 100-mL volumetric flask. Add 2.5 mL of methanol, and mix until solution is complete. Dilute with water to volume, and mix to obtain

a solution having a known concentration of about 0.165 mg per mL.

**Assay preparation**—Transfer an accurately measured volume of Oral Solution, equivalent to about 33 mg of acetaminophen, to a 200-mL volumetric flask, add 5 mL of methanol, and mix. Dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm × 15-cm column that contains packing L7. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor for the acetaminophen peak is not greater than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the acetaminophen peaks. Calculate the quantity, in mg, of acetaminophen ( $C_8H_9NO_2$ ) in each mL of the Oral Solution taken by the formula:

$$200(C/V)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Acetaminophen RS in the *Standard preparation*; *V* is the volume, in mL, of the Oral Solution taken; and *r<sub>U</sub>* and *r<sub>S</sub>* are the acetaminophen peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for chlorpheniramine maleate (if present)**—

**Mobile phase and Chromatographic system**—Proceed as directed in the *Assay for pseudoephedrine hydrochloride*.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Chlorpheniramine Maleate RS in water to obtain a solution having a known concentration of about 1 mg per mL. Transfer 1.0 mL of this solution to a 100-mL volumetric flask, add 80 mL of *Mobile phase*, dilute with water to volume, and mix.

**Assay preparation**—Transfer an accurately measured volume of Oral Solution, equivalent to about 1 mg of chlorpheniramine maleate, to a 100-mL volumetric flask. Add 80 mL of *Mobile phase*, dilute with water to volume, and mix.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the chlorpheniramine peaks. Calculate the quantity, in mg, of chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ) in the Oral Solution taken by the formula:

$$100(C/V)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Chlorpheniramine Maleate RS in the *Standard preparation*; *V* is the volume, in mL, of the Oral Solution taken; and *r<sub>U</sub>* and *r<sub>S</sub>* are the chlorpheniramine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for dextromethorphan hydrobromide (if present)**—

**Mobile phase and Chromatographic system**—Proceed as directed in the *Assay for pseudoephedrine hydrochloride*.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Dextromethorphan Hydrobromide RS in water to obtain a solution having a known concentration of about 1.5 mg per mL. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, add 80 mL of *Mobile phase*, dilute with water to volume, and mix.

**Assay preparation**—Transfer an accurately measured volume of Oral Solution, equivalent to about 7.5 mg of dextromethorphan hydrobromide, to a 100-mL volumetric flask,

add 80 mL of *Mobile phase*, dilute with water to volume, and mix.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the dextromethorphan peaks. Calculate the quantity, in mg, of dextromethorphan hydrobromide ( $C_{18}H_{25}NO \cdot HBr \cdot H_2O$ ) in each mL of the Oral Solution taken by the formula:

$$(370.33/352.32)(100C/V)(r_U / r_S)$$

in which 370.33 and 352.32 are the molecular weights of dextromethorphan hydrobromide monohydrate and anhydrous dextromethorphan hydrobromide, respectively;  $C$  is the concentration, in mg per mL, of USP Dextromethorphan Hydrobromide RS in the *Standard preparation*;  $V$  is the volume, in mL, of the Oral Solution taken; and  $r_U$  and  $r_S$  are the dextromethorphan peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

### Tablets Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine

» Tablets Containing at Least Three of the Following—Acetaminophen and Salts of Chlorpheniramine, Dextromethorphan, and Pseudoephedrine contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of acetaminophen ( $C_8H_9NO_2$ ), chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ), dextromethorphan hydrobromide ( $C_{18}H_{25}NO \cdot HBr \cdot H_2O$ ), and pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ) or pseudoephedrine sulfate [ $(C_{10}H_{15}NO)_2 \cdot H_2SO_4$ ]. NOTE—The heading of this monograph does not constitute the official title. It is not intended that the name described herein be recognized as the official title or the common or usual name. The name for each article encompassed by this monograph shall be composed of the names of the active ingredients contained therein, as well as the quantitative amount of each active ingredient, and a statement of the function (or purpose) of the ingredient in the article.

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

#### USP Reference standards <11>—

USP Acetaminophen RS  
USP Chlorpheniramine Maleate RS  
USP Dextromethorphan Hydrobromide RS  
USP Pseudoephedrine Hydrochloride RS  
USP Pseudoephedrine Sulfate RS

**Labeling**—The label for each article encompassed by this monograph bears a name composed of the active ingredients. The label states the name and quantity of each active ingredient and indicates its function (or purpose) in the article. When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.

#### Identification—

**A:** If pseudoephedrine hydrochloride or pseudoephedrine sulfate is claimed in the labeling to be present, the chromat-

ogram of the *Assay preparation*, obtained as directed in the *Assay for pseudoephedrine hydrochloride* or the *Assay for pseudoephedrine sulfate*, exhibits a major peak for pseudoephedrine, the retention time of which corresponds to that exhibited by the *Standard preparation*.

**B:** If acetaminophen is claimed in the labeling to be present, the chromatogram of the *Assay preparation*, obtained as directed in the *Assay for acetaminophen*, exhibits a major peak for acetaminophen, the retention time of which corresponds to that exhibited by the *Standard preparation*.

**C:** If chlorpheniramine maleate is claimed in the labeling to be present, the chromatogram of the *Assay preparation*, obtained as directed in the *Assay for chlorpheniramine maleate*, exhibits a major peak for chlorpheniramine, the retention time of which corresponds to that exhibited by the *Standard preparation*.

**D:** If dextromethorphan hydrobromide is claimed in the labeling to be present, the chromatogram of the *Assay preparation*, obtained as directed in the *Assay for dextromethorphan hydrobromide*, exhibits a major peak for dextromethorphan, the retention time of which corresponds to that exhibited by the *Standard preparation*.

#### Dissolution, Procedure for a Pooled Sample <711>—

##### TEST 1—

**Medium:** pH 5.8 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*); 900 mL.

**Apparatus 2:** 50 rpm.

**Time:** 45 minutes.

**Test preparation**—Mix 9.0 mL of a filtered portion of the solution under test with 1.0 mL of 1% phosphoric acid solution.

**Procedure**—Determine the amounts of pseudoephedrine hydrochloride or pseudoephedrine sulfate (as appropriate), acetaminophen, chlorpheniramine maleate, and dextromethorphan hydrobromide dissolved, employing the procedures set forth in the *Assay for pseudoephedrine hydrochloride* or *Assay for pseudoephedrine sulfate*, *Assay for acetaminophen*, *Assay for chlorpheniramine maleate*, and *Assay for dextromethorphan hydrobromide*, respectively, making any necessary volumetric adjustments.

**Tolerances**—Not less than 75% (Q) of the labeled amounts of pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ) or pseudoephedrine sulfate [ $(C_{10}H_{15}NO)_2 \cdot H_2SO_4$ ], acetaminophen ( $C_8H_9NO_2$ ), chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ), and dextromethorphan hydrobromide ( $C_{18}H_{25}NO \cdot HBr \cdot H_2O$ ) are dissolved in 45 minutes.

**TEST 2**—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

**Medium:** water; 900 mL.

**Apparatus, Time, Test preparation, Procedure, and Tolerances**—Proceed as directed for *Test 1*.

**Uniformity of dosage units <905>**: meet the requirements.

**Assay for pseudoephedrine hydrochloride** (where pseudoephedrine hydrochloride is the salt form used, if present in the formulation)—

**Mobile phase**—Prepare a filtered and degassed mixture of methanol and water (60:40) containing 0.34 g of monobasic potassium phosphate, 0.3 g of triethylamine hydrochloride, 0.15 g of sodium lauryl sulfate, and 0.1 mL of phosphoric acid in each 100 mL of solution. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Pseudoephedrine Hydrochloride RS in water to obtain a solution having a known concentration of about 3.0 mg per mL. Transfer 1.0 mL of this solution to a 25-mL volumetric flask, add 2.5 mL of methanol, dilute with 0.1% phosphoric acid to volume, and mix.

**Chlorpheniramine standard preparation**—Prepare as directed for the *Standard preparation* in the Assay for chlorpheniramine maleate.

**Dextromethorphan standard preparation**—Prepare as directed for the *Standard preparation* in the Assay for dextromethorphan hydrobromide.

**System suitability solution 1** (for Tablets that contain either all the four ingredients or a combination of three containing chlorpheniramine salt)—Mix equal volumes of the *Standard preparation* and the *Chlorpheniramine standard preparation*.

**System suitability solution 2** (for Tablets that contain no chlorpheniramine salt)—Mix equal volumes of the *Standard preparation* and the *Dextromethorphan standard preparation*.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed quantity of the powder, equivalent to about 6 mg of pseudoephedrine hydrochloride, to a 50-mL volumetric flask. Add 5 mL of methanol, and sonicate to disperse the powder. Dilute with 0.1% phosphoric acid to volume, mix, and filter.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 214-nm detector and a 4.6-mm × 15-cm column that contains packing L11. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor for the pseudoephedrine peak is not greater than 2.5, and the relative standard deviation for replicate injections is not more than 2.0%. Separately inject about 10 µL of *System suitability solution 1* or *System suitability solution 2*, as appropriate. The resolution, *R*, between pseudoephedrine and chlorpheniramine or between pseudoephedrine and dextromethorphan is not less than 2.0.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the pseudoephedrine peaks. Calculate the quantity, in mg, of pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ) in the portion of Tablets taken by the formula:

$$50C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Pseudoephedrine Hydrochloride RS in the *Standard preparation*, and *r<sub>U</sub>* and *r<sub>S</sub>* are the pseudoephedrine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for pseudoephedrine sulfate** (where pseudoephedrine sulfate is the salt form used, if present in the formulation)—

**Mobile phase, Chlorpheniramine standard preparation, Dextromethorphan standard preparation, System suitability solutions, and Chromatographic system**—Proceed as directed in the Assay for pseudoephedrine hydrochloride.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Pseudoephedrine Sulfate RS in water to obtain a solution having a known concentration of about 3.0 mg per mL. Transfer 2.0 mL of this solution to a 25-mL volumetric flask, add 2.5 mL of methanol, dilute with 0.1% phosphoric acid to volume, and mix.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed quantity of the powder, equivalent to about 12 mg of pseudoephedrine sulfate, to a 50-mL volumetric flask. Add 5 mL of methanol, and sonicate to disperse the powder. Dilute with 0.1% phosphoric acid to volume, mix, and filter.

**Procedure**—Proceed as directed for *Procedure* in the Assay for pseudoephedrine hydrochloride. Calculate the quantity, in

mg, of pseudoephedrine sulfate [ $(C_{10}H_{15}NO)_2 \cdot H_2SO_4$ ] in the portion of Tablets taken by the formula:

$$50C(r_U / r_S)$$

in which the terms are as defined therein, pseudoephedrine sulfate being substituted for pseudoephedrine hydrochloride.

**Assay for acetaminophen (if present)**—

**Mobile phase**—Prepare a filtered and degassed mixture of water, methanol, and glacial acetic acid (79:20:1). Make adjustments, if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Transfer about 50 mg of USP Acetaminophen RS, accurately weighed, to a 100-mL volumetric flask. Add 4 mL of methanol, and mix until solution is complete. Dilute with 0.1% phosphoric acid to volume, and mix.

**Assay preparation**—Weigh and powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of acetaminophen, to a 50-mL volumetric flask. Add about 7.5 mL of methanol, and sonicate to disperse the powder. Add 0.5 mL of phosphoric acid, dilute with water to volume, mix, and filter. Transfer 25.0 mL of the filtered solution to a 100-mL volumetric flask, dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm × 15-cm column that contains packing L7. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor for the acetaminophen peak is not greater than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the acetaminophen peaks. Calculate the quantity, in mg, of acetaminophen ( $C_8H_9NO_2$ ) in the portion of Tablets taken by the formula:

$$200C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Acetaminophen RS in the *Standard preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the acetaminophen peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for chlorpheniramine maleate (if present)**—

**Mobile phase and Chromatographic system**—Proceed as directed in the Assay for pseudoephedrine hydrochloride.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Chlorpheniramine Maleate RS in water to obtain a solution having a known concentration of about 0.8 mg per mL. Quantitatively dilute a portion of this solution with 0.1% phosphoric acid to obtain a solution having a known concentration of about 8 µg per mL.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 2 mg of chlorpheniramine maleate, to a 250-mL volumetric flask. Add 25 mL of methanol, and sonicate to disperse the powder. Add 1 mL of phosphoric acid, dilute with water to volume, mix, and filter.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the chlorpheniramine peaks. Calculate the quantity, in mg, of chlorpheniramine maleate

( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ) in the portion of Tablets taken by the formula:

$$250C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Chlorpheniramine Maleate RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses for chlorpheniramine obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for dextromethorphan hydrobromide** (if present)—

*Mobile phase and Chromatographic system*—Proceed as directed in the *Assay for pseudoephedrine hydrochloride*.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Dextromethorphan Hydrobromide RS in water to obtain a solution having a known concentration of about 0.6 mg per mL. Quantitatively dilute a portion of this solution with 0.1% phosphoric acid to obtain a solution having a known concentration of about 0.06 mg per mL.

*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 6 mg of dextromethorphan hydrobromide, to a 100-mL volumetric flask. Add 10 mL of methanol, and sonicate to disperse the powder. Add 0.4 mL of phosphoric acid, dilute with water to volume, mix, and filter.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses for the dextromethorphan peaks. Calculate the quantity, in mg, of dextromethorphan hydrobromide ( $C_{18}H_{25}NO \cdot HBr \cdot H_2O$ ) in the portion of Tablets taken by the formula:

$$(370.33 / 352.32)(100C)(r_U / r_S)$$

in which 370.33 and 352.32 are the molecular weights of dextromethorphan hydrobromide monohydrate and anhydrous dextromethorphan hydrobromide, respectively; C is the concentration, in mg per mL, of USP Dextromethorphan Hydrobromide RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the dextromethorphan peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Acetaminophen, Chlorpheniramine Maleate, and Dextromethorphan Hydrobromide Tablets

» Acetaminophen, Chlorpheniramine Maleate, and Dextromethorphan Hydrobromide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of acetaminophen ( $C_8H_9NO_2$ ), chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ), and dextromethorphan hydrobromide ( $C_{18}H_{25}NO \cdot HBr \cdot H_2O$ ).

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

**Labeling**—The label states the name and quantity of each active ingredient and indicates its function (or purpose) in the article. When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.

**USP Reference standards** (11)—

USP Acetaminophen RS  
USP Chlorpheniramine Maleate RS

USP Dextromethorphan Hydrobromide RS  
USP Pseudoephedrine Hydrochloride RS

**Identification**—

**A:** The chromatogram of the *Assay preparation*, obtained as directed in the *Assay for acetaminophen*, exhibits a major peak for acetaminophen, the retention time of which corresponds to that exhibited by the *Standard preparation*.

**B:** The chromatogram of the *Assay preparation*, obtained as directed in the *Assay for chlorpheniramine maleate*, exhibits a major peak for chlorpheniramine, the retention time of which corresponds to that exhibited by the *Standard preparation*.

**C:** The chromatogram of the *Assay preparation*, obtained as directed in the *Assay for dextromethorphan hydrobromide*, exhibits a major peak for dextromethorphan, the retention time of which corresponds to that exhibited by the *Standard preparation*.

**Dissolution**, Procedure for a Pooled Sample (711)—

TEST 1—

*Medium:* water; 900 mL.

*Apparatus 2:* 50 rpm.

*Time:* 45 minutes.

*Test solution*—Mix 9.0 mL of a filtered portion of the solution under test with 1.0 mL of 1% phosphoric acid solution.

*Procedure*—Determine the amounts of acetaminophen, chlorpheniramine maleate, and dextromethorphan hydrobromide dissolved, employing the procedures set forth in the *Assay for acetaminophen*, *Assay for chlorpheniramine maleate*, and *Assay for dextromethorphan hydrobromide*, respectively, making any necessary volumetric adjustments.

*Tolerances*—Not less than 75% (Q) of the labeled amounts of acetaminophen ( $C_8H_9NO_2$ ), chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ), and dextromethorphan hydrobromide ( $C_{18}H_{25}NO \cdot HBr \cdot H_2O$ ) are dissolved in 45 minutes.

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

*Medium:* 0.1 M hydrochloric acid; 900 mL.

*Apparatus, Time, Test solution, Procedure, and Tolerances*—Proceed as directed for *Test 1*.

TEST 3—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

*Medium:* pH 5.8 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*); 900 mL.

*Apparatus, Time, Test solution, Procedure, and Tolerances*—Proceed as directed for *Test 1*.

**Uniformity of dosage units** (905): meet the requirements.

**Assay for acetaminophen**—

*Mobile phase*—Prepare a filtered and degassed mixture of water, methanol, and glacial acetic acid (79:20:1). Make adjustments, if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Transfer about 50 mg of USP Acetaminophen RS, accurately weighed, to a 100-mL volumetric flask. Add 4 mL of methanol, and mix until solution is complete. Dilute with 0.1% phosphoric acid to volume, and mix.

*Assay preparation*—Weigh and powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of acetaminophen, to a 50-mL volumetric flask. Add about 7.5 mL of methanol, and sonicate to disperse the powder. Add 0.5 mL of phosphoric acid, dilute with water to volume, mix, and filter. Transfer 25.0 mL of the filtered solution to a 100-mL volumetric flask, dilute with water to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm  $\times$  15-cm column that contains packing L7.

The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor for the acetaminophen peak is not greater than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the acetaminophen peaks. Calculate the quantity, in mg, of acetaminophen ( $C_8H_9NO_2$ ) in the portion of Tablets taken by the formula:

$$200C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Acetaminophen RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the acetaminophen peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

#### Assay for chlorpheniramine maleate—

*Mobile phase*—Prepare a filtered and degassed mixture of methanol and water (60:40) containing 0.34 g of monobasic potassium phosphate, 0.3 g of triethylamine hydrochloride, 0.15 g of sodium lauryl sulfate, and 0.1 mL of phosphoric acid in each 100 mL of solution. Make adjustments, if necessary (see *System Suitability* under *Chromatography* (621)).

*Pseudoephedrine hydrochloride stock preparation*—Dissolve an accurately weighed quantity of USP Pseudoephedrine Hydrochloride RS in water to obtain a solution having a known concentration of about 3.0 mg per mL. Transfer 1.0 mL of this solution to a 25-mL volumetric flask, add 2.5 mL of methanol, dilute with 0.1% phosphoric acid to volume, and mix.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Chlorpheniramine Maleate RS in water to obtain a solution having a known concentration of about 0.8 mg per mL. Quantitatively dilute a portion of this solution with 0.1% phosphoric acid to obtain a solution having a known concentration of about 8  $\mu$ g per mL.

*System suitability solution*—Mix equal volumes of the *Pseudoephedrine hydrochloride stock preparation* and the *Standard preparation*.

*Assay preparation*—Weigh and powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 2 mg of chlorpheniramine maleate, to a 250-mL volumetric flask. Add about 25 mL of methanol, and sonicate to disperse the powder. Add 1 mL of phosphoric acid, dilute with water to volume, mix, and filter.

*Chromatographic system*—The liquid chromatograph is equipped with a 214-nm detector and a 4.6-mm  $\times$  15-cm column that contains packing L11. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor for the pseudoephedrine peak is not greater than 2.5, and the relative standard deviation for replicate injections is not more than 2.0%. Inject about 10  $\mu$ L of the *System suitability solution*; the resolution,  $R$ , between pseudoephedrine and chlorpheniramine is not less than 2.0.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the chlorpheniramine peaks. Calculate the quantity, in mg, of chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ) in the portion of Tablets taken by the formula:

$$250C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Chlorpheniramine Maleate RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses for chlorpheniramine

obtained from the *Assay preparation* and the *Standard preparation*, respectively.

#### Assay for dextromethorphan hydrobromide—

*Mobile phase*—Prepare a filtered and degassed mixture of methanol and water (60:40) containing 0.34 g of monobasic potassium phosphate, 0.3 g of triethylamine hydrochloride, 0.15 g of sodium lauryl sulfate, and 0.1 mL of phosphoric acid in each 100 mL of solution. Make adjustments, if necessary (see *System Suitability* under *Chromatography* (621)).

*Pseudoephedrine hydrochloride stock preparation*—Dissolve an accurately weighed quantity of USP Pseudoephedrine Hydrochloride RS in water to obtain a solution having a known concentration of about 3.0 mg per mL. Transfer 1.0 mL of this solution to a 25-mL volumetric flask, add 2.5 mL of methanol, dilute with 0.1% phosphoric acid to volume, and mix.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Dextromethorphan Hydrobromide RS in water to obtain a solution having a known concentration of about 0.6 mg per mL. Quantitatively dilute a portion of this solution with 0.1% phosphoric acid to obtain a solution having a known concentration of about 0.06 mg per mL.

*System suitability solution*—Mix equal volumes of the *Pseudoephedrine hydrochloride stock preparation* and the *Standard preparation*.

*Assay preparation*—Weigh and powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 6 mg of dextromethorphan hydrobromide, to a 100-mL volumetric flask. Add 10 mL of methanol, and sonicate to disperse the powder. Add 0.4 mL of phosphoric acid, dilute with water to volume, mix, and filter.

*Chromatographic system*—The liquid chromatograph is equipped with a 214-nm detector and a 4.6-mm  $\times$  15-cm column that contains packing L11. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor for the pseudoephedrine peak is not greater than 2.5, and the relative standard deviation for replicate injections is not more than 2.0%. Inject about 10  $\mu$ L of the *System suitability solution*; the resolution,  $R$ , between pseudoephedrine and dextromethorphan is not less than 2.0.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses for the dextromethorphan peaks. Calculate the quantity, in mg, of dextromethorphan hydrobromide ( $C_{18}H_{25}NO \cdot HBr \cdot H_2O$ ) in the portion of Tablets taken by the formula:

$$(370.33 / 352.32)(100C)(r_U / r_S)$$

in which 370.33 and 352.32 are the molecular weights of dextromethorphan hydrobromide monohydrate and anhydrous dextromethorphan hydrobromide, respectively; C is the concentration, in mg per mL, of USP Dextromethorphan Hydrobromide RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the dextromethorphan peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Acetaminophen and Codeine Phosphate Capsules

» Acetaminophen and Codeine Phosphate Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts

of acetaminophen ( $\text{C}_8\text{H}_9\text{NO}_2$ ) and codeine phosphate ( $\text{C}_{18}\text{H}_{21}\text{NO}_3 \cdot \text{H}_3\text{PO}_4 \cdot \frac{1}{2}\text{H}_2\text{O}$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers, and store at controlled room temperature.

**USP Reference standards** (11)—

USP Acetaminophen RS

USP Codeine Phosphate RS

**Identification**—

**A:** The retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**B:** Transfer a portion of Capsule contents, equivalent to about 12 mg of codeine phosphate, to a separator, add 5 mL of water, 1 mL of ammonium hydroxide, and 5 mL of methylene chloride, shake for 1 minute, and allow the layers to separate. Use the clear, lower layer as the test solution. Prepare a Standard solution of USP Acetaminophen RS and USP Codeine Phosphate RS in methanol containing 12 mg of each per mL. Apply 10  $\mu\text{L}$  of each solution to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of methanol and ammonium hydroxide (49:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by examination under short-wave-length UV light: the  $R_f$  values of the two principal spots obtained from the test solution correspond to those obtained from the Standard solution.

**Dissolution**, *Procedure for a Pooled Sample* (711)—

*Medium:* 0.01 N hydrochloric acid; 900 mL.

*Apparatus 2:* 50 rpm.

*Time:* 30 minutes.

*Procedure*—Determine the amounts of acetaminophen ( $\text{C}_8\text{H}_9\text{NO}_2$ ) and codeine phosphate hemihydrate ( $\text{C}_{18}\text{H}_{21}\text{NO}_3 \cdot \text{H}_3\text{PO}_4 \cdot \frac{1}{2}\text{H}_2\text{O}$ ) dissolved by employing the procedure set forth in the *Assay*, except to use 0.01 N hydrochloric acid to prepare the *Codeine phosphate standard stock solution* and to make any other necessary volumetric adjustments.

*Tolerances*—Not less than 75% (Q) of the labeled amounts of  $\text{C}_8\text{H}_9\text{NO}_2$  and  $\text{C}_{18}\text{H}_{21}\text{NO}_3 \cdot \text{H}_3\text{PO}_4 \cdot \frac{1}{2}\text{H}_2\text{O}$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

PROCEDURE FOR CONTENT UNIFORMITY—

*Buffer solution, Mobile phase, Codeine phosphate standard stock solution, Standard preparation, and Chromatographic system*—Prepare as directed in the *Assay*.

*Sample preparation*—Transfer the contents of 1 Capsule to a 100-mL volumetric flask, add about 75 mL of *Mobile phase*, and sonicate for 10 minutes. Dilute with *Mobile phase* to volume, and mix. Transfer 5.0-mL of the resulting solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Pass a portion of this solution through a suitable 1- $\mu\text{m}$  filter.

*Procedure*—Separately inject equal volumes (about 30  $\mu\text{L}$ ) of the *Standard preparation* and the *Sample preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of acetaminophen ( $\text{C}_8\text{H}_9\text{NO}_2$ ) in the Capsule taken by the formula:

$$1000C_A(r_U / r_S)$$

in which  $C_A$  is the concentration, in mg per mL, of USP Acetaminophen RS in the *Standard preparation*; and  $r_U$  and  $r_S$

are the peak responses obtained from the *Sample preparation* and the *Standard preparation*, respectively. Calculate the quantity, in mg, of codeine phosphate hemihydrate ( $\text{C}_{18}\text{H}_{21}\text{NO}_3 \cdot \text{H}_3\text{PO}_4 \cdot \frac{1}{2}\text{H}_2\text{O}$ ) in the Capsule taken by the formula:

$$(406.37/397.37)1000C_U(r_U / r_S)$$

in which 406.37 and 397.37 are the molecular weights of codeine phosphate hemihydrate and anhydrous codeine phosphate, respectively;  $C_U$  is the concentration, in mg per mL, of USP Codeine Phosphate RS in the *Standard preparation*; and the other terms are as defined herein.

**Assay**—

*Buffer solution, Mobile phase, Codeine phosphate standard stock solution, Standard preparation, and Chromatographic system*—Prepare as directed in the *Assay* under *Acetaminophen and Codeine Phosphate Tablets*.

*Assay preparation*—Remove as completely as possible the contents of not fewer than 20 Capsules, weigh, and mix. Transfer an accurately weighed portion of the combined contents, equivalent to about 300 mg of acetaminophen, to a 100-mL volumetric flask, add about 75 mL of *Mobile phase*, and sonicate for 10 minutes. Dilute with *Mobile phase* to volume, and mix. Transfer 5.0-mL of the resulting solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Pass a portion of this solution through a suitable 1- $\mu\text{m}$  filter.

*Procedure*—Separately inject equal volumes (about 30  $\mu\text{L}$ ) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of acetaminophen ( $\text{C}_8\text{H}_9\text{NO}_2$ ) in the portion of Capsules taken by the formula:

$$(LC_A / C_U)(r_U / r_S)$$

in which  $L$  is the labeled quantity, in mg, of acetaminophen in each Capsule;  $C_A$  is the concentration, in mg per mL, of USP Acetaminophen RS in the *Standard preparation*;  $C_U$  is the concentration, in mg per mL, of acetaminophen in the *Assay preparation*, based upon the labeled quantity per Capsule and the extent of dilution; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively. Calculate the quantity, in mg, of codeine phosphate hemihydrate ( $\text{C}_{18}\text{H}_{21}\text{NO}_3 \cdot \text{H}_3\text{PO}_4 \cdot \frac{1}{2}\text{H}_2\text{O}$ ) in the portion of Capsules taken by the formula:

$$(406.37/397.37)(LC_C / C_U)(r_U / r_S)$$

in which 406.37 and 397.37 are the molecular weights of codeine phosphate hemihydrate and anhydrous codeine phosphate, respectively;  $L$  is the labeled quantity, in mg, of codeine phosphate hemihydrate in each Capsule;  $C_C$  is the concentration, in mg per mL, of USP Codeine Phosphate RS in the *Standard preparation*;  $C_U$  is the concentration, in mg per mL, of codeine phosphate hemihydrate in the *Assay preparation*, based upon the labeled quantity per Capsule and the extent of dilution; and the other terms are as defined herein.

## Acetaminophen and Codeine Phosphate Oral Solution

» Acetaminophen and Codeine Phosphate Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of acetaminophen ( $\text{C}_8\text{H}_9\text{NO}_2$ ) and co-

deine phosphate hemihydrate ( $\text{C}_{18}\text{H}_{21}\text{NO}_3 \cdot \text{H}_3\text{PO}_4 \cdot \frac{1}{2}\text{H}_2\text{O}$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers, and store at controlled room temperature.

**USP Reference standards** (11)—

USP Acetaminophen RS

USP Codeine Phosphate RS

**Identification**—

**A:** The retention times of the major peaks in the chromatograms of the *Assay preparation* correspond to those in the chromatograms of the *Standard preparations*, as obtained in the *Assay for acetaminophen* and the *Assay for codeine phosphate*, respectively.

**B:** Transfer a volume of Oral Solution, equivalent to about 12 mg of codeine phosphate, to a separator, add 1 mL of ammonium hydroxide and 5 mL of methylene chloride, shake for 1 minute, and allow the layers to separate. Use the clear, lower layer as the test solution. Prepare a Standard solution of USP Acetaminophen RS and USP Codeine Phosphate RS in methanol containing 12 mg of each per mL. Apply 10  $\mu\text{L}$  of each solution to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of methanol and ammonium hydroxide (49:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by examination under short-wavelength UV light: the  $R_f$  values of the two principal spots obtained from the test solution correspond to those obtained from the Standard solution.

**Uniformity of dosage units** (905)—

FOR ORAL SOLUTION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** (698)—

FOR ORAL SOLUTION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

**pH** (791): between 4.0 and 6.1.

**Alcohol content** (if present), *Method II* (611): between 90.0% and 120.0% of the labeled amount of  $\text{C}_2\text{H}_5\text{OH}$ , acetone being used as the internal standard.

**Assay for acetaminophen**—

*Mobile phase*—Prepare a suitable mixture of water and methanol (7:3), and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Acetaminophen RS in *Mobile phase* to obtain a solution having a known concentration of about 0.48 mg per mL.

*Assay preparation*—Transfer an accurately measured volume of Oral Solution, equivalent to about 120 mg of acetaminophen, to a 250-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency determined from the analyte peak is not less than 1000 theoretical plates, the tailing factor for the analyte peak is not more than 1.5, and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 10  $\mu\text{L}$ ) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the acetaminophen peaks. Calculate

the quantity, in mg, of acetaminophen ( $\text{C}_8\text{H}_9\text{NO}_2$ ) in each mL of the Oral Solution taken by the formula:

$$250(C/V)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Acetaminophen RS in the *Standard preparation*;  $V$  is the volume, in mL, of Oral Solution taken; and  $r_U$  and  $r_S$  are the peak responses of acetaminophen obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for codeine phosphate**—

*Mobile phase*—Dissolve 4.44 g of docusate sodium in 1000 mL of a mixture of methanol, water, tetrahydrofuran, and phosphoric acid (600:360:40:1) with stirring, and pass through a membrane filter having a 0.45- $\mu\text{m}$  or finer porosity. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Solvent mixture*—Mix water and methanol (7:3).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Codeine Phosphate RS in *Solvent mixture* to obtain a solution having a known concentration of about 0.12 mg per mL.

*Assay preparation*—Transfer an accurately measured volume of Oral Solution, equivalent to about 12 mg of codeine phosphate hemihydrate, to a 100-mL volumetric flask, dilute with *Solvent mixture* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency determined from the analyte peak is not less than 1500 theoretical plates; the tailing factor for the analyte peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 3.0%.

*Procedure*—Separately inject equal volumes (about 10  $\mu\text{L}$ ) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the codeine peaks. Calculate the quantity, in mg, of codeine phosphate hemihydrate ( $\text{C}_{18}\text{H}_{21}\text{NO}_3 \cdot \text{H}_3\text{PO}_4 \cdot \frac{1}{2}\text{H}_2\text{O}$ ) in each mL of the Oral Solution taken by the formula:

$$(406.37/397.37)(100C/V)(r_U / r_S)$$

in which 406.37 and 397.37 are the molecular weights of codeine phosphate hemihydrate and anhydrous codeine phosphate, respectively;  $C$  is the concentration, in mg per mL, of USP Codeine Phosphate RS in the *Standard preparation*;  $V$  is the volume, in mL, of Oral Solution taken; and  $r_U$  and  $r_S$  are the peak responses of codeine phosphate obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Acetaminophen and Codeine Phosphate Oral Suspension

» Acetaminophen and Codeine Phosphate Oral Suspension is a suspension of Acetaminophen and Codeine Phosphate in a suitable aqueous vehicle. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of acetaminophen ( $\text{C}_8\text{H}_9\text{NO}_2$ ) and codeine phosphate hemihydrate ( $\text{C}_{18}\text{H}_{21}\text{NO}_3 \cdot \text{H}_3\text{PO}_4 \cdot \frac{1}{2}\text{H}_2\text{O}$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers, and store at controlled room temperature.

**USP Reference standards** (11)—

USP Acetaminophen RS  
USP Codeine Phosphate RS

**Identification**—

**A:** The retention times of the major peaks in the chromatograms of the *Assay preparations* correspond to those in the chromatograms of the *Standard preparation*, as obtained in the *Assay*.

**B:** Using the Oral Suspension, proceed as directed for *Identification test B* under *Acetaminophen and Codeine Phosphate Oral Solution*: the indicated results are obtained.

**Uniformity of dosage units** (905)—

FOR ORAL SUSPENSION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** (698)—

FOR ORAL SUSPENSION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

**pH** (791): between 4.0 and 6.1.

**Assay**—

**Mobile phase**—Dissolve 4.9 g of monobasic potassium phosphate in 900 mL of water, adjust with phosphoric acid to a pH of 3.9, add 216 mg of sodium 1-octanesulfonate, and mix. Add 100 mL of acetonitrile, mix, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Diluent**—Prepare a mixture of 0.01 N sodium hydroxide and methanol (70:30).

**Codeine phosphate standard stock solution**—Prepare a solution of USP Codeine Phosphate RS, accurately weighed, in *Diluent* having a known concentration of about 0.5 mg per mL.

**Standard stock preparation**—Transfer an accurately weighed quantity of about 5/*J* mg of USP Acetaminophen RS, *J* being the ratio of the labeled amount, in mg, of acetaminophen to the labeled amount, in mg, of codeine phosphate hemihydrate, and 10.0 mL of *Codeine phosphate standard stock solution* to a 100-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

**Standard preparation**—Transfer 10.0 mL of *Standard stock preparation* to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. This solution contains about 0.01 mg of USP Codeine Phosphate RS and 0.01/*J* mg of USP Acetaminophen RS per mL.

**Assay preparation**—Transfer an accurately measured volume of well-mixed Oral Suspension, equivalent to about 50 mg of acetaminophen, to a 100-mL volumetric flask. Add 50 mL of *Diluent*, and mix by mechanical means for 30 minutes. Dilute with *Diluent* to volume, and mix. [NOTE—Foaming may be minimized by adding a few drops of acetonitrile before diluting with *Diluent* to volume.] Centrifuge a portion of this mixture, and transfer 10.0 mL of the clear supernatant to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Resolution solution**—Prepare a solution in *Diluent* containing about 0.02 mg of sodium benzoate and 0.03 mg of methylparaben per mL. Transfer 10.0 mL of this solution and 10.0 mL of *Standard stock preparation* to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 15-cm column that contains 5-μm packing L11. The flow rate is about 2 mL per minute. Chromatograph the *Resolution solution*, and measure the peak responses as directed for *Procedure*: the relative retention times are about 0.25 for acetaminophen, 0.5 for benzoate, 1.0 for codeine, and 1.3 for methylparaben; and the resolution, *R*, between each pair of adjacent peaks is not less than 2. Chromatograph the *Standard preparation*, and record the

peak responses as directed for *Procedure*: the tailing factor for each analyte peak is not more than 2, the peak efficiency is not less than 500 theoretical plates, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of acetaminophen (C<sub>8</sub>H<sub>9</sub>NO<sub>2</sub>) in each mL of the Oral Suspension taken by the formula:

$$500(C/V)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Acetaminophen RS in the *Standard preparation*; *V* is the volume, in mL, of Oral Suspension taken; and *r<sub>U</sub>* and *r<sub>S</sub>* are the acetaminophen peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively. Calculate the quantity, in mg, of codeine phosphate hemihydrate (C<sub>18</sub>H<sub>21</sub>NO<sub>3</sub> · H<sub>3</sub>PO<sub>4</sub> · 1/2H<sub>2</sub>O) in each mL of the Oral Suspension taken by the formula:

$$(406.37/397.37)(500C/V)(r_U / r_S)$$

in which 406.37 and 397.37 are the molecular weights of codeine phosphate hemihydrate and anhydrous codeine phosphate, respectively; *C* is the concentration, in mg per mL, of USP Codeine Phosphate RS in the *Standard preparation*; *V* is the volume, in mL, of Oral Suspension taken; and *r<sub>U</sub>* and *r<sub>S</sub>* are the codeine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Acetaminophen and Codeine Phosphate Tablets

» Acetaminophen and Codeine Phosphate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of acetaminophen (C<sub>8</sub>H<sub>9</sub>NO<sub>2</sub>) and codeine phosphate hemihydrate (C<sub>18</sub>H<sub>21</sub>NO<sub>3</sub> · H<sub>3</sub>PO<sub>4</sub> · 1/2H<sub>2</sub>O).

**Packaging and storage**—Preserve in tight, light-resistant containers, and store at controlled room temperature.

**USP Reference standards** (11)—

USP Acetaminophen RS  
USP Codeine Phosphate RS

**Identification**—

**A:** The retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**B:** A quantity of finely powdered Tablets, equivalent to about 12 mg of codeine phosphate, meets the requirements of *Identification test B* under *Acetaminophen and Codeine Phosphate Capsules*.

**Dissolution** (711)—

**Medium:** 0.01 N hydrochloric acid; 900 mL.

**Apparatus 2:** 50 rpm.

**Time:** 30 minutes.

**Procedure**—Determine the amounts of acetaminophen (C<sub>8</sub>H<sub>9</sub>NO<sub>2</sub>) and codeine phosphate hemihydrate (C<sub>18</sub>H<sub>21</sub>NO<sub>3</sub> · H<sub>3</sub>PO<sub>4</sub> · 1/2H<sub>2</sub>O) dissolved by employing the procedure set forth in the *Assay*, except to use 0.01 N hydrochloric acid to prepare the *Codeine phosphate standard stock solution* and to make any other necessary volumetric adjustments.

**Tolerances**—Not less than 75% (*Q*) of the labeled amounts of  $C_8H_9NO_2$  and  $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**PROCEDURE FOR CONTENT UNIFORMITY—**

**Buffer solution, Mobile phase, Codeine phosphate standard stock solution, Standard preparation, and Chromatographic system**—Prepare as directed in the Assay.

**Sample preparation**—Transfer 1 Tablet to a 100-mL volumetric flask, add about 75 mL of *Mobile phase*, and sonicate for 10 minutes. Dilute with *Mobile phase* to volume, and mix. Transfer 5.0 mL of the resulting solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Pass a portion of this solution through a suitable 1- $\mu$ m filter.

**Procedure**—Separately inject equal volumes (about 30  $\mu$ L) of the *Standard preparation* and the *Sample preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of acetaminophen ( $C_8H_9NO_2$ ) in each Tablet taken by the formula:

$$1000C_A(r_U / r_S)$$

in which  $C_A$  is the concentration, in mg per mL, of USP Acetaminophen RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Sample preparation* and the *Standard preparation*, respectively. Calculate the quantity, in mg, of codeine phosphate hemihydrate ( $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ ) in each Tablet taken by the formula:

$$(406.37/397.37)1000C_C(r_U / r_S)$$

in which 406.37 and 397.37 are the molecular weights of codeine phosphate hemihydrate and anhydrous codeine phosphate, respectively;  $C_C$  is the concentration, in mg per mL, of USP Codeine Phosphate RS in the *Standard preparation*; and the other terms are as defined herein.

**Assay—**

**Buffer solution**—Dissolve 2.04 g of monobasic potassium phosphate in about 950 mL of water. Add 2 mL of triethylamine, adjust with phosphoric acid to a pH of 2.35, dilute with water to 1000 mL, and mix.

**Mobile phase**—Prepare a filtered and degassed mixture of *Buffer solution* and methanol (92:8). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Codeine phosphate standard stock solution**—Dissolve an accurately weighed quantity of USP Codeine Phosphate RS in *Mobile phase* to obtain a solution having a known concentration of about 0.3 mg per mL.

**Standard preparation**—Transfer about 30 mg of USP Acetaminophen RS and 100  $\mu$ L of *Codeine phosphate standard stock solution*,  $J$  being the ratio of the labeled amount, in mg, of codeine phosphate hemihydrate to that of acetaminophen, to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. This solution contains about 0.3 mg of acetaminophen and 0.3 $J$  mg of codeine phosphate hemihydrate per mL.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 300 mg of acetaminophen, to a 100-mL volumetric flask, add about 75 mL of *Mobile phase*, and sonicate for 10 minutes. Dilute with *Mobile phase* to volume, and mix. Transfer 5.0 mL of the resulting solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Pass a portion of this solution through a suitable 1- $\mu$ m filter.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 214-nm detector

and a 4.6-mm  $\times$  25-cm column that contains 5- $\mu$ m packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between acetaminophen and codeine phosphate is not less than 2.0; and the relative standard deviation for replicate injections is not more than 2.0% and 3.0%, respectively.

**Procedure**—Separately inject equal volumes (about 30  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of acetaminophen ( $C_8H_9NO_2$ ) in the portion of Tablets taken by the formula:

$$(LC_A / C_U)(r_U / r_S)$$

in which  $L$  is the labeled quantity, in mg, of acetaminophen in each Tablet;  $C_A$  is the concentration, in mg per mL, of USP Acetaminophen RS in the *Standard preparation*;  $C_U$  is the concentration, in mg per mL, of acetaminophen in the *Assay preparation*, based upon the labeled quantity per Tablet and the extent of dilution; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively. Calculate the quantity, in mg, of codeine phosphate hemihydrate ( $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ ) in the portion of Tablets taken by the formula:

$$(406.37/397.37)(LC_C / C_U)(r_U / r_S)$$

in which 406.37 and 397.37 are the molecular weights of codeine phosphate hemihydrate and anhydrous codeine phosphate, respectively;  $L$  is the labeled quantity, in mg, of codeine phosphate hemihydrate in each Tablet;  $C_C$  is the concentration, in mg per mL, of USP Codeine Phosphate RS in the *Standard preparation*;  $C_U$  is the concentration, in mg per mL, of codeine phosphate hemihydrate in the *Assay preparation*, based upon the labeled quantity per Tablet and the extent of dilution; and the other terms are as defined herein.

## Acetaminophen, Dextromethorphan Hydrobromide, Doxylamine Succinate, and Pseudoephedrine Hydrochloride Oral Solution

» Acetaminophen, Dextromethorphan Hydrobromide, Doxylamine Succinate, and Pseudoephedrine Hydrochloride Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of Acetaminophen ( $C_8H_9NO_2$ ), Dextromethorphan Hydrobromide ( $C_{18}H_{25}NO \cdot HBr \cdot H_2O$ ), Doxylamine Succinate ( $C_{17}H_{22}N_2O \cdot C_4H_6O_4$ ), and Pseudoephedrine Hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ).

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

**USP Reference standards** (11)—

USP Acetaminophen RS  
USP Dextromethorphan Hydrobromide RS  
USP Doxylamine Succinate RS  
USP Pseudoephedrine Hydrochloride RS

**Identification—**

**A:** The retention time of the major peak for acetaminophen in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for acetaminophen*.

**B:** The retention time of the major peak for dextromethorphan in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for dextromethorphan hydrobromide*.

**C:** The retention time of the major peak for doxylamine in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for doxylamine succinate*.

**D:** The retention time of the major peak for pseudoephedrine in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for pseudoephedrine hydrochloride*.

#### Uniformity of dosage units (905)—

FOR ORAL SOLUTION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

#### Deliverable volume (698)—

FOR ORAL SOLUTION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

**pH** (791): between 4.5 and 6.3.

**Alcohol content** (if present), *Method II* (611): between 90.0% and 110.0% of the labeled amount of  $C_2H_5OH$ .

**Microbial enumeration tests (61) and Tests for specified microorganisms (62)**—The total bacterial count does not exceed 100 cfu per g, the total combined molds and yeasts count does not exceed 10 cfu per g, and it meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

#### Assay for acetaminophen—

**Mobile phase**—Prepare a filtered and degassed mixture of water and methanol (55:45). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Acetaminophen RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.2 mg per mL.

**Assay preparation**—Dissolve an accurately measured volume of Oral Solution, equivalent to about 200 mg of acetaminophen, in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a concentration of about 0.2 mg of acetaminophen per mL.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency, determined from the analyte peak, is not less than 500 theoretical plates; the tailing factor for the acetaminophen peak is not greater than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the acetaminophen peaks. Calculate the quantity, in mg, of acetaminophen ( $C_8H_9NO_2$ ) in each mL of the Oral Solution taken by the formula:

$$(CL/D)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Acetaminophen RS in the *Standard preparation*; *L* is the labeled quantity, in mg per mL, of acetaminophen in the Oral Solution; *D* is the concentration, in mg per mL, of acetaminophen in the *Assay preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the acetaminophen peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

#### Assay for dextromethorphan hydrobromide—

**0.05 M Buffer solution**—Dissolve 6.8 g of monobasic potassium phosphate in 1 L of water.

**Mobile phase**—Prepare a filtered and degassed mixture of 0.05 M Buffer solution and acetonitrile (55:45). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve accurately weighed quantities of USP Dextromethorphan Hydrobromide RS, USP Doxylamine Succinate RS, and USP Pseudoephedrine Hydrochloride RS in *Mobile phase*, and, dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having known concentrations of about 0.1, 0.04, and 0.2 mg per mL, respectively.

**Assay preparation**—Dissolve an accurately measured volume of Oral Solution, equivalent to about 5 mg of dextromethorphan hydrobromide, in *Mobile phase*, and quantitatively dilute with *Mobile phase* to obtain a solution having a concentration of about 0.1 mg per mL.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains packing L9. The flow rate is about 2.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.38 for pseudoephedrine, 0.65 for dextromethorphan, and 1.0 for doxylamine; the tailing factors for the dextromethorphan, doxylamine, and pseudoephedrine peaks are not more than 2.5; the column efficiencies for the dextromethorphan, doxylamine, and pseudoephedrine peaks are not less than 500; and the relative standard deviations of the dextromethorphan, doxylamine, and pseudoephedrine responses for replicate injections are not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the dextromethorphan peak responses. Calculate the quantity, in mg per mL, of dextromethorphan hydrobromide ( $C_{18}H_{25}NO \cdot HBr \cdot H_2O$ ) in the portion of Oral Solution taken by the formula:

$$(370.33/352.32)(CL/D)(r_U / r_S)$$

in which 370.33 and 352.32 are the molecular weights of dextromethorphan hydrobromide monohydrate and anhydrous dextromethorphan hydrobromide, respectively; *C* is the concentration, in mg per mL, of USP Dextromethorphan Hydrobromide RS in the *Standard preparation*; *L* is the labeled quantity, in mg per mL, of dextromethorphan hydrobromide in the Oral Solution; *D* is the concentration, in mg per mL, of dextromethorphan hydrobromide in the *Assay preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the dextromethorphan peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

#### Assay for doxylamine succinate—

**0.05 M Buffer solution, Mobile phase, Standard preparation, and Chromatographic system**—Proceed as directed in the *Assay for dextromethorphan hydrobromide*.

**Assay preparation**—Dissolve an accurately measured volume of Oral Solution, equivalent to about 2 mg of doxylamine succinate, in *Mobile phase*, and dilute with *Mobile phase* to obtain a solution having a concentration of about 0.04 mg per mL.

**Procedure**—Proceed as directed for *Procedure* in the *Assay for dextromethorphan hydrobromide*. Calculate the quantity, in mg per mL, of doxylamine succinate ( $C_{17}H_{22}N_2O \cdot C_4H_6O_4$ ) in the portion of Oral Solution taken by the formula:

$$(CL/D)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Doxylamine Succinate RS in the *Standard preparation*; *L* is the

labeled quantity, in mg per mL, of doxylamine succinate in the Oral Solution;  $D$  is the concentration, in mg per mL, of doxylamine succinate in the Assay preparation; and  $r_U$  and  $r_S$  are the doxylamine peak responses obtained from the Assay preparation and the Standard preparation, respectively.

#### Assay for pseudoephedrine hydrochloride—

*0.05 M Buffer solution, Mobile phase, Standard preparation, and Chromatographic system*—Proceed as directed in the Assay for dextromethorphan hydrobromide.

*Assay preparation*—Dissolve an accurately measured volume of Oral Solution, equivalent to about 10 mg of pseudoephedrine hydrochloride, in *Mobile phase*, and dilute with *Mobile phase* to obtain a solution having a concentration of about 0.2 mg per mL.

*Procedure*—Proceed as directed for Procedure in the Assay for dextromethorphan hydrobromide. Calculate the quantity, in mg per mL, of pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ) in the portion of Oral Solution taken by the formula:

$$(CL/D)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Pseudoephedrine Hydrochloride RS in the Standard preparation;  $L$  is the labeled amount, in mg per mL, of pseudoephedrine hydrochloride in the Oral Solution;  $D$  is the concentration, in mg per mL, of pseudoephedrine hydrochloride in the Assay preparation; and  $r_U$  and  $r_S$  are the pseudoephedrine peak responses obtained from the Assay preparation and the Standard preparation, respectively.

## Acetaminophen and Diphenhydramine Citrate Tablets

» Acetaminophen and Diphenhydramine Citrate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of acetaminophen ( $C_8H_9NO_2$ ) and diphenhydramine citrate ( $C_{17}H_{21}NO \cdot C_6H_8O_7$ ).

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

#### USP Reference standards (11)—

USP Acetaminophen RS

USP Diphenhydramine Citrate RS

**Identification**—The retention times of the major peaks in the chromatograms of the Assay preparations, obtained in the Assay for acetaminophen and in the Assay for diphenhydramine citrate, relative to the retention times of the respective internal standards, correspond to those in the chromatogram of the respective Standard preparation.

#### Dissolution, Procedure for a Pooled Sample (711)—

Medium: water; 900 mL.

Apparatus 2: 50 rpm.

Time: 45 minutes.

*Procedure*—Determine the amount of acetaminophen ( $C_8H_9NO_2$ ) and of diphenhydramine citrate ( $C_{17}H_{21}NO \cdot C_6H_8O_7$ ) dissolved, employing the procedures set forth in the Assay for acetaminophen and the Assay for diphenhydramine citrate, respectively, making any necessary volumetric adjustments.

**Tolerances**—Not less than 75% ( $Q$ ) of the labeled amounts of  $C_8H_9NO_2$  and  $C_{17}H_{21}NO \cdot C_6H_8O_7$  are dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements for Content Uniformity with respect to acetaminophen and to diphenhydramine citrate.

#### Assay for acetaminophen—

*Mobile phase*—Prepare a suitable degassed and filtered mixture of water and methanol (60:40), making adjustments if necessary (see System Suitability under Chromatography (621)).

*Internal standard solution*—Prepare a solution of guaifenesin in a mixture of water and methanol (4:1) to obtain a solution containing 8.0 mg per mL.

*Standard preparation*—Transfer about 50 mg of USP Acetaminophen RS, accurately weighed, to a 100-mL volumetric flask. Dissolve in 2.5 mL of methanol, dilute with water to volume, and mix. Transfer 2.0 mL of this solution to a 50-mL volumetric flask, add 5.0 mL of Internal standard solution, dilute with Mobile phase to volume, and mix.

*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 500 mg of acetaminophen, to a 100-mL volumetric flask, add 25 mL of methanol, and shake by mechanical means for 10 minutes. Dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 2.0 mL of this solution to a 50-mL volumetric flask, add 5.0 mL of Internal standard solution, dilute with Mobile phase to volume, and mix.

*Chromatographic system* (see Chromatography (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  15-cm column that contains 5- $\mu$ m packing L1. The flow rate is about 1 mL per minute. The column temperature is maintained at about  $35 \pm 0.5^\circ$ . Chromatograph the Standard preparation, and record the responses as directed for Procedure: the column efficiency as determined from the analyte peak is not less than 1000 theoretical plates; the tailing factor for the analyte peak is not more than 2; the resolution,  $R$ , between the analyte and internal standard peaks is not less than 6.0; and the relative standard deviation of the peak response ratios for replicate injections is not more than 2.5%.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.5 for acetaminophen and 1.0 for guaifenesin. Calculate the quantity, in mg, of acetaminophen ( $C_8H_9NO_2$ ) in the portion of Tablets taken by the formula:

$$10W_S(R_U / R_S)$$

in which  $W_S$  is the weight, in mg, of USP Acetaminophen RS taken; and  $R_U$  and  $R_S$  are the ratios of the peak response of acetaminophen to that of the internal standard obtained from the Assay preparation and the Standard preparation, respectively.

#### Assay for diphenhydramine citrate—

*Mobile phase*—Prepare a suitable degassed and filtered mixture of methanol, water, and glacial acetic acid (61:38:1) containing 1.0813 g of sodium 1-octanesulfonate in each 1000 mL of solution, making adjustments if necessary (see System Suitability under Chromatography (621)).

*Solvent mixture*—Prepare a mixture of methanol and water (1:1).

*Internal standard solution*—Prepare a solution of xylometazoline hydrochloride in water having a concentration of about 8 mg per mL.

*Standard preparation*—Transfer about 38 mg of USP Diphenhydramine Citrate RS, accurately weighed, to a 100-mL volumetric flask containing 500 mg of acetaminophen. Add 5.0 mL of Internal standard solution and about 50 mL of Solvent mixture, and mix until solution is complete. Dilute with Solvent mixture to volume, and mix.

*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of

the powder, equivalent to about 38 mg of diphenhydramine citrate, to a 100-mL volumetric flask, add about 65 mL of *Solvent mixture*, and shake by mechanical means for about 15 minutes. Add 5.0 mL of *Internal standard solution*, dilute with *Solvent mixture* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 265-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. The column temperature is maintained at about 35 ± 0.5°. Chromatograph the *Standard preparation*, and record the responses as directed for *Procedure*: the column efficiency as determined from the analyte peak is not less than 1000 theoretical plates; the tailing factor for the analyte peak is not more than 1.7; the resolution, *R*, between the analyte and internal standard peaks is not less than 2.5; and the relative standard deviation of the peak response ratios for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses for the diphenhydramine citrate and xylometazoline hydrochloride peaks. The relative retention times are about 0.3 for acetaminophen, 0.7 for diphenhydramine citrate, and 1.0 for xylometazoline hydrochloride, respectively. Calculate the quantity, in mg, of diphenhydramine citrate ( $C_{17}H_{21}NO \cdot C_6H_8O_7$ ) in the portion of Tablets taken by the formula:

$$W_s(R_U / R_s)$$

in which  $W_s$  is the weight, in mg, of USP Diphenhydramine Citrate RS taken; and  $R_U$  and  $R_s$  are the ratios of the peak response of diphenhydramine citrate to that of the internal standard obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Acetaminophen, Diphenhydramine Hydrochloride, and Pseudoephedrine Hydrochloride Tablets

» Acetaminophen, Diphenhydramine Hydrochloride, and Pseudoephedrine Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of acetaminophen ( $C_8H_9NO_2$ ), diphenhydramine hydrochloride ( $C_{17}H_{21}NO \cdot HCl$ ), and pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ).

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

### USP Reference standards <11>—

USP Acetaminophen RS  
USP Diphenhydramine Hydrochloride RS  
USP Pseudoephedrine Hydrochloride RS

### Identification—

**A:** The retention time of the major peak for acetaminophen in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for acetaminophen*.

**B:** The retention time of the major peak for diphenhydramine in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for diphenhydramine hydrochloride*.

**C:** The retention time of the major peak for pseudoephedrine in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for pseudoephedrine hydrochloride*.

as obtained in the *Assay for pseudoephedrine hydrochloride*.

### Dissolution, Procedure for a Pooled Sample <711>—

**Medium:** pH 5.8 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*); 900 mL.

**Apparatus 2:** 50 rpm.

**Time:** 45 minutes.

Determine the amounts of acetaminophen ( $C_8H_9NO_2$ ), diphenhydramine hydrochloride ( $C_{17}H_{21}NO \cdot HCl$ ), and pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ) dissolved by employing the following method.

**Buffer solution, Diluting solvent, Mobile phase, and Chromatographic system**—Proceed as directed in the *Assay for acetaminophen*.

**Standard solution**—Prepare as directed for the *Standard preparation* in the *Assay for acetaminophen*.

**Test solution 1**—Combine equal volumes of the filtered solutions under test, and use the pooled sample.

**Test solution 2**—Transfer 5.0 mL of *Test solution 1* to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Procedure**—Using *Test solution 1* and the *Standard solution*, and making any necessary volumetric adjustments, proceed as directed in the *Assay for diphenhydramine hydrochloride* and the *Assay for pseudoephedrine hydrochloride*, and determine the amounts of diphenhydramine hydrochloride ( $C_{17}H_{21}NO \cdot HCl$ ) and pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ) dissolved. Using *Test solution 2* and the *Standard solution*, and making any necessary volumetric adjustments, proceed as directed in the *Assay for acetaminophen*, and determine the amount of acetaminophen ( $C_8H_9NO_2$ ) dissolved.

**Tolerances**—Not less than 75% (Q) of the labeled amounts of  $C_8H_9NO_2$ ,  $C_{17}H_{21}NO \cdot HCl$ , and  $C_{10}H_{15}NO \cdot HCl$  is dissolved in 45 minutes.

FOR TABLETS LABELED AS CHEWABLE—

**Medium:** pH 5.8 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*); 900 mL.

**Apparatus 2:** 75 rpm.

**Time:** 45 minutes.

**Tolerances**—Not less than 75% (Q) of the labeled amounts of  $C_8H_9NO_2$ ,  $C_{17}H_{21}NO \cdot HCl$ , and  $C_{10}H_{15}NO \cdot HCl$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

### Assay for acetaminophen—

**Buffer solution**—Transfer 6.8 g of monobasic potassium phosphate to a 1000-mL volumetric flask, and add water to dissolve. Add 2.0 mL of triethylamine, dilute with water to volume, and mix. Adjust with phosphoric acid to a pH of 4.0.

**Diluting solvent**—Prepare a mixture of *Buffer solution* and acetonitrile (89:11).

**Mobile phase**—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (94:6). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Dissolve accurately weighed quantities of USP Acetaminophen RS, USP Diphenhydramine Hydrochloride RS, and USP Pseudoephedrine Hydrochloride RS in *Diluting solvent*, and dilute quantitatively, and stepwise if necessary, with *Diluting solvent* to obtain a solution having known concentrations of about 0.025 mg per mL, 0.0125 mg per mL, and 0.03 mg per mL, respectively.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets, and transfer an accurately weighed portion of the powder, equivalent to about 500 mg of acetaminophen, to a 100-mL volumetric flask. Add about 75 mL of *Diluting solvent*, shake, and sonicate for 15 minutes. Cool to room temperature, dilute with *Diluting solvent* to volume,

and mix. Dilute an accurately measured volume of the solution quantitatively, and stepwise if necessary, with *Diluting solvent* to obtain a solution having a concentration of about 25 µg of acetaminophen per mL.

**Chromatographic system** (see *Chromatography* <621>).—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 15-cm column that contains packing L10. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiencies, determined from the acetaminophen, diphenhydramine, and pseudoephedrine peaks, are not less than 3000 theoretical plates; the tailing factors for the acetaminophen, diphenhydramine, and pseudoephedrine peaks are not more than 2.0; and the relative standard deviations determined from the acetaminophen, diphenhydramine hydrochloride, and pseudoephedrine hydrochloride responses for replicate injections are not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the acetaminophen peak responses. Calculate the quantity, in mg, of acetaminophen ( $C_8H_9NO_2$ ) in the portion of Tablets taken by the formula:

$$20C(r_U / r_S)$$

in which C is the concentration, in µg per mL, of USP Acetaminophen RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the acetaminophen peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

#### Assay for diphenhydramine hydrochloride—

**Buffer solution, Diluting solvent, Mobile phase, Standard preparation, and Chromatographic system**—Proceed as directed in the *Assay for acetaminophen*.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets, and transfer an accurately weighed portion of the powder, equivalent to about 12.5 mg of diphenhydramine hydrochloride, to a 100-mL volumetric flask. Add about 75 mL of *Diluting solvent*, shake, and sonicate for 15 minutes. Cool to room temperature, dilute with *Diluting solvent* to volume, and mix. Dilute an accurately measured volume of this solution quantitatively, and stepwise if necessary, with *Diluting solvent* to obtain a solution having a concentration of about 12.5 µg of diphenhydramine per mL.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the diphenhydramine peak responses. Calculate the quantity, in mg, of diphenhydramine hydrochloride ( $C_{17}H_{21}NO \cdot HCl$ ) in the portion of Tablets taken by the formula:

$$C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Diphenhydramine Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the diphenhydramine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

#### Assay for pseudoephedrine hydrochloride—

**Buffer solution, Diluting solvent, Mobile phase, Standard preparation, and Chromatographic system**—Proceed as directed in the *Assay for acetaminophen*.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 30 mg of pseudoephedrine hydrochloride, to a 100-mL volumetric flask, add about 75 mL of *Diluting solvent*, shake, and sonicate for 15 minutes. Cool to room temperature, dilute with *Diluting solvent* to volume, and mix. Dilute an accurately measured volume

of this solution quantitatively, and stepwise if necessary, with *Diluting solvent* to obtain a solution having a concentration of about 30 µg of pseudoephedrine hydrochloride per mL.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Assay preparation* and the *Standard preparation* into the chromatograph, record the chromatograms, and measure the pseudoephedrine peak responses. Calculate the quantity, in mg per mL, of pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ) in the portion of Tablets taken by the formula:

$$C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Pseudoephedrine Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the pseudoephedrine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Acetaminophen and Pseudoephedrine Hydrochloride Tablets

» Acetaminophen and Pseudoephedrine Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of acetaminophen ( $C_8H_9NO_2$ ) and pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ).

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

#### USP Reference standards <11>—

USP Acetaminophen RS

USP Pseudoephedrine Hydrochloride RS

**Identification**—The retention times of the acetaminophen and pseudoephedrine peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

#### Dissolution, Procedure for a Pooled Sample <711>—

**Medium:** pH 5.8 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*); 900 mL.

**Apparatus 2:** 50 rpm.

**Time:** 45 minutes.

Determine the amount of acetaminophen ( $C_8H_9NO_2$ ) and pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ) dissolved by employing the following method.

**Mobile phase**—Proceed as directed in the *Assay*.

**Standard solution**—Prepare a solution in *Dissolution Medium* having known concentrations of about  $L/900$  mg of USP Pseudoephedrine Hydrochloride RS and  $L/900$  mg of USP Acetaminophen RS per mL, in which L is the labeled quantity, in mg, of pseudoephedrine hydrochloride in each Tablet; and J is the ratio of the labeled quantity, in mg, of acetaminophen to the labeled quantity, in mg, of pseudoephedrine hydrochloride in each Tablet.

**Test solution**—Use a filtered portion of the solution under test.

**Chromatographic system**—Proceed as directed in the *Assay*, except to inject the *Standard solution*.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the acetaminophen and pseudoephedrine peaks. Calculate the quantity, in mg, of acetaminophen ( $C_8H_9NO_2$ )

and pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ) dissolved by the formula:

$$900C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard solution*; and  $r_U$  and  $r_S$  are the peak responses of the corresponding analyte obtained from the *Test solution* and the *Standard solution*, respectively.

**Tolerances**—Not less than 75% ( $Q$ ) of the labeled amounts of  $C_8H_9NO_2$  and  $C_{10}H_{15}NO \cdot HCl$  is dissolved in 45 minutes.

FOR TABLETS LABELED AS CHEWABLE—

**Medium:** pH 5.8 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*); 900 mL.

**Apparatus 2:** 75 rpm.

**Time:** 45 minutes.

**Standard solution, Test solution, Chromatographic system, and Procedure**—Proceed as directed above in *Procedure for a Pooled Sample*.

**Tolerances**—Not less than 75% ( $Q$ ) of the labeled amounts of  $C_8H_9NO_2$  and  $C_{10}H_{15}NO \cdot HCl$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

#### Assay—

**Diluent**—Prepare a mixture of water and acetonitrile (90:10).

**Mobile phase**—Prepare a solution of 0.005 M ethanesulfonic acid and 0.05 M monobasic potassium phosphate. Prepare a filtered and degassed mixture of this solution and acetonitrile (900:100), and adjust with 5 N sodium hydroxide or 1 N hydrochloric acid to a pH of 4.6. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Pseudoephedrine hydrochloride stock standard solution**—Quantitatively dissolve an accurately weighed quantity of USP Pseudoephedrine Hydrochloride RS in *Diluent* to obtain a solution having a known concentration of about 0.6 mg per mL.

**Standard preparation**—Transfer about 6/ $j$  mg of USP Acetaminophen RS, accurately weighed, to a 100-mL volumetric flask,  $j$  being the ratio of the labeled quantity, in mg, of acetaminophen to the labeled quantity, in mg, of pseudoephedrine hydrochloride in each Tablet. Add 2.0 mL of 1 N hydrochloric acid and about 20 mL of *Diluent*, and mix to dissolve. Add 10.0 mL of *Pseudoephedrine hydrochloride stock standard solution*, dilute with *Diluent* to volume, and mix. This solution contains about 0.06/ $j$  mg of USP Acetaminophen RS and 0.06 mg of USP Pseudoephedrine Hydrochloride RS per mL.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 30 mg of pseudoephedrine hydrochloride, to a 500-mL volumetric flask, add 10.0 mL of 1 N hydrochloric acid and about 100 mL of *Diluent*, and sonicate for 30 minutes, with occasional shaking. Allow to cool, dilute with *Diluent* to volume, and mix. Pass a portion of this solution through a glass fiber filter, and use the filtrate as the *Assay preparation*.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 214-nm detector and a 4.6-mm  $\times$  25-cm column containing base-deactivated or end-capped packing L1. The flow rate is about 3 mL per minute. Chromatograph the *Standard preparation*, and record the responses as directed for *Procedure*; the retention time for the acetaminophen peak is not less than 2 minutes and the relative retention times are about 0.55 for acetaminophen and 1.0 for pseudoephedrine; the resolution  $R$ , between acetaminophen and pseudoephedrine is not less

than 3.5; the tailing factor for the pseudoephedrine peak is not more than 2; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the acetaminophen and pseudoephedrine peaks. Calculate the quantity, in mg, of acetaminophen ( $C_8H_9NO_2$ ) and pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ) in the portion of Tablets taken by the formula:

$$500C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses for the corresponding analyte obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Acetaminophen and Tramadol Hydrochloride Tablets

### DEFINITION

Acetaminophen and Tramadol Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ) and tramadol hydrochloride ( $C_{16}H_{25}NO_2 \cdot HCl$ ).

### IDENTIFICATION

- The retention time of the major peaks in the *Tramadol sample solution* and the *Acetaminophen sample solution* corresponds to those of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

**Mobile phase:** Tetrahydrofuran, triethylamine, water, and trifluoroacetic acid (8:0.1:92:0.1). [NOTE—The apparent pH of the final solvent mixture should be between 2.2 and 2.4.]

**Diluent:** Methanol and water (1:9)

**Standard solution:** 0.065 mg/mL of USP Acetaminophen RS and 0.075 mg/mL of USP Tramadol Hydrochloride RS in *Diluent*. [NOTE—Sonication may be used to aid dissolution.]

**Sample stock solution:** Weigh NLT 20 Tablets, and determine the average Tablet weight. Grind the Tablets into a fine powder, and transfer an amount equivalent to one Tablet to a 50-mL volumetric flask. Add 30 mL of *Diluent* with continuous shaking to disperse the powder. Sonicate for 15 min with intermittent shaking, and shake the flask on a mechanical shaker for 30 min. Dilute with *Diluent* to volume, and mix well. Centrifuge the suspension, and use the supernatant for subsequent dilutions.

**Tramadol sample solution:** 75  $\mu$ g/mL of tramadol hydrochloride in *Diluent* from the *Sample stock solution*

**Acetaminophen sample solution:** 65  $\mu$ g/mL of acetaminophen in *Diluent* from the *Sample stock solution*

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** 216 nm for tramadol hydrochloride and 249 nm for acetaminophen

**Column:** 4.6-mm  $\times$  15-cm; 5- $\mu$ m packing L11

**Column temperature:** 50°

**Flow rate:** 1.0 mL/min

**Injection size:** 20  $\mu$ L

**Run time:** Four times the retention time of acetaminophen

**System suitability****Sample:** *Standard solution***Suitability requirements****Resolution:** NLT 10.0 between acetaminophen and tramadol hydrochloride**Column efficiency:** NLT 2000 theoretical plates for each analyte**Tailing factor:** NMT 2.0 for each analyte**Relative standard deviation:** NMT 2.0% for each analyte**Analysis****Samples:** *Standard solution, Tramadol sample solution, and Acetaminophen sample solution*Calculate the percentage of the labeled amount of tramadol hydrochloride ( $C_{16}H_{25}NO_2 \cdot HCl$ ) in the portion of Tablets taken:

 $r_U$  = peak response from the *Acetaminophen sample solution* $r_S$  = peak response from the *Standard solution* $C_S$  = concentration of USP Acetaminophen RS in the *Standard solution* (mg/mL) $C_U$  = nominal concentration of acetaminophen in the *Acetaminophen sample solution* (mg/mL)**Acceptance criteria:** NLT 90.0%–110.0%**PERFORMANCE TESTS****• DISSOLUTION <711>****Test 1****Medium:** 0.1 N hydrochloric acid; 900 mL**Apparatus 2:** 50 rpm**Time:** 30 min**Standard solution:** 0.36 mg/mL of USP Acetaminophen RS and 0.04 mg/mL of USP Tramadol Hydrochloride RS in *Medium***Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45- $\mu$ m pore size.**Buffer solution:** 6.8 mg/mL of monobasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 2.50.**Mobile phase:** Acetonitrile and *Buffer solution* (1:4)**Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** UV 272 nm**Column:** 4.6-mm  $\times$  15-cm; 5- $\mu$ m packing L7**Column temperature:** 25°**Flow rate:** 1.0 mL/min**Injection size:** 25  $\mu$ L**System suitability****Sample:** *Standard solution*

[NOTE—The relative retention times for acetaminophen and tramadol hydrochloride are about 0.5 and 1.0, respectively.]

**Suitability requirements****Resolution:** NLT 5.0 between the peaks for acetaminophen and tramadol hydrochloride**Relative standard deviation:** NMT 2.0% for both the acetaminophen and tramadol hydrochloride peaks**Analysis****Samples:** *Standard solution and Sample solution*Record the chromatograms for two times the retention time of tramadol hydrochloride. Calculate the percentage of the labeled amount of acetaminophen ( $C_8H_9NO_2$ ) and tramadol hydrochloride ( $C_{16}H_{25}NO_2 \cdot HCl$ ) dissolved:

$$\text{Result} = (r_U \times C_S \times V \times 100)/(r_S \times L)$$

 $r_U$  = peak response of acetaminophen or tramadol hydrochloride from the *Sample solution* $C_S$  = concentration of USP Acetaminophen RS or USP Tramadol Hydrochloride RS in the *Standard solution* (mg/mL) $V$  = volume of *Medium*, 900 mL $r_S$  = peak response of acetaminophen or tramadol hydrochloride from the *Standard solution* $L$  = label claim for acetaminophen or tramadol hydrochloride (mg/Tablet)**Tolerances:** NLT 80% (Q) of the labeled amounts of acetaminophen and tramadol hydrochloride is dissolved.**Test 2:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.**Medium:** 0.1 N hydrochloric acid; 900 mL**Apparatus 2:** 50 rpm**Time:** 20 min**Standard solution, Sample solution, Buffer solution, Mobile phase, Chromatographic system, and Analysis:** Proceed as directed in *Dissolution Test 1*.**Tolerances:** NLT 80% (Q) of the labeled amounts of acetaminophen and tramadol hydrochloride is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

**OTHER COMPONENTS****Change to read:****• LIMIT OF *p*-AMINOPHENOL**[NOTE—All Standards, the *Sample solution*, and the *Blank solution* must be mixed with the *Basic ferricyanide solution* and analyzed as soon as possible after a 30-min waiting period.]**Diluent:** Methanol and water (1:1)**Basic ferricyanide solution:** Dissolve 1 g of sodium nitroferricyanide (ERR 1-May-2012) and 1 g of anhydrous sodium carbonate in 100 mL of water.**Standard solution:** Dissolve USP *p*-Aminophenol RS in *Diluent* to obtain a solution having a known concentration of 0.05 mg/mL. Sonicate if necessary to dissolve. Transfer 5 mL of the resulting solution to a 100-mL volumetric flask, and add 50 mL of *Diluent* and 5 mL of *Basic ferricyanide solution*. Dilute with *Diluent* to volume, and mix. Let stand for 30 min. Pass the solution through a nylon membrane filter of 0.45- $\mu$ m pore size, and use the filtrate.**Sample solution:** Weigh NLT 20 Tablets. Grind the Tablets into a fine powder. Accurately transfer an amount of powder, equivalent to about 5 g of acetaminophen based on the label claim, to a 100-mL volumetric flask. Add 50 mL of *Diluent*, and sonicate for 15 min with intermittent shaking, followed by mechanical shaking for 30 min. Add 6 mL of *Basic ferricyanide solution*. Dilute with *Diluent* to volume, mix, and let stand for 30 min. Centrifuge a portion of the solution, and pass the clear supernatant through a nylon membrane filter of 0.45- $\mu$ m pore size, and use the filtrate for analysis.**Blank solution:** Add 50 mL of *Diluent* to a 100-mL volumetric flask. Add 5 mL of *Basic ferricyanide solution*. Dilute with *Diluent* to volume, and let stand for 30 min. Pass a portion of the solution through a nylon mem-

brane filter of 0.45- $\mu$ m pore size, and use the filtrate for analysis.

#### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: UV-Vis

Analytical wavelength: 710 nm

Cell: 1 cm

#### System suitability

Sample: *Standard solution*

#### Suitability requirements

Relative standard deviation: NMT 6.0%

[NOTE—The percent difference between the initial and final absorbance readings of the *Standard solution* differs by NMT 10%.]

#### Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of *p*-aminophenol in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = absorbance from the *Sample solution*

$r_S$  = absorbance from the *Standard solution*

$C_S$  = concentration of USP *p*-Aminophenol RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of acetaminophen in the *Sample solution* (mg/mL)

Acceptance criteria: NMT 0.01%

#### IMPURITIES

##### • ORGANIC IMPURITIES

Mobile phase, Diluent, and Sample stock solution: Proceed as directed in the *Assay*.

Standard solution: 0.75  $\mu$ g/mL each of USP Tramadol Hydrochloride RS and USP Tramadol Related Compound A RS in *Diluent*

Sample solution: Pass a suitable volume of *Sample stock solution* through a nylon membrane filter of 0.45- $\mu$ m pore size. Use the filtrate after discarding the first 4 mL of filtrate.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: 216 nm

Column: 4.6-mm  $\times$  15-cm; 5- $\mu$ m packing L11

Column temperature: 50°

Flow rate: 1.0 mL/min

Injection size: 30  $\mu$ L

#### System suitability

Sample: *Standard solution*

#### Suitability requirements

Resolution: NLT 2.0 between tramadol related compound A and tramadol hydrochloride

Column efficiency: NLT 2000 theoretical plates for tramadol hydrochloride

Relative standard deviation: NMT 6.0% for tramadol hydrochloride

#### Analysis

Samples: *Diluent*, *Standard solution*, and *Sample solution*  
[NOTE—Disregard the peaks due to the *Diluent*.]

Calculate the percentage of each known and unknown impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of each individual impurity from the *Sample solution*

$r_S$  = peak response of tramadol hydrochloride from the *Standard solution*

$C_S$  = concentration of USP Tramadol Hydrochloride RS in the *Standard solution* ( $\mu$ g/mL)

$C_U$  = nominal concentration of tramadol hydrochloride in the *Sample solution* ( $\mu$ g/mL)

Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
O-Desmethyl-tramadol <sup>a</sup>	0.60	0.2
Tramadol related compound A <sup>b</sup>	0.80	0.2
Tramadol hydrochloride	1.0	—
Acetaminophen	0.38	—
Any other individual unspecified degradation product	—	0.2
Total impurities	—	0.8

<sup>a</sup> 3-[(1*RS*,2*RS*)-2-[(Dimethylamino)methyl]-1-hydroxycyclohexyl]phenol.

<sup>b</sup> (*RS*,*SR*)-1-(3-Methoxyphenyl)-2-(dimethylaminomethyl)cyclohexanol hydrochloride.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store at controlled room temperature.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS (11)**
  - USP Acetaminophen RS
  - 4'-Hydroxyacetanilide.
  - C<sub>8</sub>H<sub>9</sub>NO<sub>2</sub> 151.16
  - USP *p*-Aminophenol RS
  - 4-Amino-1-hydroxybenzene.
  - C<sub>6</sub>H<sub>7</sub>NO 109.13
  - USP Tramadol Hydrochloride RS
  - (±)-*cis*-2-[(Dimethylamino)methyl]-1-(*m*-methoxyphenyl)cyclohexanol hydrochloride.
  - C<sub>16</sub>H<sub>25</sub>NO<sub>2</sub> · HCl 299.84
  - USP Tramadol Related Compound A RS
  - RS*,*SR*-1-(3-Methoxyphenyl)-2-(dimethylaminomethyl)cyclohexanol hydrochloride.

## Acetazolamide

C<sub>4</sub>H<sub>6</sub>N<sub>4</sub>O<sub>3</sub>S<sub>2</sub> 222.25

Acetamide, *N*-[5-(aminosulfonyl)-1,3,4-thiadiazol-2-yl]-

*N*-(5-Sulfamoyl-1,3,4-thiadiazol-2-yl)acetamide [59-66-5].

» Acetazolamide contains not less than 98.0 percent and not more than 102.0 percent of C<sub>4</sub>H<sub>6</sub>N<sub>4</sub>O<sub>3</sub>S<sub>2</sub>, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers, and store at room temperature.

#### USP Reference standards (11)—

USP Acetazolamide RS

#### Identification—

**A:** *Infrared Absorption* (197K).

**B:** Dissolve about 100 mg in 5 mL of 1 N sodium hydroxide. Add 5 mL of a solution made by dissolving 100 mg of hydroxylamine hydrochloride and 80 mg of cupric sulfate in 10 mL of water. Mix, and heat the resulting pale yellow solution on a steam bath for 5 minutes: a clear, bright yellow solution is produced. No heavy precipitate or dark brown color results after the mixing or heating.

**Water**, *Method I* (921): not more than 0.5%.

**Residue on ignition** (281): not more than 0.1%.

**Chloride** (221)—Digest 1.5 g with 75 mL of water at about 70° for 5 minutes. Cool to room temperature, and filter: a 25-mL portion of the filtrate shows no more chloride than corresponds to 0.10 mL of 0.020 N hydrochloric acid (0.014%).

**Sulfate** (221)—A 25-mL portion of the filtrate prepared in the test for *Chloride* shows no more sulfate than corresponds to 0.20 mL of 0.020 N sulfuric acid (0.04%).

**Selenium** (291): 0.003%, a 200-mg specimen being used.

**Heavy metals**, *Method II* (231): 0.002%.

**Silver-reducing substances**—Thoroughly wet 5.0 g with alcohol. Add 125 mL of water, 10 mL of nitric acid, and 5.0 mL of 0.1 N silver nitrate VS. Stir with a mechanical stirrer for 30 minutes. Filter, add 5 mL of ferric ammonium sulfate TS to the filtrate, and titrate with 0.1 N ammonium thiocyanate VS to a reddish-brown endpoint: not less than 4.8 mL of 0.1 N ammonium thiocyanate is required.

**Ordinary impurities** (466)—

*Test solution*: a mixture of acetone and methanol (1:1).

*Standard solution*: a mixture of acetone and methanol (1:1).

*Eluent*: a mixture of *n*-propyl alcohol and 1 N ammonium hydroxide (88:12).

*Visualization*: 1.

**Assay**—Dissolve about 200 mg of Acetazolamide, accurately weighed, in a small volume of pyridine in a 10-mL volumetric flask, add the solvent to volume, and mix. Similarly, dissolve an accurately weighed quantity of USP Acetazolamide RS in pyridine to obtain a Standard solution having a known concentration of about 20 mg per mL. Concomitantly determine the absorbances of both solutions in 0.1-mm cells at the wavelength of maximum absorbance at about 7.38  $\mu\text{m}$  (1350  $\text{cm}^{-1}$ ), with a suitable IR spectrophotometer, using pyridine as the blank. Calculate the quantity, in mg, of  $\text{C}_4\text{H}_6\text{N}_4\text{O}_3\text{S}_2$  in the portion of Acetazolamide taken by the formula:

$$10C(A_U / A_S)$$

in which C is the concentration, in mg per mL, of USP Acetazolamide RS in the Standard solution; and  $A_U$  and  $A_S$  are the absorbances of the solution of Acetazolamide and the Standard solution, respectively.

## Acetazolamide for Injection

» Acetazolamide for Injection is prepared from Acetazolamide with the aid of Sodium Hydroxide. It is suitable for parenteral use. The contents of each container, when constituted as directed in the labeling, yield a solution containing not less than 95.0 percent and not more than 110.0 percent of the labeled amount of acetazolamide ( $\text{C}_4\text{H}_6\text{N}_4\text{O}_3\text{S}_2$ ).

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* (1), preferably of Type III glass, and store at room temperature.

**USP Reference standards** (11)—

USP Acetazolamide RS

USP Endotoxin RS

**Completeness of solution** (641)—A 1.0-g portion dissolves in 10 mL of carbon dioxide-free water to yield a clear solution.

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* (1).

**Identification**—

**A**: Dissolve about 500 mg in 5 mL of water, add 2 drops of hydrochloric acid, and allow the mixture to stand for about 15 minutes. Filter through a fine sintered-glass funnel, wash with several small portions of water, and dry in vacuum over silica gel for 3 hours: the crystals so obtained respond to the *Identification* tests under *Acetazolamide*.

**B**: It responds to the tests for *Sodium* (191).

**Bacterial endotoxins** (85)—It contains not more than 0.5 USP Endotoxin Unit per mg of acetazolamide.

**pH** (791): between 9.0 and 10.0, in a freshly prepared solution (1 in 10).

**Other requirements**—It meets the requirements for *Sterility Tests* (71), *Uniformity of Dosage Units* (905), and *Labeling* under *Injections* (1).

**Assay**—Dissolve the contents of 1 container of Acetazolamide for Injection in an accurately measured volume of water corresponding to the volume of solvent specified in the labeling. Dilute a portion of the solution quantitatively and stepwise with water to obtain a solution having a concentration of about 500  $\mu\text{g}$  of acetazolamide per mL. Pipet 5 mL of the solution into a 250-mL volumetric flask, add 25 mL of 1 N hydrochloric acid, then add water to volume, and mix. Dissolve an accurately weighed quantity of USP Acetazolamide RS in sodium hydroxide solution (1 in 100) to obtain a Standard solution having a known concentration of about 100  $\mu\text{g}$  per mL. Dilute 10.0 mL of this solution with 0.1 N hydrochloric acid to 100 mL. Concomitantly determine the absorption of both solutions at the wavelength of maximum absorbance at about 265 nm, with a suitable spectrophotometer, using 0.1 N hydrochloric acid as the blank. Calculate the quantity, in  $\mu\text{g}$ , of  $\text{C}_4\text{H}_6\text{N}_4\text{O}_3\text{S}_2$  in the 5.0-mL portion of the solution of Acetazolamide for Injection taken by the formula:

$$25C(A_U / A_S)$$

in which C is the concentration, in  $\mu\text{g}$  per mL, of USP Acetazolamide RS in the Standard solution; and  $A_U$  and  $A_S$  are the absorbances of the solution from the Acetazolamide for Injection and the Standard solution, respectively.

## Acetazolamide Oral Suspension

### DEFINITION

Acetazolamide Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of acetazolamide ( $\text{C}_4\text{H}_6\text{N}_4\text{O}_3\text{S}_2$ ).

Prepare Acetazolamide Oral Suspension, 25 mg/mL, as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795); see also *Acetazolamide Oral Solution*).

Acetazolamide	2.5 g
Vehicle: a mixture of Vehicle for Oral Solution, <i>NF</i> (regular or sugar-free), and Vehicle for Oral Suspension, <i>NF</i> (1:1), or Cherry Syrup, <i>NF</i> , a sufficient quantity to make	100 mL

[NOTE—If tablets are used instead of bulk powder, the preparation becomes a suspension and should be labeled as such.]

If using tablets, place in a mortar and comminute to a fine powder, or add *Acetazolamide* powder. Add about 20 mL of the *Vehicle*, and mix to a uniform paste. Add the *Vehicle* in small portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add

enough liquid *Vehicle* to bring to final volume, and mix well.

## ASSAY

### • PROCEDURE

**Mobile phase:** Dissolve 4.1 g of anhydrous sodium acetate in 950 mL of water, and add 20 mL of methanol and 30 mL of acetonitrile. Adjust with glacial acetic acid to a pH of 4.0.

**Standard stock solution:** Transfer about 25 mg of USP Acetazolamide RS, accurately weighed, to a 50-mL volumetric flask, add 5.0 mL of 0.5 N sodium hydroxide, and mix to dissolve. Dilute with water to volume, and mix.

**Standard solution:** 250 µg/mL from the *Standard stock solution* in water

**Sample solution:** 250 µg/mL of acetazolamide from Oral Suspension in *Mobile phase*. Agitate the container of Oral Suspension for 30 min on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at  $-70^{\circ}$  until analyzed. At the time of analysis, remove the sample from the freezer, allow to reach room temperature, and mix with a vortex mixer for 30 s. Pipet 1.0 mL of this solution to a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm  $\times$  25-cm; 5-µm packing L1

**Flow rate:** 2 mL/min

**Injection size:** 20 µL

### System suitability

**Sample:** *Standard solution*

[NOTE—The retention time for the acetazolamide peak is about 3 min.]

### Suitability requirements

**Relative standard deviation:** NMT 1.1% for replicate injections

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of acetazolamide ( $C_4H_6N_4O_3S_2$ ) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of acetazolamide in the *Standard solution* (µg/mL)

$C_U$  = nominal concentration of acetazolamide in the *Sample solution* (µg/mL)

**Acceptance criteria:** 90.0%–110.0%

## SPECIFIC TESTS

- **pH** <791>: 4.0–5.0 (*Vehicle* for Oral Solution and *Vehicle* for Oral Suspension), 3.1–3.9 (*Cherry Syrup*)

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at controlled room temperature, or in a cold place.
- **LABELING:** Label it to state that it is to be well shaken before use, and to state the *Beyond-Use Date*.
- **BEYOND-USE DATE:** NMT 60 days after the day on which it was compounded
- **USP REFERENCE STANDARDS** <11>  
USP Acetazolamide RS

## Acetazolamide Tablets

» Acetazolamide Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of acetazolamide ( $C_4H_6N_4O_3S_2$ ).

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

### USP Reference standards <11>—

USP Acetazolamide RS

**Identification**—Extract a quantity of finely powdered Tablets, equivalent to about 500 mg of acetazolamide, with 50 mL of acetone. Filter, and add sufficient solvent hexane to the filtrate to cause formation of a heavy, white precipitate. Collect the precipitate on a medium-porosity, sintered-glass funnel, and dry with suction: the acetazolamide so obtained responds to the *Identification* tests under *Acetazolamide*.

### Dissolution <711>—

*Medium:* 0.01 N hydrochloric acid; 900 mL.

*Apparatus 1:* 100 rpm.

*Time:* 60 minutes.

**Procedure**—Determine the amount of  $C_4H_6N_4O_3S_2$  dissolved by employing UV absorption at the wavelength of maximum absorbance at about 265 nm on filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a *Standard solution* having a known concentration of USP Acetazolamide RS in the same *Medium*.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_4H_6N_4O_3S_2$  is dissolved in 60 minutes.

**Uniformity of dosage units** <905>: meet the requirements.

### Assay—

**Mobile phase**—Dissolve 4.1 g of anhydrous sodium acetate in 950 mL of water, add 20 mL of methanol and 30 mL of acetonitrile, and mix. Adjust with glacial acetic acid to a pH of  $4.0 \pm 0.05$ . Filter and degas the solution. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard acetazolamide stock solution**—Transfer about 25 mg of USP Acetazolamide RS, accurately weighed, to a 25-mL volumetric flask, add 2.5 mL of 0.5 N sodium hydroxide, and mix to dissolve. Dilute with water to volume, and mix.

**Internal standard solution**—Transfer about 100 mg of sulfadiazine to a 100-mL volumetric flask, add 10 mL of 0.5 N sodium hydroxide, and mix to dissolve. Dilute with water to volume, and mix.

**Standard preparation**—Transfer 10.0 mL of *Standard acetazolamide stock solution* and 10.0 mL of *Internal standard solution* to a 100-mL volumetric flask, add 10 mL of 0.5 N sodium hydroxide, dilute with water to volume, and mix to obtain a solution having a known concentration of about 0.1 mg of USP Acetazolamide RS per mL.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of acetazolamide, to a 100-mL volumetric flask, add 10 mL of 0.5 N sodium hydroxide, and sonicate for 5 minutes. Cool to room temperature, dilute with water to volume, and mix. Filter a portion of this solution, discarding the first 20 mL of the filtrate. Transfer 10.0 mL of the clear filtrate to a 100-mL volumetric flask, add 10.0 mL of *Internal standard solution* and 10 mL of 0.5 N sodium hydroxide, dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector

and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution,  $R_s$ , between the analyte and internal standard peaks is not less than 2.0; and the relative standard deviation of the ratios of the analyte peak response to the internal standard peak response for replicate injections is not more than 1.0%.

*Procedure*—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.7 for acetazolamide and 1.0 for sulfadiazine. Calculate the quantity, in mg, of acetazolamide ( $C_4H_6N_4O_3S_2$ ) in the portion of Tablets taken by the formula:

$$1000C(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Acetazolamide RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak response ratios of the analyte peak to the internal standard peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Glacial Acetic Acid

$C_2H_4O_2$  60.05  
Acetic acid [64-19-7].

### DEFINITION

Glacial Acetic Acid contains NLT 99.5% and NMT 100.5%, by weight, of  $C_2H_4O_2$ .

### IDENTIFICATION

- **IDENTIFICATION TESTS—GENERAL, Acetate <191>**: Meets the requirements  
**Sample solution** (for lanthanum nitrate test): Glacial Acetic Acid and water (1:100)

### ASSAY

- **PROCEDURE**  
**Sample solution**: Measure 2 mL of Glacial Acetic Acid into a glass-stoppered flask, previously tared while containing about 20 mL of water, and weigh again to obtain the weight of the substance under assay.  
**Analysis**: Add 20 mL of water, then add phenolphthalein TS. Titrate with 1 N sodium hydroxide VS. Each mL of 1 N sodium hydroxide is equivalent to 60.05 mg of  $C_2H_4O_2$ .  
**Acceptance criteria**: 99.5%–100.5%

### IMPURITIES

#### Inorganic Impurities

- **LIMIT OF NONVOLATILE RESIDUE**: Evaporate 20 mL in a tared dish, and dry at 105° for 1 h: the weight of the residue does not exceed 1.0 mg.
- **HEAVY METALS <231>**: NMT 5 ppm  
**Sample solution**: To the residue obtained in the test for *Limit of Nonvolatile Residue* add 8 mL of 0.1 N hydrochloric acid, warm gently until solution is complete, dilute with water to 100 mL, and use 20 mL.

- **CHLORIDE AND SULFATE, Chloride <221>**  
**Sample solution**: Dilute 1.0 mL with 20 mL of water.  
**Analysis**: Add 5 drops of silver nitrate TS.  
**Acceptance criteria**: No opalescence is produced.
- **CHLORIDE AND SULFATE, Sulfate <221>**  
**Sample solution**: Dilute 1.0 mL with 10 mL of water.  
**Analysis**: Add 1 mL of barium chloride TS.  
**Acceptance criteria**: No turbidity is produced.

### Organic Impurities

#### PROCEDURE: READILY OXIDIZABLE SUBSTANCES

**Sample solution**: Dilute 2.0 mL in a glass-stoppered vessel with 10 mL of water.  
**Analysis**: Add 0.10 mL of 0.10 N potassium permanganate.  
**Acceptance criteria**: The pink color is not changed to brown within 2 h.

### SPECIFIC TESTS

- **CONGEALING TEMPERATURE <651>**: NLT 15.6°

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE**: Preserve in tight containers, and store at room temperature.

## Acetic Acid Irrigation

### DEFINITION

Acetic Acid Irrigation is a sterile solution of Glacial Acetic Acid in Water for Injection. It contains, in each 100 mL, NLT 237.5 mg and NMT 262.5 mg of  $C_2H_4O_2$ .

### IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Acetate <191>**  
**Sample**: 100 mL of Acetic Acid Irrigation  
**Analysis**: Evaporate the *Sample* to about 10 mL.  
**Acceptance criteria**: The resulting solution meets the requirements.

### ASSAY

- **PROCEDURE**  
**Sample**: 50 mL of Acetic Acid Irrigation  
**Analysis**: Pipet the *Sample* into a 150-mL conical flask, add 2 drops of phenolphthalein TS, and titrate with 0.1 N sodium hydroxide VS. Each mL of 0.1 N sodium hydroxide is equivalent to 6.005 mg of acetic acid ( $C_2H_4O_2$ ).  
**Acceptance criteria**: 237.5–262.5 mg of  $C_2H_4O_2$  in each 100 mL of Acetic Acid Irrigation

### SPECIFIC TESTS

- **pH <791>**: 2.8–3.4
- **BACTERIAL ENDOTOXINS TEST <85>**: It contains NMT 0.5 USP Endotoxin Unit/mL.
- **OTHER REQUIREMENTS**: It meets the requirements under *Injections* (1), except that the container in which it is packaged may be designed to empty rapidly and may exceed 1000 mL in capacity.

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE**: Preserve in single-dose containers, preferably of Type I or Type II glass, and store at controlled room temperature. It may be packaged in suitable plastic containers.
- **USP REFERENCE STANDARDS <11>**  
USP Endotoxin RS

## Acetic Acid Otic Solution

### DEFINITION

Acetic Acid Otic Solution is a solution of Glacial Acetic Acid in a suitable nonaqueous solvent. It contains NLT 85.0% and NMT 130.0% of the labeled amount of  $C_2H_4O_2$ .

### IDENTIFICATION

- **A.**  
**Sample solution:** Dilute 5 mL of Acetic Acid Otic Solution with 10 mL of water.  
**Analysis:** Adjust the *Sample solution* with 1 N sodium hydroxide to a pH of 7. Add ferric chloride TS.  
**Acceptance criteria:** A deep red color is produced, and it is destroyed by the addition of hydrochloric acid.
- **B.**  
**Analysis:** Warm it with sulfuric acid and alcohol.  
**Acceptance criteria:** Ethyl acetate, recognizable by its characteristic odor, is evolved.

### ASSAY

- **PROCEDURE**  
**Sample:** A quantity of Acetic Acid Otic Solution containing 100 mg of glacial acetic acid  
**Analysis:** Transfer the *Sample* to a 250-mL conical flask, and add 5 mL of saturated sodium chloride solution, 40 mL of water, and 3 drops of phenolphthalein TS. Titrate with 0.1 N sodium hydroxide VS to a faint pink endpoint. Each mL of 0.1 N sodium hydroxide is equivalent to 6.005 mg of acetic acid ( $C_2H_4O_2$ ).  
**Acceptance criteria:** 85.0%–130.0%

### SPECIFIC TESTS

- **pH** <791>  
**Sample solution:** Acetic Acid Otic Solution and water (1:1)  
**Acceptance criteria:** 2.0–4.0

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.

## Acetohexamide

$C_{15}H_{20}N_2O_4S$  324.40  
 Benzenesulfonamide, 4-acetyl-N-[[cyclohexylamino]-carbonyl]-  
 1-[(p-Acetylphenyl)sulfonyl]-3-cyclohexylurea [968-81-0].

» Acetohexamide contains not less than 97.0 percent and not more than 101.0 percent of  $C_{15}H_{20}N_2O_4S$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** <11>—  
 USP Acetohexamide RS

### Identification—

**A:** *Infrared Absorption* <197K>.

**B:** *Ultraviolet Absorption* <197U>—

*Solution:* 10 µg per mL.

*Medium:* 0.01 N sodium hydroxide.

Absorptivities at 247 nm, calculated on the dried basis, do not differ by more than 3.0%.

**Melting range** <741>: between 182.5° and 187°.

**Loss on drying** <731>—Dry it at 105° for 3 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** <281>: not more than 0.1%.

**Selenium** <291>: 0.003%, a 200-mg specimen mixed with 200 mg of magnesium oxide being used.

**Heavy metals, Method II** <231>: 0.002%.

**Assay**—Dissolve about 300 mg of Acetohexamide, accurately weighed, in 40 mL of dimethylformamide, add 5 drops of thymol blue TS, and titrate, using a magnetic stirrer, with 0.1 N sodium methoxide VS to a blue endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N sodium methoxide is equivalent to 32.44 mg of  $C_{15}H_{20}N_2O_4S$ .

## Acetohexamide Tablets

» Acetohexamide Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of  $C_{15}H_{20}N_2O_4S$ .

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** <11>—  
 USP Acetohexamide RS

**Identification**—Evaporate on a steam bath to dryness a 20-mL portion of the diluted chloroform solution prepared as directed in the *Assay*: the residue meets the requirements of *Identification* test A under *Acetohexamide*.

**Dissolution** <711>—

*Medium:* pH 7.6 phosphate buffer (see pH <791>); 900 mL.

*Apparatus 1:* 100 rpm.

*Time:* 60 minutes.

**Procedure**—Determine the amount of  $C_{15}H_{20}N_2O_4S$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 245 nm of filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, using *Medium* as the blank, in comparison with a Standard solution having a known concentration of USP Acetohexamide RS in the same *Medium*.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_{15}H_{20}N_2O_4S$  is dissolved in 60 minutes.

**Uniformity of dosage units** <905>: meet the requirements.

**Assay**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 500 mg of acetohexamide, to a 100-mL volumetric flask, add 60 mL of 0.1 N sodium hydroxide, and shake for 30 minutes. Dilute with water to volume, mix, and filter, discarding the first 20 mL of the filtrate. Transfer 20.0 mL of the subsequent filtrate to a 125-mL separator, add 2 mL of 3 N hydrochloric acid, and extract with four 40-mL portions of chloroform, filtering each portion through chloroform-washed paper into a 200-mL volumetric flask. Dilute with chloroform to volume, and mix. Transfer 20.0 mL of this solution to a suitable beaker, and evaporate on a steam bath to dryness. Transfer the residue, with the aid of 0.1 N sodium hydroxide, to a 100-mL volumetric

flask, add 0.1 N sodium hydroxide to volume, and mix. Transfer 10.0 mL of this solution to a third 100-mL volumetric flask, dilute with water to volume, and mix. Concomitantly determine the absorbances of the solution from the Tablets and a Standard solution prepared from USP Acetohexamide RS, in the same medium, at a concentration of about 10 µg per mL, in 1-cm cells, at the wavelength of maximum absorbance at about 247 nm, with a suitable spectrophotometer, using 0.01 N sodium hydroxide as the blank. Calculate the quantity, in mg, of  $C_{15}H_{20}N_2O_4S$  in the portion of Tablets taken by the formula:

$$50C(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Acetohexamide RS in the Standard solution; and  $A_U$  and  $A_S$  are the absorbances of the solution from the Tablets and the Standard solution, respectively.

## Acetohydroxamic Acid

$C_2H_5NO_2$  75.07

N-Acetyl hydroxyacetamide.

Acetohydroxamic acid [546-88-3].

» Acetohydroxamic Acid, dried over phosphorus pentoxide for 16 hours, contains not less than 98.0 percent and not more than 101.0 percent of  $C_2H_5NO_2$ .

**Packaging and storage**—Preserve in tight containers, and store in a cool, dry place.

**USP Reference standards** (11)—

USP Acetohydroxamic Acid RS

**Completeness of solution** (641)—A 1.0-g portion dissolves in 10 mL of water to yield a clear solution.

**Color of solution**—Dissolve 1.0 g in 5 mL of water: the absorbance, determined in a 1-cm cell in the wavelength range between 400 nm and 750 nm in a suitable spectrophotometer, water being used as the blank, is not greater than 0.050.

**Identification**—

**A: Infrared Absorption** (197K).

**B:** To 10 mL of a solution (1 in 50) add 2 drops of potassium permanganate TS: the pink color of the permanganate disappears.

**Loss on drying** (731)—Dry it over phosphorus pentoxide for 16 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals, Method I** (231)—Dissolve 1 g in 23 mL of water, and add 2 mL of 1 N acetic acid: the limit is 0.002%.

**Limit of hydroxylamine**—

**Phosphate buffer**—Dissolve 1.36 g of monobasic potassium phosphate in about 950 mL of water, adjust with 1 M potassium hydroxide to a pH of 7.4, dilute with water to 1000 mL, and mix.

**Pyridoxal 5-phosphate solution**—Dissolve 50 mg of pyridoxal 5-phosphate monohydrate in 50 mL of *Phosphate buffer* in a low-actinic flask. Prepare fresh before use.

**Standard solutions**—Dissolve an accurately weighed quantity of hydroxylamine hydrochloride in water to obtain a final concentration of 2.0 mg per mL. To separate 100-mL volumetric flasks, transfer 5.0, 10.0, and 15.0 mL of the hy-

droxylamine stock solution, respectively, dilute each flask with water to volume, and mix.

**Test solution**—Transfer an accurately weighed quantity of about 1500 mg of Acetohydroxamic Acid, previously dried, to a 100-mL beaker, and dissolve in a sufficient amount of water to cover the electrode of a calibrated pH meter (about 60 mL). While stirring, adjust with 0.05 M potassium hydroxide to a pH of 7.4. Quantitatively transfer the contents of the beaker, with the aid of small portions of water, to a 100-mL volumetric flask, dilute with water to volume, and mix.

**Procedure**—Transfer 2.0 mL of each *Standard solution* and the *Test solution* into separate 100-mL volumetric flasks. Pipet 2.0 mL of water into a 100-mL volumetric flask for the reagent blank. To each flask, add 4.0 mL of *Pyridoxal 5-phosphate solution*, and mix. After 8 minutes, accurately timed, dilute the contents of each flask with *Phosphate buffer* to volume. Immediately determine the fluorescence intensities of the solutions from the *Standard solutions* and the *Test solution* in a fluorometer at an excitation wavelength of 350 nm and an emission wavelength of 450 nm, setting the instrument to zero with the reagent blank. Determine the best-fit straight line from the fluorescence intensities of the three *Standard solutions* versus the hydroxylamine hydrochloride concentrations, in µg per mL. From the best-fit straight line, determine the concentration, in µg per mL, of hydroxylamine hydrochloride in the *Test solution*. Calculate the percentage of hydroxylamine in the portion of Acetohydroxamic Acid taken by the formula:

$$(33.03/69.50)(10C/W)$$

in which 33.03 and 69.50 are the molecular weights of hydroxylamine and hydroxylamine hydrochloride, respectively; C is the concentration, in µg per mL, of hydroxylamine hydrochloride in the *Test solution*; and W is the weight, in mg, of Acetohydroxamic Acid taken. Not more than 0.5% is found.

**Assay**—

**Ferric chloride solution**—Dissolve 4 g of ferric chloride in about 50 mL of 0.1 N hydrochloric acid, dilute with the same solvent to make 200 mL, and mix.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Acetohydroxamic Acid RS in 0.1 N hydrochloric acid to obtain a solution having a known concentration of about 500 µg per mL.

**Assay preparation**—Transfer about 250 mg of Acetohydroxamic Acid, previously dried and accurately weighed, to a 500-mL volumetric flask, dilute with 0.1 N hydrochloric acid to volume, and mix.

**Procedure**—Transfer 10.0 mL each of the *Standard preparation*, the *Assay preparation*, and 0.1 N hydrochloric acid to provide the blank, to separate 100-mL volumetric flasks. To each flask add about 50 mL of 0.1 N hydrochloric acid and 10.0 mL of *Ferric chloride solution*, mix, dilute with 0.1 N hydrochloric acid to volume, and mix. Without delay, concomitantly determine the absorbances of the solutions from the *Standard preparation* and the *Assay preparation* at the wavelength of maximum absorbance at about 502 nm, with a suitable spectrophotometer, using the blank to set the instrument. Calculate the quantity, in mg, of  $C_2H_5NO_2$  in the portion of Acetohydroxamic Acid taken by the formula:

$$0.5C(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Acetohydroxamic Acid RS in the *Standard preparation*; and  $A_U$  and  $A_S$  are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

## Acetohydroxamic Acid Tablets

» Acetohydroxamic Acid Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_2H_5NO_2$ .

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Acetohydroxamic Acid RS

**Identification**—Tablets produce a purple color when mixed with an acidic solution of ferric chloride.

**Dissolution**, *Procedure for a Pooled Sample* (711)—

*Medium*: 0.01 N hydrochloric acid; 900 mL.

*Apparatus 1*: 100 rpm.

*Time*: 30 minutes.

*Procedure*—Determine the amount of  $C_2H_5NO_2$  dissolved, employing the procedure set forth in the *Assay*, using a filtered portion of the solution under test as the *Assay preparation* in comparison with a Standard solution having a known concentration of USP Acetohydroxamic Acid RS in the same *Medium*.

*Tolerances*—Not less than 85% (Q) of the labeled amount of  $C_2H_5NO_2$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Limit of hydroxylamine**—

*Phosphate buffer*, *Pyridoxal 5-phosphate solution*, and *Standard solutions*—Prepare as directed in the test for *Limit of hydroxylamine* under *Acetohydroxamic Acid*.

*Test solution*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 1500 mg of acetohydroxamic acid to a 50-mL stoppered centrifuge tube. Add 30.0 mL of water, shake for about 2 minutes, and centrifuge. Pipet 15.0 mL of the clear solution into a 50-mL beaker, add just enough water to cover the electrode of a calibrated pH meter, and while stirring, adjust with 0.5 M potassium hydroxide to a pH of 7.4. Quantitatively transfer the contents of the beaker, with the aid of small portions of water, to a 50-mL volumetric flask, dilute with water to volume, and mix.

*Procedure*—Proceed as directed in the test for *Limit of hydroxylamine* under *Acetohydroxamic Acid*, except to calculate the percentage of hydroxylamine ( $H_3NO$ ) in the portion of Tablets taken by the formula:

$$(33.03/69.50)(10CA/SL)$$

in which *A* is the average weight, in mg, of each Tablet; *S* is the weight, in mg, of the portion of Tablets taken to prepare the *Test solution*; *L* is the labeled amount, in mg, of acetohydroxamic acid per Tablet; and the other terms are as defined therein. Not more than 0.5% is found.

**Assay**—

*Ferric chloride solution* and *Standard preparation*—Prepare as directed in the *Assay* under *Acetohydroxamic Acid*.

*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 500 mg of acetohydroxamic acid, to a 1000-mL volumetric flask, add about 500 mL of 0.1 N hydrochloric acid, and shake for 1 minute. Dilute with 0.1 N hydrochloric acid to volume, and mix. Filter, discarding the first 40 mL of the filtrate. Use the clear filtrate as the *Assay preparation*.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Acetohydroxamic Acid*. Calculate the quantity, in mg, of  $C_2H_5NO_2$  in the portion of Tablets taken by the formula:

$$C(A_U / A_S).$$

## Acetylcholine Chloride

$C_7H_{16}ClNO_2$  181.66  
Ethanaminium, 2-(acetyloxy)-*N,N,N*-trimethyl-, chloride;  
Choline acetate (ester) chloride [60-31-1].

### DEFINITION

Acetylcholine Chloride contains NLT 98.0% and NMT 102.0% of acetylcholine chloride ( $C_7H_{16}ClNO_2$ ), calculated on the dried basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.**

**Sample solution**: 100 mg/mL in water

**Analysis**: To 5 mL of *Sample solution* add 5 mL of silver nitrate TS.

**Acceptance criteria**: A white, curdy precipitate, which is soluble in ammonium hydroxide but insoluble in nitric acid, is formed.

### ASSAY

#### • PROCEDURE

**Sample**: 400 mg of Acetylcholine Chloride

**Analysis**: Dissolve in 15 mL of water in a glass-stoppered conical flask, add 40.0 mL of 0.1 N sodium hydroxide VS, and heat on a steam bath for 30 min. Insert the stopper, allow to cool, add phenolphthalein TS, and titrate the excess alkali with 0.1 N sulfuric acid VS. Perform a blank determination (see *Titrimetry* (541), *Residual Titrations*). Each mL of 0.1 N sodium hydroxide is equivalent to 18.17 mg of  $C_7H_{16}ClNO_2$ .

**Acceptance criteria**: 98.0%–102.0% on the dried basis

### OTHER COMPONENTS

#### • CONTENT OF CHLORIDE

**Sample**: 280 mg of Acetylcholine Chloride

**Analysis**: Dissolve the *Sample* in 140 mL of water, and add 1 mL of dichlorofluorescein TS. Titrate with 0.1 N silver nitrate VS until the silver chloride flocculates and the mixture acquires a faint pink color. Each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of Cl.

**Acceptance criteria**: 19.3%–19.8% of Cl on the dried basis

### IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.2%

### SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE**, *Class I* (741): 149°–152°

#### • ACIDITY

**Sample**: 100 mg of Acetylcholine Chloride

**Analysis**: Dissolve the *Sample* in 10 mL of recently boiled water, and add at once 1 drop of bromothymol blue TS.

**Acceptance criteria**: NMT 0.50 mL of 0.010 N sodium hydroxide is required to produce a color change.

- **LOSS ON DRYING** (731)  
Analysis: Dry a sample at 105° for 3 h.  
Acceptance criteria: NMT 1.0%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in a tight container, and store at controlled room temperature.
- **USP REFERENCE STANDARDS** (11)  
USP Acetylcholine Chloride RS

## Acetylcholine Chloride for Ophthalmic Solution

**DEFINITION**

Acetylcholine Chloride for Ophthalmic Solution is a sterile mixture of Acetylcholine Chloride with Mannitol or other suitable diluent, prepared by freeze-drying. Each container contains NLT 90.0% and NMT 115.0% of the labeled amount of acetylcholine chloride ( $C_7H_{16}ClNO_2$ ).

**IDENTIFICATION**

- **A.**  
Standard solution: 10 mg/mL of USP Acetylcholine Chloride RS  
Sample solution: 10 mg/mL of acetylcholine chloride  
**Chromatographic system**  
(See *Chromatography* (621), *Thin-Layer Chromatography*.)  
Adsorbent: 0.25-mm layer of aluminum oxide  
Application volume: 2  $\mu$ L  
Developing solvent system: Mix butyl alcohol, glacial acetic acid, and water (40:10:50). Allow the layers to separate completely. Use the upper layer.  
Spray reagent A: Freshly prepared solution of 5 mg/mL of cobaltous chloride prepared as follows. Dissolve the required amount of cobaltous chloride in 50% of the final volume of water, and dilute with 50% alcohol. [NOTE—This solution is freshly prepared.]  
Spray reagent B: Freshly prepared potassium ferrocyanide solution prepared as follows. Dissolve 1.0 g of potassium ferrocyanide in 100 mL of water, and dilute with 50 mL of alcohol.  
**Analysis**  
Samples: Standard solution and Sample solution  
Develop the chromatogram, without delay, in a vapor-saturated chamber containing the *Developing solvent system*. Allow the solvent front to move about 10 cm beyond the initial spotting line. Dry the plate with a current of warm air. Immediately spray the plate with *Spray reagent A*. Dry the plate as before, and immediately spray the plate with *Spray reagent B*. Dry the plate with a current of warm air.  
Acceptance criteria: The  $R_f$  value and color of the principal spot from the *Sample solution* correspond to those from the *Standard solution*.
- **B.**  
Sample solution: Nominally 10 mg/mL of acetylcholine chloride  
Analysis: To 2 mL of *Sample solution* add 1 drop of nitric acid and 1 mL of silver nitrate TS.  
Acceptance criteria: A curdy, white precipitate, soluble in an excess of 6 N ammonium hydroxide, is formed.

**ASSAY**• **PROCEDURE**

**Mobile phase:** Add 1.03 g of sodium 1-heptanesulfonate to a mixture of 900 mL of water and 10 mL of methanol. Adjust with ammonium hydroxide or glacial acetic acid to a pH of 4.0. Add 50 mL of acetonitrile. Dilute with water to 1 L. [NOTE—A slight variation of the amount of acetonitrile may be required to improve resolution or adjust retention time.]

**Standard solution:** A quantity of USP Acetylcholine Chloride RS in *Mobile phase*, to obtain a solution having a known concentration equal to that of the acetylcholine chloride in the *Sample solution*

**Sample solution:** Transfer the contents of 1 container of Acetylcholine Chloride for Ophthalmic Solution to a 10-mL volumetric flask with the aid of *Mobile phase*, and dilute with *Mobile phase* to volume.

**System suitability solution:** 0.2% each of acetylcholine chloride and choline chloride

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** Refractive index

**Column:** 3.9-mm  $\times$  30-cm; packing L1

**Flow rate:** 2 mL/min

**Injection volume:** 50  $\mu$ L

**System suitability**

**Samples:** Standard solution and System suitability solution

**Suitability requirements**

**Resolution:** NLT 2.0 between acetylcholine chloride and choline chloride, *System suitability solution*

**Relative standard deviation:** NMT 3.5%, *Standard solution*

**Analysis**

**Samples:** Standard solution and Sample solution  
Calculate the percentage of acetylcholine chloride ( $C_7H_{16}ClNO_2$ ) in the container taken:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Acetylcholine Chloride RS in the *Standard solution* (mg/mL)

$V$  = volume of the *Sample solution*, 10 mL

$L$  = label claim (mg/vial)

**Acceptance criteria:** 90.0%–115.0%

**PERFORMANCE TESTS**

- **UNIFORMITY OF DOSAGE UNITS** (905): Meets the requirements

**SPECIFIC TESTS**

- **STERILITY TESTS** (71): Meets the requirements

• **ACIDITY**

**Analysis:** Dissolve an amount of Acetylcholine Chloride for Ophthalmic Solution equivalent to 100 mg of acetylcholine chloride in 10 mL of recently boiled water. Add at once 1 drop of bromothymol blue TS.

**Acceptance criteria:** NMT 0.50 mL of 0.010 N sodium hydroxide is required to produce a color change.

- **WATER DETERMINATION, Method I** (921)

**Analysis:** Perform the titration in the original container, observing precautions against contact with water or moist atmosphere. Adjust the concentration of the reagent so that the titration volume approaches but does not exceed the capacity of the container. Titrate to an amber color that persists for 15 s after mixing.

**Acceptance criteria:** NMT 1.0%

- **CONSTITUTED SOLUTION:** At the time of use, it meets the requirements for *Injections* (1), *Constituted Solutions*.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers as described in *Injections* (1), *Containers for Sterile Solids*, and store at controlled room temperature.
- **USP REFERENCE STANDARDS** (11)  
USP Acetylcholine Chloride RS

## Acetylcysteine

$C_5H_9NO_3S$   
L-Cysteine, *N*-acetyl-;  
*N*-Acetyl-L-cysteine [616-91-1].

163.19

### DEFINITION

Acetylcysteine contains NLT 98.0% and NMT 102.0% of  $C_5H_9NO_3S$ , calculated on the dried basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION** <197K>

### ASSAY

#### • PROCEDURE

**Mobile phase:** 6.8 g/L of monobasic potassium phosphate. Adjust with phosphoric acid to a pH of 3.0.

**Sodium metabisulfite solution:** 0.5 mg/mL of sodium metabisulfite in water, freshly prepared

**Internal standard solution:** 5 mg/mL of USP L-Phenylalanine RS in *Sodium metabisulfite solution*

**Standard stock solution:** 10 mg/mL of USP Acetylcysteine RS in *Sodium metabisulfite solution*

**Standard solution:** 0.5 mg/mL of USP Acetylcysteine RS and 0.25 mg/mL of USP L-Phenylalanine RS in *Sodium metabisulfite solution* from *Standard stock solution* and *Internal standard solution*

**Sample stock solution:** 10 mg/mL of Acetylcysteine in *Sodium metabisulfite solution*

**Sample solution:** 0.5 mg/mL of Acetylcysteine and 0.25 mg/mL of USP L-Phenylalanine RS in *Sodium metabisulfite solution* from *Sample stock solution* and *Internal standard solution*

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 214 nm

**Column:** 3.9-mm × 30-cm; packing L1

**Flow rate:** 1.5 mL/min

**Injection size:** 5 µL

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for acetylcysteine and L-phenylalanine are about 0.5 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 6 between acetylcysteine and L-phenylalanine

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of acetylcysteine ( $C_5H_9NO_3S$ ) in the portion of Acetylcysteine taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratio of acetylcysteine to L-phenylalanine from the *Sample solution*

$R_S$  = peak response ratio of acetylcysteine to L-phenylalanine from the *Standard solution*

$C_S$  = concentration of USP Acetylcysteine RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of acetylcysteine in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the dried basis

### IMPURITIES

- **RESIDUE ON IGNITION** <281>: NMT 0.5%

- **HEAVY METALS**, *Method II* <231>

[**CAUTION**— Exercise care because explosion may occur.]

**Analysis:** In a dropwise manner, wet the sample with 2 mL of nitric acid, and proceed as directed for the *Test preparation*.

**Acceptance criteria:** NMT 10 ppm

### SPECIFIC TESTS

- **OPTICAL ROTATION**, *Specific Rotation* <781S>

**Buffer:** Mix 29.5 mL of 1 N sodium hydroxide, 50 mL of 1 M monobasic potassium phosphate, and sufficient water to make 100 mL. Adjust to a pH of  $7.0 \pm 0.1$  by adding more of either solution, as necessary.

**Sample solution:** In a 25-mL volumetric flask, mix 1.25 g with 1 mL of edetate disodium solution (1 in 100), add 7.5 mL of sodium hydroxide solution (1 in 25), and mix to dissolve. Dilute with *Buffer* to volume.

**Acceptance criteria:**  $+21^\circ$  to  $+27^\circ$

- **pH** <791>: 2.0–2.8 in a solution (1 in 100)

- **LOSS ON DRYING** <731>: Dry a sample at a pressure of about 50 mm of mercury at  $70^\circ$  for 4 h: it loses NMT 1.0% of its weight.

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.

- **USP REFERENCE STANDARDS** <11>

USP Acetylcysteine RS

USP L-Phenylalanine RS

## Acetylcysteine Solution

» Acetylcysteine Solution is a sterile solution of Acetylcysteine in water, prepared with the aid of Sodium Hydroxide. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of acetylcysteine ( $C_5H_9NO_3S$ ).

**Packaging and storage**—Preserve in single-unit or multi-unit tight containers that effectively exclude oxygen, and store at controlled room temperature.

#### USP Reference standards <11>—

USP Acetylcysteine RS

USP L-Phenylalanine RS

**Identification**—Place about 10 mL in a suitable beaker, and adjust to a pH of about 2 (pH indicator paper) using 3 N hydrochloric acid. Add up to 2 g of finely powdered sodium chloride, in two portions of about 200 mg each initially, and then in smaller portions (about 25 mg), stirring after each addition until the sodium chloride dissolves and a precipitate is formed. [NOTE—The precipitate appears as a very fine powder, and the solution turns cloudy. If no precipitate forms, add an additional drop of 3 N hydrochloric acid, and stir until the precipitate forms.] Allow to stand at room temperature for 15 minutes, and collect the residue by suction filtration: the acetylcysteine so obtained, after being dried as directed in the test for *Loss on drying* under *Acetylcysteine*, responds to the *Identification* test under *Acetylcysteine*.

**Sterility** <71>: meets the requirements.

**pH** <791>: between 6.0 and 7.5.

**Assay—**

*Mobile phase, Internal standard solution, Standard preparation, and Chromatographic system*—Proceed as directed in the Assay under Acetylcysteine.

*Assay preparation*—Pipet a volume of Solution, equivalent to about 1000 mg of acetylcysteine, into a 100-mL volumetric flask, dilute with sodium bisulfite solution (1 in 2000) to volume, and mix. Pipet 10.0 mL of this solution and 10.0 mL of *Internal standard solution* into a 200-mL volumetric flask, dilute with sodium metabisulfite solution (1 in 2000) to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the Assay under Acetylcysteine. Calculate the quantity, in mg, of  $C_5H_9NO_3S$  in each mL of the Solution taken by the formula:

$$2000(C/V)(R_U / R_S)$$

in which C is the concentration, in mg per mL, of USP Acetylcysteine RS in the *Standard preparation*; V is the volume, in mL, of Solution taken; and  $R_U$  and  $R_S$  are the ratios of the peak response of acetylcysteine to that of DL-phenylalanine obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Acetylcysteine and Isoproterenol Hydrochloride Inhalation Solution

» Acetylcysteine and Isoproterenol Hydrochloride Inhalation Solution is a sterile solution of Acetylcysteine and Isoproterenol Hydrochloride in water. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of acetylcysteine ( $C_5H_9NO_3S$ ), and not less than 90.0 percent and not more than 115.0 percent of the labeled amount of isoproterenol hydrochloride ( $C_{11}H_{17}NO_3 \cdot HCl$ ).

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I glass, tightly closed with a glass or polyethylene closure, and store at controlled room temperature.

**Labeling**—The label indicates that the Inhalation Solution is not to be used if its color is pinkish or darker than slightly yellow or if it contains a precipitate.

**USP Reference standards** <11>—

USP Acetylcysteine RS

USP Isoproterenol Hydrochloride RS

USP L-Phenylalanine RS

**Color and clarity**—Using the Inhalation Solution as the *Test solution*, proceed as directed for *Color and clarity* under *Isoproterenol Inhalation Solution*.

**Identification—**

**A:** Place 2 mL in a 10-mL beaker, and adjust with 3 N hydrochloric acid to a pH of about 3 (pH indicator paper). Add 500 mg to 1 g of finely powdered sodium chloride, in two portions of about 200 mg each initially, and then in smaller portions (about 25 mg), stirring after each addition, until a precipitate is formed. Allow to stand at room temperature for 15 minutes, and collect the residue by suction filtration: the acetylcysteine so obtained, after being dried as directed in the test for *Loss on drying* under Acetylcysteine, responds to the *Identification* test under Acetylcysteine.

**B:** *Ferro-Citrate Solution* and *Buffer Solution*—Prepare as directed under *Epinephrine Assay* <391>.

*Procedure*—Place a volume of Inhalation Solution, equivalent to about 0.26 mg of isoproterenol hydrochloride, in a test tube with 3 mL of 0.1 M mercuric chloride, and mix. Add 100  $\mu$ L of *Ferro-Citrate Solution* and 1.0 mL of *Buffer Solution*, and mix: the presence of isoproterenol hydrochloride is confirmed by the development of a purple color.

**Sterility** <71>: meets the requirements.

**pH** <791>: between 6.0 and 7.0.

**Assay for acetylcysteine—**

*Mobile phase, Internal standard solution, Standard preparation, and Chromatographic system*—Proceed as directed in the Assay under Acetylcysteine.

*Assay preparation*—Pipet a volume of Inhalation Solution, equivalent to about 1000 mg of acetylcysteine, into a 100-mL volumetric flask, dilute with sodium metabisulfite solution (1 in 2000) to volume, and mix. Pipet 10 mL of this solution and 10 mL of *Internal standard solution* into a 200-mL volumetric flask, dilute with sodium metabisulfite solution (1 in 2000) to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the Assay under Acetylcysteine. Calculate the quantity, in mg, of  $C_5H_9NO_3S$  in each mL of the Inhalation Solution taken by the formula:

$$2000(C/V)(R_U / R_S)$$

in which C is the concentration, in mg per mL, of USP Acetylcysteine RS in the *Standard preparation*; V is the volume, in mL, of Inhalation Solution taken; and  $R_U$  and  $R_S$  are the ratios of the peak response of acetylcysteine to that of DL-phenylalanine obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for isoproterenol hydrochloride—**

*Mobile phase*—Dissolve 13.6 g of monobasic potassium phosphate in 1000 mL of water, and pass through a membrane filter having a 0.45- $\mu$ m porosity. Add 20.0 mL of methanol, mix, and degas.

*Internal standard solution*—Place about 150 mg of acetaminophen in a 500-mL volumetric flask, add 5 mL of glacial acetic acid, dilute with water to volume, and mix.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Isoproterenol Hydrochloride RS in 0.05 M sodium metabisulfite to obtain a solution having a known concentration of 0.15 mg per mL. Transfer 10.0 mL of this solution to a 25-mL volumetric flask, add 10.0 mL of *Internal standard solution*, dilute with 0.2 M acetic acid to volume, and mix.

*Assay preparation*—Transfer an accurately measured volume of Inhalation Solution, equivalent to about 1.5 mg of isoproterenol hydrochloride, and 10 mL of *Internal standard solution* to a 25-mL volumetric flask, add dilute glacial acetic acid (1 in 100) to volume, and mix.

*Chromatographic system* (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 280-nm detector and a 3.9-mm  $\times$  40-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.5 for isoproterenol hydrochloride and 1.0 for acetaminophen; the resolution,  $R$ , between isoproterenol hydrochloride and acetaminophen is not less than 6; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 25  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quan-

tity, in mg, of isoproterenol hydrochloride ( $C_{11}H_{17}NO_3 \cdot HCl$ ) in each mL of the Inhalation Solution taken by the formula:

$$(25C/V)(R_U / R_S)$$

in which C is the concentration, in mg per mL, of USP Isoproterenol Hydrochloride RS in the *Standard preparation*; V is the volume, in mL, of Inhalation Solution taken; and  $R_U$  and  $R_S$  are the ratios of the peak responses of isoproterenol hydrochloride to those of acetaminophen obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Acitretin

$C_{21}H_{26}O_3$  326.43  
2,4,6,8-Nonatetraenoic acid, 9-(4-methoxy-2,3,6-trimethylphenyl)-3,7-dimethyl-, (*all-E*)-; (*all-E*)-9-(4-Methoxy-2,3,6-trimethylphenyl)-3,7-dimethyl-2,4,6,8-nonatetraenoic acid [55079-83-9].

### DEFINITION

Acitretin contains NLT 98.0% and NMT 102.0% of  $C_{21}H_{26}O_3$ , calculated on the dried basis.

**[CAUTION]**—Acitretin is a teratogen. Great care should be taken when handling to avoid inhalation of dust or contact with skin.]

[NOTE—Use low-actinic glassware and perform all tests under yellow and subdued light.]

### IDENTIFICATION

- A. INFRARED ABSORPTION** (197K)
- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

[NOTE—Store the solutions at 4° before injection.]

**Mobile phase:** Alcohol, glacial acetic acid, and water (92:0.3:8)

**System suitability stock solution:** 0.01 mg/mL each of USP Acitretin RS and USP Tretinoin RS in alcohol.

[NOTE—Dissolve in tetrahydrofuran before diluting with alcohol.]

**System suitability solution:** 0.25 µg/mL each of USP Acitretin RS and USP Tretinoin RS in alcohol, from *System suitability stock solution*

**Standard solution:** 0.1 mg/mL of USP Acitretin RS in alcohol. [NOTE—Dissolve in tetrahydrofuran before diluting with alcohol. The final concentration of tetrahydrofuran in the preparation will be 2%.]

**Sample stock solution:** 0.25 mg/mL of Acitretin in tetrahydrofuran and alcohol (1:19). [NOTE—Dissolve in tetrahydrofuran before diluting with alcohol.]

**Sample solution:** 0.1 mg/mL of Acitretin in alcohol, from *Sample stock solution*

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 360 nm

**Column:** 4-mm × 25-cm; packing L1

**Flow rate:** 0.6 mL/min

**Injection size:** 10 µL

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for tretinoin and acitretin are 0.84 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 2.0 between tretinoin and acitretin, *System suitability solution*

**Relative standard deviation:** NMT 1.0% of acitretin, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{21}H_{26}O_3$  in the portion of Acitretin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Acitretin RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Acitretin in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the dried basis

### IMPURITIES

#### Inorganic Impurities

- RESIDUE ON IGNITION** (281): NMT 0.1%
- HEAVY METALS**, *Method II* (231): NMT 20 ppm

#### Organic Impurities

[NOTE—Store the solutions at 4° before injection.]

#### PROCEDURE

**Mobile phase and Chromatographic system:** Proceed as directed in the *Assay*.

**Standard solution:** 0.8 µg/mL each of USP Acitretin RS, USP Acitretin Related Compound A RS, and USP Acitretin Related Compound B RS in alcohol. [NOTE—Dissolve in tetrahydrofuran before diluting with alcohol.]

**Sample solution:** 0.25 mg/mL of Acitretin in tetrahydrofuran and alcohol (1:19). [NOTE—Dissolve in tetrahydrofuran before diluting with alcohol.]

#### System suitability

(See *Chromatography* (621), *System Suitability*.)

**Sample:** *Standard solution*

#### Suitability requirements

**Resolution:** NLT 1.5 between acitretin related compound A and acitretin; NLT 1.5 between acitretin related compound B and acitretin

**Relative standard deviation:** NMT 10.0% for acitretin related compound A and NMT 10.0% for acitretin related compound B

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of acitretin related compound A and acitretin related compound B in the portion of Acitretin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the relevant impurity from the *Sample solution*

- $r_s$  = peak response from the relevant impurity from the *Standard solution*  
 $C_s$  = concentration of USP Acitretin Related Compound A RS or USP Acitretin Related Compound B RS in the *Standard solution* ( $\mu\text{g/mL}$ )  
 $C_U$  = concentration of Acitretin in the *Sample solution* ( $\mu\text{g/mL}$ )  
 Calculate the percentage of impurities other than acitretin related compounds A and B in the portion of Acitretin taken:

$$\text{Result} = (r_U/r_s) \times (C_s/C_U) \times 100$$

- $r_U$  = peak response of each individual unspecified impurity from the *Sample solution*  
 $r_s$  = peak response of USP Acitretin RS in the *Standard solution*  
 $C_s$  = concentration of USP Acitretin RS in the *Standard solution* ( $\mu\text{g/mL}$ )  
 $C_U$  = concentration of Acitretin in the *Sample solution* ( $\mu\text{g/mL}$ )

**Acceptance criteria**

**Individual impurities:** See *Impurity Table 1*.

**Total impurities:** NMT 1.0%

**Impurity Table 1**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Acitretin related compound A	0.78	0.3
Acitretin	1.0	—
Acitretin related compound B	1.61	0.3
Any unspecified impurity	—	0.1
Total unspecified impurities	—	0.4

**SPECIFIC TESTS**

- LOSS ON DRYING (731):** Dry a sample in a vacuum at a pressure not exceeding 19 mm of mercury at 100° for 4 h: it loses NMT 0.2% of its weight.

**ADDITIONAL REQUIREMENTS**

- PACKAGING AND STORAGE:** Preserve in tight containers, protected from light. Store at controlled room temperature.
- USP REFERENCE STANDARDS (11)**
  - USP Acitretin RS
  - USP Acitretin Related Compound A RS  
(2Z,4E,6E,8E)-9-(4-Methoxy-2,3,6-trimethylphenyl)-3,7-dimethylnona-2,4,6,8-tetraenoic acid.  
 $\text{C}_{21}\text{H}_{26}\text{O}_3$  326.43
  - USP Acitretin Related Compound B RS  
Ethyl (all-E)-9-(4-methoxy-2,3,6-trimethylphenyl)-3,7-dimethylnona-2,4,6,8-tetraenoate.  
 $\text{C}_{23}\text{H}_{30}\text{O}_3$  354.48
  - USP Tretinoin RS

**Acitretin Capsules****DEFINITION**

Acitretin Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of acitretin ( $\text{C}_{21}\text{H}_{26}\text{O}_3$ ).

**[CAUTION—**Acitretin is a teratogen. Great care should be taken when handling to avoid inhalation of dust or contact with skin.]

**[NOTE—**Use low-actinic glassware and perform all tests under yellow and subdued light. Make all injections within 1 h of *Sample solution* preparation.]

**IDENTIFICATION**

- THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)**

**Standard solution:** 10 mg/mL of USP Acitretin RS in tetrahydrofuran

**Sample solution:** Equivalent to 20 mg of acitretin from Capsules. Grind to a fine powder, then triturate for 30 s with 2 mL of tetrahydrofuran. Transfer the suspension to a 12-mL conical centrifuge tube, and centrifuge to obtain a clear supernatant.

**Application volume:** 10  $\mu\text{L}$

**Developing solvent system:** Chloroform and methanol (4:1)

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Proceed as directed in the chapter, and then air-dry.

Spray the plate with a saturated solution of antimony trichloride in chloroform (250 mg/mL) followed by concentrated sulfuric acid, and then locate the spots.

**ASSAY**

- PROCEDURE**

**Diluent:** Methanol and tetrahydrofuran (13:10)

**Mobile phase:** Methanol, alcohol, glacial acetic acid, and water (74:5:0.5:21)

**Standard solution:** 0.1 mg/mL of USP Acitretin RS in a mixture of *Diluent* and water (23:2). Dissolve USP Acitretin RS in *Diluent* equivalent to 80% of the final volume, sonicate for 5 min, add water equivalent to 8% of the final volume, and dilute with *Diluent* to volume.

**System suitability solution:** Transfer 2 mL of the *Standard solution* to a clear 4-mL glass vial. After sealing the vial with a teflon-lined silicone septum and cap, place the vial on its side in a light chamber, expose it to 400 foot-candles of fluorescent light for 5 min, and then completely wrap the vial with aluminum foil.

[NOTE—Exposure to the fluorescent light allows for the formation of two degradation products: acitretin related compound A and the 9-*cis* isomer]

**Sample solution:** 0.1 mg/mL of acitretin in a mixture of *Diluent* and water (23:2). Open NLT 20 Capsules, composite the Capsule fill, and mix well. Transfer the Capsule fill to a volumetric flask, add water equivalent to 8% of the final volume to wet the sample, and sonicate for 5 min. Dilute with *Diluent* to volume, and sonicate for 5 min. Cool to room temperature, pass the suspension through a suitable filter of 0.5- $\mu\text{m}$  pore size, and use the clear filtrate. [NOTE—Inject the *Sample solution* within 1 h of preparation.]

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 365 nm

**Column:** 4.6-mm  $\times$  15-cm; 5- $\mu\text{m}$  packing L1

**Flow rate:** 1 mL/min

**Injection size:** 25  $\mu\text{L}$

**System suitability**

**Samples:** *Standard solution* and *System suitability solution*

**Suitability requirements**

**Resolution:** NLT 3.0 between acitretin related compound A and acitretin; NLT 1.8 between the 9-*cis* isomer and acitretin, *System suitability solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $\text{C}_{21}\text{H}_{26}\text{O}_3$  in the portion of Capsules taken:

$$\text{Result} = (r_U/r_s) \times (C_s/C_U) \times 100$$

- $r_U$  = peak response from the *Sample solution*  
 $r_s$  = peak response from the *Standard solution*  
 $C_s$  = concentration of USP Acitretin RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

## PERFORMANCE TESTS

### • DISSOLUTION <711>

**Medium:** 3% sodium lauryl sulfate in deaerated water, pH 9.6 to 10.0; 900 mL

**Apparatus 1:** 100 rpm

**Time:** 30 min

Determine the amount of  $C_{21}H_{26}O_3$  dissolved using the following method.

**Standard solution:** Transfer about 14 mg of USP Acitretin RS to a 500-mL volumetric flask. Dissolve in 50 mL of alcohol, and dilute with *Medium* to volume.

**For Capsules labeled to contain 10 mg:** Transfer 20 mL of this solution to a 50-mL volumetric flask, and dilute with *Medium* to volume.

**Sample solution:** Use portions of the solution under test passed through a suitable filter of 0.45- $\mu$ m pore size.

**Capsule shell solution:** Dissolve 6 clean empty-shell Capsules in 900 mL of *Medium*.

### Analysis

**Samples:** *Standard solution*, *Sample solution*, and *Capsule shell solution*

**Analytical wavelength:** 347 nm

**Cell length:** 2 mm

**Blank:** *Medium*

Calculate the amount of  $C_{21}H_{26}O_3$  dissolved:

$$\text{Result} = [(A_U - A_{CS})/A_S] \times (C_S/L) \times V \times 100$$

$A_U$  = absorbance of the *Sample solution*

$A_{CS}$  = Capsule shell correction, calculated as shown below

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of the appropriate *Standard solution* (mg/mL)

$L$  = Capsule label claim (mg)

$V$  = volume of *Medium* (mL), 900

The Capsule shell correction,  $A_{CS}$ , is calculated as follows:

$$A_{CS} = A_{CSS}/N$$

$A_{CSS}$  = absorbance of the *Capsule shell solution*

$N$  = number of Capsule shells used to prepare the *Capsule shell solution*

**Tolerances:** NLT 85% (Q) of the labeled amount of  $C_{21}H_{26}O_3$  is dissolved.

### • UNIFORMITY OF DOSAGE UNITS <905>: Meet the requirements

## IMPURITIES

### Organic Impurities

#### • PROCEDURE: LIMIT OF DEGRADATION PRODUCTS

**Diluent, Mobile phase, System suitability solution, Sample solution, Chromatographic system, and System suitability:** Proceed as directed in the *Assay*.

### Analysis

**Sample:** *Sample solution*

Calculate the percentage of each degradation product in the portion of Capsules taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response for each individual impurity

$r_T$  = sum of the responses of all the peaks

## Acceptance criteria

**Individual impurities:** See *Impurity Table 1*.

**Impurity Table 1**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Acitretin related compound $A^a$	0.84	0.5
Acitretin	1.0	—
9- <i>cis</i> isomer <sup>b</sup>	1.09	—
Any unspecified impurity	—	0.4
Total unspecified impurities	—	0.8

<sup>a</sup> [(2Z,4E,6E,8E)-9-(4-Methoxy-2,3,6-trimethylphenyl)-3,7-dimethylnona-2,4,6,8-tetraenoic acid] ( $C_{21}H_{26}O_3$  326.43).

<sup>b</sup> (E,E,Z,E)-9-(4-Methoxy-2,3,6-trimethylphenyl)-3,7-dimethyl-2,4,6,8-nonatetraenoic acid.

## ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers.

• **USP REFERENCE STANDARDS <11>**  
USP Acitretin RS

## Acyclovir

$C_8H_{11}N_5O_3$  225.20

6H-Purin-6-one, 2-amino-1,9-dihydro-9-[(2-hydroxyethoxy)methyl]-.

9-[(2-Hydroxyethoxy)methyl]guanine [59277-89-3].

» Acyclovir contains not less than 98.0 percent and not more than 101.0 percent of  $C_8H_{11}N_5O_3$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers. Store at room temperature. Protect from light and moisture.

**USP Reference standards <11>**—

USP Acyclovir RS

### Identification—

**A:** *Infrared Absorption* <197K>.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay and limit for guanine*.

**Water, Method I <921>:** not more than 6.0%.

### Ordinary impurities <466>—

**Test solution:** dimethyl sulfoxide.

**Standard solution:** dimethyl sulfoxide.

**Eluant:** a mixture of chloroform, methanol, and ammonium hydroxide (80:20:2).

**Visualization:** 1.

**Application volume:** 5  $\mu$ L.

**Limit:** 1%.

### Assay and limit for guanine—

**Mobile phase**—Prepare a filtered and degassed solution of glacial acetic acid in water (1 in 1000). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**System suitability solution 1**—Dissolve accurately weighed quantities of USP Acyclovir RS and guanine in 0.1 N sodium hydroxide, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having known concentrations of about 0.1 mg of each per mL.

**System suitability solution 2**—Dissolve an accurately weighed quantity of guanine in 0.1 N sodium hydroxide, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.7 µg per mL.

**Guanine standard preparation**—Transfer about 8.75 mg of guanine, accurately weighed, to a 500-mL volumetric flask. Dissolve in 50 mL of 0.1 N sodium hydroxide, dilute with water to volume, and mix. Transfer 2.0 mL of this solution to a 50-mL volumetric flask, dilute with 0.01 N sodium hydroxide to volume, and mix to obtain a solution having a concentration of about 0.7 µg per mL.

**Standard preparation**—Dissolve about 25 mg of USP Acyclovir RS, accurately weighed, in 5 mL of 0.1 N sodium hydroxide in a 50-mL volumetric flask, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a 50-mL volumetric flask, dilute with 0.01 N sodium hydroxide to volume, and mix to obtain a solution having a known concentration of about 0.1 mg of USP Acyclovir RS per mL.

**Assay preparation**—Dissolve about 100 mg of Acyclovir, accurately weighed, in 20 mL of 0.1 N sodium hydroxide in a 200-mL volumetric flask, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a 50-mL volumetric flask, dilute with 0.01 N sodium hydroxide to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 3 mL per minute. Chromatograph *System suitability solution 1*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between acyclovir and guanine is not less than 2.0; the tailing factor for the analyte peak is not more than 2; and the relative standard deviation for replicate injections for the acyclovir peak is not more than 2.0%. Chromatograph *System suitability solution 2*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation*, the *Guanine standard preparation*, and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for all the peaks. Calculate the quantity, in µg, of guanine in the portion of Acyclovir taken by the formula:

$$1000C(r_U / r_S)$$

in which  $C$  is the concentration, in µg per mL, of guanine in the *Guanine standard preparation*; and  $r_U$  and  $r_S$  are the peak responses due to guanine in the *Assay preparation* and the *Guanine standard preparation*, respectively: not more than 0.7% of guanine is found. Calculate the quantity, in mg, of  $C_8H_{11}N_5O_3$  in the portion of Acyclovir taken by the formula:

$$1000C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Acyclovir RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses due to acyclovir in the *Assay preparation* and the *Standard preparation*, respectively.

## Acyclovir Capsules

### DEFINITION

Acyclovir Capsules contain NLT 93.0% and NMT 107.0% of the labeled amount of acyclovir ( $C_8H_{11}N_5O_3$ ).

### IDENTIFICATION

- A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

**Mobile phase:** 0.02 M acetic acid

**System suitability solution A:** 0.1 mg/mL each of USP Acyclovir RS and guanine. Dissolve in 0.1 N sodium hydroxide, and dilute with water.

**System suitability solution B:** 2.0 µg/mL of guanine. Dissolve in 0.1 N sodium hydroxide, and dilute with water.

**Standard solution:** 0.1 mg/mL of USP Acyclovir RS. Dissolve in 0.1 N sodium hydroxide, and dilute with water.

**Sample solution:** Nominally 0.1 mg/mL of acyclovir prepared as follows. Transfer the contents of Capsules equivalent to 10 mg of acyclovir (NLT 10 Capsules) to a 100-mL volumetric flask. Dissolve in 10 mL of 0.1 N sodium hydroxide, dilute to volume with water, and filter.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 25-cm; packing L1

**Flow rate:** 1.5 mL/min

**Injection volume:** 20 µL

#### System suitability

**Samples:** *System suitability solution A* and *System suitability solution B*

[NOTE—The relative retention times for guanine and acyclovir are about 0.6 and 1.0, respectively, in *System suitability solution A*.]

#### Suitability requirements

**Resolution:** NLT 2.0 between guanine and acyclovir, *System suitability solution A*

**Relative standard deviation:** NMT 2.0% for the acyclovir peak, *System suitability solution A*

**Relative standard deviation:** NMT 2.0%, *System suitability solution B*

**Analysis:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of acyclovir ( $C_8H_{11}N_5O_3$ ) in the portion of Capsules taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times 100$$

$r_U$  = peak response of the *Sample solution*

$r_S$  = peak response of the *Standard solution*

$C_S$  = concentration of USP Acyclovir RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of acyclovir in the *Sample solution* (mg/mL)

**Acceptance criteria:** 93.0%–107.0%

### PERFORMANCE TESTS

#### DISSOLUTION <711>

**Medium:** 0.1 N hydrochloric acid; 900 mL

**Apparatus 1:** 100 rpm

**Time:** 45 min

**Detector:** UV 254 nm

**Standard solution:** USP Acyclovir RS in *Medium*

**Sample solutions:** Dilute with *Medium* to a concentration that is similar to the *Standard solution*.

**Analysis:** Determine the amount of acyclovir ( $C_8H_{11}N_5O_3$ ) dissolved from UV absorption at the wavelength of maximum absorption on filtered portions of the solution under test.

**Tolerances:** NLT 75% ( $Q$ ) of the labeled amount of acyclovir ( $C_8H_{11}N_5O_3$ ) is dissolved.

- UNIFORMITY OF DOSAGE UNITS <905>:** Meet the requirements for *Content Uniformity*

**IMPURITIES****• PROCEDURE**

Mobile phase, System suitability solution A, System suitability solution B, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the Assay.

**Analysis:** *Sample solution*

Calculate the percentage of each impurity in the portion of Capsules taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response for each impurity

$r_T$  = sum of the responses for all of the peaks

**Acceptance criteria**

Guanine: NMT 2.0%

Any individual impurity: NMT 0.5%

**ADDITIONAL REQUIREMENTS**

- PACKAGING AND STORAGE:** Preserve in tight containers. Store between 15° and 25°. Protect from light and moisture.
- USP REFERENCE STANDARDS** <11>  
USP Acyclovir RS

**Acyclovir for Injection****DEFINITION**

Acyclovir for Injection contains NLT 90.0% and NMT 110.0% of the labeled amount of acyclovir ( $C_8H_{11}N_5O_3$ ).

**IDENTIFICATION**

- A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

**ASSAY****• PROCEDURE**

Mobile phase: 0.02 M acetic acid

System suitability solution A: 0.1 mg/mL each of USP Acyclovir RS and guanine in 0.1 N sodium hydroxide

System suitability solution B: 2.0 µg/mL of guanine in 0.1 N sodium hydroxide

Standard solution: 0.1 mg/mL of USP Acyclovir RS in 0.1 N sodium hydroxide

Sample solution: Nominally 0.1 mg/mL of acyclovir prepared as follows. Constitute 1 vial of Acyclovir for Injection with water. Transfer an amount, equivalent to 10 mg of acyclovir, to a 100-mL volumetric flask, and dilute with water to volume.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.2-mm × 25-cm; packing L1

Flow rate: 1.5 mL/min

Injection volume: 20 µL

**System suitability**

Samples: *System suitability solution A* and *System suitability solution B*

[NOTE—The relative retention times for guanine and acyclovir are 0.6 and 1.0, respectively, in *System suitability solution A*.]

**Suitability requirements**

Resolution: NLT 2.0 between guanine and acyclovir, *System suitability solution A*

Relative standard deviation: NMT 2.0% for the acyclovir peak, *System suitability solution A*

Relative standard deviation: NMT 2.0%, *System suitability solution B*

**Analysis**

Calculate the percentage of acyclovir ( $C_8H_{11}N_5O_3$ ) in the portion of Acyclovir for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of the *Sample solution*

$r_S$  = peak response of the *Standard solution*

$C_S$  = concentration of USP Acyclovir RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

**IMPURITIES****• PROCEDURE**

**Solution A:** 0.17 M acetic acid and methanol (125:8)

**Solution B:** Methanol

Mobile phase: See *Table 1*.

**Table 1**

Time (min)	Solution A (%)	Solution B (%)
0	100	0
15	100	0
45	65	35
46	100	0
56	100	0

**System suitability solution:** 0.5 µg/mL each of purine and USP Acyclovir RS in *Solution A*

**Acyclovir standard solution:** 5 µg/mL of USP Acyclovir RS in *Solution A*

**Guanine solution:** 0.05 mg/mL of guanine prepared as follows. Dissolve 25 mg of guanine in 50 mL of 0.1 N sodium hydroxide in a 500-mL volumetric flask, and bring the solution to volume with water.

**Standard solution A:** 0.5 µg/mL of *Acyclovir standard solution* in *Solution A*

**Standard solution B:** 5 µg/mL of *Guanine solution* in *Solution A*

**Sample solution:** Equivalent to 0.5 mg/mL of acyclovir from a mixture of NLT 10 reconstituted vials of Acyclovir for Injection in *Solution A*

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 1 mL/min

Injection volume: 50 µL

**System suitability**

Samples: *System suitability solution*, *Standard solution A*, and *Standard solution B*

[NOTE—Typical retention times for guanine and acyclovir of *Standard solution A* and *Standard solution B* are 5.8 and 14 min, respectively.]

**Suitability requirements**

Resolution: NLT 2.0 between purine and acyclovir, *System suitability solution*

Relative standard deviation: NMT 1% for the acyclovir and the guanine peaks, *Standard solution A* and *Standard solution B*

**Analysis 1**

Calculate the percentage of guanine in the Acyclovir for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response for guanine, if present, in the *Sample solution*

$r_S$  = peak response of guanine in the *Standard solution*

$C_S$  = concentration of guanine in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of acyclovir in the  
Sample solution (mg/mL)

**Acceptance criteria 1:** NMT 1.0% guanine

#### Analysis 2

Calculate the percentage of each other impurity in the portion of Acyclovir for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response for each impurity

$r_S$  = peak response of acyclovir in the Standard solution

$C_S$  = concentration of USP Acyclovir RS in the Standard solution (mg/mL)

$C_U$  = nominal concentration of acyclovir in the Sample solution (mg/mL)

**Acceptance criteria 2:** NMT 0.15% for any peak having a relative retention time of about 0.7 compared to the acyclovir peak; NMT 0.5% for any other individual impurity; and NMT 1.0% for the total of all other impurities

#### SPECIFIC TESTS

- **PH** (791): 11.0–12.5, 50 mg/mL of acyclovir
- **WATER DETERMINATION, Method I** (921): NMT 5.5%
- **STERILITY TESTS** (71): Meets the requirements
- **UNIFORMITY OF DOSAGE UNITS** (905): Meets the requirements
- **BACTERIAL ENDOTOXINS TEST** (85): NMT 0.174 USP Endotoxin Unit/mg of acyclovir
- **OTHER REQUIREMENTS:** Meets the requirements for labeling in *Injections* (1), *Labeling*

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store between 15° and 25°. Protect from light.
- **USP REFERENCE STANDARDS** (11)  
USP Acyclovir RS  
USP Endotoxin RS

## Acyclovir Ointment

#### DEFINITION

Acyclovir Ointment contains NLT 90.0% and NMT 110.0% of the labeled amount of acyclovir ( $C_8H_{11}N_5O_3$ ), in a suitable ointment base.

#### IDENTIFICATION

- **A.** The retention time of the major peak of the Sample solution corresponds to that of the Standard solution, as obtained in the Assay.

#### ASSAY

##### • PROCEDURE

**Mobile phase:** 0.02 M acetic acid

**System suitability solution A:** 0.1 mg/mL each of USP Acyclovir RS and guanine in 0.1 N sodium hydroxide

**System suitability solution B:** 2.0 µg/mL of guanine in 0.1 N sodium hydroxide

**Standard solution:** 0.1 mg/mL of USP Acyclovir RS in 0.1 N sodium hydroxide

**Sample solution:** Nominally 0.1 mg/mL of acyclovir prepared as follows. Transfer an amount of Ointment, equivalent to 10 mg of acyclovir, to a 100-mL volumetric flask. Dissolve in and dilute with 0.1 N sodium hydroxide to volume.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 25-cm; packing L1

**Flow rate:** 3 mL/min

**Injection volume:** 20 µL

#### System suitability

**Samples:** System suitability solution A and System suitability solution B

[NOTE—The relative retention times for guanine and acyclovir are about 0.6 and 1.0, respectively, in System suitability solution A.]

#### Suitability requirements

**Resolution:** NLT 2.0 between guanine and acyclovir, System suitability solution A

**Relative standard deviation:** NMT 2.0% for the acyclovir peak, System suitability solution A; NMT 2.0%, System suitability solution B

#### Analysis

**Samples:** Standard solution and Sample solution

Calculate the percentage of the labeled amount of acyclovir ( $C_8H_{11}N_5O_3$ ) in the portion of Ointment taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the Sample solution

$r_S$  = peak response from the Standard solution

$C_S$  = concentration of USP Acyclovir RS in the Standard solution (mg/mL)

$C_U$  = nominal concentration of acyclovir in the Sample solution (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

#### PERFORMANCE TESTS

- **MINIMUM FILL** (755): Meets the requirements

#### IMPURITIES

##### • LIMIT OF GUANINE

**Mobile phase, Sample solution, and Chromatographic system:** Proceed as directed in the Assay.

**Standard solution:** 2.0 µg/mL of guanine in 0.1 M sodium hydroxide

#### Analysis

**Samples:** Standard solution and Sample solution

Calculate the percentage of guanine in the portion of Ointment taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of guanine from the Sample solution

$r_S$  = peak response of guanine from the Standard solution

$C_S$  = concentration of guanine in the Standard solution (mg/mL)

$C_U$  = nominal concentration of acyclovir in the Sample solution (mg/mL)

**Acceptance criteria:** NMT 2.0%

#### SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): It meets the requirements of the tests for the absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store between 15° and 25° in a dry place.
- **USP REFERENCE STANDARDS** (11)  
USP Acyclovir RS

## Acyclovir Oral Suspension

### DEFINITION

Acyclovir Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of acyclovir ( $C_8H_{11}N_5O_3$ ).

### IDENTIFICATION

- A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

**Mobile phase:** 0.02 M acetic acid

**System suitability solution A:** 0.1 mg/mL each of USP Acyclovir RS and guanine in 0.1 N sodium hydroxide

**System suitability solution B:** 2.0 µg/mL of guanine in 0.1 N sodium hydroxide

**Standard solution:** 0.1 mg/mL of USP Acyclovir RS in 0.1 N sodium hydroxide

**Sample stock solution:** Nominally 1 mg/mL of acyclovir prepared as follows. Transfer an amount of well-shaken Oral Suspension equivalent to 200 mg of acyclovir to a 200-mL volumetric flask. Add 100 mL of 0.1 N sodium hydroxide, shake by mechanical means for 15 min, and sonicate, if necessary, to dissolve the Oral Suspension completely. Dilute with 0.1 N sodium hydroxide to volume.

**Sample solution:** Transfer 10.0 mL of the *Sample stock solution* to a 100-mL volumetric flask, and dilute with water to volume.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*).

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 25-cm; packing L1

**Flow rate:** 3 mL/min

**Injection volume:** 20 µL

#### System suitability

**Samples:** *System suitability solution A* and *System suitability solution B*

[NOTE—The relative retention times for guanine and acyclovir are about 0.6 and 1.0, respectively, in *System suitability solution A*.]

#### Suitability requirements

**Resolution:** NLT 2.0 between guanine and acyclovir, *System suitability solution A*

**Relative standard deviation:** NMT 2.0% for replicate injections for the acyclovir peak, *System suitability solution A*

**Relative standard deviation:** NMT 2.0% for replicate injections, *System suitability solution B*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of acyclovir ( $C_8H_{11}N_5O_3$ ) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Acyclovir RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of acyclovir in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

### IMPURITIES

#### LIMIT OF GUANINE

**Mobile phase, System suitability solution A, System suitability solution B, Sample solution, Chromatographic system, and System suitability:** Proceed as directed in the *Assay*.

**Standard solution:** 2.0 µg/mL of guanine in 0.1 M sodium hydroxide

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of guanine in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response for guanine from the *Sample solution*

$r_S$  = peak response for guanine from the *Standard solution*

$C_S$  = concentration of guanine in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of acyclovir in the *Sample solution* (mg/mL)

**Acceptance criteria:** NMT 2.0%

### SPECIFIC TESTS

- MICROBIAL ENUMERATION TESTS** <61> and **TESTS FOR SPECIFIED MICROORGANISMS** <62>: Its total count does not exceed  $10^1$  cfu/mL, and it meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

- PH** <791>: 4.5–7.0

### PERFORMANCE TESTS

- UNIFORMITY OF DOSAGE UNITS** <905>: Meets the requirements for Oral Suspension packaged in single-unit containers
- DELIVERABLE VOLUME** <698>: Meets the requirements for Oral Suspension packaged in multiple-unit containers

### ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight containers. Store between 15° and 25°. Protect from light.
- USP REFERENCE STANDARDS** <11>  
USP Acyclovir RS

## Acyclovir Tablets

### DEFINITION

Acyclovir Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of acyclovir ( $C_8H_{11}N_5O_3$ ).

### IDENTIFICATION

- A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

**Mobile phase:** 0.02 M acetic acid

**System suitability solution A:** 0.1 mg/mL each of USP Acyclovir RS and guanine. Dissolve in 0.1 N sodium hydroxide, and dilute with water.

**System suitability solution B:** 2.0 µg/mL of guanine. Dissolve in 0.1 N sodium hydroxide, and dilute with water.

**Standard solution:** 0.1 mg/mL of USP Acyclovir RS. Dissolve in 0.1 N sodium hydroxide, and dilute with water.

**Sample solution:** Nominally 0.1 mg/mL of acyclovir prepared as follows. Transfer an amount of finely powdered Tablets equivalent to 10 mg of acyclovir (NLT 10 Tablets) to a 100-mL volumetric flask. Dissolve in 10 mL of 0.1 N sodium hydroxide, dilute with water to volume, and filter.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*).

Mode: LC  
 Detector: UV 254 nm  
 Column: 4.6-mm × 25-cm; packing L1  
 Column temperature: 40°  
 Flow rate: 1.5 mL/min  
 Injection volume: 20 µL

**System suitability**

**Samples:** *System suitability solution A* and *System suitability solution B*

[NOTE—The relative retention times for guanine and acyclovir are about 0.6 and 1.0, respectively, in *System suitability solution A*.]

**Suitability requirements**

**Resolution:** NLT 2.0 between guanine and acyclovir, *System suitability solution A*

**Relative standard deviation:** NMT 2.0% for the acyclovir peak, *System suitability solution A*; NMT 2.0%, *System suitability solution B*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
 Calculate the percentage of the labeled amount of acyclovir (C<sub>8</sub>H<sub>11</sub>N<sub>5</sub>O<sub>3</sub>) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*  
 $r_S$  = peak response from the *Standard solution*  
 $C_S$  = concentration of USP Acyclovir RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of acyclovir in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

**PERFORMANCE TESTS****• DISSOLUTION <711>**

**Medium:** 0.1 N hydrochloric acid; 900 mL

**Apparatus 2:** 50 rpm

**Time:** 45 min

**Instrumental conditions**

**Mode:** UV

**Wavelength:** 254 nm

**Standard solution:** USP Acyclovir RS in *Medium*

**Sample solutions:** Dilute with *Medium* to a concentration that is similar to the *Standard solution*.

**Analysis:** Determine the amount of acyclovir (C<sub>8</sub>H<sub>11</sub>N<sub>5</sub>O<sub>3</sub>) dissolved from UV absorption at the wavelength of maximum absorbance on filtered portions of the solution under test.

**Tolerances:** NLT 80% (Q) of the labeled amount of acyclovir (C<sub>8</sub>H<sub>11</sub>N<sub>5</sub>O<sub>3</sub>) is dissolved.

- UNIFORMITY OF DOSE UNITS <905>** Meet the requirements for *Weight Variation*

**IMPURITIES****• PROCEDURE**

**Mobile phase, System suitability solution A, System suitability solution B, Sample solution, Chromatographic system, and System suitability:** Proceed as directed in the *Assay*.

**Analysis**

**Sample:** *Sample solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response for each impurity  
 $r_T$  = sum of the responses for all of the peaks

**Acceptance criteria**

**Guanine:** NMT 2.0%

**Any other impurity:** NMT 0.5%

**ADDITIONAL REQUIREMENTS**

- PACKAGING AND STORAGE:** Preserve in tight containers. Store between 15° and 25°. Protect from light and moisture.

**• USP REFERENCE STANDARDS <11>**

USP Acyclovir RS

**Add the following:**

**• Adapalene**

C<sub>28</sub>H<sub>28</sub>O<sub>3</sub> 412.52  
 2-Naphthalenecarboxylic acid, 6-(4-methoxy-3-tricyclo[3.3.1.1.3,7]dec-1-ylphenyl)-;  
 6-[3-(1-Adamantyl)-4-methoxyphenyl]-2-naphthoic acid.  
 [106685-40-9].

**DEFINITION**

Adapalene contains NLT 98.0% and NMT 102.0% of adapalene (C<sub>28</sub>H<sub>28</sub>O<sub>3</sub>), calculated on the dried basis.

**IDENTIFICATION****• A. INFRARED ABSORPTION <197K>**

- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY****• PROCEDURE**

**Mobile phase:** Acetonitrile, tetrahydrofuran, trifluoroacetic acid, and water (21: 16: 0.01: 13)

**Standard stock solution:** 0.2 mg/mL of USP Adapalene RS in *Mobile phase*. Dissolve USP Adapalene RS in a minimal amount of tetrahydrofuran (about 1%–5% of the final volume), using sonication as needed, and dilute with *Mobile phase* to volume.

**Standard solution:** 40 µg/mL of USP Adapalene RS in *Mobile phase* from the *Standard stock solution*

**Sample stock solution:** 0.2 mg/mL of Adapalene in *Mobile phase*. Dissolve Adapalene in a minimal amount of tetrahydrofuran (about 1%–5% of the final volume), using sonication as needed, and dilute with *Mobile phase* to volume.

**Sample solution:** 40 µg/mL of Adapalene in *Mobile phase* from the *Sample stock solution*

**Chromatographic system**

(See *Chromatography <621>*, *System Suitability*.)

**Mode:** LC

**Detector:** UV 235 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L1

**Flow rate:** 1 mL/min

**Injection volume:** 20 µL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Relative standard deviation:** NMT 1.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of adapalene (C<sub>28</sub>H<sub>28</sub>O<sub>3</sub>) in the portion of Adapalene taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_u$  = peak response from the *Sample solution*  
 $r_s$  = peak response from the *Standard solution*  
 $C_s$  = concentration of USP Adapalene RS in the *Standard solution* (µg/mL)  
 $C_u$  = concentration of Adapalene in the *Sample solution* (µg/mL)

**Acceptance criteria:** 98.0%–102.0% on the dried basis

### IMPURITIES

• **RESIDUE ON IGNITION** (281): NMT 0.20%

• **HEAVY METALS**, *Method II* (231): NMT 20 µg/g

[NOTE—On the basis of the synthetic route, perform either *Organic Impurities, Procedure 1* or *Organic Impurities, Procedure 2*.]

#### • ORGANIC IMPURITIES, PROCEDURE 1

*Procedure 1* is recommended if adapalene related compounds A and B may be present.

**Mobile phase:** Proceed as directed in the *Assay*.

**Standard stock solution:** 0.2 mg/mL of USP Adapalene RS, 0.3 mg/mL of USP Adapalene Related Compound A RS, and 0.2 mg/mL of USP Adapalene Related Compound B RS in *Mobile phase*. Dissolve USP Adapalene RS, USP Adapalene Related Compound A RS, and USP Adapalene Related Compound B RS in a minimal amount of tetrahydrofuran (about 1%–5% of the final volume), using sonication as needed, and dilute with *Mobile phase* to volume.

**Standard solution:** 0.2 µg/mL of USP Adapalene RS, 0.3 µg/mL of USP Adapalene Related Compound A RS, and 0.2 µg/mL of USP Adapalene Related Compound B RS in *Mobile phase* from the *Standard stock solution*

**Sample solution:** 0.2 mg/mL of Adapalene in *Mobile phase*. Dissolve Adapalene in a minimal amount of tetrahydrofuran (about 1%–5% of the final volume), using sonication as needed, and dilute with *Mobile phase* to volume.

**Chromatographic system:** Proceed as directed in the *Assay*, except use a run time of NLT two times the retention time of adapalene peak for *Standard solution* and NLT six times the retention time of adapalene peak for *Sample solution*.

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Relative standard deviation:** NMT 3.0% for the adapalene peak

**Column efficiency:** NLT 3000 theoretical plates for the adapalene peak

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of adapalene related compounds A and B in the portion of Adapalene taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

$r_u$  = peak area of each impurity from the *Sample solution*  
 $r_s$  = peak area of corresponding adapalene related compound A or adapalene related compound B from the *Standard solution*  
 $C_s$  = concentration of corresponding USP Adapalene Related Compound A RS or USP Adapalene Related Compound B RS in the *Standard solution* (mg/mL)  
 $C_u$  = concentration of Adapalene in the *Sample solution* (mg/mL)

Calculate the percentage of each unspecified impurity in the portion of Adapalene taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

$r_u$  = peak area of each unspecified impurity from the *Sample solution*  
 $r_s$  = peak area of adapalene from the *Standard solution*

$C_s$  = concentration of USP Adapalene RS in the *Standard solution* (mg/mL)

$C_u$  = concentration of Adapalene in the *Sample solution* (mg/mL)

**Acceptance criteria:** See *Table 1*. Disregard any impurity peaks less than 0.05%.

**Table 1**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Adapalene related compound A <sup>a</sup>	0.52	0.10
Adapalene	1.0	—
Adapalene related compound B <sup>b</sup>	1.57	0.10
Any individual unspecified impurity	—	0.10
Total impurities	—	0.50

<sup>a</sup> Methyl 6-bromo-2-naphthoate.

<sup>b</sup> Methyl 6-[3-(1-Adamantyl)-4-methoxyphenyl]-2-naphthoate.

#### • ORGANIC IMPURITIES, PROCEDURE 2

*Procedure 2* is recommended if adapalene related compounds E, C, and D may be present.

**Solution A:** Glacial acetic acid and water (0.1:100)

**Solution B:** Acetonitrile and tetrahydrofuran (65:35)

**Mobile phase:** See *Table 2*.

**Table 2**

Time (min)	Solution A (%)	Solution B (%)
0	50	50
2.5	50	50
40	28	72
42	28	72
42.1	50	50
50	50	50

**Diluent:** Acetonitrile, tetrahydrofuran, and water (37:20:43)

**Standard stock solution:** 0.2 mg/mL of USP Adapalene RS in tetrahydrofuran

**Standard solution:** 2.0 µg/mL of USP Adapalene RS in *Diluent* from the *Standard stock solution*

**System suitability solution:** 0.2 mg/mL of USP Adapalene RS and 1.2 µg/mL each of USP Adapalene Related Compound C RS, USP Adapalene Related Compound D RS, and USP Adapalene Related Compound E RS prepared by dissolving the standards in tetrahydrofuran equivalent to 50% of the final volume, and diluting with *Diluent* to volume

**Sample solution:** 2.0 mg/mL of Adapalene prepared by dissolving in tetrahydrofuran equivalent to 50% of the final volume, and diluting with *Diluent* to volume

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 270 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L11 with 7.5% carbon loading

**Column temperature:** 30°

**Flow rate:** 1.2 mL/min

**Injection volume:** 25 µL

#### System suitability

**Sample:** *System suitability solution*

#### Suitability requirements

**Resolution:** NLT 4.5 between the adapalene and adapalene related compound C peaks

**Signal-to-noise ratio:** NLT 10 for the adapalene related compound C peak

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Adapalene taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_S$  = peak response of adapalene from the *Standard solution*

$C_S$  = concentration of adapalene in the *Standard solution* (mg/mL)

$C_U$  = concentration of Adapalene in the *Sample solution* (mg/mL)

$F$  = relative response factor for each individual impurity (see *Table 3*)

**Acceptance criteria:** See *Table 3*. Disregard any impurity peaks less than 0.05%.

**Table 3**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Adapalene related compound E <sup>a</sup>	0.3	1.4	0.3
Hydroxyadapalene <sup>b</sup>	0.5	0.91	0.1
Adapalene related compound C <sup>c</sup>	0.9	0.14	0.1
Adapalene	1.0	—	—
Adapalene related compound D <sup>d</sup>	1.9	0.71	0.2
Any individual unspecified impurity	—	1.0	0.1
Total impurities	—	—	0.5

<sup>a</sup> 2,2'-Binaphthyl-6,6'-dicarboxylic acid.

<sup>b</sup> 6-[3-(3-Hydroxyadamant-1-yl)-4-methoxyphenyl]-2-naphthoic acid.

<sup>c</sup> 2-(Adamant-1-yl)methoxybenzene.

<sup>d</sup> 4,4'-Dimethoxy-3,3'-di(adamant-1-yl)biphenyl.

• **RESIDUAL SOLVENT: LIMIT OF TRIETHYLAMINE**

[NOTE—This test should be performed if triethylamine is used in the manufacturing process.]

**Diluent:** Dimethyl sulfoxide and 1 N sodium hydroxide solution (4:1)

**Standard solution:** 3.2 µg/mL of USP Triethylamine RS in *Diluent*

**Sample solution:** 40 mg/mL of Adapalene in *Diluent*

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 30-m × 0.53-mm; 3.0-µm coating of G27

**Temperatures**

**Injection port:** 250°

**Detector:** 300°

**Column:** See *Table 4*.

**Table 4**

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
40	0	40	5
40	40	240	5

**Headspace operating parameters**

[NOTE—Headspace operating parameters can be modified in order to optimize the performance.]

**Equilibration temperature:** 95°

**Equilibration time:** 15 min

**Transfer line temperature:** 125°

**Pressurization time:** 3 min

**Carrier gas:** Nitrogen

**Flow rate:** 4.8 mL/min

**Injection volume:** 1 mL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Relative standard deviation:** NMT 15%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the content, in ppm, of triethylamine in the portion of Adapalene taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 10^6$$

$r_U$  = peak response of triethylamine from the *Sample solution*

$r_S$  = peak response of triethylamine from the *Standard solution*

$C_S$  = concentration of triethylamine in the *Standard solution* (mg/mL)

$C_U$  = concentration of Adapalene in the *Sample solution* (mg/mL)

**Acceptance criteria:** NMT 80 ppm

**SPECIFIC TESTS**

• **LOSS ON DRYING** <731>

**Analysis:** Dry a sample at 105° for 4 h.

**Acceptance criteria:** NMT 0.6%

**ADDITIONAL REQUIREMENTS**

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at room temperature.

• **LABELING:** If a test for *Organic Impurities* other than *Procedure 1* is used, the labeling states the test with which the article complies.

• **USP REFERENCE STANDARDS** <11>

## Adenine

C<sub>5</sub>H<sub>5</sub>N<sub>5</sub>

1H-Purin-6-amine;

1,6-Dihydro-6-iminopurine [73-24-5].

135.13

**DEFINITION**

Adenine contains NLT 98.0% and NMT 102.0% of  $C_5H_5N_5$ , calculated on the dried basis.

**IDENTIFICATION**

- **INFRARED ABSORPTION** <197K>

**ASSAY**

- **PROCEDURE**

**Sample:** 200 mg of Adenine

**Blank:** 80 mL of a mixture of 100 mL of glacial acetic acid and 300 mL of acetic anhydride

**Titrimetric System**

**Mode:** Direct titration

**Titrant:** 0.1 N perchloric acid VS standardized as follows: Transfer 300 mg of potassium biphthalate to a 150-mL beaker and, by stirring, dissolve in 80 mL of a mixture of 100 mL of glacial acetic acid and 300 mL of acetic anhydride. Titrate with the perchloric acid solution. Each 20.42 mg of potassium biphthalate is equivalent to 1 mL of 0.1 N perchloric acid.

**Endpoint detection:** Potentiometric

**Analysis:** Dissolve the *Sample* in 80 mL of a mixture of 100 mL of glacial acetic acid and 300 mL of acetic anhydride by stirring, and titrate with the *Titrant*. Calculate the percentage of adenine ( $C_5H_5N_5$ ) in the portion taken:

$$\text{Result} = [(V - B) \times N \times F \times 100]/W$$

V = *Sample* titrant volume (mL)

B = *Blank* titrant volume (mL)

N = titrant normality (mEq/mL)

F = equivalency factor, 135.13 mg/mEq

W = weight of *Sample* (mg)

**Acceptance criteria:** 98.0%–102.0% on the dried basis

**IMPURITIES****Inorganic Impurities**

- **RESIDUE ON IGNITION** <281>: NMT 0.1%
- **HEAVY METALS**, *Method II* <231>: NMT 10 ppm

**Organic Impurities**

- **PROCEDURE**

**pH 7.0 phosphate buffer:** Dissolve 4.54 g of monobasic potassium phosphate in water to make 500 mL of solution. Dissolve 4.73 g of anhydrous dibasic sodium phosphate in water to make 500 mL of solution. Mix 38.9 mL of the monobasic potassium phosphate solution with 61.1 mL of the dibasic sodium phosphate solution. Adjust, if necessary, by the dropwise addition of the dibasic sodium phosphate solution to a pH of 7.0.

**Standard stock solution:** Dissolve a suitable quantity of USP Adenine RS in hot water, cool, and dilute quantitatively with water to obtain a solution having a known concentration of 0.19 mg/mL.

**Standard solutions:** Pipet 5-mL portions of the *Standard stock solution* into three 100-mL volumetric flasks, and dilute with 0.10 N hydrochloric acid, 0.010 N sodium hydroxide, and *pH 7.0 phosphate buffer*, respectively, to volume.

**Sample stock solution:** Dissolve a suitable quantity of Adenine in hot water, cool, and dilute quantitatively with water to obtain a solution having a known concentration of 0.19 mg/mL.

**Sample solutions:** Pipet 5-mL portions of the *Sample stock solution* into three 100-mL volumetric flasks, and dilute with 0.10 N hydrochloric acid, 0.010 N sodium hydroxide, and *pH 7.0 phosphate buffer*, respectively, to volume.

**Spectrometric conditions**

(See *Spectrophotometry and Light-Scattering* <851>.)

**Mode:** UV-Vis

**Wavelength range:** 220–320 nm

**Cell:** 1 cm

**Blank:** Water

**Analysis**

**Samples:** *Standard solutions* and *Sample solutions*

**Acceptance criteria:** The respective absorptivities, calculated on the dried basis, at the wavelengths of maximum absorbance, for each pair of corresponding solutions do not differ by more than 2.0%.

**SPECIFIC TESTS**

- **LOSS ON DRYING** <731>: Dry a sample at 110° for 4 h: it loses NMT 1.0% of its weight.
- **NITROGEN CONTENT**, *Method II* <461>: 50.2%–53.4%, calculated on the dried basis

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** <11>  
USP Adenine RS

---

**Adenosine**

---

$C_{10}H_{13}N_5O_4$

6-Amino-9-β-D-ribofuranosyl-9H-purine;

9-β-D-Ribofuranosyladenine [58-61-7].

267.24

**DEFINITION**

Adenosine contains NLT 99.0% and NMT 101.0% of adenosine ( $C_{10}H_{13}N_5O_4$ ), calculated on the dried basis.

**IDENTIFICATION**

- **A. INFRARED ABSORPTION** <197M>

**ASSAY**

- **ADENOSINE**

**Sample:** 200 mg of Adenosine previously dried at 105° for 2 h

**Titrimetric system**

(See *Titrimetry* <541>.)

**Mode:** Direct titration

**Titrant:** 0.1 N perchloric acid VS

**Endpoint detection:** Potentiometric

**Blank:** 50 mL of glacial acetic acid

**Analysis:** Dissolve the *Sample* in 50 mL of glacial acetic acid, and titrate with 0.1 N perchloric acid VS. Calculate the percentage of adenosine ( $C_{10}H_{13}N_5O_4$ ) in the portion of Adenosine taken:

$$\text{Result} = [(V_S - V_B) \times N \times F \times 100]/W$$

$V_S$  = *Titrant* volume consumed by the *Sample* (mL)

$V_B$  = *Titrant* volume consumed by the *Blank* (mL)

N = normality of the *Titrant* (mEq/mL)

F = equivalency factor, 267.25 mg/mEq

W = *Sample* weight (mg)

Acceptance criteria: 99.0%–101.0% on the dried basis

#### IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%
- **HEAVY METALS**, *Method II* (231): NMT 10 ppm

#### Delete the following:

##### ▲ LIMIT OF AMMONIA

**Sample solution:** Suspend 0.5 g in 10 mL of water. Stir for 30 s, and pass through a coarse filter. Dilute the filtrate with water to 15 mL, and use the filtrate.

**Standard solution:** 0.4 µg/mL of ammonium chloride in water

**Analysis:** To the *Sample solution* and the *Standard solution* add 0.3 mL of alkaline mercuric–potassium iodide TS, cap the test tubes, and allow to stand for 5 min.

**Acceptance criteria:** The *Sample solution* does not exhibit a more intense yellow color than that of the *Standard solution* (NMT 4 ppm of ammonia).▲USP36

#### Delete the following:

##### ▲ LIMIT OF CHLORIDE

**Sample solution:** Suspend 0.2 g in 10 mL of water. Stir for 30 s, pass through a coarse filter, and use the filtrate.

**Standard solution:** 2.3 µg/mL of sodium chloride in water

**Analysis:** To the *Sample solution* and 10 mL of the *Standard solution* add 1 mL of nitric acid and 1 mL of silver nitrate TS, and dilute each solution with water to 40 mL. Allow the solutions to stand for 5 min, protected from light.

**Acceptance criteria:** When viewed against a dark background, the *Sample solution* is not more turbid than the *Standard solution* (NMT 0.007% chloride).▲USP36

#### Delete the following:

##### ▲ LIMIT OF SULFATE

**Sample solution:** Suspend 0.75 g in 15 mL of water. Stir for 30 s, pass through a coarse filter, and use the filtrate.

**Standard solution:** Add 0.15 mL of 0.020 N sulfuric acid to 15 mL of water.

**Analysis:** To the *Sample solution* and the *Standard solution* add 2 mL of barium chloride TS and 1 mL of 3 N hydrochloric acid, dilute each solution with water to 30 mL, and mix. Allow the solutions to stand for 5 min.

**Acceptance criteria:** The *Sample solution* is not more turbid than the *Standard solution* (NMT 0.02% sulfate).

▲USP36

##### • ORGANIC IMPURITIES

**Solution A:** 6.8 g/L of potassium hydrogen sulfate and 3.4 g/L of tetrabutylammonium hydrogen sulfate in water. Adjust with 2 N potassium hydroxide to a pH of 6.5.

**Solution B:** 0.1 g/L of sodium azide solution

**Mobile phase:** *Solution A* and *Solution B* (60:40)

**System suitability solution:** 0.2 mg/mL each of Adenosine and inosine in *Mobile phase*

**Sample solution:** 1 mg/mL of Adenosine in *Mobile phase*

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L1

**Flow rate:** 1.5 mL/min

**Injection volume:** 20 µL

**Run time:** 2 times the retention time of adenosine

**System suitability**

**Sample:** *System suitability solution*

**Suitability requirements**

**Resolution:** NLT 9.0 between adenosine and inosine

**Tailing factor:** NMT 2.5

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Sample:** *Sample solution*

Calculate the percentage of each impurity in the portion of Adenosine taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_T$  = sum of all the responses for all peaks from the *Sample solution*

**Acceptance criteria**

**Individual impurities:** NMT 0.1% each of guanosine, inosine, and uridine, and NMT 0.2% of adenine

**Total impurities:** NMT 0.5%

#### SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE** (741): 233°–238°

- **OPTICAL ROTATION**, *Specific Rotation* (7815)

**Sample solution:** 20 mg/mL in sodium hydroxide solution (1 in 20), from a sample previously dried at 105° for 2 h

**Acceptance criteria:** –68° to –72°

#### Delete the following:

- **ACIDITY OR ALKALINITY:** Suspend 1 g in 20 mL of carbon dioxide-free water. Stir for 30 s, and pass through a coarse filter. To each of two 10-mL portions of the filtrate add 0.1 mL of bromocresol purple TS.

**Acceptance criteria:** NMT 0.3 mL of 0.01 N sodium hydroxide is required to produce a blue-violet color in one portion. NMT 0.1 mL of 0.01 N hydrochloric acid is required to produce a yellow color in the other portion.

▲USP36

- **LOSS ON DRYING** (731)

**Analysis:** Dry a sample at 105° for 2 h.

**Acceptance criteria:** NMT 0.5%

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at controlled room temperature.
- **USP REFERENCE STANDARDS** (11)  
USP Adenosine RS

## Adenosine Injection

#### DEFINITION

Adenosine Injection is a sterile solution of Adenosine in Water for Injection. It may contain Sodium Chloride. It contains NLT 90.0% and NMT 110.0% of the labeled amount of adenosine (C<sub>10</sub>H<sub>13</sub>N<sub>5</sub>O<sub>4</sub>).

#### IDENTIFICATION

- The retention time of the adenosine peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY****Change to read:****PROCEDURE**

**Mobile phase:** Dissolve 2.0 g of monobasic potassium phosphate in 800 mL of water. Add 5 mL of 1.0 M tetrabutylammonium dihydrogen phosphate, dilute with water to 980 mL, and mix. Add 20 mL of acetonitrile.

**System suitability solution:** 0.03 mg/mL each of USP Adenosine RS and inosine dissolved in warm water (50° to 55°), and diluted with water

**Standard solution:** 0.03 mg/mL of USP Adenosine RS dissolved in warm water (50° to 55°), and diluted with water to volume. Before addition of the warm water, if sodium chloride is present in the Injection, add 0.01 mL of a solution of sodium chloride (0.9 in 100) per mL of the anticipated final volume of the *Standard solution*.

▲<sup>USP36</sup>

**Sample solution:** Nominally 0.03 mg/mL of adenosine, from a suitable volume of Injection in water

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 3.9-mm × 30-cm; packing L1

**Flow rate:** 2.5 mL/min

**Injection volume:** 10 µL

**Run time:** 2.5 times the retention time of adenosine

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

▲[NOTE—The relative retention times of inosine and adenosine are 0.43 and 1.0, respectively.]▲<sup>USP36</sup>

**Suitability requirements**

**Resolution:** NLT 6.0 between adenosine and inosine, *System suitability solution*

**Tailing factor:** NMT 2.0 for the adenosine peak, *System suitability solution*

**Relative standard deviation:** NMT 1.5%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of adenosine (C<sub>10</sub>H<sub>13</sub>N<sub>5</sub>O<sub>4</sub>) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Adenosine RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of adenosine in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

**IMPURITIES****Change to read:****ORGANIC IMPURITIES**

**Mobile phase, System suitability solution, Standard solution, ▲<sup>USP36</sup> Chromatographic system, and System suitability:** Proceed as directed in the *Assay*.

**Sample solution:** Nominally 0.3 mg/mL of adenosine from a volume of Injection, in water

**Analysis**

**Sample:** *Sample solution*

Calculate the percentage of each impurity in the volume of Injection taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response for each impurity

$r_T$  = sum of the responses of all of the peaks

**Acceptance criteria**

**Any individual impurity:** NMT 1.0%

**Total impurities:** NMT 1.5%

**SPECIFIC TESTS**

• **PH** <791>: 4.5–7.5

• **PARTICULATE MATTER IN INJECTIONS** <788>: It meets the requirements for small-volume injections.

• **BACTERIAL ENDOTOXINS TEST** <85>: When the product is used for rapid intravenous injection, it contains NMT 11.62 USP Endotoxin Units/mg of adenosine. When the product is used for continuous peripheral intravenous infusion, it contains NMT 5.95 USP Endotoxin Units/mg of adenosine.

• **OTHER REQUIREMENTS:** It meets the requirements under *Injections* <1>.

**ADDITIONAL REQUIREMENTS**

• **PACKAGING AND STORAGE:** Preserve in tight, single-dose containers, preferably of Type I glass, and store at controlled room temperature.

• **USP REFERENCE STANDARDS** <11>

USP Adenosine RS

USP Endotoxin RS

**Medical Air**

» Medical Air is a natural or synthetic mixture of gases consisting largely of nitrogen and oxygen. It contains not less than 19.5 percent and not more than 23.5 percent, by volume, of O<sub>2</sub>.

**Packaging and storage**—Preserve in cylinders or in a low pressure collecting tank. Containers used for Medical Air are not to be treated with any toxic, sleep-inducing, or narcosis-producing compounds, and are not to be treated with any compound that would be irritating to the respiratory tract when the Medical Air is used.

[NOTE—Reduce the container pressure by means of a regulator. Measure the gases with a gas volume meter downstream from the detector tube in order to minimize contamination or change of the specimens. The various detector tubes called for in the respective tests are listed under *Reagent Specifications* in the section *Reagents, Indicators, and Solutions*.]

**Labeling**—Where it is piped directly from the collecting tank to the point of use, label each outlet “Medical Air.”

**Water and oil**—Support 1 container in an inverted position (with the valve at the bottom) for 5 minutes. Cautiously open the valve slightly, maintaining the container in an inverted position. Vent the gas with a barely audible flow against a stainless steel mirror for a few seconds: no liquid is discernible on the mirror.

**Odor**—Carefully open the container valve to produce a moderate flow of gas. Do not direct the gas stream toward the face, but deflect a portion of the stream toward the nose: no appreciable odor is discernible.

**Carbon dioxide**—Pass 1000 ± 50 mL through a carbon dioxide detector tube at the rate specified for the tube: the indicator change corresponds to not more than 0.05%.

**Carbon monoxide**—Pass 1000 ± 50 mL through a carbon monoxide detector tube at the rate specified for the tube: the indicator change corresponds to not more than 0.001%.

**Limit of nitric oxide and nitrogen dioxide**—Pass 550 ± 50 mL through a nitric oxide–nitrogen dioxide detector tube at the rate specified for the tube: the indicator change corresponds to not more than 2.5 ppm.

**Sulfur dioxide**—Pass  $1050 \pm 50$  mL through a sulfur dioxide detector tube at the rate specified for the tube: the indicator change corresponds to not more than 5 ppm.

**Assay**—Determine the oxygen concentration of Medical Air using an electrochemical cell analyzer readable to 0.1% of oxygen and calibrated with ambient air to an accuracy of  $\pm 0.2\%$  of oxygen. [NOTE—The instrument utilizes the variations of electric current produced by the interaction of oxygen with an electrochemical cell to display the oxygen strength of a confined sample or an in-line flow of the gas. This current generates a signal proportional to the oxygen concentration, which is displayed on a meter.]

## Alanine

$C_3H_7NO_2$   
L-Alanine [56-41-7].

89.09

### DEFINITION

Alanine contains NLT 98.5% and NMT 101.5% of  $C_3H_7NO_2$ , as L-alanine, calculated on the dried basis.

### IDENTIFICATION

- **INFRARED ABSORPTION** <197K>

### ASSAY

#### • PROCEDURE

**Sample:** 80 mg of Alanine

**Titrimetric system**

(See *Titrimetry* <541>.)

**Mode:** Direct titration

**Titrant:** 0.1 N perchloric acid VS

**Endpoint detection:** Potentiometric

**Blank:** 3 mL of formic acid in 50 mL of glacial acetic acid

**Analysis:** Dissolve the *Sample* in a mixture of 3 mL of formic acid and 50 mL of glacial acetic acid, and titrate with 0.1 N perchloric acid VS. Calculate the percentage of  $C_3H_7NO_2$  in the portion taken:

$$\text{Result} = [(V - B) \times N \times F \times 100] / W$$

V = *Sample* titrant volume (mL)

B = *Blank* titrant volume (mL)

N = titrant normality (mEq/mL)

F = equivalency factor: 89.09 mg/mEq

W = weight of the *Sample* (mg)

**Acceptance criteria:** 98.5%–101.5% on the dried basis

### IMPURITIES

#### Inorganic Impurities

- **RESIDUE ON IGNITION** <281>: NMT 0.15%
- **CHLORIDE AND SULFATE**, *Chloride* <221>: A 1.0-g portion shows no more chloride than corresponds to 0.70 mL of 0.020 N hydrochloric acid (0.05%).
- **CHLORIDE AND SULFATE**, *Sulfate* <221>: A 1.0-g portion shows no more sulfate than corresponds to 0.30 mL of 0.020 N sulfuric acid (0.03%).
- **IRON** <241>: NMT 30 ppm
- **HEAVY METALS**, *Method I* <31>: NMT 15 ppm

#### Organic Impurities

##### • PROCEDURE

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture

**Standard solution:** 0.05 mg/mL of USP L-Alanine RS.

[NOTE—This solution has a concentration equivalent to 0.5% of that of the *Sample solution*.]

**System suitability solution:** 0.4 mg/mL each of USP L-Alanine RS and USP Glycine RS

**Sample solution:** 10 mg/mL of Alanine

**Spray reagent:** 2 mg/mL of ninhydrin in a mixture of butyl alcohol and 2 N acetic acid (95:5)

**Developing solvent system:** Butyl alcohol, glacial acetic acid, and water (60:20:20)

**Application volume:** 5  $\mu$ L

#### Analysis

**Samples:** *Standard solution*, *System suitability solution*, and *Sample solution*

Proceed as directed for *Chromatography* <621>, *Thin-Layer Chromatography*. After air-drying the plate, repeat the development process. After air-drying a second time, spray with *Spray reagent*, and heat to  $100^\circ$ – $105^\circ$  for 15 min. Examine the plate under white light. The chromatogram obtained from the *System suitability solution* exhibits two clearly separated spots.

#### Acceptance criteria

**Individual impurities:** Any secondary spot of the *Sample solution* is not larger or more intense than the principal spot of the *Standard solution*, NMT 0.5%

**Total impurities:** NMT 2.0%

### SPECIFIC TESTS

- **OPTICAL ROTATION**, *Specific Rotation* <781S>:  $+13.7^\circ$  to  $+15.1^\circ$

**Sample solution:** 100 mg/mL in 6 N hydrochloric acid

- **pH** <791>: 5.5–7.0, in a solution (1 in 20)
- **LOSS ON DRYING** <731>: Dry a sample at  $105^\circ$  for 3 h: it loses NMT 0.2% of its weight.

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- **USP REFERENCE STANDARDS** <11>  
USP L-Alanine RS  
USP Glycine RS

## Albendazole

$C_{12}H_{15}N_3O_2S$  265.33

Carbamic acid, [5-(propylthio)-1H-benzimidazol-2-yl]-, methyl ester;

Methyl 5-(propylthio)-2-benzimidazolecarbamate [54965-21-8].

### DEFINITION

Albendazole contains NLT 98.0% and NMT 102.0% of albendazole ( $C_{12}H_{15}N_3O_2S$ ), calculated on the dried basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION** <197M>
- **B.** The  $R_f$  value of the principal spot of the *Sample solution* corresponds to that of the principal spot of the *Standard solution*, as obtained in the test for *Organic Impurities*.

### ASSAY

#### • PROCEDURE

**Sample:** 250 mg of Albendazole

**Analysis:** Transfer the *Sample* to a suitable flask, and dissolve in 100 mL of glacial acetic acid, warming gently if necessary. Cool, and titrate with 0.1 N perchloric acid VS to a potentiometric endpoint (see *Titrimetry* <541>).

Perform a blank determination. Each mL of 0.1 N perchloric acid is equivalent to 26.53 mg of  $C_{12}H_{15}N_3O_2S$ .  
**Acceptance criteria:** 98.0%–102.0% on the dried basis

**IMPURITIES**

- **RESIDUE ON IGNITION** (281): NMT 0.2%

- **ORGANIC IMPURITIES**

**Standard stock solution:** 5 mg/mL of USP Albendazole RS in glacial acetic acid

**Standard solution:** 0.05 mg/mL of USP Albendazole RS in glacial acetic acid from *Standard stock solution*

**Sample solution:** 10 mg/mL in glacial acetic acid

**Chromatographic system**

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

**Mode:** TLC

**Adsorbant:** 0.25-mm layer of silica gel mixture

**Application volume:** 10  $\mu$ L

**Developing solvent system:** Chloroform, ether, and glacial acetic acid (60:10:10)

**Analysis:** Proceed as directed for *Chromatography* (621), *Thin-Layer Chromatography*.

**Samples:** *Standard stock solution*, *Standard solution*, and *Sample solution*

Develop the chromatogram in the *Developing solvent system* until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, allow the solvent to evaporate from the plate, and examine the plate under short-wavelength UV light.

**Acceptance criteria:** 0.5%; no spot, other than the principal spot of the *Sample solution*, is larger or more intense than the principal spot of the *Standard solution*.

**SPECIFIC TESTS**

- **LOSS ON DRYING** (731)

**Analysis:** Dry at 105° for 4 h.

**Acceptance criteria:** NMT 0.5%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- **USP REFERENCE STANDARDS** (11)  
USP Albendazole RS

**Sample stock solution:** Equivalent to 1 mg/mL of albendazole from a volume of Oral Suspension in *Solution A*

**Sample solution:** Nominally 100  $\mu$ g/mL of albendazole from *Sample stock solution* in *Mobile phase*. [NOTE—Filter, if necessary, to obtain a clear solution.]

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 308 nm

**Column:** 4-mm  $\times$  25-cm; packing L1

**Flow rate:** 2 mL/min

**Injection volume:** 20  $\mu$ L

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Column efficiency:** NLT 2000 theoretical plates

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of albendazole ( $C_{12}H_{15}N_3O_2S$ ) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Albendazole RS in the *Standard solution* ( $\mu$ g/mL)

$C_U$  = nominal concentration of albendazole in the *Sample solution* ( $\mu$ g/mL)

**Acceptance criteria:** 90.0%–110.0%

**SPECIFIC TESTS**

- **PH** (791): 4.5–5.5

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- **LABELING:** Label it to indicate that it is for veterinary use only.
- **USP REFERENCE STANDARDS** (11)  
USP Albendazole RS

---

## Albendazole Oral Suspension

---

**DEFINITION**

Albendazole Oral Suspension is Albendazole in an aqueous vehicle. It contains one or more preservatives and dispersing or suspending agents. It contains NLT 90.0% and NMT 110.0% of the labeled amount of albendazole ( $C_{12}H_{15}N_3O_2S$ ).

**IDENTIFICATION**

- **A. ULTRAVIOLET ABSORPTION** (197U)

**Sample stock solution:** 1 mg/mL of albendazole from a quantity of Suspension, in a mixture of methanol and hydrochloric acid (99:1). Filter the mixture, if necessary, to obtain a clear solution.

**Sample solution:** 0.01 mg/mL of albendazole in 0.1 N sodium hydroxide from *Sample stock solution*

**Acceptance criteria:** Meets the requirements

**ASSAY**

- **PROCEDURE**

**Solution A:** Methanol and hydrochloric acid (99:1)

**Solution B:** 13.75 g/L of monobasic sodium phosphate

**Mobile phase:** Methanol and *Solution B* (60:40)

**Standard stock solution:** 1 mg/mL of USP Albendazole RS in *Solution A*

**Standard solution:** 100  $\mu$ g/mL of USP Albendazole RS from *Standard stock solution* in *Mobile phase*

---

## Albendazole Tablets

---

» Albendazole Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of albendazole ( $C_{12}H_{15}N_3O_2S$ ).

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

**Labeling**—Tablets intended for veterinary use only are so labeled.

**USP Reference standards** (11)—

USP Albendazole RS

USP Parbendazole RS

**Identification**—

**A:** *Ultraviolet Absorption* (197U)—

**Solution:** Dilute a portion of the clear filtrate used to prepare the *Assay preparation* and a portion of the stock solution used to prepare the *Standard preparation* prepared in the *Assay* with *Acidified methanol*, prepared as directed for *Dissolution*, to obtain solutions containing about 10  $\mu$ g of albendazole per mL.

**B:** The retention time of the major peak for albendazole in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Dissolution** (711)—

*Medium:* 0.1 N hydrochloric acid; 900 mL.

*Apparatus 2:* 50 rpm.

*Time:* 30 minutes.

Determine the amount of  $C_{12}H_{15}N_3O_2S$  dissolved using the following procedure.

*Acidified methanol*—To about 50 mL of methanol in a 100-mL volumetric flask add 2 mL of hydrochloric acid, dilute with methanol to volume, and mix.

*Standard solution*—Transfer about 90 mg of USP Albendazole RS, accurately weighed, to a 250-mL volumetric flask, add 10 mL of *Acidified methanol*, and shake to dissolve. Dilute with 0.1 N hydrochloric acid to volume, and mix. Transfer 5.0 mL of this solution to a 200-mL volumetric flask, dilute with 0.1 N sodium hydroxide to volume, and mix.

*Procedure*—Transfer 10.0 mL of a filtered portion of the solution under test to a 250-mL volumetric flask, dilute with 0.1 N sodium hydroxide to volume, and mix. Concomitantly determine the absorbances of this solution and the *Standard solution* at the wavelengths of maximum and minimum absorbance at about 308 nm and 350 nm, using 0.1 N sodium hydroxide as the blank. Calculate the quantity, in mg, of  $C_{12}H_{15}N_3O_2S$  dissolved by the formula:

$$22.5C(A_U / A_S)$$

in which C is the concentration, in  $\mu\text{g}$  per mL, of USP Albendazole RS in the *Standard solution*; and  $A_U$  and  $A_S$  are the differences in absorbance between 308 nm and 350 nm obtained from the solution under test and the *Standard solution*, respectively.

*Tolerances*—Not less than 80% (Q) of the labeled amount of  $C_{12}H_{15}N_3O_2S$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

*Procedure for content uniformity*—

*Acidified methanol and Standard solution*—Prepare as directed under *Dissolution*.

*Test solution*—Place 1 Tablet in a 500-mL volumetric flask, add about 300 mL of *Acidified methanol*, and shake by mechanical means for about 30 minutes. Dilute with *Acidified methanol* to volume, and mix. Filter a portion of this solution, discarding the first 20 mL of the filtrate. Transfer 4.0 mL of the clear filtrate to a 200-mL volumetric flask, dilute with 0.1 N sodium hydroxide to volume, and mix.

*Procedure*—Concomitantly determine the absorbances of the *Standard solution* and the *Test solution* at the wavelengths of maximum and minimum absorbance at about 308 nm and 350 nm, using 0.1 N sodium hydroxide as the blank. Calculate the quantity, in mg, of  $C_{12}H_{15}N_3O_2S$  in the Tablet taken by the formula:

$$25C(A_U / A_S)$$

in which C is the concentration, in  $\mu\text{g}$  per mL, of USP Albendazole RS in the *Standard preparation*; and  $A_U$  and  $A_S$  are the differences in absorbance between 308 nm and 350 nm obtained from the *Test solution* and the *Standard solution*, respectively.

**Assay**—

*Mobile phase*—Dissolve 0.50 g of monobasic ammonium phosphate in 400 mL of water. Add 600 mL of methanol, mix, and filter, discarding the first 15 mL of the filtrate. Degass the clear filtrate before use. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Sulfuric acid in methanol*—Prepare a mixture of 1 mL of sulfuric acid and 99 mL of methanol.

*Internal standard solution*—Transfer about 150 mg of USP Parbendazole RS to a 50-mL volumetric flask. Add 5 mL of *Sulfuric acid in methanol*, 25 mL of methanol, and shake to dissolve. Dilute with methanol to volume, and mix.

*Standard preparation*—Transfer about 100 mg of USP Albendazole RS, accurately weighed, to a 50-mL volumetric flask. Add 5 mL of *Sulfuric acid in methanol* and 25 mL of methanol, and shake to dissolve. Dilute with methanol to volume, and mix. Transfer 5.0 mL of this stock solution and 5.0 mL of *Internal standard solution* to a second 50-mL volumetric flask, dilute with methanol to volume, and mix.

*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of albendazole, to a 50-mL volumetric flask. Add 5 mL of *Sulfuric acid in methanol* and 20 mL of methanol, and shake by mechanical means for about 15 minutes. Dilute with methanol to volume, mix, and filter, discarding the first 15 mL of the filtrate. Transfer 5.0 mL of the clear filtrate and 5.0 mL of *Internal standard solution* to a second 50-mL volumetric flask, dilute with methanol to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  25-cm column that contains 5- $\mu\text{m}$  packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 2.0; the column efficiency is not less than 1000 theoretical plates; the resolution between the albendazole peak and the parbendazole peak is not less than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—[NOTE—Use peak heights where peak responses are indicated.] Separately inject equal volumes (about 20  $\mu\text{L}$ ) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{12}H_{15}N_3O_2S$  in the portion of Tablets taken by the formula:

$$500C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of USP Albendazole RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak response ratios of the albendazole peak to the parbendazole peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Albumin Human

### DEFINITION

Albumin Human conforms to the regulations of the federal Food and Drug Administration concerning biologics (640.80 to 640.86) (see *Biologics* (1041)). It is a sterile, nonpyrogenic preparation of serum albumin obtained by fractionating material (source blood, plasma, serum, or placentas) from healthy human donors, the source material being tested for the absence of hepatitis B surface antigen. It is made by a process that yields a product that is safe for intravenous use. NLT 96% of its total protein is albumin. It is a solution containing, in each 100 mL, either 25 g of serum albumin osmotically equivalent to 500 mL of normal human plasma, or 20 g equivalent to 400 mL, or 5 g equivalent to 100 mL, or 4 g equivalent to 80 mL, and contains NLT 93.75% and NMT 106.25% of the labeled amount in the case of the solution containing 4 g in each 100 mL, and NLT 94.0% and NMT 106.0% of the labeled amount in the other cases. It contains no added antimicrobial agent, but may contain sodium acetyltrypophanate with or without sodium caprylate as a stabilizing agent. It has a sodium content of NLT 130

mEq/L and NMT 160 mEq/L. It has a heme content such that the absorbance of a solution, diluted to contain 1% of protein, in a 1-cm holding cell, measured at a wavelength of 403 nm, is NMT 0.25. It meets the requirements of the test for heat stability and for pH.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at the temperature recommended by the manufacturer or indicated on the label.
- **EXPIRATION DATE:** The expiration date is not later than 5 years after issue from manufacturer's cold storage (5°, 3 years) if labeling recommends storage between 2° and 10°; not later than 3 years after issue from manufacturer's cold storage (5°, 3 years) if labeling recommends storage at temperatures not higher than 37°; and not later than 10 years after date of manufacture if in a hermetically sealed metal container and labeling recommends storage between 2° and 10°.
- **LABELING:** Label it to state that it is not to be used if it is turbid and that it is to be used within 4 h after the container is entered. Label it also to state the osmotic equivalent in terms of plasma, the sodium content, and the type of source material (venous plasma, placental plasma, or both) from which it was prepared. Label it also to indicate that additional fluids are needed when the 20-g/100-mL or 25-g/100-mL product is administered to a markedly dehydrated patient.

## Albuterol

$C_{13}H_{21}NO_3$  239.31  
1,3-Benzenedimethanol,  $\alpha^1$ -[[[(1,1-dimethylethyl)amino]methyl]-4-hydroxy-;  
 $\alpha^1$ -[(*tert*-Butylamino)methyl]-4-hydroxy-*m*-xylene- $\alpha,\alpha'$ -diol  
[18559-94-9].

#### DEFINITION

Albuterol contains NLT 98.5% and NMT 101.0% of albuterol ( $C_{13}H_{21}NO_3$ ), calculated on the anhydrous basis.

#### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B. ULTRAVIOLET ABSORPTION** (197U)  
Sample solution: 80  $\mu$ g/mL in 0.1 N hydrochloric acid  
Acceptance criteria: Meets the requirements

#### ASSAY

- **PROCEDURE**  
Sample solution: 8 mg/mL of Albuterol in glacial acetic acid  
Analysis: To 50 mL of the *Sample solution* add 2 drops of crystal violet TS, and titrate with 0.1 N perchloric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 23.93 mg of  $C_{13}H_{21}NO_3$ .  
Acceptance criteria: 98.5%–101.0% on the anhydrous basis

#### IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%
- **ORGANIC IMPURITIES**  
Standard solution: 0.10 mg/mL of USP Albuterol RS in methanol  
Sample solution: 20 mg/mL of Albuterol in methanol

#### Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

**Mode:** TLC

**Adsorbent:** 0.25-mm layer of chromatographic silica gel

**Application volume:** 10  $\mu$ L

**Developing solvent system:** Methyl isobutyl ketone, isopropyl alcohol, ethyl acetate, ammonium hydroxide, and water (50:45:35:3:18)

**Visualization:** Iodine vapor

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Proceed as directed in the chapter, applying aliquots of the *Standard solution* and the *Sample solution*. Develop in the *Developing solvent system* until the solvent front has moved three-fourths the length of the plate. Remove the plate from the developing chamber, air-dry, and expose it to iodine vapor.

**Acceptance criteria:** Any spot, other than the principal spot, obtained from the *Sample solution* is not greater in size and intensity than the spot produced by the *Standard solution* (0.5%), and the sum of the impurities is not greater than 2.0%.

#### SPECIFIC TESTS

- **WATER DETERMINATION**, *Method I* (921): NMT 0.5%

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers.
- **USP REFERENCE STANDARDS** (11)  
USP Albuterol RS

## Albuterol Sulfate

$(C_{13}H_{21}NO_3)_2 \cdot H_2SO_4$  576.70  
1,3-Benzenedimethanol,  $\alpha^1$ -[[[(1,1-dimethylethyl)amino]methyl]-4-hydroxy-, sulfate (2:1) (salt).  
 $\alpha^1$ -[(*tert*-Butylamino)methyl]-4-hydroxy-*m*-xylene- $\alpha,\alpha'$ -diol sulfate (2:1) (salt) [51022-70-9].

» Albuterol Sulfate contains not less than 98.5 percent and not more than 101.0 percent of  $(C_{13}H_{21}NO_3)_2 \cdot H_2SO_4$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

**USP Reference standards** (11)—

USP Albuterol Related Compound A RS

4-[2-[(1,1-Dimethylethyl)amino]-1-hydroxyethyl]-2-methylphenol sulfate.

USP Albuterol Sulfate RS

#### Identification—

**A:** *Infrared Absorption* (197K).

**B:** *Ultraviolet Absorption* (197U)—

*Solution:* 80  $\mu$ g per mL.

*Medium:* 0.1 N hydrochloric acid.

**C:** Shake a quantity of it, equivalent to 4 mg of albuterol, with 10 mL of water, and filter: the filtrate so obtained meets the requirements of the tests for *Sulfate* (191).

**D:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Water, Method I** (921): not more than 0.5%.

**Residue on ignition** (281): not more than 0.1%.

**Chromatographic purity**—It meets the requirements of the test for *Chromatographic purity* under *Albuterol*, except to read *Albuterol Sulfate* in place of *Albuterol* and to use water instead of methanol as the solvent to prepare the *Standard solution* and the *Test solution*.

**Assay—**

0.05 ± 0.01 M *Ammonium acetate solution*—Dissolve 3.85 g of ammonium acetate in 1000 mL of water, and mix.

*Mobile phase*—Prepare a degassed mixture of water, 0.05 ± 0.01 M *Ammonium acetate solution*, and isopropanol [65:30: (5 ± 1)], and adjust dropwise with acetic acid to a pH of 4.5 ± 0.3.

*Resolution solution*—Dissolve accurately weighed quantities of USP *Albuterol Sulfate RS* and USP *Albuterol Related Compound A RS* in water, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.140 mg per mL and 0.030 mg per mL, respectively.

*Standard preparation*—Dissolve an accurately weighed quantity of USP *Albuterol Sulfate RS* in water, and dilute quantitatively with water to obtain a solution having a known concentration of about 0.6 mg per mL.

*Assay preparation*—Transfer about 60 mg of *Albuterol Sulfate*, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 276-nm detector and a 4.6-mm × 20-cm column that contains packing L10. The flow rate is about 2.0 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between albuterol and albuterol related compound A is not less than 1.5; and the relative standard deviation for replicate injections is not more than 1.5%.

*Procedure*—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $(C_{13}H_{21}NO_3)_2 \cdot H_2SO_4$  in the portion of *Albuterol Sulfate* taken by the formula:

$$100C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP *Albuterol Sulfate RS* in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Albuterol Tablets

» *Albuterol Tablets* contain an amount of albuterol sulfate  $[(C_{13}H_{21}NO_3)_2 \cdot H_2SO_4]$  equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of albuterol ( $C_{13}H_{21}NO_3$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers, and store at controlled room temperature.

**USP Reference standards** (11)—

USP *Albuterol Sulfate RS*

**Identification—**

**A:** The  $R_f$  value of the principal spot obtained from the *Test preparation* corresponds to that obtained from *Standard solution A* in the chromatograms obtained as directed in the test for *Related compounds*.

**B:** Shake a quantity of the powdered *Tablets*, equivalent to about 4 mg of *Albuterol*, with 10 mL of water and filter: the filtrate responds to the tests for *Sulfate* (191).

**Dissolution, Procedure for a Pooled Sample** (711)—

*Medium:* water; 500 mL.

*Apparatus 2:* 50 rpm.

*Time:* 30 minutes.

Determine the amount of  $C_{13}H_{21}NO_3$  dissolved using the following method.

*Mobile phase, Standard preparation, and Chromatographic system*—Prepare as directed in the *Assay*.

*Procedure*—Inject a suitable volume (about 100 µL) of a portion of the solution under test, previously passed through a 0.45-µm nylon filter, into the chromatograph, record the chromatogram, and measure the response for the major peak. Calculate the quantity of  $C_{13}H_{21}NO_3$  dissolved by comparing this peak response with the major peak response similarly obtained on chromatographing the *Standard preparation* previously diluted, if necessary, with a mixture of water and methanol (6:4) to obtain a *Standard solution* having a known concentration of USP *Albuterol Sulfate RS* approximately corresponding to the concentration of the solution under test.

*Tolerances*—Not less than 80% ( $Q$ ) of the labeled amount of  $C_{13}H_{21}NO_3$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Related compounds—**

*Test preparation*—Place a quantity of finely powdered *Tablets*, equivalent to 48 mg of albuterol, into a suitable container. Add 60 mL of diluted alcohol (1 in 2), and shake by mechanical means for 30 minutes. Filter the mixture, and wash the filter with small portions of alcohol, combining this with the filtrate. Evaporate the filtrate to dryness under reduced pressure at a temperature below 40°. Dissolve the residue as completely as possible in 2 mL of water.

*Standard solutions*—Prepare solutions of USP *Albuterol Sulfate RS* in water having known concentrations of 0.580 mg per mL (*Solution A*), 0.218 mg per mL (*Solution B*), and 0.073 mg per mL (*Solution C*) equivalent to 0.483 mg, 0.183 mg, and 0.061 mg, respectively, of albuterol.

*Procedure*—Apply 10 µL aliquots (in two successive portions of 5 µL, allowing the solvent to evaporate between applications) of the *Test preparation* and each of *Standard solutions A*, *B*, and *C* to separate points to a suitable chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Air-dry, and place the plate in a saturated chromatographic chamber. Develop the chromatograms with a solvent system consisting of a mixture of methyl isobutyl ketone, isopropyl alcohol, ethyl acetate, water, and ammonium hydroxide (50:45:35:18:3) until the solvent front has moved about 17 cm. Remove the plate from the developing chamber, air-dry, and spray first with 3-methyl-2-benzothiazolinone hydrazone hydrochloride TS, then with ammoniacal potassium ferricyanide TS, and finally again with 3-methyl-2-benzothiazolinone hydrazone hydrochloride TS. Examine the plate and estimate the responses of any secondary spots observed in the lane of the *Test preparation* by comparison with those of *Standard solutions A*, *B*, and *C*. No major secondary spot is greater in size or intensity than the principal spot produced by *Standard solution A* (2.0%). No other secondary spot is greater in size or intensity than the principal spot produced by *Standard solution B* (0.75%). No more than two other secondary spots are equal in size or intensity than the principal spot produced by *Standard solution C* (0.25%). The sum of the intensities of all secondary spots obtained from the *Test preparation* corresponds to not more than 3.5%.

**Assay—**

**1% Acetic acid**—Transfer a 20-mL portion of glacial acetic acid to a suitable volumetric flask, and dilute with water to 200 mL.

**Mobile phase**—Dissolve 1.13 g of sodium 1-hexane-sulfonate in 1200 mL of water, add 12 mL of glacial acetic acid, and mix. Prepare a filtered and degassed mixture of this solution and methanol (6:4). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Transfer about 12 mg of USP Albuterol Sulfate RS, accurately weighed, to a 100-mL volumetric flask. Add 60 mL of 1% Acetic acid, sonicate for 5 minutes, dilute with methanol to volume, and mix. Pipet 25 mL of this solution into a 100-mL volumetric flask, dilute with a mixture of water and methanol (6:4) to volume, and mix.

**Assay preparation**—Transfer a number of whole Tablets, equivalent to about 50 mg of albuterol, to a 2000-mL volumetric flask. Add 1200 mL of 1% Acetic acid, shake by mechanical means for 45 minutes, sonicate for 10 minutes, allow to cool to room temperature, dilute with methanol to volume, and mix. Pass through a suitable filter having a 0.45-μm or finer porosity.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 276-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency determined from the analyte peak is not less than 800 theoretical plates; the tailing factor for the analyte peak is not more than 2.5; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 25 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of albuterol (C<sub>13</sub>H<sub>21</sub>NO<sub>3</sub>) in the number of Tablets taken by the formula:

$$2000C(r_U / r_S)(239.31/576.70)$$

in which 2000 is the volume, in mL, of the *Assay preparation*; C is the concentration, in mg per mL, of USP Albuterol Sulfate RS in the *Standard preparation*;  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively; 2 is the number of molecules of albuterol released from each molecule of albuterol sulfate; and 239.31 and 576.70 are the molecular weights of albuterol and albuterol sulfate, respectively.

## Alclometasone Dipropionate

C<sub>28</sub>H<sub>37</sub>ClO<sub>7</sub> 521.04  
 Pregna-1,4-diene-3,20-dione, 7-chloro-11-hydroxy-16-methyl-17,21-bis(1-oxopropoxy)-, (7α,11β,16α)-; 7α-Chloro-11β,17,21-trihydroxy-16α-methylpregna-1,4-diene-3,20-dione 17,21-dipropionate [66734-13-2].

**DEFINITION**

Alclometasone Dipropionate contains NLT 97.0% and NMT 102.0% of C<sub>28</sub>H<sub>37</sub>ClO<sub>7</sub>, calculated on the dried basis.

**IDENTIFICATION**

- A. INFRARED ABSORPTION** <197M>
- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, both relative to the *Internal standard solution*, as obtained in the *Assay*.

**ASSAY****PROCEDURE**

**Solution A:** 6.80 mg/mL of monobasic potassium phosphate (0.05 M)

**Mobile phase:** Methanol and *Solution A* (2:1)

**Internal standard solution:** 2 mg/mL of betamethasone dipropionate in methanol

**Standard stock solution:** 1.2 mg/mL of USP Alclometasone Dipropionate RS in methanol

**Standard solution:** 4.0 mL of *Standard stock solution* and 4.0 mL of *Internal standard solution*. Dilute with methanol to 25 mL. [NOTE—This solution contains approximately 0.2 mg/mL of USP Alclometasone Dipropionate RS.]

**Sample stock solution:** 1.2 mg/mL of Alclometasone Dipropionate in methanol

**Sample solution:** 4 mL of *Sample stock solution* and 4 mL of *Internal standard solution*. Dilute with methanol to 25 mL.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4-mm × 30-cm; packing L1

**Flow rate:** 1.2 mL/min

**Injection size:** 10 μL

**System suitability**

**Sample:** *Standard solution*

[NOTE—The relative retention times for alclometasone dipropionate and betamethasone dipropionate are about 0.7 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 3.0 between the analyte and the internal standard peaks

**Relative standard deviation:** NMT 2%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of C<sub>28</sub>H<sub>37</sub>ClO<sub>7</sub> in the portion of Alclometasone Dipropionate taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak height ratio from the *Sample solution*

$R_S$  = peak height ratio from the *Standard solution*

$C_S$  = concentration of USP Alclometasone Dipropionate RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of the *Sample solution* (mg/mL)

**Acceptance criteria:** 97.0%–102.0% on the dried basis

**IMPURITIES****Inorganic Impurities**

- RESIDUE ON IGNITION** <281>: NMT 0.1%

Remove the tube from the bath, shake vigorously until the specimen components resolidify, and return the tube to the 60° water bath until the semisolid components melt. Remove the tube from the bath, shake vigorously until the specimen components resolidify, and place the tube in an ice-methanol bath for 15 min. Remove the tube from the bath, and centrifuge at 2500 rpm for 5

min. Transfer the clear supernatant to a small stoppered flask, and allow to equilibrate to room temperature.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4-mm × 30-cm; packing L1

**Flow rate:** 1.2 mL/min

**Injection volume:** 20 µL

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for alclometasone dipropionate and betamethasone dipropionate are about 0.7 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 3.0 between the analyte and internal standard peaks

**Relative standard deviation:** NMT 2%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of alclometasone dipropionate ( $C_{28}H_{37}ClO_7$ ) in the portion of Cream taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak height ratio of alclometasone dipropionate to the internal standard from the *Sample solution*

$R_S$  = peak height ratio of alclometasone dipropionate to the internal standard from the *Standard solution*

$C_S$  = concentration of USP Alclometasone Dipropionate RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of alclometasone dipropionate in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

#### PERFORMANCE TESTS

- **MINIMUM FILL** <755>: Meets the requirements

#### SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** <61> and **TESTS FOR SPECIFIED MICROORGANISMS** <62>: Meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in collapsible tubes or tight containers, and store at controlled room temperature.
- **USP REFERENCE STANDARDS** <11>  
USP Alclometasone Dipropionate RS

## Alclometasone Dipropionate Ointment

#### DEFINITION

Alclometasone Dipropionate Ointment contains NLT 90.0% and NMT 110.0% of the labeled amount of alclometasone dipropionate ( $C_{28}H_{37}ClO_7$ ) in a suitable ointment base.

#### IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, both relative to the internal standard, as obtained in the *Assay*.
- **B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** <201>  
**Standard solution:** 0.25 mg/mL USP Alclometasone Dipropionate RS in methanol

**Sample solution:** Place a quantity of Ointment, equivalent to 1.25 mg of alclometasone dipropionate, in a 50-mL centrifuge tube, add 10 mL of 2,2,4-trimethylpentane, insert a stopper securely into the tube, and disperse the specimen using a vortex mixer. Add 5.0 mL of a solution of methanol in water (45 in 50), insert the stopper securely, shake vigorously for 2 min, and centrifuge at 2500 rpm for 3 min. Remove the lower, aqueous alcohol phase, and transfer to a stoppered vial.

#### Chromatographic system

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture

**Application volume:** 20 µL

**Developing solvent system:** Chloroform and acetone (7:1)

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Dry the applications with the aid of a stream of nitrogen, and develop the chromatograms in a saturated, unlined chromatographic chamber. When the solvent front has moved three-fourths of the length of the plate, remove the plate from the chamber, mark the solvent front, and allow the solvent to evaporate. Observe the plate under short-wavelength UV light.

**Acceptance criteria:** The  $R_f$  value of the principal spot obtained from the *Sample solution* corresponds to that of the *Standard solution*.

#### ASSAY

##### • PROCEDURE

**Buffer:** 6.80 g/L of monobasic potassium phosphate (0.05 M)

**Solution A:** Dilute 450 mL of methanol with water to 500 mL.

**Mobile phase:** Methanol and *Buffer* (2:1)

**Internal standard solution:** 0.15 mg/mL of betamethasone dipropionate in *Solution A*

**Standard stock solution:** 0.1 mg/mL of USP Alclometasone Dipropionate RS in *Solution A*

**Standard solution:** 0.05 mg/mL of USP Alclometasone Dipropionate RS obtained by combining, in a small stoppered flask, 5.0 mL of *Standard stock solution* and 5.0 mL of *Internal standard solution*

**Sample solution:** Transfer a quantity of Ointment, equivalent to 0.5 mg of alclometasone dipropionate, to a 50-mL centrifuge tube, add 10 mL of 2,2,4-trimethylpentane, insert a stopper securely into the tube, and disperse the specimen using a vortex mixer. Add 5.0 mL of *Internal standard solution* and 5.0 mL of *Solution A*, insert the stopper securely, shake vigorously for 2 min, and centrifuge at 2500 rpm for 3 min. Remove the lower, aqueous alcohol phase, and transfer this *Sample solution* to a stoppered vial.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4-mm × 30-cm; packing L1

USP Alclometasone Dipropionate RS

## Alcohol

$C_2H_6O$  46.07  
Ethanol;  
Ethyl alcohol [64-17-5].

#### DEFINITION

Alcohol contains NLT 92.3% and NMT 93.8%, by weight, corresponding to NLT 94.9% and NMT 96.0%, by volume, at 15.56°, of  $C_2H_5OH$ .

#### IDENTIFICATION

- **A.** It meets the requirements of the test for *Specific Gravity* (841).
- **B. INFRARED ABSORPTION** (197F) or (197S): Neat

#### IMPURITIES

##### Inorganic Impurities

- **LIMIT OF NONVOLATILE RESIDUE:** Evaporate 100 mL in a tared dish on a water bath, and dry at 100°–105° for 1 h: the weight of the residue is NMT 2.5 mg.

##### Organic Impurities

##### PROCEDURE

**Sample solution A:** Alcohol (substance under test)  
**Sample solution B:** 300 ppm of 4-methylpentan-2-ol in *Sample solution A*  
**Standard solution A:** 200 ppm of methanol in *Sample solution A*  
**Standard solution B:** 10 ppm of methanol and 10 ppm of acetaldehyde in *Sample solution A*  
**Standard solution C:** 30 ppm of acetal in *Sample solution A*

**Standard solution D:** 2 ppm of benzene in *Sample solution A*

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 0.32-mm × 30-m fused silica capillary column bonded with a 1.8-μm layer of phase G43

**Split ratio:** 20:1

**Temperature**

**Detector:** 280°

**Injector:** 200°

**Column:** See the temperature program table below.

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
40	0	40	12
40	10	240	10

**Linear velocity:** 35 cm/s

**Carrier gas:** Helium

**Injection size:** 1.0 μL

#### System suitability

**Sample:** *Standard solution B*

#### Suitability requirements

**Resolution:** NLT 1.5 between the first major peak (acetaldehyde) and the second major peak (methanol)

#### Analysis

**Samples:** *Sample solution A*, *Sample solution B*, *Standard solution A*, *Standard solution B*, *Standard solution C*, and *Standard solution D*

#### Methanol calculation

$$\text{Result} = (r_U/r_S)$$

$r_U$  = peak area of methanol from *Sample solution A*

$r_S$  = peak area of methanol from *Standard solution A*

#### Acetaldehyde and Acetal calculation

$$\text{Result} = \{[A_E/(A_T - A_E)] \times C_S\} + \{[D_E/(D_T - D_E)] \times C_U\}$$

$A_E$  = area of the acetaldehyde peak from *Sample solution A*

$A_T$  = area of the acetaldehyde peak from *Standard solution B*

$C_S$  = concentration of acetaldehyde added in *Standard solution B*, 10 ppm

$D_E$  = area of the acetal peak from *Sample solution A*

$D_T$  = area of the acetal peak from *Standard solution C*

$C_U$  = concentration of acetal added in *Standard solution C*, 30 ppm

#### Benzene calculation

$$\text{Result} = [B_E/(B_T - B_E)] \times C_S$$

$B_E$  = area of the benzene peak from *Sample solution A*

$B_T$  = area of the benzene peak from *Standard solution D*

$C_S$  = concentration of benzene added in *Standard solution D*, 2 ppm

[NOTE— If necessary, the identity of benzene can be confirmed using another suitable chromatographic system (stationary phase with a different polarity).]

#### Other impurities calculation

$$\text{Result} = (r_U/r_M) \times C_M$$

- $r_U$  = peak area of each impurity in *Sample solution B*  
 $r_M$  = peak area of 4-methylpentan-2-ol in *Sample solution B*  
 $C_M$  = concentration of 4-methylpentan-2-ol in *Sample solution B*

**Acceptance criteria:** See *Impurity Table 1*.

**Impurity Table 1**

Name	Acceptance Criteria
Methanol	NMT 0.5, corresponding to 200 ppm
Acetaldehyde and Acetal	NMT 10 ppm, expressed as acetaldehyde
Benzene	NMT 2 ppm
Sum of all other impurities <sup>a</sup>	NMT 300 ppm

<sup>a</sup> Disregard any peaks of less than 9 ppm.

### SPECIFIC TESTS

- SPECIFIC GRAVITY (841):** 0.812–0.816 at 15.56°, indicating 92.3%–93.8%, by weight, or 94.9%–96.0%, by volume, of C<sub>2</sub>H<sub>5</sub>OH

- ULTRAVIOLET ABSORPTION**

**Analytical wavelength:** 235–340 nm

**Cell:** 5 cm

**Reference:** Water

**Acceptance criteria**

**Absorbance:** NMT 0.40 at 240 nm; NMT 0.30, between 250 nm and 260 nm; NMT 0.10, between 270 nm and 340 nm

**Curve:** The absorption curve is smooth

- CLARITY OF SOLUTION**

[NOTE—The *Sample solution* is to be compared to *Reference suspension A* and to water in diffused daylight 5 min after preparation of *Reference suspension A*.]

**Hydrazine solution:** 10 mg/mL of hydrazine sulfate in water. [NOTE—Allow to stand for 4–6 h.]

**Methenamine solution:** Transfer 2.5 g of methenamine to a 100-mL glass-stoppered flask, add 25.0 mL of water, insert the glass stopper, and mix to dissolve.

**Primary opalescent suspension:** Transfer 25.0 mL of *Hydrazine solution* to the *Methenamine solution* in the 100-mL glass-stoppered flask. Mix, and allow to stand for 24 h. [NOTE—This suspension is stable for 2 months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well mixed before use.]

**Opalescence standard:** Transfer 15.0 mL of the *Primary opalescent suspension* to a 1000-mL volumetric flask, and dilute with water to volume. [NOTE—This suspension should not be used beyond 24 h after preparation.]

**Reference suspension A:** *Opalescence standard* and water (1 in 20)

**Reference suspension B:** *Opalescence standard* and water (1 in 10)

**Sample solution A:** Substance to be examined

**Sample solution B:** Dilute 1.0 mL of *Sample solution A* with water to 20 mL, and allow to stand for 5 min before testing.

**Analysis:** Transfer a sufficient portion of *Sample solution A* and *Sample solution B* to separate test tubes of colorless, transparent, neutral glass with a flat base and an internal diameter of 15–25 mm to obtain a depth of 40 mm. Similarly transfer portions of *Reference suspension A*, *Reference suspension B*, and water to separate matching test tubes. Compare *Sample solution A*, *Sample solution B*, *Reference suspension A*, *Reference suspension B*, and water in diffused daylight, viewing vertically against a black background. (See *Spectrophotometry and Light-Scattering (851)*, *Visual Comparison*.)

[NOTE—The diffusion of light must be such that *Reference suspension A* can readily be distinguished from water, and that *Reference suspension B* can readily be distinguished from *Reference suspension A*.]

**Acceptance criteria:** *Sample solution A* and *Sample solution B* show the same clarity as that of water or their opalescence is not more pronounced than that of *Reference suspension A*.

- ACIDITY OR ALKALINITY**

**Phenolphthalein solution:** Dissolve 0.1 g of phenolphthalein in 80 mL of alcohol, and dilute with water to 100 mL.

**Analysis:** To 20 mL of alcohol add 20 mL of freshly boiled and cooled water and 0.1 mL of *Phenolphthalein solution*. The solution is colorless. Add 1.0 mL of 0.01 N sodium hydroxide.

**Acceptance criteria:** The solution is pink (30 ppm, expressed as acetic acid).

- COLOR OF SOLUTION**

**Standard stock solution:** Combine 3.0 mL of ferric chloride CS, 3.0 mL of cobaltous chloride CS, 2.4 mL of cupric sulfate CS, and 1.6 mL of dilute hydrochloric acid (10 g/L).

**Standard solution:** Transfer 1.0 mL of *Standard stock solution* to a 100-mL volumetric flask, and dilute with dilute hydrochloric acid (10 g/L). [NOTE—Prepare the *Standard solution* immediately before use.]

**Sample solution:** Substance to be examined

**Analysis:** Transfer a sufficient portion of the *Sample solution* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15–25 mm to obtain a depth of 40 mm. Similarly transfer portions of the *Standard solution* and water to separate, matching test tubes. Compare the *Sample solution*, *Standard solution*, and water in diffused daylight, viewing vertically against a white background. (See *Spectrophotometry and Light-Scattering (851)*, *Visual Comparison*.)

**Acceptance criteria:** The *Sample solution* has the appearance of water or is not more intensely colored than the *Standard solution*.

### ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight containers, protected from light.
- USP REFERENCE STANDARDS (11)**  
USP Alcohol RS

## Dehydrated Alcohol

C<sub>2</sub>H<sub>6</sub>O

Ethanol;

Ethyl alcohol [64-17-5].

46.07

### DEFINITION

Dehydrated Alcohol contains NLT 99.2% by weight, corresponding to NLT 99.5% by volume, at 15.56°, of C<sub>2</sub>H<sub>5</sub>OH.

### IDENTIFICATION

- A. SPECIFIC GRAVITY (841):** NMT 0.7962 at 15.56°, indicating NLT 99.2% of C<sub>2</sub>H<sub>5</sub>OH by weight
- B. INFRARED ABSORPTION (197S) or (197F):** Neat

### IMPURITIES

- LIMIT OF NONVOLATILE RESIDUE**

**Sample:** 100 mL of Dehydrated Alcohol

**Analysis:** Evaporate the *Sample* in a tared dish on a water bath, and dry at 100°–105° for 1 h.

**Acceptance criteria:** The weight of the residue is NMT 2.5 mg.

• **VOLATILE IMPURITIES**

**Sample solution A:** Substance to be examined

**Sample solution B:** 300 µL/L of 4-methylpentan-2-ol in *Sample solution A*

**Standard solution A:** 200 µL/L of methanol in *Sample solution A*

**Standard solution B:** 10 µL/L of methanol and 10 µg/L of acetaldehyde in *Sample solution A*

**Standard solution C:** 30 µL/L of acetal in *Sample solution A*

**Standard solution D:** 2 µL/L of benzene in *Sample solution A*

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 0.32-mm × 30-m fused silica capillary; bonded with a 1.8-µm layer of phase G43

**Split ratio:** 1:20

**Temperatures**

**Injector:** 200°

**Detector:** 280°

**Column:** See *Table 1*.

**Table 1**

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
40	0	40	12
40	10	240	10

**Flow rate:** 35 cm/s

**Carrier gas:** Helium

**Injection volume:** 1.0 µL

**System suitability**

**Sample:** *Standard solution B*

**Suitability requirements**

**Resolution:** NLT 1.5 between the first major peak (acetaldehyde) and the second major peak (methanol)

**Analysis**

**Samples:** *Sample solution A*, *Sample solution B*, *Standard solution A*, *Standard solution B*, *Standard solution C*, and *Standard solution D*

**Methanol calculation**

$$\text{Result} = r_U/r_S$$

$r_U$  = peak area of methanol from *Sample solution A*

$r_S$  = peak area of methanol from *Standard solution A*

**Acetaldehyde calculation** (sum of acetaldehyde and acetal)

$$\text{Result} = \{[A_E/(A_T - A_E)] \times C_A\} + \{[D_E/(D_T - D_E)] \times C_D\}$$

$A_E$  = area of the acetaldehyde peak from *Sample solution A*

$A_T$  = area of the acetaldehyde peak from *Standard solution B*

$C_A$  = concentration of acetaldehyde in *Standard solution B* (µL/L)

$D_E$  = area of the acetal peak from *Sample solution A*

$D_T$  = area of the acetal peak from *Standard solution C*

$C_D$  = concentration of acetal in *Standard solution C* (µL/L)

**Benzene calculation**

$$\text{Result} = (B_E/(B_T - B_E)) \times C_B$$

$B_E$  = area of the benzene peak from *Sample solution A*

$B_T$  = area of the benzene peak from *Standard solution D*

$C_B$  = concentration of benzene in *Standard solution D* (µL/L)

[NOTE—If necessary, the identity of benzene can be confirmed using another suitable chromatographic system (stationary phase with a different polarity).]

**Any other impurity calculation**

$$\text{Result} = (r_U/r_m) \times C_m$$

$r_U$  = peak area of each impurity from *Sample solution B*

$r_m$  = peak area of 4-methylpentan-2-ol from *Sample solution B*

$C_m$  = concentration of 4-methylpentan-2-ol in *Sample solution B* (µL/L)

**Acceptance criteria:** See *Table 2*.

**Table 2**

Name	Acceptance Criteria
Methanol	NMT 0.5, corresponding to 200 µL/L
Acetaldehyde and acetal	10 µL/L, expressed as acetaldehyde
Benzene	2 µL/L
Sum of all other impurities <sup>a</sup>	300 µL/L

<sup>a</sup> Disregard any peaks of less than 9 µL/L.

**SPECIFIC TESTS**

• **ULTRAVIOLET ABSORPTION**

**Analytical wavelength:** 200–400 nm

**Cell:** 5 cm

**Reference:** Water

**Acceptance criteria**

**Absorbance:** NMT 0.40 at 240 nm; NMT 0.30 between 250 and 260 nm; NMT 0.10 between 270 and 340 nm

**Curve:** Smooth between 235 and 340 nm

• **CLARITY OF SOLUTION**

[NOTE—The *Sample solution* is to be compared to *Standard suspension A* and to water in diffused daylight 5 min after preparation of *Standard suspension A*.]

**Hydrazine solution:** 10 mg/mL of hydrazine sulfate in water. Allow to stand for 4–6 h.

**Methenamine solution:** Transfer 2.5 g of methenamine to a 100-mL glass-stoppered flask, add 25.0 mL of water, insert the glass stopper, and mix to dissolve.

**Primary opalescent suspension:** Transfer 25.0 mL of *Hydrazine solution* to the *Methenamine solution* in the 100-mL glass-stoppered flask. Mix, and allow to stand for 24 h. This suspension is stable for 2 months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well mixed before use.

**Opalescence standard:** Transfer 15.0 mL of the *Primary opalescent suspension* to a 1000-mL volumetric flask, and dilute with water to volume. This suspension should not be used beyond 24 h after preparation.

**Standard suspension A:** Dilute 5.0 mL of *Standard stock suspension* with water to 100.0 mL.

**Standard suspension B:** Dilute 10.0 mL of *Standard stock suspension* with water to 100.0 mL.

**Sample solution A:** Substance to be examined

**Sample solution B:** 1.0 mL of *Sample solution A* diluted with water to 20 mL. Allow to stand for 5 min before testing.

**Blank:** Water

**Analysis**

**Samples:** *Standard suspension A*, *Standard suspension B*, *Sample solution A*, *Sample solution B*, and *Blank*. Transfer a sufficient portion of *Sample solution A* and *Sample solution B* to separate test tubes of colorless, transparent, neutral glass with a flat base and an internal diameter of 15–25 mm to obtain a depth of 40 mm. Similarly transfer portions of *Standard suspension A*, *Standard suspension B*, and *Blank* to separate matching test tubes. Compare samples in diffused daylight, viewing vertically against a black background (see *Spectrophotometry and Light-Scattering* (851), *Visual Comparison*).

**Acceptance criteria:** *Sample solution A* and *Sample solution B* show the same clarity as that of water, or their opalescence is not more pronounced than that of *Standard suspension A*. [NOTE—The diffusion of light must be such that *Standard suspension A* can be readily distinguished from water, and that *Standard suspension B* can be readily distinguished from *Standard suspension A*.]

• **ACIDITY OR ALKALINITY**

**Phenolphthalein solution:** Dissolve 0.1 g of phenolphthalein in 80 mL alcohol, and dilute with water to 100 mL.

**Sample solution:** 20 mL of Dehydrated Alcohol

**Analysis:** To the *Sample solution* add 20 mL of freshly boiled and cooled water and 0.1 mL of *Phenolphthalein solution*. The solution is colorless. Add 1.0 mL of 0.01 N sodium hydroxide.

**Acceptance criteria:** The solution is pink (30 µg/g, expressed as acetic acid).

• **COLOR OF SOLUTION**

**Standard stock solution:** Combine 3.0 mL of ferric chloride CS, 3.0 mL of cobaltous chloride CS, 2.4 mL of cupric sulfate CS, and 1.6 mL of dilute hydrochloric acid (10 mg/mL).

**Standard solution:** 1.0 mL of *Standard stock solution*, diluted with dilute hydrochloric acid (10 mg/mL) to 100 mL. Prepare this immediately before use.

**Sample solution:** Substance to be examined

**Analysis**

**Samples:** *Standard solution*, *Sample solution*, and water. Transfer a sufficient portion of each of the *Samples* to individual test tubes of colorless, transparent, neutral glass with a flat base and an internal diameter of 15–25 mm to obtain a depth of 40 mm. Compare the *Samples* in diffused daylight, viewing vertically against a white background (see *Spectrophotometry and Light-Scattering* (851), *Visual Comparison*).

**Acceptance criteria:** The *Sample solution* has the appearance of water or is not more intensely colored than the *Standard solution*.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers, protected from light.
- **USP REFERENCE STANDARDS** (11)  
USP Dehydrated Alcohol RS

## Dehydrated Alcohol Injection

» Dehydrated Alcohol Injection is Dehydrated Alcohol suitable for parenteral use.

**Packaging and storage—**Preserve in tight, single-dose containers, preferably of Type I glass, and store at controlled room temperature. The container may contain an inert gas in the headspace.

**Identification—**

**A:** Mix 5 drops in a small beaker with 1 mL of potassium permanganate solution (1 in 100) and 5 drops of 2 N sulfuric acid, and cover the beaker immediately with a filter paper moistened with a solution recently prepared by dissolving 0.1 g of sodium nitroferricyanide and 0.25 g of piperazine in 5 mL of water: an intense blue color is produced on the filter paper, the color becoming paler after a few minutes.

**B:** To 5 mL of a solution (1 in 10) add 1 mL of 1.0 N sodium hydroxide, then slowly (over a period of 3 minutes) add 2 mL of 0.1 N iodine: the odor of iodoform develops, and a yellow precipitate is formed within 30 minutes.

**Specific gravity** (841): not more than 0.8035 at 15.56°, indicating not less than 96.8%, by weight, of C<sub>2</sub>H<sub>5</sub>OH.

**Acidity—**To 50 mL, in a glass-stoppered flask, add 50 mL of recently boiled water. Add phenolphthalein TS, and titrate with 0.020 N sodium hydroxide to a pink color that persists for 30 seconds: not more than 10.0 mL of 0.020 N sodium hydroxide is required for neutralization.

**Limit of nonvolatile residue—**Evaporate 40 mL in a tared dish on a water bath, and dry at 105° for 1 hour: the weight of the residue does not exceed 1 mg.

**Water-insoluble substances—**Dilute it with an equal volume of water: the mixture is clear and remains clear for 30 minutes after cooling to 10°.

**Aldehydes and other foreign organic substances—**

Place 20 mL in a glass-stoppered cylinder that has been thoroughly cleaned with hydrochloric acid, then rinsed with water and finally with the dehydrated alcohol to be tested. Cool the contents to approximately 15°, and add, by means of a carefully cleaned pipet, 0.10 mL of 0.10 N potassium permanganate, noting accurately the time of addition. Mix at once by inverting the stoppered cylinder, and allow it to stand at 15° for 5 minutes: the pink color does not entirely disappear.

**Amyl alcohol and nonvolatile, carbonizable substances—**

Allow 25 mL to evaporate spontaneously from a porcelain dish, carefully protected from dust, until the surface of the dish is barely moist: no red or brown color is produced immediately upon the addition of a few drops of sulfuric acid.

**Ultraviolet absorbance—**Record the UV absorption spectrum between 340 nm and 235 nm in a 1-cm cell, with water in a matched cell in the reference beam: the absorbance is not more than 0.08 at 240 nm, and 0.02 between 270 nm and 340 nm, and the curve drawn through these points is smooth.

**Limit of acetone and isopropyl alcohol—**To 1.0 mL add 1 mL of water, 1 mL of a saturated solution of dibasic sodium phosphate, and 3 mL of a saturated solution of potassium permanganate. Warm the mixture to 45° to 50°, and allow to stand until the permanganate color is discharged. Add 3 mL of 2.5 N sodium hydroxide, and pass, without washing, through a sintered-glass filter. Prepare a control containing 1 mL of the saturated solution of dibasic sodium phosphate, 3 mL of 2.5 N sodium hydroxide, and 80 µg of acetone in 9 mL. To each solution add 1 mL of furfural solution (1 in 100), and allow to stand for 10 minutes, then to 1.0 mL of each solution add 3 mL of hydrochloric acid: any pink color produced in the test solution is not more intense than that in the control.

**Methanol—**To 1 drop add 1 drop of water, 1 drop of dilute phosphoric acid (1 in 20), and 1 drop of potassium permanganate solution (1 in 20). Mix, allow to stand for 1 minute, and add sodium metabisulfite solution (1 in 20), dropwise, until the permanganate color is discharged. If a brown color remains, add 1 drop of the dilute phosphoric acid. To the colorless solution add 5 mL of freshly prepared chromotropic acid TS, and heat on a water bath at 60° for 10 minutes: no violet color appears.

**Other requirements**—It meets the requirements under *Injections* <1>.

## Rubbing Alcohol

» Rubbing Alcohol and all preparations under the classification of Rubbing Alcohols are manufactured in accordance with the requirements of the U.S. Treasury Department, Bureau of Alcohol, Tobacco, and Firearms, Formula 23-H (8 parts by volume of acetone, 1.5 parts by volume of methyl isobutyl ketone, and 100 parts by volume of ethyl alcohol) being used. It contains not less than 68.5 percent and not more than 71.5 percent by volume of dehydrated alcohol, the remainder consisting of water and the denaturants, with or without color additives, and perfume oils. Rubbing Alcohol contains, in each 100 mL, not less than 355 mg of sucrose octaacetate or not less than 1.40 mg of denatonium benzoate. The preparation may be colored with one or more color additives, listed by the FDA for use in drugs. A suitable stabilizer may be added. Rubbing Alcohol complies with the requirements of the Bureau of Alcohol, Tobacco, and Firearms of the U.S. Treasury Department.

NOTE—Rubbing Alcohol is packaged, labeled, and sold in accordance with the regulations issued by the U.S. Treasury Department, Bureau of Alcohol, Tobacco, and Firearms.

**Packaging and storage**—Preserve in tight containers, remote from fire, and store at controlled room temperature.

**Labeling**—Label it to indicate that it is flammable.

**USP Reference standards** <11>—

USP Denatonium Benzoate RS

**Specific gravity** (841): between 0.8691 and 0.8771 at 15.56° (the U.S. Government standard temperature for alcohol determination), for Rubbing Alcohol manufactured with specially denatured alcohol Formula 23-H.

**Limit of nonvolatile residue**—

Where the denaturant is denatonium benzoate—Evaporate 200.0 mL of Rubbing Alcohol, transferred in convenient portions, in a suitable tared dish on a steam bath, and dry the residue at 105° for 1 hour: the weight of the residue is not less than 2.8 mg. (Retain the residue for the Assay for denatonium benzoate.)

Where the denaturant is sucrose octaacetate—Evaporate 25.0 mL of Rubbing Alcohol in a suitable tared dish on a steam bath, and dry the residue at 105° for 1 hour: the weight of the residue is not less than 89 mg. (Retain the residue for the Assay for sucrose octaacetate.)

**Methanol**—Dilute 0.50 mL of it with water to 1.0 mL. To 0.50 mL of the resulting solution add 1 drop of dilute phosphoric acid (1 in 20) and 1 drop of potassium permanganate solution (1 in 20). Mix, allow to stand for 1 minute, and add sodium metabisulfite solution (1 in 20), dropwise, until the permanganate color is discharged. If a brown color remains, add 1 drop of dilute phosphoric acid (1 in 20). To the colorless solution add 5 mL of freshly prepared chromotropic acid TS, and heat in a water bath at 60° for 10 minutes: no violet color appears.

**Assay for denatonium benzoate**—

**Buffer solution**—Dissolve 9.23 g of anhydrous dibasic sodium phosphate in 800 mL of water, adjust with saturated citric acid solution to a pH of  $4 \pm 0.1$ , dilute with water to 1000 mL, and mix.

**Standard preparation**—Dissolve about 25 mg of USP Denatonium Benzoate RS, accurately weighed, in water to make 500 mL, and mix.

**Assay preparation**—Dissolve the residue obtained in the test for *Limit of nonvolatile residue* in 50.0 mL of water, and transfer to a suitable flask.

**Procedure**—Treat the *Standard preparation*, *Assay preparation*, and blank similarly and concomitantly. Transfer 10.0 mL each of the *Standard preparation*, *Assay preparation*, and *Buffer solution* to individual 250-mL separators, and add to each 40 mL of *Buffer solution*, 10 mL of a 1 in 1000 solution of bromophenol blue in chloroform, and 60 mL of chloroform. Shake the separators vigorously for 2 minutes, allow to stand for 15 minutes, then withdraw the chloroform layers through chloroform-washed cotton into 100-mL volumetric flasks. Repeat the extraction with 20 mL of chloroform, adding the filtered chloroform extracts to the respective volumetric flasks, dilute with chloroform to volume, and mix. Without delay, concomitantly determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 410 nm, with a suitable spectrophotometer, using the blank to set the instrument. Calculate the quantity, in mg, of denatonium benzoate ( $C_{28}H_{34}N_2O_3 \cdot H_2O$ ) in 100 mL of Rubbing Alcohol taken by the formula:

$$0.025C(A_U / A_S)$$

in which C is the concentration, in  $\mu\text{g}$  per mL, of USP Denatonium Benzoate RS in the *Standard preparation*; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for sucrose octaacetate**—Using about 50 mL of 70% alcohol, transfer the residue obtained in the test for *Limit of nonvolatile residue* to a 500-mL conical flask. Neutralize the solution with 0.1 N sodium hydroxide VS, using phenolphthalein TS as the indicator. Add 25.0 mL of 0.1 N sodium hydroxide, attach an air condenser to the flask, and reflux on a steam bath for 1 hour. Remove from the steam bath, cool quickly, and titrate the excess alkali with 0.1 N sulfuric acid VS, using phenolphthalein TS as the indicator. Perform a blank determination (see *Residual Titrations* under *Titrimetry* <541>). Each mL of 0.1 N sodium hydroxide is equivalent to 8.483 mg of sucrose octaacetate ( $C_{28}H_{38}O_{19}$ ).

## Alcohol in Dextrose Injection

» Alcohol in Dextrose Injection is a sterile solution of Alcohol and Dextrose in Water for Injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of alcohol ( $C_2H_5OH$ ), and not less than 95.0 percent and not more than 105.0 percent of the labeled amount of dextrose ( $C_6H_{12}O_6 \cdot H_2O$ ).

**Packaging and storage**—Preserve in tight, single-dose containers, preferably of Type I or Type II glass, and store at controlled room temperature.

**Labeling**—The label states the total osmolality of the solution expressed in mOsmol per L.

**USP Reference standards** <11>—

USP Endotoxin RS

**Identification**—It responds to the *Identification* tests under *Dextrose* and under *Dehydrated Alcohol*.

**Bacterial endotoxins** (85)—It contains not more than 0.5 USP Endotoxin Unit per mL.

**pH** (791): between 3.5 and 6.5, determined on a portion to which 0.30 mL of saturated potassium chloride solution has been added for each 100 mL and which previously has been diluted with water, if necessary, to a concentration of not more than 5% of dextrose.

**Heavy metals** (231)—Transfer a volume of Injection, equivalent to 4.0 g of dextrose, to a vessel, and adjust the volume to 25 mL by evaporation or by addition of water, as necessary: the limit is 0.0005C%, in which C is the labeled amount, in g, of  $C_6H_{12}O_6 \cdot H_2O$  per mL of Injection.

**Limit of 5-hydroxymethylfurfural and related substances**—Dilute an accurately measured volume of Injection, equivalent to 1.0 g of  $C_6H_{12}O_6 \cdot H_2O$ , with water to 500.0 mL. Determine the absorbance of this solution in a 1-cm cell at 284 nm, with a suitable spectrophotometer, using water as the blank: the absorbance is not more than 0.25.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay for alcohol**—Determine by *Method I—Distillation Method* under *Alcohol Determination* (611), using a 50.0-mL portion of Injection.

**Assay for dextrose**—Transfer an accurately measured volume of Injection, containing from 2 to 5 g of dextrose, to a 100-mL volumetric flask. Add 0.2 mL of 6 N ammonium hydroxide, dilute with water to volume, and mix. Determine the angular rotation in a suitable polarimeter tube (see *Optical Rotation* (781)). Calculate the percentage (g per 100 mL) of dextrose ( $C_6H_{12}O_6 \cdot H_2O$ ) in the portion of Injection taken by the formula:

$$(100/52.9)(198.17/180.16)AR$$

in which 100 is the percentage; 52.9 is the midpoint of the specific rotation range for anhydrous dextrose, in degrees; 198.17 and 180.16 are the molecular weights for dextrose monohydrate and anhydrous dextrose, respectively; A is 100 mm divided by the length of the polarimeter tube, in mm; and R is the observed rotation, in degrees.

## Alendronate Sodium

$C_4H_{12}NNaO_7P_2 \cdot 3H_2O$  325.12

Phosphonic acid, (4-amino-1-hydroxybutylidene)bis-, monosodium salt, trihydrate.

Sodium trihydrogen (4-amino-1-hydroxybutylidene) diphosphonate, trihydrate [121268-17-5].

» Alendronate Sodium contains not less than 98.0 percent and not more than 102.0 percent of  $C_4H_{12}NNaO_7P_2$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers. Store at room temperature.

**USP Reference standards** (11)—

USP Alendronate Sodium RS

## Identification—

**A:** *Infrared Absorption* (197M).

**B:** It meets the requirements of the flame test for *Sodium* (191).

**Loss on drying** (731)—Dry it at a pressure not exceeding 5 mm of mercury at 140° to constant weight: it loses not less than 16.1% and not more than 17.1% of its weight.

**Heavy metals, Method III** (231): 0.001%.

## Chromatographic purity—

**Borate solution and Diluent**—Prepare as directed in the Assay.

**Buffer solution**—Transfer 5.88 g of sodium citrate dihydrate and 2.84 g of anhydrous dibasic sodium phosphate to a 2-L volumetric flask, dilute with water to volume, and mix. Adjust with phosphoric acid to a pH of 8, and pass the solution through a filter having a 0.5-μm or finer porosity.

**9-Fluorenylmethyl chloroformate solution**—Prepare a solution in acetonitrile containing about 4 mg of 9-fluorenylmethyl chloroformate per mL. Prepare this solution fresh just prior to use.

**Solution A**—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (17:3).

**Solution B**—Prepare a filtered and degassed mixture of acetonitrile and *Buffer solution* (7:3).

**Mobile phase**—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard stock solution**—Prepare a solution of USP Alendronate Sodium RS in *Diluent* having a known concentration of about 0.6 mg per mL.

**Standard solution**—Transfer 5.0 mL of the *Standard stock solution* to a 50-mL polypropylene, screw-cap centrifuge tube containing 5 mL of *Borate solution*. Add 5 mL of acetonitrile and 5 mL of *9-Fluorenylmethyl chloroformate solution*, and shake for 45 seconds. Allow to stand at room temperature for 30 minutes. Add 20 mL of methylene chloride, and shake vigorously for 1 minute. Centrifuge for 5 to 10 minutes, and use a portion of the clear upper aqueous layer.

**Diluted standard solution**—Dilute a portion of the *Standard stock solution* with *Diluent* to obtain a solution having a known concentration of about 0.6 μg per mL. Using 5 mL of this solution, proceed as directed for the *Standard solution*, beginning with “to a 50-mL polypropylene, screw-cap centrifuge tube.”

**Reagent blank**—Using a 5.0-mL portion of *Diluent*, proceed as directed for *Standard solution*, beginning with “to a 50-mL polypropylene, screw-cap centrifuge tube.”

**Test solution**—Transfer about 30 mg of Alendronate Sodium, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix. Using a 5.0-mL volume of this solution, proceed as directed for *Standard solution*, beginning with “to a 50-mL polypropylene, screw-cap centrifuge tube.”

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 266-nm detector and a 4.1-mm × 25-cm column that contains packing L21. The flow rate is about 1.8 mL per minute. The column temperature is maintained at about 45°. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0	100	0	equilibration
0–15	100→50	0→50	linear gradient
15–25	50→0	50→100	linear gradient
25–27	0→100	100→0	linear gradient
27–32	100	0	isocratic

Chromatograph the *Standard solution* and the *Diluted standard solution*, and record the peak responses as directed for *Procedure*: the tailing factor for the main peak in the chromatogram of the *Standard solution* is not more than 2.0; and the peak at that locus in the chromatogram of the *Diluted standard solution* is detectable with a signal-to-noise ratio of not less than 3.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the *Test solution* and the *Reagent blank* into the chromatograph, record the chromatograms, and measure the responses for all the peaks. Disregard any peak corresponding to those obtained from the *Reagent blank*. Calculate the percentage of each impurity in the portion of Alendronate Sodium taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the area of each impurity peak, and  $r_s$  is the sum of all impurity peaks and the main peak: not more than 0.1% of any individual impurity is found, and not more than 0.5% of total impurities is found.

#### Assay—

*Buffer solution*—Transfer 14.7 g of sodium citrate dihydrate and 7.05 g of anhydrous dibasic sodium phosphate to a 1-L volumetric flask, dilute with water to volume, mix, and adjust with phosphoric acid to a pH of 8.

*Diluent*—Dissolve 29.4 g of sodium citrate dihydrate in water in a 1-L volumetric flask, dilute with water to volume, and mix.

*Borate solution*—Dissolve 19.1 g of sodium borate in water in a 1-L volumetric flask, dilute with water to volume, and mix.

*9-Fluorenylmethyl chloroformate solution*—Prepare a solution in acetonitrile containing about 0.5 mg of 9-fluorenylmethyl chloroformate per mL. Prepare this solution fresh just prior to use.

*Mobile phase*—Prepare a filtered and degassed mixture of *Buffer solution*, acetonitrile, and methanol (70:25:5). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard stock preparation*—Prepare a solution of USP Alendronate Sodium RS in *Diluent* having a known concentration of about 0.1 mg per mL. Calculate the concentration,  $C_s$ , of anhydrous alendronate sodium in this solution.

*Standard preparation*—Transfer 5.0 mL of the *Standard stock preparation* to a 50-mL polypropylene, screw-cap centrifuge tube containing 5 mL of *Borate solution*. Add 5 mL of *9-Fluorenylmethyl chloroformate solution*, and shake for 30 seconds. Allow to stand at room temperature for 25 minutes. Add 25 mL of methylene chloride, and shake vigorously for 1 minute. Centrifuge for 5 to 10 minutes. Use a portion of the clear upper aqueous layer.

*Reagent blank*—Using 5.0 mL of *Diluent*, proceed as directed for *Standard preparation*, beginning with “to a 50-mL polypropylene, screw-cap centrifuge tube.”

*Assay stock preparation*—Transfer about 25 mg of Alendronate Sodium, accurately weighed, to a 250-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

*Assay preparation*—Using 5.0 mL of the *Assay stock preparation*, proceed as directed for the *Standard preparation*, beginning with “to a 50-mL polypropylene, screw-cap centrifuge tube.”

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 266-nm detector and a 4.1-mm  $\times$  25-cm column that contains packing L21. The flow rate is about 1.2 mL per minute. The column temperature is maintained at about 35°. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 1500 theoretical plates, the tailing factor is not more than

1.5, and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation*, the *Assay preparation*, and the *Reagent blank* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_4H_{12}NNaO_7P_2$  in the portion of Alendronate Sodium taken by the formula:

$$DC_s (r_u / r_s)$$

in which  $D$  is the dilution factor for the *Assay stock preparation*;  $C_s$  is as defined under the *Standard stock preparation*; and  $r_u$  and  $r_s$  are the peak area responses for alendronic acid obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Alendronate Sodium Tablets

### DEFINITION

Alendronate Sodium Tablets contain an amount of Alendronate Sodium equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of alendronic acid ( $C_4H_{13}NO_7P_2$ ).

### IDENTIFICATION

- The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

### ASSAY

#### PROCEDURE

**Solution A:** 14.7 g/L of sodium citrate dihydrate and 7.05 g/L of anhydrous dibasic sodium phosphate in water. [NOTE—Adjust with phosphoric acid to a pH of 8.0 before bringing the solution to volume.]

**Solution B:** 38.1 g/L of sodium borate in water

**Solution C:** 1 mg/mL of 9-fluorenylmethyl chloroformate in acetonitrile. [NOTE—Prepare this solution fresh just before use.]

**Mobile phase:** Acetonitrile, methanol, and *Solution A* (20:5:75)

**Diluent:** 29.4 g/L of sodium citrate dihydrate in water  
**Standard stock solution:** 0.03 mg/mL of anhydrous alendronate sodium in *Diluent*, from USP Alendronate Sodium RS

**Standard solution:** Transfer 5.0 mL of the *Standard stock solution* to a 50-mL polypropylene screw-cap centrifuge tube containing 5 mL of *Solution B*, and mix for 3 min. Add 4 mL of *Solution C*, and agitate for 30 s. Allow the solution to stand at room temperature for 25 min. Add 25 mL of methylene chloride, and agitate for 40 s. Centrifuge the mixture for 10 min. Use the clear upper aqueous layer.

**Sample stock solution:** Transfer NLT 10 Tablets to a 1000-mL volumetric flask. Add 500 mL of *Diluent*, shake by mechanical means for 30 min, and sonicate for 5 min. Dilute with *Diluent* to volume, and centrifuge a portion of this solution. Quantitatively dilute a portion of the clear supernatant to a concentration of 0.02–0.03 mg/mL of alendronic acid.

**Sample solution:** Transfer 5.0 mL of the *Sample stock solution* to a 50-mL polypropylene screw-cap centrifuge tube containing 5 mL of *Solution B*, and mix for 3 min. Add 4 mL of *Solution C*, and agitate for 30 s. Allow the solution to stand at room temperature for 25 min. Add 25 mL of methylene chloride, and agitate for 40 s. Centrifuge the mixture for 10 min. Use the clear upper aqueous layer.

**Blank:** Transfer 5 mL of *Diluent* to a 50-mL polypropylene screw-cap centrifuge tube containing 5 mL of *Solution B*, and mix for 3 min. Add 4 mL of *Solution C*, and

agitate for 30 s. Allow the solution to stand at room temperature for 25 min. Add 25 mL of methylene chloride, and agitate for 40 s. Centrifuge the mixture for 10 min. Use the clear upper aqueous layer.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 266 nm

**Column:** 4.1-mm × 25-cm; packing L21

**Column temperature:** 35°

**Flow rate:** 1 mL/min

**Injection size:** 50 µL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Capacity factor:** NLT 2.0

**Relative standard deviation:** NMT 2.0% for replicate injections

#### Analysis

**Samples:** *Standard solution*, *Sample solution*, and *Blank*  
Calculate the percentage of the label claim in the portion of  $C_4H_{13}NO_7P_2$  taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$r_U$  = peak area from the *Sample solution*

$r_S$  = peak area from the *Standard solution*

$C_S$  = concentration of anhydrous USP Alendronate Sodium RS in the *Standard stock solution* (mg/mL)

$C_U$  = nominal concentration of alendronic acid in the *Sample stock solution* (mg/mL)

$M_{r1}$  = molecular weight of alendronic acid, 249.10

$M_{r2}$  = molecular weight of anhydrous alendronate sodium, 271.09

**Acceptance criteria:**  $C_4H_{12}NNaO_7P_2$  equivalent to 90.0%–110.0% of the labeled amount of  $C_4H_{13}NO_7P_2$

## PERFORMANCE TESTS

### • DISSOLUTION <711>

#### Test 1

**Medium:** Water; 900 mL

**Apparatus 2:** 50 rpm

**Time:** 15 min

Determine the amount of  $C_4H_{13}NO_7P_2$  dissolved by using the following method.

**Solution A and Mobile phase:** Proceed as directed in the *Assay*.

**Diluent:** 176.4 g/L of sodium citrate in *Medium*

**Solution B:** Dissolve 6.2 g of boric acid in approximately 950 mL of water. Adjust with 1 N sodium hydroxide to a pH of 9.0, and dilute with water to 1 L.

**Solution C:** 0.5 mg/mL of 9-fluorenylmethyl chloroformate in acetonitrile. [NOTE—Prepare this solution fresh.]

**Standard stock solution:** USP Alendronate Sodium RS in *Medium* to make a concentration equivalent to dissolving 1 Tablet in 900 mL of the same *Medium*. Calculate the concentration,  $C$  (mg/mL), of anhydrous alendronate sodium in this solution.

**Standard solution:** Transfer 5.0 mL of the *Standard stock solution* to a 50-mL polypropylene screw-cap centrifuge tube containing 1.0 mL of *Diluent* and 5.0 mL of *Solution B*, and mix for 3 min. Add 4.0 mL of *Solution C*, and agitate for 30 s. Allow the solution to stand at room temperature for 25 min. Add 25 mL of methylene chloride, and agitate for 40 s. Centrifuge the mixture for 5 min. Use a portion of the clear, upper aqueous layer.

**Blank:** Transfer 5 mL of water to a 50-mL polypropylene screw-cap centrifuge tube containing 1.0 mL of *Diluent* and 5.0 mL of *Solution B*, and mix for 3 min. Add 4.0 mL of *Solution C*, and agitate for 30 s. Allow the solution to stand at room temperature for 25 min. Add 25 mL of methylene chloride, and agitate for

40 s. Centrifuge the mixture for 5 min. Use a portion of the clear, upper aqueous layer.

**Sample solution:** Withdraw a portion of the solution under test, and centrifuge immediately. Transfer 5.0 mL of the supernatant to a 50-mL polypropylene screw-cap centrifuge tube containing 1.0 mL of *Diluent* and 5.0 mL of *Solution B*, and mix for 3 min. Add 4.0 mL of *Solution C*, and agitate for 30 s. Allow the solution to stand at room temperature for 25 min. Add 25 mL of methylene chloride, and agitate for 40 s. Centrifuge the mixture for 5 min. Use a portion of the clear, upper aqueous layer.

**Chromatographic system and System suitability:** Proceed as directed in the *Assay*.

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_4H_{13}NO_7P_2$  dissolved:

$$\text{Result} = (r_U/r_S) \times C \times (M_{r1}/M_{r2}) \times V \times (100/L)$$

$r_U$  = peak area from the *Sample solution*

$r_S$  = peak area from the *Standard solution*

$C$  = defined under the *Standard stock solution*

$M_{r1}$  = molecular weight of alendronic acid, 249.10

$M_{r2}$  = molecular weight of alendronate sodium, 271.09

$V$  = volume of the *Medium*, 900 mL

$L$  = Tablet label claim (mg)

**Tolerances:** NLT 80% (Q) of the labeled amount of  $C_4H_{13}NO_7P_2$  is dissolved; for tablets labeled for weekly dosing, NLT 75% (Q) of the labeled amount of  $C_4H_{13}NO_7P_2$  is dissolved.

#### Test 2

If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.

**Medium:** Water; 900 mL

**Apparatus 2:** 50 rpm

**Time:** 30 min

Determine the amount of  $C_4H_{12}NNaO_7P_2 \cdot 3H_2O$  dissolved using the following method.

**Solution B and Solution C:** Proceed as directed in the *Assay*.

**0.6 M citrate buffer:** 176.4 g/L of sodium citrate dihydrate in water

**0.05 M buffer:** Transfer 14.7 g of sodium citrate dihydrate and 7.05 g of anhydrous dibasic sodium phosphate to a 1000-mL volumetric flask, dissolve in about 900 mL of water, adjust with phosphoric acid to a pH of 8.0, and dilute with water to volume.

**Mobile phase:** 0.05 M buffer, acetonitrile, and methanol (76:19:5)

**Standard stock solution:** Prepare a solution of USP Alendronate Sodium RS in *Medium* with a final concentration corresponding to the concentration obtained by dissolving 1 tablet in 900 mL of *Medium*. Calculate the concentration,  $C$  (mg/mL), of anhydrous alendronate sodium in this solution.

**Standard solution:** Transfer 5.0 mL of the *Standard stock solution* to a 50-mL screw-cap polypropylene centrifuge tube containing 1.0 mL of 0.6 M citrate buffer and 5.0 mL of *Solution B*, and mix for about 3 min. Add 4.0 mL of *Solution C*, and agitate for about 30 s. Allow the solution to stand at room temperature for about 30 min. Add 25 mL of methylene chloride, and agitate vigorously for about 40 s. Centrifuge the mixture for 10 min. Use a portion of the clear upper aqueous layer.

**Blank:** Using 5 mL of water, proceed as directed for the *Standard solution*, beginning with "to a 50-mL screw-cap polypropylene centrifuge tube".

#### Sample solution

**For Tablets labeled to contain 5 mg, 10 mg, 35 mg, or 40 mg:** After 30 min, withdraw 30 mL of the solution under test, and pass through a suitable 0.45-µm filter, discarding the first 10 mL. Using 5.0 mL of the

filtrate, proceed as directed for the *Standard solution*, beginning with "to a 50-mL screw-cap polypropylene centrifuge tube".

**For Tablets labeled to contain 70 mg:** After 30 min, withdraw 30 mL of the solution under test, and pass through a suitable 0.45- $\mu$ m filter, discarding the first 10 mL. Transfer 6.0 mL of the filtrate to a 10-mL volumetric flask, and dilute with water to volume. Using 5.0 mL of this dilution, proceed as directed for the *Standard solution*, beginning with "to a 50-mL screw-cap polypropylene centrifuge tube".

**Chromatographic system and System suitability:** Proceed as directed in the *Assay*.

**Analysis:** Proceed as directed in *Test 1*.

**Tolerances:** NLT 80% (Q) of the labeled amount of alendronate sodium ( $C_4H_{12}NNaO_7P_2 \cdot 3H_2O$ ) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store between 15° and 30°.
- **LABELING:** The labeling indicates weekly dosing where appropriate. When more than one *Dissolution* test is given, the labeling states the test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS** (11)  
USP Alendronate Sodium RS

## Alfentanil Hydrochloride

$C_{21}H_{32}N_6O_3 \cdot HCl \cdot H_2O$  470.99

Propanamide, *N*-[1-[2-(4-ethyl-4,5-dihydro-5-oxo-1*H*-tetrazol-1-yl)ethyl]-4-(methoxymethyl)-4-piperidinyl]-*N*-phenyl, monohydrochloride, monohydrate.

*N*-[1-[2-(4-Ethyl-5-oxo-2-tetrazolin-1-yl)-ethyl]-4-(methoxymethyl)-4-piperidinyl]propionanilide monohydrochloride monohydrate [70879-28-6; 69049-06-5].

» Alfentanil Hydrochloride contains not less than 98.0 percent and not more than 102.0 percent of  $C_{21}H_{32}N_6O_3 \cdot HCl$ , calculated on the anhydrous basis.

**Caution—Handle Alfentanil Hydrochloride with great care since it is a potent opioid analgesic. Great care should be taken to prevent inhaling particles of Alfentanil Hydrochloride and exposing the skin to it.**

**Packaging and storage—**Preserve in tight containers, and store at controlled room temperature.

**USP Reference standards** (11)—

USP Alfentanil Hydrochloride RS

**Identification, Infrared Absorption** (197K).

**Water, Method I** (921): not more than 4.0%.

**Residue on ignition** (281): not more than 0.1%.

**Chromatographic purity—**

**Mobile phase—**Prepare a filtered and degassed mixture of 0.01 M tetrabutylammonium hydrogen sulfate and acetonitrile (86:14). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard solution—**Dissolve an accurately weighed quantity of USP Alfentanil Hydrochloride RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.54 mg per mL.

**Test solution—**Transfer about 54 mg of Alfentanil Hydrochloride, accurately weighed, to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 235-nm detector and a 4.6-mm  $\times$  25-cm column that contains spherical 5- $\mu$ m packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed under *Procedure*: the column efficiency is not less than 5400 theoretical plates, the tailing factor is not more than 1.3, and the relative standard deviation for replicate injections is not more than 1.0%.

**Procedure—**Inject a volume (about 25  $\mu$ L) of the *Test solution* into the chromatograph, record the chromatogram, and measure the responses for all of the peaks. Calculate the percentage of each impurity in the portion of Alfentanil Hydrochloride taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the response of each impurity peak, and  $r_s$  is the sum of all of the peaks: not more than 0.5% of any single impurity is found, and the sum of all impurities is not more than 1.0%.

**Assay—**Dissolve about 350 mg of Alfentanil Hydrochloride, accurately weighed, in 30 mL of glacial acetic acid. Add 3 mL of mercuric acetate TS and 3 drops of *p*-naphtholbenzein TS, and titrate with 0.1 N perchloric acid VS to a green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 45.298 mg of  $C_{21}H_{32}N_6O_3 \cdot HCl$ .

## Alfentanil Injection

» Alfentanil Injection is a sterile solution of Alfentanil Hydrochloride in Water for Injection. It contains an amount of Alfentanil Hydrochloride equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{21}H_{32}N_6O_3$ .

**Caution—Handle Alfentanil Injection with great care since it is a potent opioid analgesic.**

**Packaging and storage—**Preserve in tight single-dose or multiple-dose containers, preferably of Type I glass, and store at controlled room temperature.

**USP Reference standards** (11)—

USP Alfentanil Hydrochloride RS

USP Endotoxin RS

**Identification—**

**A:** It responds to the *Thin-layer Chromatographic Identification Test* (201), a test solution of it diluted, if necessary, with water, to obtain a concentration of 0.5 mg of alfentanil per mL. Prepare a Standard solution in water to obtain a concentration of 0.54 mg per mL of USP Alfentanil Hydrochloride RS. Apply 200  $\mu$ L each of the Standard solution and the test solution, develop the plate using a solvent system consisting of a mixture of chloroform, methanol, and formic acid (85:10:5), and visualize the spots using Dragendorff's reagent.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the

chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Bacterial endotoxins** (85)—It contains not more than 10 USP Endotoxin Units per mL.

**pH** (791): between 4.0 and 6.0.

**Particulate matter** (788): meets the requirements for small-volume injections.

#### Chromatographic purity—

*Mobile phase* and *Chromatographic system*—Proceed as directed in the test for *Chromatographic purity* under *Alfentanil Hydrochloride*.

*Standard solution*—Use the *Standard preparation* as obtained in the *Assay*.

*Test solution*—Use the *Assay preparation*.

*Procedure*—Inject a volume (about 25  $\mu$ L) of the *Test solution* into the chromatograph, record the chromatogram, and measure the responses for all of the peaks. Calculate the percentage of each impurity in the portion of Injection taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the response of each impurity peak, and  $r_s$  is the sum of all of the peaks: the sum of all the impurities is not more than 2.0%.

**Other requirements**—It meets the requirements under *Injections* (1).

#### Assay—

*Mobile phase* and *Chromatographic system*—Proceed as directed in the test for *Chromatographic purity* under *Alfentanil Hydrochloride*.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Alfentanil Hydrochloride RS in saline TS, and dilute quantitatively, and stepwise if necessary, with saline TS to obtain a solution having a known concentration of about 0.54 mg per mL.

*Assay preparation*—Transfer an accurately measured volume of Injection to a suitable container, and dilute with saline TS, if necessary, to obtain a concentration of about 0.50 mg per mL of alfentanil.

*Procedure*—Separately inject equal volumes (about 25  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{21}H_{32}N_6O_3$  in each mL of the Injection taken by the formula:

$$(416.52/452.98)C(r_U / r_S)$$

in which 416.52 and 452.98 are the molecular weights of alfentanil and alfentanil hydrochloride, respectively; C is the concentration, in mg per mL, of USP Alfentanil Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Alfuzosin Hydrochloride

$C_{19}H_{27}N_5O_4 \cdot HCl$  425.91  
2-Furancarboxamide, N-[3-[(4-amino-6,7-dimethoxy-2-quinazolinyl)methylamino]propyl]tetrahydro-, monohydrochloride ( $\pm$ );

( $\pm$ )-N-[3-[(4-Amino-6,7-dimethoxy-2-quinazolinyl)methylamino]propyl]tetrahydro-2-furamide monohydrochloride [81403-68-1].

#### DEFINITION

Alfuzosin Hydrochloride contains NLT 99.0% and NMT 101.0% of alfuzosin hydrochloride ( $C_{19}H_{27}N_5O_4 \cdot HCl$ ), calculated on the anhydrous basis.

#### IDENTIFICATION

- A. INFRARED ABSORPTION** (197K)
- B. IDENTIFICATION TESTS—GENERAL, Chloride** (191): Meets the requirements

#### ASSAY

##### PROCEDURE

**Sample:** 300 mg

**Diluent:** Glacial acetic acid and acetic anhydride (1:1)

**Titrimetric system**

(See *Titrimetry* (541).)

**Mode:** Direct titration

**Titrant:** 0.1 N perchloric acid VS

**Endpoint detection:** Potentiometric

**Analysis:** Dissolve the *Sample* in 80 mL of *Diluent*. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid VS is equivalent to 42.59 mg of alfuzosin hydrochloride ( $C_{19}H_{27}N_5O_4 \cdot HCl$ ).

**Acceptance criteria:** 99.0%–101.0% on the anhydrous basis

#### IMPURITIES

- RESIDUE ON IGNITION** (281): NMT 0.1%

##### ORGANIC IMPURITIES

**Buffer:** Dilute 5 mL of perchloric acid in 900 mL of water, adjust with 2 M sodium hydroxide to a pH of 3.5, and dilute with water to 1 L.

**Mobile phase:** Acetonitrile, tetrahydrofuran, and *Buffer* (20:1:80)

**System suitability solution:** 0.4 mg/mL of USP Alfuzosin System Suitability Mixture RS in *Mobile phase*

**Sample solution:** 0.40 mg/mL of Alfuzosin Hydrochloride in *Mobile phase*

**Reference solution:** 0.40  $\mu$ g/mL of Alfuzosin Hydrochloride in *Mobile phase* from the *Sample solution*

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm  $\times$  15-cm; 5- $\mu$ m packing L1

**Flow rate:** 1.5 mL/min

**Injection volume:** 10  $\mu$ L

**System suitability**

**Sample:** *System suitability solution*

**Suitability requirements**

**Peak-to-valley ratio:** The ratio of the height of the impurity A peak to the height of the valley between the impurity A peak and alfuzosin is NLT 5.

##### Analysis

**Samples:** *Sample solution* and *Reference solution*  
Calculate the percentage of each impurity in the portion of Alfuzosin Hydrochloride taken:

$$\text{Result} = (r_U / r_S) \times (1/D) \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_S$  = peak response of alfuzosin from the *Reference solution*

D = dilution factor between the *Sample solution* and the *Reference solution*, 1000

**Acceptance criteria:** See *Table 1*. [NOTE—Disregard any peak with an area less than 0.05%.]

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Impurity D <sup>a</sup>	0.5	0.20
Alfuzosin	1.0	—
Impurity A <sup>b</sup>	1.2	— <sup>c</sup>
Any other individual, unidentified impurity	—	0.10
Total impurities	—	0.30

<sup>a</sup> N-(4-Amino-6,7-dimethoxyquinazolin-2-yl)-N-methylpropane-1,3-diamine.

<sup>b</sup> N-[3-[(4-Amino-6,7-dimethoxyquinazolin-2-yl)(methyl)amino]propyl]furan-2-carboxamide.

<sup>c</sup> Impurity A, a component of USP Alfuzosin System Suitability Mixture RS, is not a specified impurity.

### SPECIFIC TESTS

#### • OPTICAL ROTATION <781>

**Sample solution:** 20 mg/mL in carbon dioxide-free water

**Acceptance criteria:** −0.10° to +0.10°

#### Change to read:

#### • WATER DETERMINATION, Method I <921>: •NMT 2.0%• (RB)

1-May-2012

#### • PH <791>

**Sample solution:** 20 mg/mL in carbon dioxide-free water

**Acceptance criteria:** 4.0–5.5

### ADDITIONAL REQUIREMENTS

#### • PACKAGING AND STORAGE: Preserve in tight containers. Protect from light and humidity, and store at room temperature.

#### • USP REFERENCE STANDARDS <11>

USP Alfuzosin Hydrochloride RS

USP Alfuzosin System Suitability Mixture RS

Alfuzosin Hydrochloride containing approximately 0.4% of impurity A (N-[3-[(4-amino-6,7-dimethoxyquinazolin-2-yl)(methyl)amino]propyl]furan-2-carboxamide), and about 0.4% of impurity D (N-(4-amino-6,7-dimethoxyquinazolin-2-yl)-N-methylpropane-1,3-diamine).

#### Add the following:

## ▲Alfuzosin Hydrochloride Extended-Release Tablets

### DEFINITION

Alfuzosin Hydrochloride Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of alfuzosin hydrochloride (C<sub>19</sub>H<sub>27</sub>N<sub>5</sub>O<sub>4</sub> · HCl).

### IDENTIFICATION

#### • A. INFRARED ABSORPTION <197> [NOTE—Methods described under *Infrared Absorption* <197K> or <197A> may be used.]

**Sample:** Grind 4 Tablets, and add 20 mL of water.

[NOTE—When analyzing multi-layer Tablets, isolate the layer containing alfuzosin hydrochloride using a suitable tool.] Add 20 mL of strong ammonia solution. Extract with 20 mL of methylene chloride, and separate the organic layer. Repeat the extraction successively with 20 mL, then with 10 mL of methylene chloride. Wash

the combined organic layers with 20 mL of water. Dry the organic solution using a phase separation filter. Take 2.0 mL of the dried organic solution, and mix with 200 mg of finely ground potassium bromide. Evaporate the methylene chloride at 60°, then at 105° for 30 min. Make a disc. Alternatively, evaporate methylene chloride from the dried organic solution at 60°, then at 105° for 30 min. Perform the IR spectrum.

**Acceptance criteria:** The maxima of the spectrum obtained from the *Sample* correspond in position and relative intensity to those obtained from USP Alfuzosin Hydrochloride RS, treated in the same manner as the *Sample*, beginning with “Add 20 mL of water.”

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### • PROCEDURE

**Solution A:** 5.0 mL of perchloric acid in 900 mL of water. Adjust with 2 M sodium hydroxide to a pH of 3.5, and dilute with water to 1000 mL.

**Mobile phase:** Acetonitrile, tetrahydrofuran, and *Solution A* (20:1:80)

**Diluent:** 0.01 N hydrochloric acid

**Standard stock solution:** 0.15 mg/mL of USP Alfuzosin Hydrochloride RS in methanol

**Standard solution:** 0.03 mg/mL of USP Alfuzosin Hydrochloride RS in *Diluent* from the *Standard stock solution*

**Sample stock solution:** Place a suitable number of Tablets into a suitable volumetric flask to obtain a solution having a concentration of 0.16 mg/mL of alfuzosin hydrochloride. Add 80% of the flask volume of methanol, and stir for at least 1 h using a magnetic stirrer. Add 10% of the flask volume of *Diluent*, mix, and allow it to cool to room temperature. Dilute the resulting suspension with methanol to volume, stir, and allow to settle for 30 min.

**Sample solution:** 0.03 mg/mL of alfuzosin hydrochloride in *Diluent* from the *Sample stock solution* supernatant. Pass through a suitable filter.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 15-cm; 5-μm packing L1

**Flow rate:** 1.5 mL/min

**Injection volume:** 20 μL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** 0.8–1.5 for alfuzosin

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of alfuzosin hydrochloride (C<sub>19</sub>H<sub>27</sub>N<sub>5</sub>O<sub>4</sub> · HCl) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Alfuzosin Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

### PERFORMANCE TESTS

#### • DISSOLUTION <711>

##### Test 1

**Medium:** 0.01 N hydrochloric acid; 500 mL

**Apparatus 2:** 100 rpm, with Tablet holder (see *Figure 1*)

Figure 1. 37.5-mm (l) × 20-mm (d) stainless steel cylinders are used as sample holders. The cylinders contain screw caps drilled with seven 4.5-mm holes. Seven 4.5-mm holes are drilled in the bottom, and 12 longitudinal series of five 5-mm holes are drilled on the cylinders, alternatively starting and ending with one 1.7-mm hole.

**Times:** 1, 6, 12, and 20 h  
**Sample solution:** Pass a portion of the solution under test through a suitable filter.  
**Standard solution:** L/500 (mg/mL) of USP Alfuzosin Hydrochloride RS in Medium, where L is the Tablet label claim in mg  
**Detector:** UV 330 nm  
**Blank:** Medium  
**Path length:** 1 cm  
**Tolerances:** See Table 1.

Table 1

Level	Time (h)	Amount Dissolved
L1		Each Tablet:
	1	10%–20%
	6	40%–55%
	12	65%–85%
	20	NLT 85%
L2		Average of 12 Tablets complies with L1 and each Tablet:
	1	9%–22%
	6	36%–61%
	12	59%–94%
	20	NLT 77%
L3		Average of 24 Tablets complies with L1, NMT 2 Tablets outside L2, and all Tablets within:
	1	8%–24%
	6	32%–66%
	12	52%–102%
	20	NLT 68%

**Test 2:** If the product complies with this test, the labeling indicates that it meets USP Dissolution Test 2.  
**Medium:** 0.01 N hydrochloric acid; 900 mL  
**Apparatus 2:** 100 rpm  
**Times:** 1, 3, 12, and 24 h  
**Buffer:** Dilute 5.0 mL of perchloric acid in 900 mL of water, adjust with diluted sodium hydroxide (0.1 g/mL) to a pH of 3.5 ± 0.5, and dilute with water to 1 L.  
**Mobile phase:** Acetonitrile and Buffer (25:75)  
**Standard stock solution:** 0.28 mg/mL of USP Alfuzosin Hydrochloride RS, prepared as follows. In a 200-mL volumetric flask dissolve 55.5 mg of USP Alfuzosin Hy-

drochloride RS in 5 mL of methanol, sonicate to dissolve, and dilute with Medium to volume.  
**Standard solution:** 0.011 mg/mL of USP Alfuzosin Hydrochloride RS in Medium from the Standard stock solution  
**Sample solution:** Pass a portion of the solution under test through a suitable filter.  
**Chromatographic system**  
(See Chromatography <621>, System Suitability.)  
**Mode:** LC  
**Detector:** UV 244 nm  
**Column:** 4.6-mm × 15-cm; 5-μm packing L7  
**Column temperature:** 30°  
**Flow rate:** 1.2 mL/min  
**Injection volume:** 20 μL  
**System suitability**  
**Sample:** Standard solution  
**Suitability requirements**  
**Tailing factor:** NMT 2.0  
**Capacity factor:** NLT 3000 theoretical plates  
**Relative standard deviation:** NMT 2.0%  
**Analysis**  
**Samples:** Standard solution and Sample solution  
Calculate the concentration (C<sub>i</sub>) of alfuzosin hydrochloride (C<sub>19</sub>H<sub>27</sub>N<sub>5</sub>O<sub>4</sub> · HCl) in the sample withdrawn from the vessel at each time point (i):

$$\text{Result}_i = (r_U/r_S) \times C_S$$

r<sub>U</sub> = peak response from the Sample solution  
r<sub>S</sub> = peak response from the Standard solution  
C<sub>S</sub> = concentration of the Standard solution (mg/mL)  
Calculate the percentage of the labeled amount of alfuzosin hydrochloride (C<sub>19</sub>H<sub>27</sub>N<sub>5</sub>O<sub>4</sub> · HCl) dissolved at each time point (i):

$$\text{Result}_1 = C_i \times V \times (1/L) \times 100$$

$$\text{Result}_2 = \{[C_2 \times V] + [C_1 \times V_S]\} \times (1/L) \times 100$$

$$\text{Result}_3 = \{[C_3 \times V] + [(C_2 + C_1) \times V_S]\} \times (1/L) \times 100$$

$$\text{Result}_4 = \{[C_4 \times V] + [(C_3 + C_2 + C_1) \times V_S]\} \times (1/L) \times 100$$

C<sub>i</sub> = concentration of alfuzosin hydrochloride in the portion of sample withdrawn at the specified time point (mg/mL)  
V = volume of medium, 900 mL  
L = label claim (mg/Tablet)  
V<sub>S</sub> = volume of the Sample solution withdrawn at each time point and replaced with Medium (mL)  
**Tolerances:** See Table 2.

Table 2

Time point (i)	Time (h)	Amount Dissolved
1	1	NMT 20%
2	3	15%–35%
3	12	50%–70%
4	24	NLT 80%

- **UNIFORMITY OF DOSAGE UNITS (905):** Meets the requirements
- **IMPURITIES**
  - **ORGANIC IMPURITIES**  
**Solution A, Mobile phase, Diluent, Sample solution, and Chromatographic system:** Proceed as directed in the Assay.

**System suitability stock solution:** 0.4 mg/mL of USP Alfuzosin System Suitability Mixture A RS in methanol

**System suitability solution:** 0.03 mg/mL of USP Alfuzosin System Suitability Mixture A RS in *Diluent* from the *System suitability stock solution*

**Standard stock solution:** 0.15 mg/mL of USP Alfuzosin Hydrochloride RS in methanol

**Standard solution:** 0.03 mg/mL of USP Alfuzosin Hydrochloride RS in *Diluent* from the *Standard stock solution*

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

#### Suitability requirements

**Resolution:** NLT 1.0 between alfuzosin and the furamide analog, and NLT 1.0 between deacylated alfuzosin and the *N*-formyl analog, *System suitability solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response for each impurity from the *Sample solution*

$r_S$  = peak response for alfuzosin from the *Sample solution*

$C_S$  = concentration of USP Alfuzosin Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of alfuzosin hydrochloride in the *Sample solution* (mg/mL)

**Acceptance criteria:** See *Table 3*.

**Table 3**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Deacylated alfuzosin <sup>a</sup>	0.46	0.40
<i>N</i> -Formyl analog <sup>b</sup>	0.50	0.30
Alfuzosin	1.0	—
Furamide analog <sup>c</sup>	1.18	— <sup>d</sup>
Any individual unspecified impurity	—	0.20
Total impurities	—	0.80

<sup>a</sup> *N*-(3-Aminopropyl)-6,7-dimethoxy-*N*-(2-methylquinazolin-2-yl)-2,4-diamine.

<sup>b</sup> *N*-[3-[(4-Amino-6,7-dimethoxyquinazolin-2-yl)(methyl)amino]propyl]formamide.

<sup>c</sup> *N*-[3-[(4-Amino-6,7-dimethoxyquinazolin-2-yl)(methyl)amino]propyl]furan-2-carboxamide.

<sup>d</sup> Furamide analog, a component of USP Alfuzosin System Suitability Mixture A RS, is not a specified impurity.

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Protect from light and moisture. Store at controlled room temperature.

• **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.

#### • USP REFERENCE STANDARDS (11)

USP Alfuzosin Hydrochloride RS

USP Alfuzosin System Suitability Mixture A RS

Furamide analog: *N*-{3-[(4-Amino-6,7-dimethoxyquinazolin-2-yl)(methyl)amino]propyl}furan-2-carboxamide.

$C_{19}H_{23}N_5O_4$  385.42

Deacylated alfuzosin: *N*-(3-Aminopropyl)-6,7-dimethoxy-*N*-(2-methylquinazolin-2-yl)-2,4-diamine.

$C_{14}H_{21}N_5O_2$  291.35

*N*-Formyl analog: *N*-[3-[(4-Amino-6,7-dimethoxyquinazolin-2-yl)(methyl)amino]propyl]formamide.

$C_{15}H_{21}N_5O_3$  319.36<sup>▲</sup><sub>USP36</sub>

## Allantoin

$C_4H_6N_4O_3$

Urea, (2,5-dioxo-4-imidazolidinyl)-;

Allantoin [97-59-6].

158.12

#### DEFINITION

Allantoin contains NLT 98.5% and NMT 101.0% of  $C_4H_6N_4O_3$ .

#### IDENTIFICATION

• **A. INFRARED ABSORPTION** (197K)

• **B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** (201): The  $R_f$  value of the principal spot from *Sample solution A* corresponds to that from *Standard solution A*, as described in the test for *Organic Impurities*.

#### ASSAY

##### • PROCEDURE

**Sample:** 120 mg

**Analysis:** Transfer the *Sample* to a 100-mL beaker, dissolve by stirring in 40 mL of water, and titrate with 0.1 M sodium hydroxide. Use a suitable electrode system (see *Titrimetry* (541)). Each mL of 0.1 M sodium hydroxide is equivalent to 15.81 mg of  $C_4H_6N_4O_3$ .

**Acceptance criteria:** 98.5%–101.0%

#### IMPURITIES

• **RESIDUE ON IGNITION** (281): NMT 0.1%

##### • ORGANIC IMPURITIES

**Adsorbent:** Cellulose

**Diluent:** Methanol and water (1:1)

**Urea stock solution:** 1 mg/mL of USP Urea RS in water

**Standard solution A:** 1 mg/mL of USP Allantoin RS in *Diluent*

**Standard solution B:** 0.1 mg/mL of USP Urea RS in methanol, from *Urea stock solution*

**Standard solution C:** *Standard solution A* and *Standard solution B* (1:1)

**Sample solution A:** Transfer 0.10 g of Allantoin to a 10-mL volumetric flask, add 5 mL of water, dissolve by heating, and allow to cool. Dilute with methanol to volume. [NOTE—Use immediately after preparation.]

**Sample solution B:** Transfer 1 mL of *Sample solution A* to a 10-mL volumetric flask, and dilute with *Diluent* to volume.

**Spray reagent:** 5 mg/mL of *p*-dimethylaminobenzaldehyde in a mixture of methanol and hydrochloric acid (3:1)

##### Application volume

**Standard solution A:** 5  $\mu$ L

**Standard solution B:** 5  $\mu$ L

**Standard solution C:** 5  $\mu$ L

**Sample solution A:** 10  $\mu$ L

**Sample solution B:** 5  $\mu$ L

**Developing solvent system:** Butyl alcohol, glacial acetic acid, and water (60:15:25)

**Analysis:** Proceed as directed for *Chromatography* (621), *Thin-Layer Chromatography*. Develop the chromatogram until the solvent front has moved about 10 cm. Spray the plate with *Spray reagent*, dry in a current of hot air, and after 30 min examine under visible light.

**Acceptance criteria:** Any spot from *Sample solution A*, except for the principal spot, is not more intense than

the spot from *Standard solution B* (NMT 0.5%). The test is not valid unless the principal spots from *Standard solution C* are clearly separated.

### SPECIFIC TESTS

#### • ACIDITY OR ALKALINITY

**Sample solution:** 5 mg/mL in carbon dioxide-free water  
**Analysis:** To 5 mL of the *Sample solution* add 5 mL of water, 0.1 mL of methyl red TS, and 0.2 mL of 0.01 M sodium hydroxide.

**Acceptance criteria:** A yellow color is observed. The solution turns red upon the addition of 0.4 mL of 0.01 M hydrochloric acid.

#### • LOSS ON DRYING (731):

Dry a sample at 105° to constant weight: it loses NMT 0.1% of its weight.

#### • REDUCING SUBSTANCES

**Sample solution:** 1.0 g of Allantoin in 10 mL of water. Shake for 2 min, and filter.

**Analysis:** To the *Sample solution* add 1.5 mL of 0.02 M potassium permanganate.

**Acceptance criteria:** The solution remains violet for at least 10 min.

### ADDITIONAL REQUIREMENTS

#### • USP REFERENCE STANDARDS (11)

USP Allantoin RS

USP Urea RS

## Allopurinol

C<sub>5</sub>H<sub>4</sub>N<sub>4</sub>O 136.11

4*H*-Pyrazolo[3,4-*d*]pyrimidin-4-one, 1,5-dihydro-

1,5-Dihydro-4*H*-pyrazolo[3,4-*d*]pyrimidin-4-one.

1*H*-Pyrazolo[3,4-*d*]pyrimidin-4-ol [315-30-0].

» Allopurinol contains not less than 98.0 percent and not more than 102.0 percent of C<sub>5</sub>H<sub>4</sub>N<sub>4</sub>O, calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers. Store at room temperature.

#### USP Reference standards (11)—

USP Allopurinol RS

USP Allopurinol Related Compound A RS

3-Amino-4-carboxamidopyrazole hemisulfate.

(C<sub>4</sub>H<sub>6</sub>N<sub>4</sub>O)<sub>2</sub> · H<sub>2</sub>SO<sub>4</sub> 350.32

USP Allopurinol Related Compound B RS

5-(Formylamino)-1*H*-pyrazole-4-carboxamide.

C<sub>5</sub>H<sub>6</sub>N<sub>4</sub>O<sub>2</sub> 154.13

USP Allopurinol Related Compound C RS

USP Allopurinol Related Compound E RS

Ethyl 5-(formylamino)-1*H*-pyrazole-4-carboxylate.

USP Allopurinol Related Compound F RS

Ethyl 3-(2-carbethoxy-2-cyanoethyl)amino-1*H*-pyrazole-4-carboxylate.

**Identification, Infrared Absorption** (197K).

**Loss on drying** (731)—Dry it in vacuum at 105° for 5 hours: it loses not more than 0.5% of its weight.

**Related compounds**—[NOTE—Store and inject the *Standard solution* and the *Test solution* at 8°, using a cooled autosampler.]

**Solution A**—Dissolve 1.25 g of monobasic potassium phosphate in 1000 mL of water, filter, and degas.

**Solution B**—Use methanol.

**Mobile phase**—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Diluent**—Prepare a mixture of *Solution A* and *Solution B* (90:10).

**Allopurinol related compound F solution**—Accurately weigh about 5 mg of USP Allopurinol Related Compound F RS into a suitable flask. Add 2.0 mL of 0.1 N sodium hydroxide, promptly sonicate with swirling for 1 to 3 minutes to dissolve, add 80 mL of *Diluent*, and sonicate for an additional 5 minutes.

**Standard stock solution**—Accurately weigh about 5 mg each of USP Allopurinol RS, USP Allopurinol Related Compound A RS, USP Allopurinol Related Compound B RS, USP Allopurinol Related Compound C RS, USP Allopurinol Related Compound D RS, and USP Allopurinol Related Compound E RS, and transfer to a 100-mL volumetric flask. Add 2.0 mL of 0.1 N sodium hydroxide, promptly sonicate with swirling for not more than 1 minute to dissolve, add the entire volume of *Allopurinol related compound F solution* to the flask, rinse the flask in which *Allopurinol related compound F solution* was prepared with a small amount of *Diluent*, and add the rinsings to the solution. Sonicate for an additional 5 minutes. Dilute with *Diluent* to volume. [NOTE—This solution is stable for 48 hours when stored at 8°.]

**Standard solution**—Quantitatively dilute an accurately measured volume of the *Standard stock solution* with *Diluent* to obtain a solution having known concentrations of about 0.5 µg of allopurinol and about 0.5 µg each of allopurinol related compounds A, B, C, D, E, and F per mL.

**Test solution**—Transfer about 25 mg of Allopurinol, accurately weighed, to a 100-mL volumetric flask, add 5.0 mL of 0.1 N sodium hydroxide to dissolve, promptly sonicate with swirling for not more than 1 minute, add 80 mL of *Diluent*, and sonicate for an additional 5 minutes. Dilute with *Diluent* to volume.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The column temperature is maintained at 30°. The flow rate is about 1.0 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–30	90→70	10→30	linear gradient
30–35	70	30	isocratic
35–36	70→90	30→10	linear gradient
36–46	90	10	re-equilibration

Chromatograph the *Standard solution*, identify the peaks (see *Table 1*), and record the peak responses as directed for *Procedure*: the resolution, *R*, between allopurinol related compounds C and B is not less than 0.8; and the tailing factor for the allopurinol peak is not more than 1.5.

**Procedure**—Separately inject equal volumes (about 40 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and identify the allopurinol peak and the peaks due to impurities listed in *Table 1*.

Table 1

Name	Relative Retention Time	Limit (%)
Allopurinol related compound A <sup>1</sup>	0.62	0.2
Allopurinol related compound C <sup>2</sup>	0.79	0.2
Allopurinol related compound B <sup>3</sup>	0.81	0.2
Allopurinol	1.0	—
Allopurinol related compound D <sup>4</sup>	4.4	0.2
Allopurinol related compound E <sup>5</sup>	4.8	0.2
Allopurinol related compound F <sup>6</sup>	6.5	0.2

<sup>1</sup>3-Amino-1H-pyrazole-4-carboxamide.

<sup>2</sup>5-(4H-1,2,4-Triazol-4-yl)-1H-pyrazole-4-carboxamide.

<sup>3</sup>5-(Formylamino)-1H-pyrazole-4-carboxamide.

<sup>4</sup>Ethyl-5-amino-1H-pyrazole-4-carboxylate.

<sup>5</sup>Ethyl-5-(formylamino)-1H-pyrazole-4-carboxylate.

<sup>6</sup>Ethyl-(E/Z)-3-(2-carboxy-2-cyanoethenyl)amino-1H-pyrazole-4-carboxylate.

Calculate the percentage of each impurity in the portion of Allopurinol taken by the formula:

$$10(C/W)(r_i / r_s)$$

in which C is the concentration, in µg per mL, of each individual impurity in the *Standard solution*; W is the weight, in mg, of Allopurinol taken to prepare the *Test solution*; and  $r_i$  and  $r_s$  are the peak responses for each individual impurity obtained from the *Test solution* and the *Standard solution*, respectively. [NOTE—For unspecified impurities,  $r_s$  is the peak response for the allopurinol peak obtained from the *Standard solution*.] In addition to not exceeding the limits for each impurity in Table 1, not more than 0.1% of any individual unspecified impurity is found; and not more than 1.0% of total impurities is found.

**Limit of hydrazine**—[NOTE—Under the following conditions, any hydrazine present in the sample will react with benzaldehyde to form benzalazine.]

**Sodium hydroxide 2N solution**—Dissolve 8.5 g of sodium hydroxide in water, and dilute with the same solvent to 100 mL. Alternatively, a commercially available sodium hydroxide 2N solution can be used.

**Diluent**—Prepare a mixture of *Sodium hydroxide 2N solution* and methanol (1:1).

**Benzaldehyde solution**—Prepare a solution in *Diluent* containing 40 mg of benzaldehyde per mL. Prepare immediately before use.

**Hydrazine solution**—Transfer 10.0 mg of hydrazine sulfate to a 50-mL volumetric flask, dissolve in *Diluent* by sonicating for about 2 minutes, and dilute with *Diluent* to volume. Dilute this solution quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 2.0 µg of hydrazine sulfate per mL.

**Standard solution**—Transfer 5.0 mL of the *Hydrazine solution* to a suitable flask, add 4 mL of *Benzaldehyde solution*, mix, and allow to stand for 2.5 hours at room temperature. Add 5.0 mL of hexane, and shake for 1 minute. Allow the layers to separate, and use the upper (hexane) layer.

**Test solution**—Transfer about 250.0 mg of Allopurinol, accurately weighed, to a suitable flask, and dissolve in 5.0 mL of *Diluent*. Add 4 mL of *Benzaldehyde solution*, mix, and allow to stand for 2.5 hours at room temperature. Add 5.0 mL of hexane, and shake for 1 minute. Allow the layers to separate, and use the upper (hexane) layer.

**Blank solution**—Mix 5.0 mL of *Diluent* and 4 mL of *Benzaldehyde solution*, and allow to stand for 2.5 hours at room

temperature. Add 5.0 mL of hexane, and shake for 1 minute. Allow the layers to separate, and use the upper (hexane) layer.

**Mobile phase**—Prepare a mixture of hexane and isopropyl alcohol (95:5).

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 310-nm detector and a 4.0-mm × 25-cm column that contains 5-µm packing L10. The column temperature is maintained at 30°, and the flow rate is about 1.5 mL per minute. Chromatograph the *Standard solution*, identify the components on the basis of their relative retention time (1.0 for benzaldehyde and about 0.8 for benzalazine), and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between benzaldehyde and benzalazine is not less than 2.0; and the relative standard deviation for replicate injections is not greater than 15.0% for the benzalazine peak.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Blank solution*, the *Standard solution*, and the *Test solution* into a chromatograph, record the chromatogram for at least two times the retention time of the benzaldehyde peak, identify the components, and measure the responses of peaks due to benzalazine. Calculate the amount, in ppm, of hydrazine in the portion of Allopurinol taken by the formula:

$$1000(32.05 / 130.12) (C_s / C_t)(r_u / r_s)$$

in which 32.05 and 130.12 are the molecular weights of hydrazine and hydrazine sulfate, respectively; 1000 is the conversion coefficient from µg per mL to ppm;  $C_s$  is the concentration, in µg per mL, of hydrazine sulfate in the *Hydrazine solution*;  $C_t$  is the concentration, in mg per mL, of allopurinol in the *Allopurinol solution*; and  $r_u$  and  $r_s$  are the peak responses for the benzalazine peak obtained from the *Test solution* and the *Standard solution*, respectively: not more than 10 ppm of hydrazine is found.

**Assay**—[NOTE—Store and inject the *System suitability solution*, the *Standard preparation*, and the *Assay preparation* at 8°, using a cooled autosampler.]

**Mobile phase**—Dissolve 1.25 g of monobasic potassium phosphate in 1000 mL of water, filter, and degas.

**System suitability solution**—Transfer accurately weighed quantities of USP Allopurinol RS, USP Allopurinol Related Compound B RS, and USP Allopurinol Related Compound C RS, each to a suitable volumetric flask, dissolve in a small volume of 0.1 N sodium hydroxide, and immediately and quantitatively dilute with *Mobile phase* to obtain solutions having known concentrations of about 0.05 mg per mL. Transfer 1.0 mL of each of these three solutions to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Allopurinol RS in a small volume of 0.1 N sodium hydroxide, and immediately and quantitatively dilute with *Mobile phase* to obtain a solution having a known concentration of about 0.5 mg per mL. Quantitatively dilute an accurately measured volume of this solution with *Mobile phase* to obtain a solution having a known concentration of about 0.08 mg of allopurinol per mL.

**Assay preparation**—Transfer about 50 mg of Allopurinol, accurately weighed, to a 100-mL volumetric flask, dissolve in 5.0 mL of 0.1 N sodium hydroxide, immediately dilute with *Mobile phase* to volume, and mix. Quantitatively dilute an accurately measured volume of this solution with *Mobile phase* to obtain a solution having a known concentration of about 0.08 mg of allopurinol per mL.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1.8 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between allopuri-

not related compound B and allopurinol related compound C is not less than 1.1, and that between allopurinol related compound C and allopurinol is not less than 6.0. [NOTE—For the purpose of identification, the relative retention times are about 0.7 for allopurinol related compound B, 0.8 for allopurinol related compound C, and 1.0 for allopurinol.] Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of  $C_5H_4N_4O$  in the portion of Allopurinol taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which  $C_U$  and  $C_S$  are the concentrations, in mg per mL, of allopurinol in the *Assay preparation* and the *Standard preparation*, respectively; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Allopurinol Oral Suspension

### DEFINITION

Allopurinol Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of allopurinol ( $C_5H_4N_4O$ ). Prepare Allopurinol Oral Suspension 20 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Allopurinol	2 g
Glycerin	5 mL
Vehicle for Oral Suspension, NF	45 mL
Vehicle for Oral Solution, NF, a sufficient quantity to make	100 mL

Select the number of tablets that contain the specified amount of allopurinol, and calculate the quantity of each ingredient required for the total amount to be prepared. Count, weigh, or measure each ingredient. Thoroughly pulverize the tablets. Mix the powdered *Allopurinol* tablets and *Glycerin* to form a smooth paste. Incorporate the *Vehicle for Oral Suspension*. Add sufficient *Vehicle for Oral Solution* to volume, and mix well. Adjust the pH, if necessary. Package and label.

### SPECIFIC TESTS

- **pH** (791): 6.5–7.5

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in a tight container, and store at controlled room temperature.
- **LABELING:** Label it to state that it is to be shaken well before use, and that it is to be discarded after 60 days. Label it to state that it is to be kept out of the reach of children. Label it to indicate the nominal content of allopurinol in the Oral Suspension.
- **BEYOND-USE DATE:** NMT 60 days after the date on which it was compounded

## Allopurinol Tablets

» Allopurinol Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of allopurinol ( $C_5H_4N_4O$ ).

**Packaging and storage**—Preserve in well-closed containers.

### USP Reference standards (11)—

USP Allopurinol RS

**Identification**—Extract a quantity of finely powdered Tablets, equivalent to about 50 mg of allopurinol, by trituration with 10 mL of 0.1 N sodium hydroxide. Filter, acidify the filtrate with 1 N acetic acid, collect the precipitated allopurinol (allow 10 to 15 minutes for sufficient precipitation to occur), wash the precipitate with 3 mL of dehydrated alcohol, in portions, and finally wash with 4 mL of anhydrous ethyl ether. Allow to dry in air for 15 minutes, then dry at 105° for 3 hours: the residue so obtained meets the requirements for the *Identification* test under *Allopurinol*.

### Dissolution (711)—

*Medium:* 0.01 N hydrochloric acid; 900 mL.

*Apparatus 2:* 75 rpm.

*Time:* 45 minutes.

**Standard stock solution**—Prepare a stock solution by transferring about 40 mg of USP Allopurinol RS, accurately weighed, to a 200-mL volumetric flask. Add 10 mL of 0.1 N sodium hydroxide, sonicate for about 2 minutes, shake by mechanical means for about 10 minutes, dilute with *Dissolution Medium* to volume, and mix.

**Standard solution**—Dilute the *Standard stock solution* with *Dissolution Medium* to obtain a solution having a concentration similar to that expected in the solution under test.

**Procedure**—Determine the amount of  $C_5H_4N_4O$  dissolved by employing UV absorption at the wavelength of maximum absorbance at about 250 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, in comparison with the *Standard solution*.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_5H_4N_4O$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—[NOTE—Do not allow the *Mobile phase* to remain in the column overnight. After performing the procedure, flush the system with water for not less than 20 minutes, and then flush with methanol for 20 minutes.]

**Mobile phase**—Prepare a filtered and degassed 0.05 M solution of monobasic ammonium phosphate.

**Internal standard solution**—On the day of use, dissolve about 50 mg of hypoxanthine in 10 mL of 0.1 N sodium hydroxide, shake by mechanical means until dissolved (about 10 minutes), dilute with water to 50 mL, and mix.

**Standard preparation**—On the day of use, transfer about 50 mg of USP Allopurinol RS, accurately weighed, to a 50-mL volumetric flask, add 10 mL of 0.1 N sodium hydroxide, shake by mechanical means for 10 minutes, dilute with water to volume, and mix. Transfer 4.0 mL of this solution and 2.0 mL of *Internal standard solution* to a 200-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 50 mg of allopurinol, to a 50-mL volumetric flask, add 10 mL of 0.1 N sodium hydroxide, shake by mechanical means for 10 minutes, add water to volume, and mix. [NOTE—From this point, conduct the remainder of the Assay without delay.] Filter, rejecting the first 10 mL of the filtrate. Transfer 4.0 mL of the filtrate and 2.0 mL of *Internal standard solution* to a 200-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm × 30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.6 for hypoxanthine and 1.0 for allopurinol; the resolution, *R*, between the analyte and internal standard is not less than 5; and the relative standard deviation for replicate injections is not more than 3.0%.

**Procedure**—Separately inject equal volumes (about 15 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of allopurinol (C<sub>5</sub>H<sub>4</sub>N<sub>4</sub>O) in the portion of Tablets taken by the formula:

$$2.5C(R_U / R_S)$$

in which *C* is the concentration, in µg per mL, of USP Allopurinol RS in the *Standard preparation*; and *R<sub>U</sub>* and *R<sub>S</sub>* are the peak response ratios of allopurinol to hypoxanthine obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Allyl Isothiocyanate

C<sub>4</sub>H<sub>5</sub>NS 99.15  
3-Isothiocyanato-1-propene.  
Isothiocyanic acid allyl ester [57-06-7].

» Allyl Isothiocyanate contains not less than 93.0 percent and not more than 105.0 percent of C<sub>4</sub>H<sub>5</sub>NS.

**Caution**—Allyl Isothiocyanate is a potent lachrymator, with a pungent irritating odor. Care should be taken to protect the eyes, to prevent inhalation of fumes, and to avoid tasting.

**Packaging and storage**—Preserve in tight containers.

**Identification, Infrared Absorption** <197F>—The spectrum exhibits pronounced peaks at about 700-cm<sup>-1</sup>, 950-cm<sup>-1</sup>, 980-cm<sup>-1</sup>, 1300-cm<sup>-1</sup>, 1340-cm<sup>-1</sup>, 1350-cm<sup>-1</sup>, 1410-cm<sup>-1</sup>, 1420-cm<sup>-1</sup>, 1650-cm<sup>-1</sup>, 2100-cm<sup>-1</sup>, and 2200-cm<sup>-1</sup>.

**Specific gravity** <841>: between 1.013 and 1.020.

**Refractive index** <831>: between 1.527 and 1.531, determined at 20°.

**Distilling range, Method I** <721>: between 148° and 154°.

**Limit of phenols**—Dilute 1 mL of it with 5 mL of alcohol, and add 1 drop of ferric chloride TS: a blue color is not produced immediately.

**Assay**—Transfer about 4 mL of Allyl Isothiocyanate, accurately weighed, to a 100-mL volumetric flask, add alcohol to volume, and mix. Transfer 5.0 mL of this stock solution to a 100-mL conical flask, add 50.0 mL of 0.1 N silver nitrate VS and 5 mL of ammonia TS. Connect the flask to a reflux condenser, heat on a water bath for 1 hour, and allow to cool to room temperature. Disconnect the flask from the condenser, transfer the contents of the conical flask to a 100-mL volumetric flask with the aid of water, dilute with water to volume, and mix. Pass through a dry filter, discarding the first 10 mL of the filtrate. To 50.0 mL of the subse-

quent filtrate add 5 mL of nitric acid and 2 mL of ferric ammonium sulfate TS, and titrate the excess silver nitrate with 0.1 N ammonium thiocyanate VS. Perform a blank determination, using 5 mL of alcohol in place of the stock solution, and make any necessary correction. Each mL of 0.1 N silver nitrate is equivalent to 4.958 mg of C<sub>4</sub>H<sub>5</sub>NS.

## Aloe

### DEFINITION

Aloe is the dried latex of the leaves of *Aloe barbadensis* Mill. (*Aloe vera* L.), known in commerce as Curaçao Aloe, or of *Aloe ferox* Mill. and hybrids of this species with *Aloe africana* Mill. and *Aloe spicata* Baker, known in commerce as Cape Aloe (Fam. Liliaceae). Aloe yields NLT 50.0% of water-soluble extractive.

### IDENTIFICATION

- **A.** Powdered Aloe dissolves in nitric acid with effervescence, forming a reddish-brown to brown or green solution.
- **B. PROCEDURE**  
**Sample:** 1 g, finely powdered  
**Analysis:** Mix the *Sample* with 25 mL of cold water. Shake the mixture occasionally during 2 h, filter, and wash the filter and residue with sufficient cold water to make the filtrate measure 100 mL.  
**Acceptance criteria:** The color of the filtrate, viewed in the bulb of a 100-mL volumetric flask, is dark orange with Curaçao Aloe, and greenish yellow with Cape Aloe. The filtrate darkens on standing. [NOTE—Reserve the filtrate for *Identification* tests C and D.]
- **C. PROCEDURE**  
**Sample:** 5 mL of the filtrate obtained in *Identification* test B  
**Analysis:** Add 2 mL of nitric acid to the *Sample*.  
**Acceptance criteria:** The mixture exhibits a reddish-orange color with Curaçao Aloe, and a reddish-brown color that changes rapidly to green with Cape Aloe.
- **D. PROCEDURE**  
**Sample:** 10 mL of the filtrate obtained in *Identification* test B  
**Analysis:** Mix the *Sample* with 2 mL of ammonium hydroxide.  
**Acceptance criteria:** The mixture exhibits an amber color with Cape Aloe, and a dark amber color with Curaçao Aloe.

### ASSAY

#### • WATER-SOLUBLE EXTRACTIVE

**Sample:** 2 g of powdered Aloe  
**Analysis:** Macerate the *Sample* in 70 mL of water in a suitable flask. Shake the mixture during 8 h at 30-min intervals, and allow it to stand for 16 h without shaking. Filter, and wash the flask and residue with small portions of water, passing the washings through the filter, until the filtrate measures 100.0 mL. Evaporate a 50-mL aliquot of the filtrate in a tared dish on a steam bath to dryness, and dry at 110° to constant weight.  
**Acceptance criteria:** The weight of water-soluble extractive so obtained is NLT 50% of the weight of Aloe taken.

### SPECIFIC TESTS

#### • WATER DETERMINATION, Method III <921>

**Sample:** Use a powdered sample. If the Aloe is not powdered, crush it in a mortar until it passes through a no. 40 sieve, and mix the ground material before weighing the sample.

**Analysis:** Dry at 105° for 5 h

**Acceptance criteria:** NMT 12.0%

• **ARTICLES OF BOTANICAL ORIGIN, Total Ash** <561>

**Acceptance criteria:** NMT 4.0%

• **ALCOHOL-INSOLUBLE SUBSTANCES**

**Sample:** 1 g of powdered Aloe

**Analysis:** Add the *Sample* to 50 mL of alcohol in a flask. Heat the mixture to boiling, and maintain at incipient boiling for 15 min, replacing any loss due to evaporation. Remove from the heat, and shake the mixture at intervals during 1 h. Pass through a small dried and tared filter paper or a dried and tared filtering crucible, and wash the residue on the filter with alcohol until the last washing is colorless. Dry the residue at 105° to constant weight.

**Acceptance criteria:** The weight of the residue does not exceed 10.0% of the weight of Aloe taken.

• **BOTANIC CHARACTERISTICS**

**Curaçao aloe:** Brownish black, opaque masses. Its fractured surface is uneven, waxy, and somewhat resinous.

**Cape aloe:** Dusky to dark brown irregular masses, the surfaces of which are often covered with a yellowish powder. Its fracture is smooth and glassy.

**Powdered aloe:** Yellow, yellowish brown to olive-brown in color. When mounted in a bland expressed oil, it appears as greenish-yellow to reddish-brown angular or irregular fragments, the hues of which depend to some extent upon the thickness of the fragments.

## Alprazolam

$C_{17}H_{13}ClN_4$  308.76  
4*H*-[1,2,4]Triazolo[4,3- $\alpha$ ][1,4]benzodiazepine, 8-chloro-1-methyl-6-phenyl-;  
8-Chloro-1-methyl-6-phenyl-4*H*-s-triazolo[4,3- $\alpha$ ][1,4]benzodiazepine [28981-97-7].

### DEFINITION

Alprazolam contains NLT 98.0% and NMT 102.0% of  $C_{17}H_{13}ClN_4$ .

[**CAUTION**—Care should be taken to prevent inhaling particles of Alprazolam and exposing the skin to it.]

### IDENTIFICATION

• **A. INFRARED ABSORPTION** <197M>

- **B.** The retention time of the major peak from the *Sample solution* corresponds to that from the *Standard solution*, as obtained in the *Assay*.

### ASSAY

• **PROCEDURE**

**Diluent:** Acetonitrile and water (1:1)

**Buffer:** 1.4 g/L of monobasic potassium phosphate in water

**Mobile phase:** Acetonitrile and *Buffer* (1:1)

**Standard solution:** 25  $\mu$ g/mL of USP Alprazolam RS in *Diluent*. [NOTE—The solution is stable for 48 h at room temperature when stored in closed containers.]

**Sample solution:** 25  $\mu$ g/mL of Alprazolam in *Diluent*. Sonicate for about 1 min. [NOTE—The solution is stable for 48 h at room temperature when stored in closed containers.]

### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 231 nm

**Column:** 4.6-mm  $\times$  25-cm; packing L1

**Column temperature:** 40°

**Flow rate:** 1 mL/min

**Injection size:** 20  $\mu$ L

### System suitability

**Sample:** *Standard solution*

### Suitability requirements

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of alprazolam ( $C_{17}H_{13}ClN_4$ ) in the portion of Alprazolam taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area from the *Sample solution*

$r_S$  = peak area from the *Standard solution*

$C_S$  = concentration of USP Alprazolam RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Alprazolam in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0%

### IMPURITIES

• **RESIDUE ON IGNITION** <281>: NMT 0.5%

• **HEAVY METALS, Method II** <231>: 20 ppm

• **ORGANIC IMPURITIES**

**Diluent, Buffer, Mobile phase, and Chromatographic system:** Proceed as directed in the *Assay*.

**System suitability solution:** 20  $\mu$ g/mL each of USP Alprazolam RS, USP Alprazolam Related Compound A RS, and USP 2-Amino-5-chlorobenzophenone RS in *Diluent*.  
**Standard solution:** 0.25  $\mu$ g/mL of USP Alprazolam RS in *Diluent*. [NOTE—When stored in closed containers, the solution is stable for 48 h at room temperature.]

**Sample solution:** 250  $\mu$ g/mL of Alprazolam in *Diluent*. Sonicate for about 1 min. [NOTE—When stored in closed containers, the *Sample solution* is stable for 24 h at room temperature.]

### System suitability

**Samples:** *Standard solution* and *System suitability solution*

[NOTE—For relative retention times, see *Table 1*.]

### Suitability requirements

**Resolution:** NLT 2.0 between alprazolam related compound A and alprazolam, *System suitability solution*

**Relative standard deviation:** NMT 5.0%, *Standard solution*

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Alprazolam taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response for each impurity in the *Sample solution*

$r_S$  = peak response for alprazolam from the *Standard solution*

$C_S$  = concentration of USP Alprazolam RS in the *Standard solution* ( $\mu$ g/mL)

$C_U$  = concentration of Alprazolam in the *Sample solution* ( $\mu$ g/mL)

$F$  = relative response factor (see *Table 1*)

Acceptance criteria: See Table 1.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Alprazolam related compound A	0.8	0.76	0.15
Alprazolam	1.0	1.0	—
2-Amino-5-chlorobenzophenone	4.0	1.0	0.15
Individual unspecified impurity	—	1.0	0.10
Total impurities	—	—	1.0

#### SPECIFIC TESTS

- **LOSS ON DRYING** (731): Dry a sample at 105° for 1 h: it loses NMT 0.5% of its weight.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- **USP REFERENCE STANDARDS** (11)
  - USP Alprazolam RS
  - USP Alprazolam Related Compound A RS
  - 2-(2-Acetylhydrazino)-7-chloro-5-phenyl-3H-1,4-benzodiazepine.
  - USP 2-Amino-5-chlorobenzophenone RS
  - 2-Amino-5-chlorobenzophenone.
  - C<sub>13</sub>H<sub>10</sub>ClNO 231.68

## Alprazolam Oral Suspension

#### DEFINITION

Alprazolam Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of alprazolam (C<sub>17</sub>H<sub>13</sub>ClN<sub>4</sub>).

Prepare Alprazolam Oral Suspension 1 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Solutions* (795)).

Alprazolam	100 mg
Vehicle: a mixture of Vehicle for Oral Solution (regular or sugar-free), NF, and Vehicle for Oral Suspension, NF (1:1), a sufficient quantity to make	100 mL

Commminute tablets in a suitable mortar to a fine powder, or add *Alprazolam* powder. Add about 20 mL of the *Vehicle*, and mix to a uniform paste. Add the *Vehicle* in small portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add sufficient *Vehicle* to bring to final volume, and mix well.

#### ASSAY

##### PROCEDURE

**Buffer:** 0.04 M sodium acetate solution. Adjust with glacial acetic acid to a pH of 2.4.

**Mobile phase:** Methanol, acetonitrile, and *Buffer* (45:8:47)

**Standard solution:** 20 µg/mL of USP Alprazolam RS in *Mobile phase*

**Sample solution:** Agitate the container of Oral Suspension for 30 min on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at –70° until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix with a vortex mixer for 30 s. Dilute a suitable vol-

ume of the Oral Suspension in *Mobile phase* to obtain a nominal concentration of 20 µg/mL.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 230 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L1

**Flow rate:** 0.6 mL/min

**Injection size:** 20 µL

#### System suitability

**Sample:** *Standard solution*

[NOTE—The retention time of alprazolam is about 10 min.]

#### Suitability requirements

**Relative standard deviation:** NMT 1.4% for replicate injections

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of alprazolam (C<sub>17</sub>H<sub>13</sub>ClN<sub>4</sub>) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of alprazolam in the *Standard solution* (µg/mL)

$C_U$  = nominal concentration of alprazolam in the *Sample solution* (µg/mL)

**Acceptance criteria:** 90.0%–110.0%

#### SPECIFIC TESTS

- **pH** (791): 4.0–5.0

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at controlled room temperature, or under refrigeration.
- **LABELING:** Label it to state that it is to be well-shaken before use, and to state the *Beyond-Use Date*.  
**Beyond-Use Date:** NMT 60 days after the day on which it was compounded
- **USP REFERENCE STANDARDS** (11)
  - USP Alprazolam RS

## Alprazolam Tablets

#### DEFINITION

Alprazolam Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of alprazolam (C<sub>17</sub>H<sub>13</sub>ClN<sub>4</sub>).

#### IDENTIFICATION

##### A. INFRARED ABSORPTION

**Sample:** An amount of finely powdered Tablets, equivalent to 15 mg of alprazolam, prepared as follows. Dissolve the *Sample* in 10 mL of 10 mg/mL of sodium carbonate solution. Add 15 mL of chloroform, and shake vigorously for 30 min. Centrifuge, withdraw the aqueous layer, and transfer the chloroform to a clean container. Add 200 mg of potassium bromide. Evaporate the chloroform from this mixture to dryness, and dry the dispersion in vacuum at 60° for 24 h. Grind this dispersion into a fine powder. Prepare a suitable pellet for testing by placing 100 mg of dried potassium bromide into a die. Sprinkle 20 mg of the finely ground alprazolam–potassium bromide dispersion onto the dried potassium bromide layer, and cover with another specimen of 100 mg of dried potassium bromide.

**Acceptance criteria:** The IR absorption spectrum of the potassium bromide dispersion so obtained exhibits maxima characteristic of alprazolam, as compared to

that of a similar preparation of USP Alprazolam RS, at the following wavenumbers: at 1609, 1578, 1566, 1539, 1487, and 1379 wavenumbers in the region of 1650–1300  $\text{cm}^{-1}$ ; at 932, 891, 826, 779, 746, 696, and 658 wavenumbers in the region of 975–600  $\text{cm}^{-1}$ .

## ASSAY

### PROCEDURE

**Mobile phase:** Acetonitrile, chloroform, butyl alcohol, glacial acetic acid, and water (850: 80: 50: 0.5: 20)

**Internal standard solution:** 0.25 mg/mL of triazolam in acetonitrile

**Standard stock solution:** 0.25 mg/mL of USP Alprazolam RS in *Internal standard solution*

**Standard solution:** 25  $\mu\text{g/mL}$  of USP Alprazolam RS from *Standard stock solution* in acetonitrile

**Sample solution:** Nominally 25  $\mu\text{g/mL}$  of alprazolam from finely powdered Tablets (NLT 20) prepared as follows. Transfer a suitable amount of the powdered tablets to a suitable volumetric flask. Add 1% of the flask volume of water. Transfer 10% of the flask volume of *Internal standard solution*, shake vigorously for 10 min, and dilute with acetonitrile to volume.

### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm  $\times$  30-cm; packing L3

**Flow rate:** 2 mL/min

**Injection size:** 20  $\mu\text{L}$

### System suitability

**Sample:** *Standard solution*

### Suitability requirements

**Resolution:** NLT 2.0 between triazolam and alprazolam

**Relative standard deviation:** NMT 2.0% for replicate injections

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of alprazolam ( $\text{C}_{17}\text{H}_{13}\text{ClN}_4$ ) in the portion of Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak area response ratio of the alprazolam peak relative to the internal standard peak from the *Sample solution*

$R_S$  = peak area response ratio of the alprazolam peak relative to the internal standard peak from the *Standard solution*

$C_S$  = concentration of USP Alprazolam RS in the *Standard solution* ( $\mu\text{g/mL}$ )

$C_U$  = nominal concentration of alprazolam in the *Sample solution* ( $\mu\text{g/mL}$ )

**Acceptance criteria:** 90.0%–110.0%

## PERFORMANCE TESTS

### DISSOLUTION, Procedure for a Pooled Sample <711>

**Buffer stock solution:** Dissolve 80 g of monobasic potassium phosphate and 20 g of dibasic potassium phosphate in 1 L of water. Add, with mixing, phosphoric acid or potassium hydroxide solution (45 in 100), as necessary to adjust the solution, such that the resulting solution has a pH of  $6.0 \pm 0.1$ .

**Buffer:** Prepare a 1-in-10 dilution of the *Buffer stock solution* to obtain a solution that has a pH of  $6.0 \pm 0.1$ .

**Medium:** *Buffer*; 500 mL

**Apparatus 1:** 100 rpm

**Time:** 30 min

**Mobile phase:** Acetonitrile, tetrahydrofuran, and *Buffer* (35:5:60)

**Standard stock solution:** 0.05 mg/mL of USP Alprazolam RS in methanol

**Standard solution:** Add 50 mL of *Buffer stock solution* and 250 mL of water to a 500-mL flask. Add to the flask 5.0 mL of *Standard stock solution* for every 0.25 mg of alprazolam contained in the Tablet being assayed. Dilute with water to volume.

**Sample solution:** Pass a portion of the solution under test through a suitable filter.

### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm  $\times$  10-cm; packing L7

**Flow rate:** 1 mL/min

### System suitability

**Sample:** *Standard solution*

### Suitability requirements

**Column efficiency:** NLT 500 theoretical plates

**Relative standard deviation:** NMT 3.0% for replicate injections

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of labeled amount of alprazolam ( $\text{C}_{17}\text{H}_{13}\text{ClN}_4$ ) dissolved.

**Tolerances:** NLT 80% (Q) of the labeled amount of alprazolam ( $\text{C}_{17}\text{H}_{13}\text{ClN}_4$ ) is dissolved.

### UNIFORMITY OF DOSAGE UNITS <905>

**Mobile phase, Chromatographic system, and System suitability:** Proceed as directed in the Assay.

**Internal standard solution** 0.032 mg/mL of triazolam in acetonitrile

**Standard solution:** 0.025 mg/mL of USP Alprazolam RS in *Internal standard solution*

**Sample solution:** Transfer 1 Tablet to a container. Add 0.4 mL of water directly onto the Tablet, allow the Tablet to stand for 2 min, and then swirl the container to disperse the Tablet. For every 0.25 mg of alprazolam contained in the Tablet, add 10.0 mL of *Internal standard solution* to the container. Shake, and centrifuge if necessary.

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of alprazolam ( $\text{C}_{17}\text{H}_{13}\text{ClN}_4$ ) in the Tablet taken:

$$\text{Result} = (R_U/R_S) \times C \times V \times (100/L)$$

$R_U$  = peak area response ratio of the alprazolam peak relative to the internal standard peak from the *Sample solution*

$R_S$  = peak area response ratio of the alprazolam peak relative to the internal standard peak from the *Standard solution*

$C$  = concentration of USP Alprazolam RS in the *Standard solution* (mg/mL)

$V$  = volume of *Internal standard solution* used to prepare the *Sample solution* (mL)

$L$  = label claim (mg/Tablet)

**Acceptance criteria:** Meet the requirements

## ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at controlled room temperature.

• **USP REFERENCE STANDARDS <11>**

USP Alprazolam RS

## Alprazolam Extended-Release Tablets

### DEFINITION

Alprazolam Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of alprazolam ( $C_{17}H_{13}ClN_4$ ).

### IDENTIFICATION

**A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### • PROCEDURE

**Mobile phase:** Acetonitrile, water, and phosphoric acid (350:650:1)

**Standard solution:** 0.05 mg/mL of USP Alprazolam RS in methanol

**Sample solution:** Transfer an appropriate number of Tablets into a suitable volumetric flask to obtain a nominal concentration of about 0.05 mg/mL of alprazolam. Sonicate in 80% of the flask volume of methanol for 15 min, shake mechanically for 30 min, dilute with methanol to final volume, filter a portion of the solution, and discard the first 3 mL of filtrate.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm  $\times$  15-cm; 5- $\mu$ m packing L7

**Column temperature:** 30°

**Flow rate:** 1 mL/min

**Injection size:** 10  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** NMT 2.0 for alprazolam

**Efficiency:** NLT 3000 theoretical plates for alprazolam

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of alprazolam ( $C_{17}H_{13}ClN_4$ ), based on the label claim, in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Alprazolam RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of alprazolam in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

### PERFORMANCE TESTS

#### • DISSOLUTION <711>

##### Test 1

**Medium:** pH 6.0 phosphate buffer (8.0 g/L of monobasic potassium phosphate and 2.0 g/L of dibasic potassium phosphate in water; adjust with phosphoric acid or potassium hydroxide to a pH of 6.0  $\pm$  0.1); 500 mL

**Apparatus 1:** 100 rpm

**Time:** 1, 4, 8, and 12 h

**Mobile phase:** Acetonitrile, tetrahydrofuran, and *Medium* (7:1:12)

**Standard stock solution:** 0.5 mg/mL of USP Alprazolam RS in acetonitrile

**Standard solution:** (L/500) mg/mL of USP Alprazolam RS in *Medium* from the *Standard stock solution*, where L is the label claim in mg/Tablet

**Sample solution:** Pass a portion of the solution under test through a suitable filter.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm  $\times$  10-cm; 5- $\mu$ m packing L7

**Flow rate:** 1 mL/min

**Injection size:** 100  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** NMT 2.0

**Column efficiency:** NLT 3000 theoretical plates

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of alprazolam ( $C_{17}H_{13}ClN_4$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Alprazolam RS in the *Standard solution* (mg/mL)

L = label claim (mg/Tablet)

V = volume of *Medium*, 500 mL

**Tolerances:** See *Table 1*.

**Table 1**

Time (h)	Amount Dissolved		
	0.5-mg Tablet	2-mg Tablet	3-mg Tablet
1	NMT 25%	NMT 20%	NMT 20%

System suitability

Sample: Standard solution

Suitability requirements

Tailing factor: NMT 1.5

Relative standard deviation: NMT 2.0%

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of the labeled amount of alprazolam (C<sub>17</sub>H<sub>13</sub>ClN<sub>4</sub>) in the portion of Tablets taken:

Result = (r<sub>U</sub>/r<sub>S</sub>) × (C<sub>S</sub>/C<sub>U</sub>) × 100

r<sub>U</sub> = peak response from the Sample solution

r<sub>S</sub> = peak response from the Standard solution

C<sub>S</sub> = concentration of USP Alprazolam RS in the Standard solution (μg/mL)

C<sub>U</sub> = nominal concentration of alprazolam in the Sample solution (μg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

Change to read:

• DISINTEGRATION <701>

• Test 1 • (RB 1-May-2012)

Time: NMT 60 s

• Test 2: If the product complies with this test, the labeling indicates that it meets USP Disintegration Test 2.

Time: NMT 30 s • (RB 1-May-2012)

Change to read:

• DISSOLUTION <711>

• Test 1 • (RB 1-May-2012)

Medium: pH 6.0 phosphate buffer (•8 g/L of monobasic potassium phosphate and 2 g/L of dibasic potassium phosphate in water. Adjust with phosphoric acid or diluted potassium hydroxide to a pH of 6.0 ± 0.1 • (RB 1-May-2012)); 900 mL

Apparatus 2: 50 rpm

Time: 10 min

Mobile phase, Chromatographic system, and System suitability: Proceed as directed in the Assay, except use an injection size of 100 μL.

Standard stock solution: 50 μg/mL of USP Alprazolam RS in methanol. [NOTE—Sonicate to help dissolve, if necessary.]

Standard solution: (L/1000) μg/mL of USP Alprazolam RS in Medium from the Standard stock solution, where L is the label claim in μg/Tablet

Sample solution: Pass a portion of the solution under test through a nylon membrane filter of 0.45-μm pore size, discarding the first few mL.

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of the labeled amount of alprazolam (C<sub>17</sub>H<sub>13</sub>ClN<sub>4</sub>) dissolved:

Result = (r<sub>U</sub>/r<sub>S</sub>) × C<sub>S</sub> × V × (1/L) × 100

r<sub>U</sub> = peak response from the Sample solution

r<sub>S</sub> = peak response from the Standard solution

C<sub>S</sub> = concentration of USP Alprazolam RS in the Standard solution (mg/mL)

V = volume of Medium, 900 mL

L = label claim (mg/Tablet)

Tolerances: NLT 80% (Q) of the labeled amount of alprazolam (C<sub>17</sub>H<sub>13</sub>ClN<sub>4</sub>) is dissolved.

• Test 2: If the product complies with this test, the labeling indicates that it meets USP Dissolution Test 2.

Medium: pH 6.0 phosphate buffer (8 g/L of monobasic potassium phosphate and 2 g/L of dibasic potassium

phosphate in water, adjusted with phosphoric acid or potassium hydroxide to a pH of 6.0 ± 0.1); 500 mL

Apparatus 2: 50 rpm

Time: 10 min

Buffer: 1.36 g/L of monobasic potassium phosphate adjusted with dilute sodium hydroxide to a pH of 6.0

Mobile phase: Acetonitrile and Buffer (35:65)

Standard stock solution: 50 μg/mL of USP Alprazolam RS in methanol. [NOTE—Sonicate to help dissolve, if necessary.]

Standard solution: (L/500) μg/mL of USP Alprazolam RS in Medium from the Standard stock solution, where L is the label claim in μg/Tablet

Sample solution: Pass a 5-mL aliquot of the solution under test through a suitable filter of 0.45-μm pore size, discarding the first 3 mL.

Chromatographic system

(See Chromatography <621>, System Suitability.)

Mode: LC

Detector: UV 230 nm

Column: 4.6-mm × 7.5-cm; 5-μm packing L7

Flow rate: 1.5 mL/min

Injection volume: 40 μL

Run time: 3 times the retention time of alprazolam

System suitability

Sample: Standard solution

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of the labeled amount of alprazolam (C<sub>17</sub>H<sub>13</sub>ClN<sub>4</sub>) dissolved:

Result = (r<sub>U</sub>/r<sub>S</sub>) × C<sub>S</sub> × V × (1/L) × 100

r<sub>U</sub> = peak response from the Sample solution

r<sub>S</sub> = peak response from the Standard solution

C<sub>S</sub> = concentration of USP Alprazolam RS in the Standard solution (mg/mL)

V = volume of Medium, 500 mL

L = label claim (mg/Tablet)

Tolerances: NLT 70% (Q) of the labeled amount of alprazolam (C<sub>17</sub>H<sub>13</sub>ClN<sub>4</sub>) is dissolved. • (RB 1-May-2012)

• UNIFORMITY OF DOSAGE UNITS (905): Meet the requirements

IMPURITIES

• ORGANIC IMPURITIES

Buffer and Diluent: Prepare as directed in the Assay.

Solution A: Acetonitrile, methanol, and Buffer (25:20:55)

Solution B: Acetonitrile, methanol, and Buffer (40:5:55)

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
12	100	0
15	0	100
60	0	100
65	100	0
70	100	0

Standard solution: 0.6 μg/mL of USP Alprazolam RS in Diluent

Sample solution: 200 μg/mL of alprazolam in Diluent. Prepare using 10 Tablets, and pass through a suitable filter.

**Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** UV 240 nm**Column:** 4.6-mm × 15-cm; 5-μm packing L7**Column temperature:** 30°**Flow rate:** 1.2 mL/min**Injection volume:** 25 μL**System suitability****Sample:** *Standard solution***Suitability requirements****Theoretical plates:** NLT 2000**Tailing factor:** NMT 1.5**Relative standard deviation:** NMT 6.0%**Analysis****Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

 $r_U$  = peak response of each impurity from the *Sample solution* $r_S$  = peak response of alprostadil from the *Standard solution* $C_S$  = concentration of USP Alprostadil RS in the *Standard solution* (μg/mL) $C_U$  = nominal concentration of alprostadil in the *Sample solution* (μg/mL) $F$  = relative response factor (see *Table 2*)**Acceptance criteria:** See *Table 2*. Disregard any peaks less than 0.05%.**Table 2**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Alprostadil related compound A <sup>a,b</sup>	0.8	—	—
Alprostadil	1.0	—	—

(1R,2R,3R)-3-Hydroxy-2-[(E)-(3S)-3-hydroxy-1-octenyl]-5-oxocyclopentane heptanoic acid [745-65-3].

» Alprostadil contains not less than 95.0 percent and not more than 105.0 percent of  $C_{20}H_{34}O_5$ , calculated on the anhydrous basis.**Caution**—Great care should be taken to prevent inhaling particles of Alprostadil and exposing the skin to it.**Packaging and storage**—Preserve in tight containers, and store in a refrigerator.**USP Reference standards** <11>—

USP Alprostadil RS

USP Prostaglandin A<sub>1</sub> RSUSP Prostaglandin B<sub>1</sub> RS $C_{20}H_{32}O_4$  336.47**Identification, Infrared Absorption** <197M>.**Water, Method I** <921>: not more than 0.5%, using 0.5 g.**Residue on ignition** <281>: not more than 0.5%, using 0.3 g.**Limit of chromium—****Standard solution**—Dissolve an accurately weighed quantity of chromium trichloride in 0.05 M nitric acid, and dilute, stepwise if necessary, with 0.05 M nitric acid to obtain a solution having a known concentration of about 3.04 μg per mL. Transfer 2 mL of this solution to a 100-mL volumetric flask, dilute with alcohol to volume, and mix. This solution contains 20 ng of chromium per mL.**Test solution**—Transfer about 10 mg of Alprostadil, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with alcohol to volume, and mix.**Procedure**—Separately inject equal volumes (about 20 μL) of the *Standard solution* and the *Test solution* into a suitable graphite furnace atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* <851>), equipped with a chromium hollow-cathode lamp, with a drying temperature of 100°, an ashing temperature of 1000°, and an atomization temperature of 2700°. Use alcohol as the blank. Concomitantly determine the absorbances at the chromium emission line at 357.9 nm, and calculate the percentage of chromium (Cr) in the portion of Alprostadil taken by the formula:

$$100(C_S/C_A)(A_U/A_S)$$

in which  $C_S$  is the concentration, in mg per mL, of chromium in the *Standard solution*;  $C_A$  is the concentration, in mg per mL, of Alprostadil in the *Test solution*; and  $A_U$  and  $A_S$  are the absorbances obtained from the *Test solution* and *Standard solution*, respectively: not more than 0.002% is found.**Limit of rhodium—****Standard solution**—Dissolve an accurately weighed quantity of rhodium chloride hydrate in 1.2 M hydrochloric acid, and dilute, stepwise if necessary, with 1.2 M hydrochloric acid to obtain a solution having a known concentration of 100 μg of rhodium per mL. Transfer 5 mL of this solution to a 100-mL volumetric flask, dilute with alcohol to volume,

and mix. Transfer 2 mL of this solution to a 200-mL volumetric flask, dilute with alcohol to volume, and mix. This solution contains 50 ng of rhodium per mL.

**Test solution**—Transfer about 20 mg of Alprostadil, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with alcohol to volume, and mix.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard solution* and the *Test solution* into a suitable graphite furnace atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* (851)), equipped with a rhodium hollow-cathode lamp, with a drying temperature of 100°, an ashing temperature of 1000°, and an atomization temperature of 2800°. Use alcohol as the blank. Simultaneously determine the absorbances at the rhodium emission line at 343.5 nm, and calculate the percentage of rhodium (Rh) in the portion of Alprostadil taken by the formula:

$$100(C_S / C_A)(A_U / A_S)$$

in which  $C_S$  is the concentration, in mg per mL, of rhodium in the *Standard solution*;  $C_A$  is the concentration, in mg per mL, of Alprostadil in the *Test solution*; and  $A_U$  and  $A_S$  are the absorbances obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.002% is found.

#### Limit of foreign prostaglandins—

##### TEST 1—

**NOTE**—Use freshly prepared solutions. Measure the peak responses at the following wavelengths: prostaglandin  $A_1$  at 224 nm; prostaglandin  $B_1$  at 280 nm; and all other foreign prostaglandin impurities at 200 nm.

**Mobile phase**—Proceed as directed in the Assay.

**Standard solution**—Dissolve accurately weighed quantities of USP Alprostadil RS, USP Prostaglandin  $A_1$  RS, and USP Prostaglandin  $B_1$  RS in a mixture of methanol and water (9:1), and dilute quantitatively, and stepwise if necessary, with a mixture of methanol and water (9:1) to obtain a solution having known concentrations of about 6  $\mu$ g per mL, 15  $\mu$ g per mL, and 6  $\mu$ g per mL, respectively.

**Test solution**—Dissolve about 15 mg of Alprostadil, accurately weighed, in 5 mL of a mixture of methanol and water (9:1), and mix.

**Chromatographic system**—Proceed as directed in the Assay. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the resolution between prostaglandin  $A_1$  and alprostadil is not less than 7.5, and the relative standard deviation from the peaks at their respective wavelength for replicate injections is not more than 4.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses at 200 nm, 224 nm, and 280 nm. Calculate the percentage of prostaglandin  $A_1$  and prostaglandin  $B_1$  in the portion of Alprostadil taken by the formula:

$$500(C_S / W)(r_i / r_s)$$

in which  $C_S$  is the concentration, in mg per mL, of USP Prostaglandin  $A_1$  RS or USP Prostaglandin  $B_1$  RS in the *Standard solution*;  $W$  is the weight, in mg, of Alprostadil taken for the *Test solution*;  $r_i$  is the peak response for prostaglandin  $A_1$  or prostaglandin  $B_1$  obtained from the *Test solution*; and  $r_s$  is the peak response of prostaglandin  $A_1$  or prostaglandin  $B_1$  obtained from the *Standard solution*: not more than 1.5% of prostaglandin  $A_1$  is found; and not more than 0.1% of prostaglandin  $B_1$  is found. Calculate the percentage of each impurity occurring at 200 nm and eluting before pros-

taglandin  $A_1$  in the portion of Alprostadil taken by the formula:

$$500(C_S / W)(r_i / r_s)$$

in which  $C_S$  is the concentration, in mg per mL, of USP Alprostadil RS in the *Standard solution*;  $r_i$  is the peak response for each impurity obtained from the *Test solution*;  $r_s$  is the peak response for alprostadil obtained from the *Standard solution*; and the other terms are as defined herein: not more than 0.9% of any foreign prostaglandin impurity is found. Calculate the percentage of any impurity having a relative retention time of 0.6, relative to the prostaglandin  $A_1$  peak detected at 224 nm, in the portion of Alprostadil taken by the formula:

$$500(C_S / W)(r_i / r_s)$$

in which  $C_S$  is the concentration, in mg per mL, of USP Prostaglandin  $A_1$  RS in the *Standard solution*;  $r_i$  is the peak response for any impurity having a relative retention time of 0.6, relative to the prostaglandin  $A_1$  peak, obtained from the *Test solution*;  $r_s$  is the peak response of prostaglandin  $A_1$  obtained from the *Standard solution*; and the other terms are as defined herein: not more than 0.9% of any impurity having a relative retention time of 0.6, relative to the prostaglandin  $A_1$  peak, is found.

##### TEST 2—

**Mobile phase**—Prepare a filtered and degassed mixture of methanol, acetonitrile, and 0.02 M monobasic potassium phosphate (2:1:1), and adjust with phosphoric acid to a pH of 3. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard solution**—Dissolve an accurately weighed quantity of USP Alprostadil RS in a mixture of acetonitrile and water (1:1) to obtain a solution having a known concentration of about 10  $\mu$ g per mL.

**Test solution**—Dissolve about 25 mg of Alprostadil, accurately weighed, in 5 mL of a mixture of acetonitrile and water (1:1), using ultrasound if necessary.

**Identification solution**—Use the *Standard solution* under Test 1.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a photodiode array detector or equivalent capable of detecting UV wavelengths between 200 nm and 300 nm and a 4.6-mm  $\times$  25-cm column that contains packing L1. The flow rate is about 1.2 mL per minute. Chromatograph the *Identification solution* as directed for *Procedure*: the relative retention times for prostaglandin  $A_1$  and alprostadil are about 1.2 and 1.0, respectively; the resolution between prostaglandin  $A_1$  and alprostadil is not less than 4.0. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation determined from the main peak for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses at 200 nm, 224 nm, and 280 nm. Calculate the percentage of each impurity occurring at 200 nm and eluting after prostaglandin  $A_1$ , excluding prostaglandin  $B_1$ , in the portion of Alprostadil taken by the formula:

$$500(C_S / W)(r_i / r_s)$$

in which  $C_S$  is the concentration, in mg per mL, of USP Alprostadil RS in the *Standard solution*;  $W$  is the weight, in mg, of Alprostadil taken for the *Test solution*;  $r_i$  is the peak response for each impurity obtained from the *Test solution*; and  $r_s$  is the peak response for alprostadil obtained from the *Standard solution*: the sum of the peaks having relative retention times of 2.0 and 2.3 is not more than 0.6%; not more than 0.9% of any other foreign prostaglandin impurity

is found; and not more than 2.0% of total impurities is found, the results for *Test 1* and *Test 2* being added.

#### Assay—

NOTE—Use freshly prepared solutions.

**Mobile phase**—Prepare a filtered and degassed mixture of methanol, 0.1 M monobasic potassium phosphate and acetonitrile (2:2:1), and adjust with phosphoric acid to a pH of 3.0. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Internal standard solution**—Dissolve an accurately weighed quantity of ethylparaben in a mixture of methanol and water (9:1), and dilute quantitatively, and stepwise if necessary, with a mixture of methanol and water (9:1) to obtain a solution having a concentration of about 0.05 mg per mL.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Alprostadil RS in a mixture of methanol and water (9:1), and dilute quantitatively, and stepwise if necessary, with a mixture of methanol and water (9:1) to obtain a solution having a known concentration of about 0.3 mg per mL. To 2.0 mL of this solution, add 1.0 mL of *Internal standard solution*, and mix.

**System suitability solution**—Dilute an accurately measured amount of USP Prostaglandin A<sub>1</sub> RS with *Standard preparation* to obtain a solution having a concentration of 4.5 µg of prostaglandin A<sub>1</sub> per mL. To 2.0 mL of this solution, add 1.0 mL of *Internal standard solution*, and mix.

**Assay preparation**—Transfer about 7.5 mg of Alprostadil, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with a mixture of methanol and water (9:1) to volume, and mix. To 2.0 mL of this solution, add 1.0 mL of *Internal standard solution*, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a photodiode array detector or equivalent capable of detecting UV wavelengths between 200 nm and 300 nm and a 4.6-mm × 25-cm column that contains packing L1. The column temperature is maintained at 40°. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between prostaglandin A<sub>1</sub> and alprostadil is not less than 7.5, and between prostaglandin A<sub>1</sub> and ethylparaben is not less than 2.0; and the relative standard deviation determined from the peak area ratio of alprostadil to ethylparaben for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms at 200 nm, and measure the areas for the major peaks. Calculate the quantity, in mg, of C<sub>20</sub>H<sub>34</sub>O<sub>5</sub> in the portion of Alprostadil taken by the formula:

$$25C(R_U/R_S)$$

in which *C* is the concentration, in mg per mL, of USP Alprostadil RS in the *Standard preparation*; and *R<sub>U</sub>* and *R<sub>S</sub>* are the peak area ratios of alprostadil to ethylparaben obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Alprostadil Injection

» Alprostadil Injection is a sterile solution of Alprostadil in Dehydrated Alcohol. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of alprostadil (C<sub>20</sub>H<sub>34</sub>O<sub>5</sub>).

**Packaging and storage**—Preserve in tight, single-dose containers, preferably of Type I glass. Store in a refrigerator.

USP Endotoxin RS

#### Identification, Infrared Absorption <197K>—

**Test specimen**—Dry an amount of Injection, equivalent to about 2 mg of alprostadil, on about 500 mg of spectroscopic grade potassium bromide at about 40° to 50° under vacuum. Prepare a pellet from this mixture.

**Standard specimen**: a similar preparation of USP Alprostadil RS, in dehydrated alcohol.

**Bacterial endotoxins** <85>—It contains not more than 5 USP Endotoxin units per 100 µg of alprostadil.

**Sterility** <71>—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**Water, Method I** <921>: not more than 0.4%.

**Other requirements**—It meets the requirements under *Injections* <1>.

#### Assay—

**Mobile phase**—Prepare a filtered and degassed mixture of methylene chloride, 1,3-butanediol, and water (1000:6:0.5). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Internal standard solution**—Dissolve ethylparaben in methylene chloride to obtain a solution containing about 0.05 mg per mL.

**Standard stock preparation**—Dissolve an accurately weighed quantity of USP Alprostadil RS in dehydrated alcohol, and quantitatively dilute with dehydrated alcohol to obtain a solution having a known concentration of about 0.5 mg per mL.

**Standard preparation**—Gently evaporate a 0.5-mL portion of the *Standard stock preparation* to dryness with a stream of nitrogen. Proceed as directed for the *Assay preparation* beginning with "Add 150 µL of a 1 in 25 freshly prepared solution."

**Assay preparation**—Pool the contents of several containers of the Injection, and gently evaporate an accurately measured volume, equivalent to about 0.25 mg of alprostadil, to dryness using a stream of nitrogen. Add 150 µL of a 1 in 25 freshly prepared solution of α-bromo-2'-acetonephthone in acetonitrile, rinse the inside of the container with this solution, and swirl. Add 150 µL of a freshly prepared 1 in 200 solution of diisopropylethylamine in acetonitrile to the container, rinse the inside of the container with this solution, and swirl. Cap and sonicate to dissolve. Heat the container at 45° for 45 minutes, swirling occasionally. Sonicate again after heating is complete. [NOTE—If the entire sample does not dissolve, the specimen should be discarded.] Evaporate the solution using a stream of nitrogen, add 2.0 mL of *Internal standard solution*, and mix. Sonicate to dissolve. [NOTE—If incomplete dissolution is still observed, discard the specimen.]

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4.4-mm × 25-cm column that contains packing L18. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.4 and 1.0, for ethylparaben and alprostadil, respectively; the resolution, *R*, between alprostadil and the internal standard is not less than 9.0; and the relative standard deviation for replicate injections is not more than 2.5%.

**Procedure**—Separately inject equal volumes of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg,

of alprostadil (C<sub>20</sub>H<sub>34</sub>O<sub>5</sub>) in the volume of Injection taken by the formula:

$$C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of USP Alprostadil RS in the *Standard stock preparation*; and R<sub>U</sub> and R<sub>S</sub> are the peak response ratios of alprostadil to the internal standard obtained from the *Assay preparation* and the *Standard preparation*, respectively.

» Alteplase is a highly purified glycosylated serine protease with fibrin-binding properties and plasminogen-specific proteolytic activities. It is produced by recombinant DNA synthesis in mammalian cell culture. It has a biological potency of not less than 90.0 percent and not more than 115.0 percent of the potency stated on the label, the potency being 580,000 USP Alteplase Units per mg of protein.

The presence of host cell DNA and host cell protein impurities in Alteplase is process-specific; the limits of these impurities are determined by validated methods.

**Packaging and storage**—Preserve in tight containers, and store in the frozen state at a temperature of –20° or below.

**USP Reference standards** (11)—  
USP Alteplase RS  
USP Endotoxin RS

**Identification**—To each of three test tubes transfer 1 mL of a solution of H-D-isoleucyl-prolyl-arginyl-*p*-nitroaniline dihydrochloride containing 0.5 mg per mL. Prepare a test solution of Alteplase in water containing 1.0 to 2.5 mg per mL. Separately transfer 200 µL of this solution and 200 µL of a Standard solution of USP Alteplase RS, similarly prepared, to two of the test tubes, and to the third test tube, add 200 µL of 0.2 M arginine solution that has been adjusted with phosphoric acid (negative control) to a pH of 7.3. Mix the solutions in the test tubes, and allow to stand for 1 minute: a yellow color is produced in the solutions from the test specimen and the USP Reference Standard, while no yellow color is produced in the negative control.

**Peptide mapping**—

*Solution A*—Dissolve 6.9 g of monobasic sodium phosphate in 1000 mL of water, and adjust with phosphoric acid

to a pH of 2.85. Filter and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Solution B*—Use acetonitrile.

*Mobile phase*—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Dialysis solution*—Prepare an aqueous solution containing, in each mL, 480 mg of urea, 44 mg of tris(hydroxymethyl)aminomethane, and 0.88 mg of edetic acid. Adjust with hydrochloric acid to a pH of 8.6.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Alteplase RS in water, and dilute quantitatively with water to obtain a solution having a known concentration of about 1.0 mg per mL. Dialyze about 2.0 mL of this solution into the *Dialysis solution* at room temperature for not less than 12 hours. Measure the volume of the solution, and transfer it to a clean test tube. For each mL of solution in the tube, add 10 µL of 1 M dithiothreitol. Incubate at room temperature for 4 hours, then add 25 µL of 1 M iodoacetic acid per mL of the solution, and incubate in the dark for 30 minutes. Quench the reaction by the addition of 50 µL of 1 M dithiothreitol per mL of the solution. Dialyze the solution against 0.1 M ammonium bicarbonate for 24 hours, replacing the 0.1 M ammonium bicarbonate twice during the dialysis period. To 2.0 mL of the dialyzed solution, add 20 µg of trypsin, and incubate for 6 to 8 hours at room temperature. Again add 20 µg of trypsin, and incubate for 16 to 18 hours for a total of 24 hours of incubation of the trypsin-treated solution. [NOTE—Store this *Standard preparation* in a freezer.]

*Test preparation*—Using an accurately weighed quantity of Alteplase, proceed as directed for *Standard preparation*.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 214-nm detector and a 4.6-mm × 10-cm column that contains packing L1. The flow rate is about 1 mL per minute. The system is programmed to provide a *Mobile phase* consisting of variable mixtures of *Solution A* and *Solution B*. The system is equilibrated with 100% *Solution A*. After injection of the solution under test, the proportion of *Solution B* is increased linearly from 0% to 30% at a rate of 0.33% per minute. The proportion of *Solution B* is then increased linearly at a rate of 1.0% per minute until the proportion of *Solution B* is 60%, and is held at that composition for 10 minutes. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution, R<sub>s</sub> between peaks 6 and 7 as defined by the USP Alteplase RS Data Sheet is not less than 1.5, and the times of their baseline widths are not more than 0.5 minutes.

*Procedure*—Separately inject equal volumes (about 100 µL) of the *Standard preparation*, the *Test preparation*, and a mixture of the *Standard preparation* and the *Test preparation* (1:1) into the chromatograph, record the chromatograms, and measure the responses for not less than 20 major peaks as defined in the USP Alteplase RS Data Sheet: the retention times of corresponding peaks from the *Standard preparation* and the *Test preparation* do not differ by more than 0.4 minutes, and the peak area ratios relative to peak 19 (as shown on the USP Alteplase RS Data Sheet) do not differ by more than 20%. No additional significant peaks or shoulders are found, a significant peak or shoulder being defined as one having a peak area response of not less than 5% of peak 19.

**Bacterial endotoxins** (85)—It contains not more than 1 USP Endotoxin Unit per mg of alteplase.

**Chromatographic purity** (see *Electrophoresis* (726))—  
*SDS buffer*—Prepare a solution in sodium dodecyl sulfate solution (8 in 100) containing, in each mL, 400 mg of glycerol, 5.52 mg of tris(hydroxymethyl)aminomethane hydrochloride, 3.28 mg of tris(hydroxymethyl)aminomethane,

0.20 mg of bromophenol blue, and 0.20 mg of xylene cyanole FF.

**Diluted SDS buffer**—Dilute 1 volume of *SDS buffer* with 4 volumes of water.

**Ammoniacal silver nitrate solution**—Transfer 105 mL of sodium hydroxide solution (0.36 in 100) and 7.0 mL of ammonium hydroxide to a 500-mL volumetric flask, and add slowly, with stirring, 20.0 mL of silver nitrate solution (20 in 100). Dilute with water to volume, and mix. [NOTE—Prepare this solution immediately before use and protect it from light. This amount of solution is sufficient for two slab gels.]

**Citric acid-formaldehyde solution**—To 500 mL of water add 25 mg of citric acid, 0.25 mL of formaldehyde, and 0.025 mL of methanol, omitting the methanol if the formaldehyde is preserved with methanol. [NOTE—Prepare this solution fresh at the time of use. This amount of solution is sufficient for two slab gels.]

**Running buffer**—Prepare a buffer solution in sodium dodecyl sulfate (1 in 1000) containing 3.03 mg of tris(hydroxymethyl)aminomethane and 14.26 mg of glycine per mL.

**Carboxymethylation buffer**—Prepare an aqueous solution containing, in each mL, 480 mg of urea, 44 mg of tris(hydroxymethyl)aminomethane, and 1.2 mg of edetic acid. Adjust with hydrochloric acid if necessary to a pH of 8.6.

**Gel**—Prepare a 10% T (total acrylamide)-0.25% C (cross-linked bisacrylamide) resolving gel containing 0.1% sodium dodecyl sulfate, 0.375 M tris(hydroxymethyl)aminomethane hydrochloride, and 0.05 M tris(hydroxymethyl)aminomethane.

**0.2 M Arginine solution**—Prepare a solution of arginine in water containing 34.8 mg per mL. Adjust with phosphoric acid to a pH of 7.3.

**Stock standard solution**—Dissolve an accurately weighed quantity of USP Alteplase RS in water, and dilute quantitatively with water to obtain a solution having a known concentration of about 1 mg per mL.

**Standard solution**—Dilute an accurately measured volume of *Stock standard solution* with 0.02 M Arginine solution to obtain a solution having a concentration of 0.25 mg per mL. Heat 0.5 mL of this solution with 116  $\mu$ L of *SDS buffer* and 10  $\mu$ L of 1 M dithiothreitol at 80° for 2 minutes.

**Carboxymethylated standard solution**—Dilute 1.0 mL of *Stock standard solution* with 1 mL of *Carboxymethylation buffer*, and adjust with 1 M sodium hydroxide to a pH of 8.5. Add 20  $\mu$ L of 1 M dithiothreitol, and incubate at 37° for 60 minutes. Add 100  $\mu$ L of 1 M iodoacetic acid, and incubate in the dark for 20 minutes. Desalt by passing the solution through a chromatographic column containing fine gel chromatographic packing equilibrated with a buffer solution containing, in each mL, 20 mg of sodium dodecyl sulfate, 100 mg of glycerol, 1.42 mg of tris(hydroxymethyl)aminomethane hydrochloride, and 0.85 mg of tris(hydroxymethyl)aminomethane. Collect the protein fraction of the preparation by elution with the same buffer, and add 20  $\mu$ L of 1 M dithiothreitol. Adjust the protein concentration to about 0.2 mg per mL with a buffer solution containing, in each mL, 20 mg of sodium dodecyl sulfate, 100 mg of glycerol, 1.42 mg of tris(hydroxymethyl)aminomethane hydrochloride, 0.85 mg of tris(hydroxymethyl)aminomethane, 1.06 mg of dithiothreitol, 0.05 mg of bromophenol blue, and 0.05 mg of xylene cyanole FF.

**Stock test solution, Test solution, and Carboxymethylated test solution**—Using an accurately weighed quantity of Alteplase, proceed as directed for *Stock standard solution*, *Standard solution*, and *Carboxymethylated standard solution*, respectively.

**Molecular weight standard preparation**—Use a commercially available preparation of low molecular weight protein standards (10,000 to 100,000 Da) at about 2 mg per mL. Mix 990  $\mu$ L of *Diluted SDS buffer* and 10  $\mu$ L of the molecular weight standard mixture.

**Control solutions**—Prepare a control solution of bovine serum albumin containing 10  $\mu$ g per mL. For a 10 ng per 25  $\mu$ L load, mix 600  $\mu$ L of *Diluted SDS buffer* and 25  $\mu$ L of the control solution, and heat at 90° for 2 minutes. For a 2.5 ng per 25  $\mu$ L load, mix 594  $\mu$ L of *Diluted SDS buffer* and 6  $\mu$ L of the control solution, and heat at 90° for 2 minutes.

**Blank**—Mix 500  $\mu$ L of water, 126  $\mu$ L of *SDS buffer*, and 10  $\mu$ L of 1 M dithiothreitol.

**Procedure**—Separately apply equal volumes (about 25  $\mu$ L) of the *Test solution*, *Standard solution*, *Carboxymethylated test solution*, and *Carboxymethylated standard solution* at the 5  $\mu$ g load; apply equal volumes (about 38  $\mu$ L) of the *Standard solution* and the *Carboxymethylated standard solution* at the 7.5  $\mu$ g load; and apply the *Control solutions* at the 10 ng and 2.5 ng load onto separate lanes of the gel. Apply about 25  $\mu$ L of the *Molecular weight standard preparation* to each side of the gel, and apply about 25  $\mu$ L of the *Blank* onto a separate lane. Apply the *Test solution* and the *Standard solution* on one half and the *Carboxymethylated test solution* and *Carboxymethylated standard solution* on the other half. Perform the electrophoresis using a constant current of 1.3 to 1.5 mA per cm of gel length and the *Running buffer*. Remove the gel from the apparatus 10 to 20 minutes after the tracking dye starts to move. Place the gel in 250 mL of a solution of 20% alcohol and 6% glacial acetic acid for not less than 1 hour, and change the solution every 20 minutes, leaving the gel to soak overnight following the last change. Perform silver staining of the gel by placing the gel in 250 mL of a solution (1 in 10) in a shallow dish, and shake for about 30 minutes. Replace the glutaraldehyde solution with distilled water, allow gel to soak for about 20 minutes, and then change the water. Repeat for a total of three washings. Transfer the gel to a dish, and cover with 250 mL of *Ammoniacal silver nitrate solution*. Place the dish on a shaker for about 15 minutes. Rinse 4 times with 250 mL of water, rocking the dish for 1 minute between rinses. Continue rocking to prevent the gel from sticking and to facilitate washing. Transfer the gel to a clear dish containing 250 mL of *Citric acid-formaldehyde solution*, and rock the dish. Protein bands become visible. When the gel is visibly stained, wash immediately with water, and rinse it repeatedly with water to remove the *Citric acid-formaldehyde solution*. Rinse the gel for not less than 1 hour, and dry. Soak cellophane membranes in glycerol solution (2 in 100). Roll a membrane onto a rigid sheet of plastic. Roll the gel onto the membrane, and cover with another membrane. Lay a frame on the edges of the membranes, and clamp it to the rigid plastic sheet. Dismantle the dryer, and cut off excess cellophane when dry (about 24 hours). Visually examine the gel under light. The *Test solution* exhibits 3 major bands in the region between 66,000 Da and 31,000 Da, corresponding to the major bands from the *Standard solution*. The *Carboxymethylated test solution* exhibits 6 major bands in the region between 92,500 Da and 45,000 Da, corresponding to the major bands from the *Carboxymethylated standard solution*.

**System suitability**—The 2.5 ng and 10 ng controls must be visible. The nonreduced controls solutions migrate with an apparent molecular weight of slightly less than 66,000 Da, as compared with the molecular weight standards.

#### Single-chain content—

**Mobile phase**—Dissolve 27.6 g of monobasic sodium phosphate in 1000 mL of sodium dodecyl sulfate solution (1 in 1000), and adjust with sodium hydroxide to a pH of 6.8. Filter and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**0.02 M Dithiothreitol solution**—Prepare a solution of dithiothreitol in *Mobile phase* containing 3.12 mg per mL.

**Standard solution**—Dissolve an accurately weighed quantity of USP Alteplase RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 1 mg per mL. Pipet 1 mL of this solution into a glass tube, add 3 mL of 0.02 M

*Dithiothreitol solution*, cap the tube, and invert to mix. Heat for 3 to 5 minutes at about 80°.

*Test solution*—Using an accurately weighed quantity of Alteplase, proceed as directed for *Standard solution*.

*Chromatographic system* (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 214-nm detector and a 7.5-mm × 60-cm column that contains packing L25. The flow rate is about 0.5 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between the single-chain and two-chain alteplase peaks is not less than 1.1.

*Procedure*—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. [NOTE—The major peaks are from single-chain and two-chain alteplase and from higher and lower molecular weight species.] No peaks or shoulders in the chromatogram of the *Test solution* that are not present in the chromatogram of the *Standard solution* are found. Calculate the percentage of single-chain alteplase in the portion of Alteplase taken by the formula:

$$100(r_a / r_s)$$

in which  $r_a$  is the peak response for single-chain alteplase, and  $r_s$  is the sum of the responses of all of the alteplase peaks: not less than 60% is found.

**Protein content** (see *Spectrophotometry and Light-Scattering* <851>)—

*0.2 M Arginine solution*—Prepare a solution of arginine in water containing 34.8 mg per mL. Adjust with phosphoric acid to a pH of 7.3.

*Test solution*—Dissolve an accurately weighed quantity of Alteplase in water to obtain a solution containing about 1 mg per mL. Dilute an accurately measured volume of this solution with a volume of *0.2 M Arginine solution* to obtain a solution having an absorbance value of 0.5 to 1.0 at the wavelength of maximum absorbance at about 280 nm. Determine the dilution volume,  $V$ .

*Procedure*—Obtain an absorption spectrum of the *Test solution* in a 1-cm cell from 240 nm to 500 nm, and determine the absorbance at 320 nm and at the wavelength of maximum absorbance at about 280 nm, using *0.2 M Arginine solution* as the blank. Calculate the protein content in the portion of Alteplase taken by the formula:

$$V(A_{\max} - A_{320})/1.9$$

in which  $V$  is the volume of *0.2 M Arginine solution* required to prepare the *Test solution*,  $A_{\max}$  is the absorbance value at the wavelength of maximum absorbance, and  $A_{320}$  is the absorbance of the *Test solution* at 320 nm.

#### Assay for biological potency—

*Buffer*—Prepare an aqueous solution containing, in each mL, 1.38 mg of monobasic sodium phosphate, 7.10 mg of anhydrous dibasic sodium phosphate, 0.20 mg of sodium azide, and 0.10 mg of polysorbate 80.

*Human thrombin solution*—Prepare a solution of human thrombin in *Buffer* containing 33 U.S. Units in terms of the U.S. Standard Thrombin per mL.

*Human fibrinogen solution*—Prepare a solution of human fibrinogen in *Buffer* containing 2 mg per mL.

*Human plasminogen solution*—Prepare a solution of human plasminogen in *Buffer* containing 1 mg per mL.

*Standard preparations*—Dissolve an accurately weighed quantity of USP Alteplase RS in water, and dilute quantitatively with water to obtain a solution having a known concentration of about 1.0 mg (580,000 USP Alteplase Units) per mL. Dilute accurately measured volumes of this solution quantitatively and stepwise with water to obtain a series of five *Standard preparations* having known concentrations ranging from 145 to 9.3 USP Alteplase Units per mL.

*Assay preparations*—Dissolve an accurately weighed quantity of Alteplase in water, and dilute with water to obtain a solution having a concentration of about 1 mg per mL. Dilute an accurately measured volume of this solution quantitatively and stepwise with *Buffer* to obtain a series of dilutions of about 1:20,000, 1:10,000, and 1:5,000.

*Procedure*—To a set of labeled glass test tubes, add 0.5 mL of *Human thrombin solution*. To separate test tubes add 0.5 mL of each *Standard* and *Assay preparation*, mix, and store on ice. To a second set of labeled glass tubes, add 20  $\mu$ L of *Human plasminogen solution* and 1 mL of *Human fibrinogen solution*, mix, and store on ice. Beginning with the *Standard/thrombin mixture* containing the lowest number of USP Units per mL, record the time, and separately add 200  $\mu$ L of each of the thrombin mixtures to the test tubes containing the plasminogen-fibrinogen mixture. Using a vortex mixer, intermittently mix the contents of each tube for a total of 15 seconds, and carefully place into a rack in a 37° circulating water bath. A visually turbid clot forms within 30 seconds, followed by the formation of bubbles within the clot. Record the clot lysis time,  $t_{cl}$ , from the first addition of the Alteplase solution to the last bubble to rise to the surface. Using a least squares fit, determine the equation of the line using the log values of the standard concentration, in USP Alteplase Units per mL, versus the log values of their clot lysis times in seconds taken by the formula:

$$\log t = m(\log U_s) + b$$

in which  $t$  is the time, in seconds, to bubble release;  $U_s$  is the activity, in USP Alteplase Units per mL, of the *Standard preparation*;  $m$  is the slope of the line; and  $b$  is the y-intercept of the line. The correlation coefficient is not less than -0.9900. From the line equation and using the log of the clot lysis time for the *Assay preparation*, calculate the log of the activity,  $U_a$ , by the equation:

$$\log U_a = [(\log t) - b]/m.$$

Calculate the alteplase activity, in USP Alteplase Units per mL, taken by the formula:

$$D(10^{\log U})$$

in which  $D$  is the dilution factor for the *Assay preparation*. Calculate the specific activity in the portion of Alteplase taken by the formula:

$$U_a / P$$

in which  $P$  is the concentration of protein obtained in the test for *Protein content*.

## Alteplase for Injection

» Alteplase for Injection is a sterile lyophilized preparation of Alteplase. Its biological activity is not less than 90 percent and not more than 115 percent of that stated on the label in USP Alteplase Units. It contains not less than 95 percent and not more than 111 percent of the total protein content stated on the label.

**Packaging and storage**—Preserve in hermetic, light-resistant containers, and store in a refrigerator.

**Labeling**—Label it to state the biological activity in USP Alteplase Units per vial and the amount of protein per vial.

**USP Reference standards** <11>—

USP Alteplase RS  
USP Endotoxin RS

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* ⟨1⟩.

**Identification**—It responds to the tests for *Identification* and *Peptide mapping* under *Alteplase*.

**Bacterial endotoxins** ⟨85⟩—It contains less than 1 USP Endotoxin Unit per mg.

**Safety**—It meets the requirements for biologics as set forth for *Safety Tests—Biologicals* under *Biological Reactivity Tests, In Vivo* ⟨88⟩.

**Sterility** ⟨71⟩—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**Uniformity of dosage units** ⟨905⟩: meets the requirements for *Content Uniformity*.

**pH** ⟨791⟩: between 7.1 and 7.5, in the solution constituted as directed in the labeling.

**Water, Method I** ⟨921⟩: not more than 4.0%.

**Single-chain content**—When constituted with water, it meets the requirements for *Single-chain content* under *Alteplase*.

**Percent monomer**—

**Mobile phase**—Dissolve 34.84 g of arginine, 158.56 g of ammonium sulfate, and 100 mL of isopropyl alcohol in water, and dilute with water to 1000 mL. Adjust with phosphoric acid to a pH of 7.3, degas, and pass through a 0.45-μm porosity filter. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

**Standard solution**—Dissolve an accurately weighed quantity of USP Alteplase RS in water to obtain a solution having a known concentration of about 1 mg per mL.

**Test solution**—Dissolve an accurately weighed quantity of Alteplase for Injection in water to obtain a solution having a concentration of about 1 mg per mL.

**Resolution solution**—Prepare a solution containing 1 mg per mL of each of chicken ovalbumin and bovine gamma globulin.

**Chromatographic system** (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 280-nm detector and a 7.5-mm × 30-cm column that contains packing L25. The flow rate is between 0.5 and 1.0 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between gamma globulin and ovalbumin is not less than 1.6. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the column efficiency determined from the alteplase peak is not less than 1200 theoretical plates.

**Procedure**—Separately inject equal volumes (about 50 μL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percent monomer in the portion of Alteplase for Injection taken by the formula:

$$100(r_m / r_s)$$

in which  $r_m$  is the peak response for the alteplase monomer, and  $r_s$  is the sum of the responses of all of the alteplase related peaks: not less than 95.0% is found.

**Protein content**—Proceed as directed for *Protein content* under *Alteplase*.

**Assay for biological potency**—When constituted with water, Alteplase for Injection meets the requirements for *Assay for biological potency* under *Alteplase*.

## Altretamine

$C_9H_{18}N_6$  210.28  
1,3,5-Triazine-2,4,6-triamine, *N,N,N',N',N'',N''*-hexamethyl-; Hexamethylmelamine [645-05-6].

### DEFINITION

Altretamine contains NLT 98.0% and NMT 102.0% of altretamine ( $C_9H_{18}N_6$ ), calculated on the anhydrous basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION** ⟨197K⟩
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### • PROCEDURE

**Buffer:** 0.79 g/L of ammonium carbonate in water. Adjust with a solution of formic acid (1 in 10) or ammonium hydroxide (1 in 10) to a pH of  $8.0 \pm 0.05$ .

**Diluent:** Methanol and water (65:35)

**Mobile phase:** Methanol and *Buffer* (65:35)

**Standard stock solution:** 0.5 mg/mL of USP Altretamine RS in a mixture of methanol and water (70:30), prepared by first dissolving the Standard in methanol and then diluting with water to final volume.

**Standard solution:** 0.05 mg/mL of USP Altretamine RS in *Diluent*, from *Standard stock solution*

**Sample stock solution:** Transfer 25 mg of Altretamine to a 50-mL volumetric flask. Dissolve in 35 mL of methanol, and dilute with water to volume.

**Sample solution:** 0.05 mg/mL of Altretamine in *Diluent*, from *Sample stock solution*

#### Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

**Mode:** LC

**Detector:** UV 227 nm

**Column:** 4.6-mm × 30-cm; packing L1

**Flow rate:** 2 mL/min

**Injection volume:** 10 μL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** NMT 1.5

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of altretamine ( $C_9H_{18}N_6$ ) in the portion of Altretamine taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Altretamine RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the anhydrous basis

**IMPURITIES**

- **RESIDUE ON IGNITION** (281): NMT 0.1%
- **HEAVY METALS**, Method II (231): NMT 40 ppm

**SPECIFIC TESTS**

- **WATER DETERMINATION**, Method I (921): NMT 1%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- **USP REFERENCE STANDARDS** (11)  
USP Altretamine RS

---

**Altretamine Capsules**

---

**DEFINITION**

Altretamine Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of altretamine ( $C_9H_{18}N_6$ ).

**IDENTIFICATION**

- **A. INFRARED ABSORPTION** (197K)  
**Sample:** Remove as completely as possible the contents of 5 Capsules, and dissolve, with shaking, in 10 mL of chloroform. Filter, and evaporate the chloroform solution to dryness.  
**Acceptance criteria:** Meet the requirements
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

**ASSAY**

- **PROCEDURE**  
**Buffer:** 0.79 g/L of ammonium carbonate in water. Adjust with a solution of formic acid (1 in 10) or ammonium hydroxide (1 in 10) to a pH of  $8.0 \pm 0.05$ .  
**Diluent:** Methanol and water (65:35)  
**Mobile phase:** Methanol and *Buffer* (65:35)  
**Standard stock solution:** 0.5 mg/mL of USP Altretamine RS in a mixture of methanol and water (70:30), prepared by first dissolving the Standard in methanol and then diluting with water to final volume.  
**Standard solution:** 0.05 mg/mL of USP Altretamine RS in *Diluent*, from *Standard stock solution*  
**Sample stock solution:** Remove as completely as possible the contents of NLT 20 Capsules, and weigh. Mix the combined contents, and transfer as completely as possible to a 500-mL volumetric flask. Add 325 mL of methanol, and sonicate. Dilute with water to volume.  
**Sample solution:** Transfer a volume of the *Sample stock solution*, equivalent to 10 mg of altretamine, to a 200-mL volumetric flask, and dilute with *Diluent* to volume.  
**Chromatographic system**  
(See *Chromatography* (621), *System Suitability*.)

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of altretamine ( $C_9H_{18}N_6$ ) in the portion of Capsules taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

$r_u$  = peak response from the *Sample solution*

$r_s$  = peak response from the *Standard solution*  
 $C_s$  = concentration of USP Altretamine RS in the *Standard solution* (mg/mL)  
 $C_u$  = nominal concentration of the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

**PERFORMANCE TESTS**

- **DISSOLUTION** (711)  
**Medium:** 0.1 N hydrochloric acid; 900 mL  
**Apparatus 1:** 100 rpm  
**Time:** 30 min  
**Detector:** UV 242 nm  
**Standard solution:** USP Altretamine RS in *Medium*  
**Analysis:** Determine the amount of  $C_9H_{18}N_6$  dissolved from UV absorbances on filtered portions of the solution under test, suitably diluted if necessary with *Medium*, compared with the *Standard solution*.  
**Tolerances:** NLT 80% (Q) of the labeled amount of  $C_9H_{18}N_6$  is dissolved.
- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at controlled room temperature.
- **USP REFERENCE STANDARDS** (11)  
USP Altretamine RS

---

**Ammonium Alum**

---

$AlNH_4(SO_4)_2 \cdot 12H_2O$	453.33
$AlNH_4(SO_4)_2$	237.15
Sulfuric acid, aluminum ammonium salt (2:1:1), dodecahydrate;	
Aluminum ammonium sulfate (1:1:2), dodecahydrate [7784-26-1].	
Anhydrous [7784-25-0].	

**DEFINITION**

Ammonium Alum contains NLT 99.0% and NMT 100.5% of ammonium alum [ $AlNH_4(SO_4)_2$ ], calculated on the dried basis.

**IDENTIFICATION****Change to read:**

- **A.**  
**Sample solution:** 50 mg/mL  
**Analysis:** Add 1 N sodium hydroxide dropwise to the *Sample solution*.  
**Acceptance criteria:** A precipitate is formed, and it dissolves in an excess of the reagent with the evolution of ammonia, recognizable by  $\blacktriangle_{USP36}$  its alkaline effect upon moistened red litmus paper exposed to the vapor.
- **B. IDENTIFICATION TESTS—GENERAL, Aluminum** (191)  
**Sample solution:** 50 mg/mL  
**Acceptance criteria:** Meets the requirements

**Change to read:**

- **C. IDENTIFICATION TESTS—GENERAL, Sulfate** (191)  
**Sample solution:** 50 mg/mL  
**Analysis:** Proceed as directed in *Identification Tests—General, Sulfate* (191), except centrifuge the neutral solutions of sulfates and use the supernatants for the lead acetate test.  $\blacktriangle_{USP36}$

**Acceptance criteria:** Meets the requirements

## ASSAY

### Change to read:

#### • PROCEDURE

▲**Edetate disodium titrant:** Prepare and standardize as directed in *Reagents, Volumetric Solutions, Edetate Disodium, Twentieth-Molar (0.05 M)*.▲<sup>USP36</sup>

**Sample:** 800 mg of Ammonium Alum

**Analysis:** Transfer the *Sample* to a 400-mL beaker, moisten with 1 mL of glacial acetic acid, and add 50 mL of water, 50.0 mL of *Edetate disodium titrant* and 20 mL of acetic acid–ammonium acetate buffer TS. Warm on a steam bath until the solution is complete, and boil gently for 5 min. Cool, add 50 mL of alcohol and 2 mL of dithizone TS, and titrate ▲the excess edetate disodium▲<sup>USP36</sup> with 0.05 M zinc sulfate VS to a bright rose-pink color. Perform a blank determination, and make any necessary correction. Each mL of 0.05 M *Edetate disodium titrant* is equivalent to 11.86 mg of  $\text{AlNH}_4(\text{SO}_4)_2$ .

**Acceptance criteria:** 99.0%–100.5% on the dried basis

## IMPURITIES

#### • HEAVY METALS, Method I (231)

**Test preparation:** Dissolve 1 g in 20 mL of water, and add 5 mL of 0.1 N hydrochloric acid. Evaporate the solution in a porcelain evaporating dish to dryness. Treat the residue with 20 mL of water, and add 50 mg of hydroxylamine hydrochloride. Heat the solution on a steam bath for 10 min, cool, and dilute with water to 25 mL.

**Analysis:** Proceed as directed in the chapter, except add 50 mg of hydroxylamine hydrochloride to the *Standard Preparation*.

**Acceptance criteria:** 20 ppm

#### • IRON

**Sample solution:** 6.7 mg/mL

**Analysis:** Add 5 drops of potassium ferrocyanide TS to 20 mL of the *Sample solution*.

**Acceptance criteria:** No blue color is produced immediately.

## SPECIFIC TESTS

#### • LOSS ON DRYING (731)

**Sample:** 2.0 g

**Analysis:** Transfer the *Sample*, in a tared porcelain crucible, to a muffle furnace at 200°. Increase the temperature to 300°, and dry at 300° to a constant weight. Cool in a desiccator, and weigh.

**Acceptance criteria:** 45.0%–48.0%

#### • LIMIT OF ALKALIES AND ALKALINE EARTHS

**Sample:** 1 g

**Analysis:** Completely precipitate the aluminum from a boiling solution of the *Sample* in 100 mL of water by the addition of sufficient 6 N ammonium hydroxide to render the solution distinctly alkaline to methyl red TS, and filter. Evaporate the filtrate to dryness, and ignite.

**Acceptance criteria:** The weight of the residue is NMT 5 mg (0.5%).

## Potassium Alum

$\text{AlK}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$  474.39

Sulfuric acid, aluminum potassium salt (2:1:1), dodecahydrate.

Aluminum potassium sulfate (1:1:2) dodecahydrate [7784-24-9].

Anhydrous 258.21 [10043-67-1].

» Potassium Alum contains not less than 99.0 percent and not more than 100.5 percent of  $\text{AlK}(\text{SO}_4)_2$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers, and store at room temperature.

### Identification—

**A:** Add 1 N sodium hydroxide dropwise to a solution of it (1 in 20): a precipitate is formed that dissolves in an excess of the reagent. Ammonia is not evolved (*distinction from Ammonium Alum*).

**B:** Hold it in a nonluminous flame: a violet color is imparted to the flame.

**C:** Add 10 mL of sodium bitartrate TS to 5 mL of a saturated solution of it: a white, crystalline precipitate is formed within 30 minutes.

**D:** A solution (1 in 20) responds to the tests for *Aluminum* (191) and for *Sulfate* (191).

**Loss on drying** (731)—Transfer 2.0 g, in a tared porcelain crucible, to a muffle furnace at 200°. Increase the temperature to 400°, and dry at 400° to constant weight. Cool in a desiccator, and weigh: it loses between 43.0% and 46.0% of its weight.

**Heavy metals, Method I** (231)—Dissolve 1 g in water to make 20 mL, and add 5 mL of 0.1 N hydrochloric acid. Evaporate the solution in a porcelain evaporating dish to dryness. Treat the residue with 20 mL of water, and add 50 mg of hydroxylamine hydrochloride. Heat the solution on a steam bath for 10 minutes, cool, dilute with water to 25 mL, and proceed as directed, except to add 50 mg of hydroxylamine hydrochloride to the *Standard Preparation*: the limit is 0.002%.

**Iron**—Add 5 drops of potassium ferrocyanide TS to 20 mL of a solution (1 in 150): no blue color is produced immediately.

### Assay—

*Edetate disodium titrant*—Prepare and standardize as directed in the *Assay* under *Ammonium Alum*.

*Procedure*—Transfer about 800 mg of Potassium Alum, accurately weighed, to a 400-mL beaker, moisten with 1 mL of glacial acetic acid, and add 50 mL of water, 50.0 mL of *Edetate disodium titrant*, and 20 mL of acetic acid–ammonium acetate buffer TS. Warm on a steam bath until solution is complete, and boil gently for 5 minutes. Cool, add 50 mL of alcohol and 2 mL of dithizone TS, and titrate 0.05 M zinc sulfate VS to a bright rose-pink color. Perform a blank determination, and make any necessary correction. Each mL of 0.05 M *Edetate disodium titrant* is equivalent to 12.91 mg of  $\text{AlK}(\text{SO}_4)_2$ .

## Alumina and Magnesia Oral Suspension

» Alumina and Magnesia Oral Suspension is a mixture containing aluminum hydroxide  $[\text{Al}(\text{OH})_3]$  and Magnesium Hydroxide  $[\text{Mg}(\text{OH})_2]$ . It contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$  and magnesium hydroxide  $[\text{Mg}(\text{OH})_2]$ . It may contain a flavoring agent, and may contain suitable antimicrobial agents.

**Packaging and storage**—Preserve in tight containers, and avoid freezing.

**Labeling**—Oral Suspension may be labeled to state the aluminum hydroxide content in terms of the equivalent

amount of dried aluminum hydroxide gel, on the basis that each mg of dried gel is equivalent to 0.765 mg of  $\text{Al}(\text{OH})_3$ .

#### Identification—

**A:** To a solution of 5 g in 10 mL of 3 N hydrochloric acid add 5 drops of methyl red TS, heat to boiling, add 6 N ammonium hydroxide until the color of the solution changes to deep yellow, then continue boiling for 2 minutes, and filter: the filtrate responds to the tests for *Magnesium* (191).

**B:** Wash the precipitate obtained in *Identification* test A with hot ammonium chloride solution (1 in 50), and dissolve the precipitate in hydrochloric acid: the solution responds to the tests for *Aluminum* (191).

**Microbial enumeration tests (61) and Tests for specified microorganisms (62)**—Its total aerobic microbial count does not exceed 100 cfu per mL, and it meets the requirements of the test for absence of *Escherichia coli*.

**Acid-neutralizing capacity (301)**—The acid consumed by the minimum single dose recommended in the labeling is not less than 5 mEq, and not less than the number of mEq calculated by the formula:

$$0.55(0.0385A) + 0.8(0.0343 M)$$

in which 0.0385 and 0.0343 are the theoretical acid-neutralizing capacities, in mEq, of  $\text{Al}(\text{OH})_3$  and  $\text{Mg}(\text{OH})_2$ , respectively, and A and M are the quantities, in mg, of  $\text{Al}(\text{OH})_3$  and  $\text{Mg}(\text{OH})_2$  in the specimen tested, based on the labeled quantities.

**pH (791):** between 7.3 and 8.5.

**Chloride (221)**—Dissolve 5.0 g in the minimum volume of nitric acid required to achieve complete solution, add 1 mL of acid in excess, then add water to make 100 mL, and filter: a 10-mL portion of the filtrate shows no more chloride than corresponds to 1.0 mL of 0.020 N hydrochloric acid (0.14%).

**Sulfate (221)**—Dissolve 5.0 g in 5 mL of 3 N hydrochloric acid, with gentle heating. Cool, add water to make 250 mL, mix, and filter: a 20-mL portion of the filtrate shows no more sulfate than corresponds to 0.40 mL of 0.020 N sulfuric acid (0.1%).

**Other requirements**—It meets the requirements of the tests for *Arsenic* and *Heavy metals* under *Aluminum Hydroxide Gel*.

#### Assay for aluminum hydroxide—

**Eдетate disodium titrant**—Prepare and standardize as directed in the Assay under *Ammonium Alum*.

**Assay preparation**—Transfer an accurately measured quantity of Oral Suspension, previously well shaken in its original container, equivalent to about 1200 mg of aluminum hydroxide, to a suitable beaker. Add 20 mL of water, stir, and slowly add 10 mL of hydrochloric acid. Heat gently, if necessary, to aid solution, cool, and filter into a 200-mL volumetric flask. Wash the filter with water into the flask, add water to volume, and mix.

**Procedure**—Pipet 10 mL of Assay preparation into a 250-mL beaker, add 20 mL of water, then add, in the order named and with continuous stirring, 25.0 mL of *Eдетate disodium titrant* and 20 mL of acetic acid–ammonium acetate buffer TS, and heat near the boiling point for 5 minutes. Cool, add 50 mL of alcohol and 2 mL of dithizone TS, and mix. Titrate with 0.05 M zinc sulfate VS until the color changes from green-violet to rose-pink. Perform a blank determination, substituting 10 mL of water for the Assay preparation, and make any necessary correction. Each mL of 0.05 M *Eдетate disodium titrant* consumed is equivalent to 3.900 mg of  $\text{Al}(\text{OH})_3$ .

#### Assay for magnesium hydroxide—

**Assay preparation**—Prepare as directed in the Assay for aluminum hydroxide.

**Procedure**—Pipet a volume of Assay preparation, equivalent to about 40 mg of magnesium hydroxide, into a

400-mL beaker, add 200 mL of water and 20 mL of triethanolamine, and stir. Add 10 mL of ammonia–ammonium chloride buffer TS and 3 drops of an eriochrome black indicator solution prepared by dissolving 200 mg of eriochrome black T in a mixture of 15 mL of triethanolamine and 5 mL of dehydrated alcohol, and mix. Cool the solution to between 3° and 4° by immersion of the beaker in an ice bath, then remove, and titrate with 0.05 M edetate disodium VS to a blue endpoint. Perform a blank determination, substituting 10 mL of water for the Assay preparation, and make any necessary correction. Each mL of 0.05 M edetate disodium consumed is equivalent to 2.916 mg of  $\text{Mg}(\text{OH})_2$ .

## Alumina and Magnesia Tablets

» Alumina and Magnesia Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$  and magnesium hydroxide  $[\text{Mg}(\text{OH})_2]$ .

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—Tablets prepared with the use of Dried Aluminum Hydroxide Gel may be labeled to state the aluminum hydroxide content in terms of the equivalent amount of dried aluminum hydroxide gel, on the basis that each mg of dried gel is equivalent to 0.765 mg of  $\text{Al}(\text{OH})_3$ .

#### Identification—

**A:** To a 0.7-g portion of finely powdered Tablets add 10 mL of 3 N hydrochloric acid and 5 drops of methyl red TS, heat to boiling, and add 6 N ammonium hydroxide until the color of the solution changes to deep yellow. Continue boiling for 2 minutes, and filter: the filtrate responds to the tests for *Magnesium* (191).

**B:** Wash the precipitate obtained in *Identification* test A with a hot solution of ammonium chloride (1 in 50), and dissolve the precipitate in hydrochloric acid: the solution responds to the tests for *Aluminum* (191).

**Disintegration (701):** 10 minutes, simulated gastric fluid TS being substituted for water in the test.

**Uniformity of dosage units (905):** meet the requirements for *Weight Variation* with respect to alumina and to magnesia.

**Acid-neutralizing capacity (301)**—The acid consumed by the minimum single dose recommended in the labeling is not less than 5 mEq, and not less than the number of mEq calculated by the formula:

$$0.55(0.0385A) + 0.8(0.0343 M)$$

in which 0.0385 and 0.0343 are the theoretical acid-neutralizing capacities, in mEq, of  $\text{Al}(\text{OH})_3$  and  $\text{Mg}(\text{OH})_2$ , respectively, and A and M are the quantities, in mg, of  $\text{Al}(\text{OH})_3$  and  $\text{Mg}(\text{OH})_2$  in the specimen tested, based on the labeled quantities.

#### Assay for aluminum hydroxide—

**Eдетate disodium titrant**—Prepare and standardize as directed in the Assay under *Ammonium Alum*.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 1200 mg of aluminum hydroxide, to a 150-mL beaker, add 20 mL of water, stir, and slowly add 30 mL of 3 N hydrochloric acid. Proceed as directed for Assay preparation in the Assay for aluminum hydroxide under *Alumina and Magnesia Oral Suspension*, beginning with "Heat gently, if necessary."

**Procedure**—Proceed as directed for *Procedure* in the *Assay for aluminum hydroxide* under *Alumina and Magnesia Oral Suspension*. Each mL of 0.05 M *Edetate disodium* titrant is equivalent to 3.900 mg of  $\text{Al}(\text{OH})_3$ .

#### **Assay for magnesium hydroxide—**

**Assay preparation**—Prepare as directed in the *Assay for aluminum hydroxide*.

**Procedure**—Proceed as directed for *Procedure* in the *Assay for magnesium hydroxide* under *Alumina and Magnesia Oral Suspension*.

## **Alumina, Magnesia, and Calcium Carbonate Oral Suspension**

» Alumina, Magnesia, and Calcium Carbonate Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$ , magnesium hydroxide  $[\text{Mg}(\text{OH})_2]$ , and calcium carbonate  $(\text{CaCO}_3)$ .

**Packaging and storage**—Preserve in tight containers, and avoid freezing.

**Labeling**—Oral Suspension may be labeled to state the aluminum hydroxide content in terms of the equivalent amount of dried aluminum hydroxide gel, on the basis that each mg of dried gel is equivalent to 0.765 mg of  $\text{Al}(\text{OH})_3$ .

#### **Identification—**

**A:** To 5 g of Oral Suspension add 25 mL of 2 N sulfuric acid, stir, and allow to stand for 5 minutes. Add 25 mL of alcohol, stir, and place in an ice bath for 30 minutes. Filter while cold, retaining the filtrate for *Identification* test **B**. Wash the precipitate with 50 mL of 0.75 N sulfuric acid, and discard the washings: the precipitate so obtained, dissolved in 3 N hydrochloric acid and filtered, responds to the tests for *Calcium* (191).

**B:** To the filtrate obtained in *Identification* test **A** add 5 drops of methyl red TS, and heat to boiling. Add 6 N ammonium hydroxide until the color of the solution changes to deep yellow, continue boiling for 2 minutes, and filter through hardened filter paper. (Retain the filtrate for *Identification* test **C**.) Wash the precipitate with 350 mL of a hot ammonium chloride solution (1 in 50), discarding the washings: the precipitate so obtained, dissolved in 3 N hydrochloric acid, responds to the tests for *Aluminum* (191).

**C:** The filtrate obtained in *Identification* test **B** responds to the tests for *Magnesium* (191).

**Microbial enumeration tests (61) and Tests for specified microorganisms (62)**—Its total aerobic microbial count does not exceed 100 cfu per mL, and it meets the requirements of the test for absence of *Escherichia coli*.

**Acid-neutralizing capacity (301)**—Not less than 5 mEq of acid is consumed by the minimum single dose recommended in the labeling, and not less than the number of mEq calculated by the formula:

$$0.55(0.0385A) + 0.8(0.0343 M) + 0.9(0.02C)$$

in which 0.0385, 0.0343, and 0.02 are the theoretical acid-neutralizing capacities, in mEq, of  $\text{Al}(\text{OH})_3$ ,  $\text{Mg}(\text{OH})_2$ , and  $\text{CaCO}_3$ , respectively, and A, M, and C are the respective quantities, in mg, of  $\text{Al}(\text{OH})_3$ ,  $\text{Mg}(\text{OH})_2$ , and  $\text{CaCO}_3$  in the specimen tested, based on the labeled quantities.

**pH (791):** between 7.5 and 8.5.

**Chloride (221)**—Dissolve 5.0 g in 3 mL of nitric acid, add water to make 100 mL, and filter: a 10.0-mL portion of the

filtrate shows no more chloride than corresponds to 1.0 mL of 0.020 N hydrochloric acid (0.14%).

**Sulfate (221)**—Dissolve 5.0 g in 7 mL of 3 N hydrochloric acid, with gentle heating. Cool, add water to make 250 mL, mix, and filter: a 20.0-mL portion of the filtrate shows no more sulfate than corresponds to 0.40 mL of 0.020 N sulfuric acid (0.1%).

**Other requirements**—It meets the requirements of the tests for *Arsenic* and *Heavy metals* under *Aluminum Hydroxide Gel*.

#### **Assay for aluminum hydroxide—**

**Edetate disodium titrant**—Prepare and standardize as directed in the *Assay* under *Ammonium Alum*.

**Assay preparation**—Transfer an amount of Oral Suspension, previously shaken in its original container, equivalent to about 600 mg of aluminum hydroxide, to a tared beaker, and weigh accurately. Add 20 mL of water, stir, and slowly add 40 mL of 3 N hydrochloric acid. Heat gently, if necessary, to aid solution, cool, and transfer to a 200-mL volumetric flask. Wash the beaker with water, adding the washings to the flask, add water to volume, and mix.

**Procedure**—Pipet 10 mL of the *Assay preparation* into a 250-mL beaker, add 20 mL of water, then add, in the order named and with continuous stirring, 25.0 mL of 0.05 M *Edetate disodium* titrant and 20 mL of acetic acid–ammonium acetate buffer TS, and heat the solution near the boiling temperature for 5 minutes. Cool, add 50 mL of alcohol and 2 mL of dithizone TS, and mix. Titrate with 0.05 M zinc sulfate VS until the color changes from green-violet to rose-pink. Perform a blank determination, substituting 10 mL of water for the *Assay preparation*, and make any necessary correction. Each mL of 0.05 M *Edetate disodium* titrant consumed is equivalent to 3.900 mg of  $\text{Al}(\text{OH})_3$ .

#### **Assay for magnesium hydroxide—**

**Assay preparation**—Prepare as directed in the *Assay for aluminum hydroxide*.

**Procedure**—Pipet a volume of *Assay preparation*, equivalent to about 40 mg of magnesium hydroxide, into a 400-mL beaker, add 200 mL of water and 20 mL of triethylamine, and mix. Add 50 mL of ammonia–ammonium chloride buffer TS and 2 drops of eriochrome black indicator solution (prepared by dissolving 200 mg of eriochrome black T in a mixture of 15 mL of triethylamine and 5 mL of dehydrated alcohol, and mixing). Cool the solution to between 3° and 4° by immersing the beaker in an ice bath, and titrate with 0.05 M *edetate disodium* VS until the color changes to pure blue. Perform a blank determination, substituting 10 mL of water for the *Assay preparation*, and make any necessary correction. From the volume of 0.05 M *edetate disodium* consumed, subtract the volume of 0.05 M *edetate disodium* consumed in the *Assay for calcium carbonate*. Each mL of 0.05 M *edetate disodium* is equivalent to 2.916 mg of  $\text{Mg}(\text{OH})_2$ .

#### **Assay for calcium carbonate—**

**Assay preparation**—Prepare as directed in the *Assay for aluminum hydroxide*.

**Procedure**—Pipet a volume of the *Assay preparation*, equivalent to about 50 mg of calcium carbonate, into a 400-mL beaker, and add 200 mL of water, 5 mL of sodium hydroxide solution (1 in 2), and 250 mg of hydroxy naphthol blue. Stir with a magnetic stirrer, and titrate immediately with 0.05 M *edetate disodium* VS until the solution is distinctly blue. Each mL of 0.05 M *edetate disodium* is equivalent to 5.004 mg of calcium carbonate  $(\text{CaCO}_3)$ .

## Alumina, Magnesia, and Calcium Carbonate Chewable Tablets

*Former Title: Alumina, Magnesia, and Calcium Carbonate Tablets*

» Alumina, Magnesia, and Calcium Carbonate Chewable Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$ , magnesium hydroxide  $[\text{Mg}(\text{OH})_2]$ , and calcium carbonate ( $\text{CaCO}_3$ ).

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—Label the Chewable Tablets to indicate that they are to be chewed before being swallowed. Chewable Tablets prepared using dried aluminum hydroxide gel may be labeled to state the aluminum hydroxide content in terms of the equivalent amount of dried aluminum hydroxide gel, on the basis that each mg of dried gel is equivalent to 0.765 mg of  $\text{Al}(\text{OH})_3$ .

**Identification**—To a 3-g portion of finely powdered Chewable Tablets add 25 mL of water and 25 mL of 2 N sulfuric acid, stir, and heat on a steam bath for 10 minutes. Cool, add 50 mL of alcohol, and stir: the mixture so obtained meets the requirements of *Identification* tests A, B, and C under *Alumina, Magnesia, and Calcium Carbonate Oral Suspension*, beginning under *Identification* test A with "place in an ice bath for 30 minutes."

**Disintegration** (701): 45 minutes.

**Uniformity of dosage units** (905): meet the requirements for *Weight Variation* with respect to alumina, to magnesia, and to calcium carbonate.

**Acid-neutralizing capacity** (301)—The acid consumed by the minimum single dose recommended in the labeling is not less than 5 mEq and not less than the number of mEq calculated by the formula:

$$0.55(0.0385A) + 0.8(0.0343M) + 0.9(0.02C)$$

in which 0.0385, 0.0343, and 0.02 are the theoretical acid-neutralizing capacities, in mEq, of  $\text{Al}(\text{OH})_3$ ,  $\text{Mg}(\text{OH})_2$ , and  $\text{CaCO}_3$ , respectively; and A, M, and C are the respective quantities, in mg, of  $\text{Al}(\text{OH})_3$ ,  $\text{Mg}(\text{OH})_2$ , and  $\text{CaCO}_3$  in the specimen tested, based on the labeled quantities.

### Assay for aluminum hydroxide—

*Edetate disodium titrant*—Prepare as directed in the *Assay* under *Ammonium Alum*.

*Assay preparation*—Weigh and finely powder not fewer than 20 Chewable Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 600 mg of aluminum hydroxide, to a beaker, add 20 mL of water, and slowly add 40 mL of 3 N hydrochloric acid, with mixing. Heat the mixture to boiling, cool, and filter into a 200-mL volumetric flask. Wash the beaker with water, adding the washings to the filter. Add water to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* for aluminum hydroxide under *Alumina, Magnesia, and Calcium Carbonate Oral Suspension*. Each mL of 0.05 M *Edetate disodium titrant* is equivalent to 3.900 mg of  $\text{Al}(\text{OH})_3$ .

### Assay for magnesium hydroxide—

*Edetate disodium titrant* and *Assay preparation*—Prepare as directed in the *Assay* for aluminum hydroxide.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* for magnesium hydroxide under *Alumina, Magnesia, and Calcium Carbonate Oral Suspension*. Each mL of 0.05 M *edetate disodium* is equivalent to 2.916 mg of  $\text{Mg}(\text{OH})_2$ .

### Assay for calcium carbonate—

*Edetate disodium titrant* and *Assay preparation*—Prepare as directed in the *Assay* for aluminum hydroxide.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* for calcium carbonate under *Alumina, Magnesia, and Calcium Carbonate Oral Suspension*. Each mL of 0.05 M *edetate disodium* is equivalent to 5.004 mg of  $\text{CaCO}_3$ .

## Alumina, Magnesia, Calcium Carbonate, and Simethicone Chewable Tablets

*Former Title: Alumina, Magnesia, Calcium Carbonate, and Simethicone Tablets*

» Alumina, Magnesia, Calcium Carbonate, and Simethicone Chewable Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$ , magnesium hydroxide  $[\text{Mg}(\text{OH})_2]$ , and calcium carbonate ( $\text{CaCO}_3$ ), and an amount of polydimethylsiloxane  $([-(\text{CH}_3)_2\text{SiO}-]_n)$  that is not less than 85.0 percent and not more than 115.0 percent of the labeled amount of simethicone.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—Label the Chewable Tablets to indicate that they are to be chewed before swallowing. Label the Chewable Tablets to state the sodium content, if it is greater than 5 mg per Chewable Tablet.

**USP Reference standards** (11)—

USP Polydimethylsiloxane RS

### Identification—

**A:** Cut a Chewable Tablet into pieces, add 50 mL of 1 N sulfuric acid, stir until the pieces disintegrate, and heat on a steam bath for 10 minutes. Cool, add 50 mL of alcohol, and stir. The mixture so obtained responds to *Identification* tests A, B, and C under *Alumina, Magnesia, and Calcium Carbonate Oral Suspension*, beginning under *Identification* test A with "place in an ice bath for 30 minutes."

**B: Infrared Absorption** (197S)—

Cell: 0.5 mm.

*Solution:* prepared as directed in the *Assay* for polydimethylsiloxane.

### Microbial enumeration tests (61) and Tests for specified microorganisms (62)—

The total aerobic microbial count does not exceed 200 cfu per g, the total combined molds and yeasts count does not exceed 200 cfu per g, and the Chewable Tablets meet the requirements of the test for the absence of *Salmonella* species and *Escherichia coli*.

**Uniformity of dosage units** (905): meet the requirements for *Weight Variation* with respect to aluminum hydroxide, to magnesium hydroxide, and to calcium carbonate.

**Acid-neutralizing capacity** (301)—Dissolve an accurately counted number of Chewable Tablets, equivalent to about 120 mEq of acid-neutralizing capacity, in about 400 mL of water. Transfer the mixture to a 500-mL volumetric flask, dilute with water to volume, and mix. Use 75.0 mL of this solution as the *Test preparation*. Proceed as directed in the section *Procedure for Powders, Effervescent Solids, Suspensions and Other Liquids, Nonchewable Tablets, Chewable Tablets, and Capsules*. The acid consumed by the minimum single dose recommended in the labeling is not less than 5 mEq.

and not less than the number of mEq calculated by the formula:

$$0.55(0.0385A) + 0.8(0.0343 M) + 0.9(0.02C)$$

in which 0.0385, 0.0343, and 0.02 are the theoretical acid-neutralizing capacities, in mEq, of  $\text{Al}(\text{OH})_3$ ,  $\text{Mg}(\text{OH})_2$ , and  $\text{CaCO}_3$ , respectively; and  $A$ ,  $M$ , and  $C$  are the quantities, in mg, of  $\text{Al}(\text{OH})_3$ ,  $\text{Mg}(\text{OH})_2$ , and  $\text{CaCO}_3$  in the specimen tested, based on the labeled quantities.

#### Sodium content—

**Potassium chloride solution**—Dissolve 3 g of potassium chloride in water in a 100-mL volumetric flask, dilute with water to volume, and mix.

**Dilute hydrochloric acid**—Prepare by mixing 226 mL of hydrochloric acid with sufficient water to make 1000 mL.

**Standard solution**—Transfer 2.5420 g of sodium chloride, previously dried at  $105^\circ$  for 2 hours, to a 1000-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a second 100-mL volumetric flask, dilute with water to volume, and mix. To three separate 100-mL volumetric flasks, each containing 10.0 mL of *Potassium chloride solution* and 3.0 mL of *Dilute hydrochloric acid*, add, respectively, 10.0, 20.0, and 30.0 mL of this solution. These solutions contain 1.0, 2.0, and 3.0  $\mu\text{g}$  of sodium (Na) per mL, respectively.

**Test solution**—Accurately weigh 10 Chewable Tablets, and determine the average weight,  $A$ , in mg. Cut 4 Chewable Tablets into pieces, combine the pieces, and weigh them. Transfer the combined pieces to a 500-mL volumetric flask, add 150 mL of *Dilute hydrochloric acid*, and swirl gently to disintegrate the pieces. Dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, add 10.0 mL of *Potassium chloride solution*, dilute with water to volume, and mix.

**Blank solution**—Transfer 3.0 mL of *Dilute hydrochloric acid* and 10.0 mL of *Potassium chloride solution* to a 100-mL volumetric flask, dilute with water to volume, and mix.

**Procedure**—Concomitantly determine the absorbances of the *Standard solutions* and the *Test solution* at the sodium emission line at 589.0 nm with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* (851)) equipped with a sodium hollow-cathode lamp and an air-acetylene flame, using the *Blank solution* as the blank. Plot the absorbances of the *Standard solutions* versus concentration, in  $\mu\text{g}$  per mL, of sodium, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration,  $C$ , in  $\mu\text{g}$  per mL, of sodium in the *Test solution*. Calculate the mg of sodium (Na) in each Tablet taken by the formula:

$$5C(A/W)$$

in which  $A$  is the average weight, in mg, of each Chewable Tablet; and  $W$  is the weight, in mg, of the portion of Chewable Tablets taken to prepare the *Test solution*. Chewable Tablets contain not more than 5 mg of sodium per Chewable Tablet, except when labeled to contain more than 5 mg of sodium per Chewable Tablet, they contain not more than 110% of the labeled amount.

#### Assay for aluminum hydroxide—

**Eдетate disodium titrant**—Prepare and standardize as directed in the Assay under *Ammonium Alum*.

**Assay preparation**—Transfer an accurately counted number of Chewable Tablets, equivalent to about 665 mg of aluminum hydroxide, to a suitable beaker. Add 15 mL of hydrochloric acid, and swirl to dissolve the Chewable Tablets. Add 80 mL of water, and filter into a 200-mL volumetric flask. Wash the filter with water into the flask, add water to volume, and mix.

**Procedure**—Pipet 20 mL of *Assay preparation* into a 250-mL beaker, then add, in the order named and with continuous stirring, 25.0 mL of *Eдетate disodium titrant* and 20 mL of acetic acid–ammonium acetate buffer TS, and heat near the boiling temperature for 5 minutes. Cool, add 50 mL of alcohol and 2 mL of dithizone TS, and mix. Titrate with 0.05 M zinc sulfate VS until the color changes from green-violet to rose-pink. Perform a blank determination, substituting 20 mL of water for the *Assay preparation*, and making any necessary correction. Each mL of 0.05 M *Eдетate disodium titrant* consumed is equivalent to 3.900 mg of  $\text{Al}(\text{OH})_3$ .

#### Assay for magnesium hydroxide—

**Lanthanum chloride solution**—Transfer 17.6 g of lanthanum chloride to a 200-mL volumetric flask, add 100 mL of water, and carefully add 50 mL of hydrochloric acid. Mix, and allow to cool. Dilute with water to volume, and mix.

**Dilute hydrochloric acid**—Prepare by mixing 226 mL of hydrochloric acid with sufficient water to make 1000 mL.

**Potassium chloride solution**—Dissolve 3 g of potassium chloride in water in a 100-mL volumetric flask, dilute with water to volume, and mix.

**Magnesium stock solution**—Transfer 1.000 g of magnesium metal to a 1000-mL volumetric flask containing 10 mL of water, slowly add 10 mL of hydrochloric acid, and swirl to dissolve the metal. Dilute with water to volume, and mix. Transfer 2.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix. This solution contains 20  $\mu\text{g}$  of magnesium (Mg) per mL.

**Standard preparations**—To three separate 100-mL volumetric flasks each containing 5.0 mL of *Lanthanum chloride solution*, add 1.0, 2.0, and 3.0 mL, respectively, of the *Magnesium stock solution*. Dilute each with water to volume, and mix. These solutions contain 0.1, 0.2, and 0.3  $\mu\text{g}$  of magnesium (Mg) per mL, respectively.

**Assay preparation**—Transfer an accurately counted number of Chewable Tablets, equivalent to about 250 mg of magnesium hydroxide (100 mg of magnesium), to a 1000-mL volumetric flask. Add 500 mL of *Dilute hydrochloric acid*, and swirl to disintegrate the Chewable Tablets. Add 100.0 mL of *Potassium chloride solution*, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 2.0 mL of this solution to a second 100-mL volumetric flask, add 5.0 mL of *Lanthanum chloride solution*, dilute with water to volume, and mix.

**Blank**—Add 50 mL of *Dilute hydrochloric acid* and 10.0 mL of *Potassium chloride solution* to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a second 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 2.0 mL of this solution to a third 100-mL volumetric flask, add 5.0 mL of *Lanthanum chloride solution*, dilute with water to volume, and mix.

**Procedure**—Concomitantly determine the absorbances of the *Standard preparations* and the *Assay preparation* at the magnesium emission line at 285.2 nm, with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* (851)) equipped with a magnesium hollow-cathode lamp and an air-acetylene flame, using the *Blank* to set the instrument. Plot the absorbances of the *Standard preparations* versus concentration, in  $\mu\text{g}$  per mL, of magnesium, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration,  $C$ , in  $\mu\text{g}$  per mL, of magnesium in the *Assay preparation*. Calculate the quantity, in mg, of magnesium hydroxide  $[\text{Mg}(\text{OH})_2]$  in each Chewable Tablet taken by the formula:

$$(58.34/24.305)(500C/N)$$

in which 58.34 is the molecular weight of magnesium hydroxide; 24.305 is the atomic weight of magnesium; and  $N$

is the number of Chewable Tablets taken to prepare the Assay preparation.

#### Assay for calcium carbonate—

*Assay preparation*—Prepare as directed in the Assay for aluminum hydroxide.

*Procedure*—Pipet a volume of the Assay preparation, equivalent to about 50 mg of calcium carbonate, into a 400-mL beaker, and add 200 mL of water, a volume of sodium hydroxide solution (1 in 2) equivalent to the volume of the Assay preparation taken, and 250 mg of hydroxy naphthol blue. Stir with a magnetic stirrer, and titrate immediately with 0.05 M edetate disodium VS until the solution is distinctly blue. Perform a blank determination, substituting a volume of water equivalent to the volume of the Assay preparation taken, and make any necessary correction. Each mL of 0.05 M edetate disodium is equivalent to 5.004 mg of  $\text{CaCO}_3$ .

#### Assay for polydimethylsiloxane—

*Dilute hydrochloric acid*—Prepare by mixing 400 mL of hydrochloric acid with sufficient water to make 1000 mL.

*Standard preparation*—Transfer about 60 mg of USP Polydimethylsiloxane RS, accurately weighed, to a separator, add 30.0 mL of chloroform and 60 mL of Dilute hydrochloric acid, shake for 30 seconds, and allow the phases to separate. Remove about 10 mL of the lower, organic layer to a screw-capped, 15-mL test tube containing 0.5 g of anhydrous sodium sulfate. Close the tube with a screw-cap having an inert liner, agitate vigorously, and centrifuge the mixture until a clear supernatant is obtained.

*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 60 mg of simethicone, to a suitable screw-capped bottle, add 30.0 mL of chloroform and 60 mL of Dilute hydrochloric acid, and allow to stand, with frequent shaking, until the Chewable Tablets are dissolved. Transfer the contents of the bottle to a separator, shake, and allow the phases to separate. Remove about 10 mL of the lower, organic layer to a screw-capped, 15-mL test tube containing 0.5 g of anhydrous sodium sulfate. Close the tube with a screw-cap having an inert liner, agitate vigorously, and centrifuge the mixture until a clear supernatant is obtained.

*Blank*—Place 30.0 mL of chloroform and 60 mL of Dilute hydrochloric acid in a separator, shake for 30 seconds, and allow the phases to separate. Remove about 10 mL of the lower, organic layer to a screw-capped, 15-mL test tube containing 0.5 g of anhydrous sodium sulfate. Close the tube with a screw-cap having an inert liner, agitate vigorously, and centrifuge the mixture until a clear supernatant is obtained.

*Procedure*—Concomitantly determine the absorbances of the Standard preparation and the Assay preparation in 0.5-mm cells at the wavelength of maximum absorbance at about 7.9  $\mu\text{m}$ , with a suitable IR spectrophotometer, using the Blank to set the instrument. Calculate the quantity, in mg, of  $[-(\text{CH}_3)_2\text{SiO}-]_n$  in each Chewable Tablet taken by the formula:

$$(W/N)(A_U / A_S)$$

in which *W* is the weight, in mg, of USP Polydimethylsiloxane RS used to prepare the Standard preparation; *N* is the number of Chewable Tablets taken to prepare the Assay preparation; and *A<sub>U</sub>* and *A<sub>S</sub>* are the absorbances of the Assay preparation and the Standard preparation, respectively.

## Alumina, Magnesia, and Simethicone Oral Suspension

» Alumina, Magnesia, and Simethicone Oral Suspension contains the equivalent of not less than 90.0 percent and not more than 115.0 percent of the labeled amounts of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$  and magnesium hydroxide  $[\text{Mg}(\text{OH})_2]$ , and an amount of polydimethylsiloxane  $[-(\text{CH}_3)_2\text{SiO}-]_n$  that is not less than 85.0 percent and not more than 115.0 percent of the labeled amount of simethicone.

**Packaging and storage**—Preserve in tight containers, and avoid freezing.

**Labeling**—Oral Suspension may be labeled to state the aluminum hydroxide content in terms of the equivalent amount of dried aluminum hydroxide gel, on the basis that each mg of dried gel is equivalent to 0.765 mg of  $\text{Al}(\text{OH})_3$ . Label it to state the sodium content if it is greater than 1 mg per mL.

#### USP Reference standards (11)—

USP Polydimethylsiloxane RS

#### Identification—

**A:** Infrared Absorption (197S)—

Cell: 0.5 mm.

**Solution:** prepared as directed in the Assay for polydimethylsiloxane.

**B:** To a solution of 5 g in 10 mL of 3 N hydrochloric acid add 5 drops of methyl red TS, heat to boiling, add 6 N ammonium hydroxide until the color of the solution just changes to deep yellow, then continue boiling for 2 minutes, and filter: the filtrate so obtained responds to the tests for Magnesium (191).

**C:** Wash the precipitate obtained in Identification test B with hot ammonium chloride solution (1 in 50), and dissolve the precipitate in hydrochloric acid. Divide this solution into two portions: the dropwise addition of 6 N ammonium hydroxide to one portion yields a gelatinous white precipitate, which does not dissolve in an excess of 6 N ammonium hydroxide. The dropwise addition of 1 N sodium hydroxide to the other portion yields a gelatinous white precipitate, which dissolves in an excess of 1 N sodium hydroxide, leaving some turbidity.

**Microbial enumeration tests (61) and Tests for specified microorganisms (62)**—Its total aerobic microbial count does not exceed 100 cfu per mL, and it meets the requirements of the test for absence of *Escherichia coli*.

**Acid-neutralizing capacity (301)**—The acid consumed by the minimum single dose recommended in the labeling is not less than 5 mEq, and not less than the number of mEq calculated by the formula:

$$0.55(0.0385A) + 0.8(0.0343M)$$

in which 0.0385 and 0.0343 are the theoretical acid-neutralizing capacities, in mEq, of  $\text{Al}(\text{OH})_3$  and  $\text{Mg}(\text{OH})_2$ , respectively, and *A* and *M* are the quantities, in mg, of  $\text{Al}(\text{OH})_3$  and  $\text{Mg}(\text{OH})_2$  in the specimen tested, based on the labeled quantities.

**pH (791):** between 7.0 and 8.6.

#### Sodium content—

**Potassium chloride solution**—Prepare a solution of potassium chloride in water containing 38 mg per mL.

**Sodium chloride stock solution**—Dissolve a suitable quantity of sodium chloride, previously dried at 105° for 2 hours and accurately weighed, in water, and dilute quantitatively

and stepwise with water to obtain a solution containing 25.42 µg per mL (10 µg of sodium per mL).

**Standard preparations**—On the day of use, transfer 4.0 mL of 1 N hydrochloric acid and 10.0 mL of *Potassium chloride solution* to each of two 100-mL volumetric flasks. To the respective flasks add 5.0 mL and 10.0 mL of *Sodium chloride stock solution*. Dilute with water to volume, and mix. These solutions contain about 0.5 µg and 1.0 µg of sodium per mL, respectively.

**Test preparation**—Transfer 5.0 mL of Oral Suspension, previously well-shaken in its original container, to a 100-mL volumetric flask, add 50 mL of 1 N hydrochloric acid, boil for 15 minutes, cool to room temperature, dilute with water to volume, and mix. Filter, discarding the first few mL of the filtrate. Transfer 5.0 mL of the filtrate to a 100-mL volumetric flask containing 10.0 mL of *Potassium chloride solution*, dilute with water to volume, and mix.

**Procedure**—Concomitantly determine the absorbances of the *Standard preparations* and the *Test preparation* at the sodium emission line at 589.0 nm with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-scattering* (851)) equipped with a sodium hollow-cathode lamp and an air-acetylene flame, using as a blank a solution prepared by pipeting 4 mL of 1 N hydrochloric acid and 10.0 mL of *Potassium chloride solution* into a 100-mL volumetric flask, diluting with water to volume, and mixing. Plot the absorbances of the *Standard preparations* versus concentrations, in µg per mL, of sodium and draw a straight line between the plotted points. From the graph so obtained, determine the concentration, *C*, in µg per mL, of sodium in the *Test preparation*. Calculate the quantity, in mg, of sodium in each mL of Oral Suspension taken by the formula:

$$0.4C.$$

#### Assay for aluminum hydroxide—

**Eдетate disodium titrant**—Prepare and standardize as directed in the Assay under *Ammonium Alum*.

**Assay preparation**—Transfer an accurately measured volume of Oral Suspension, previously well-shaken in its original container, equivalent to about 800 mg of aluminum hydroxide, to a suitable beaker. Add 20 mL of water, stir, and slowly add 10 mL of hydrochloric acid. Heat gently, if necessary, to aid solution, cool, and filter into a 200-mL volumetric flask. Wash the filter with water into the flask, add water to volume, and mix.

**Procedure**—Pipet 10 mL of the *Assay preparation* into a 250-mL beaker, add 20 mL of water, then add, in the order named and with continuous stirring, 25.0 mL of *Eдетate disodium titrant* and 20 mL of acetic acid-ammonium acetate buffer TS, and heat near the boiling temperature for 5 minutes. Cool, add 50 mL of alcohol and 2 mL of dithizone TS, and mix. Titrate with 0.05 M zinc sulfate VS until the color changes from green-violet to rose-pink. Perform a blank determination, substituting 10 mL of water for the *Assay preparation*, and making any necessary correction. Each mL of 0.05 M *Eдетate disodium titrant* consumed is equivalent to 3.900 mg of  $\text{Al}(\text{OH})_3$ .

#### Assay for magnesium hydroxide—

**Assay preparation**—Prepare as directed in the Assay for aluminum hydroxide.

**Procedure**—Pipet a volume of the *Assay preparation*, equivalent to about 40 mg of magnesium hydroxide, into a 400-mL beaker, add 200 mL of water and 20 mL of triethanolamine, and stir. Add 10 mL of ammonia-ammonium chloride buffer TS and 3 drops of an eriochrome black indicator solution prepared by dissolving 200 mg of eriochrome black T in a mixture of 15 mL of triethanolamine and 5 mL of dehydrated alcohol, and mix. Cool the solution to between 3° and 4° by immersion of the beaker in an ice bath,

then remove, and titrate with 0.05 M edetate disodium VS to a blue endpoint. Perform a blank determination, substituting water for the *Assay preparation*, and make any necessary correction. Each mL of 0.05 M edetate disodium consumed is equivalent to 2.916 mg of  $\text{Mg}(\text{OH})_2$ .

**Assay for polydimethylsiloxane**—Transfer an accurately measured volume of Oral Suspension, equivalent to about 50 mg of simethicone, to a suitable round, narrow-mouth, screw-capped, 120-mL bottle, add 40 mL of 0.1 N sodium hydroxide, and swirl to disperse. Add 25.0 mL of toluene, close the bottle securely with a cap having an inert liner, and shake for 15 minutes, accurately timed, on a reciprocating shaker (e.g., about 200 oscillations per minute and a stroke of  $38 \pm 2$  mm). Transfer the mixture to a 125-mL separator. Remove about 5 mL of the upper, organic layer to a screw-capped, 15-mL test tube containing 0.5 g of anhydrous sodium sulfate. Close the tube with a screw-cap having an inert liner, agitate vigorously, and centrifuge the mixture until a clear supernatant (*Assay preparation*) is obtained. Prepare a *Standard preparation* similarly, except to dissolve about 50 mg of USP Polydimethylsiloxane RS, accurately weighed, in 25.0 mL of toluene, add 40 mL of 0.1 N sodium hydroxide, and add a volume of water equal to that of the specimen of Oral Suspension taken. Prepare a blank by mixing 10 mL of toluene with 0.5 g of anhydrous sodium sulfate and centrifuging to obtain a clear supernatant. Concomitantly determine the absorbances of the solutions in 0.5-mm cells at the wavelength of maximum absorbance at about 7.9 µm, with a suitable IR spectrophotometer, using the blank to set the instrument. Calculate the quantity, in mg, of  $[-(\text{CH}_3)_2\text{SiO}-]_n$  in each mL of the Oral Suspension taken by the formula:

$$(W / V)(A_U / A_S)$$

in which *W* is the weight, in mg, of USP Polydimethylsiloxane RS used in preparing the *Standard preparation*; *V* is the volume, in mL, of Oral Suspension taken; and *A<sub>U</sub>* and *A<sub>S</sub>* are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

## Alumina, Magnesia, and Simethicone Chewable Tablets

*Former Title: Alumina, Magnesia, and Simethicone Tablets*

» Alumina, Magnesia, and Simethicone Chewable Tablets contain the equivalent of not less than 90.0 percent and not more than 115.0 percent of the labeled amounts of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$  and magnesium hydroxide  $[\text{Mg}(\text{OH})_2]$ , and an amount of polydimethylsiloxane  $[-(\text{CH}_3)_2\text{SiO}-]_n$  that is not less than 85.0 percent and not more than 115.0 percent of the labeled amount of simethicone.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—Label the Chewable Tablets to indicate that they are to be chewed before being swallowed. Label the Chewable Tablets to state the sodium content if it is greater than 5 mg per Tablet. The Chewable Tablets may be labeled to state the aluminum hydroxide content in terms of the equivalent amount of dried aluminum hydroxide gel, on the basis that each mg of dried gel is equivalent to 0.765 mg of  $\text{Al}(\text{OH})_3$ .

**USP Reference standards** (11)—  
USP Polydimethylsiloxane RS

**Identification—**

**A:** *Infrared Absorption* (197S)—

**Cell:** 0.5 mm.

**Solution:** prepared as directed in the *Assay for polydimethylsiloxane*.

**B:** To a portion of finely powdered Chewable Tablets, equivalent to about 600 mg of magnesium hydroxide, add 25 mL of 3 N hydrochloric acid and 25 mL of water, and mix. Boil gently for 2 minutes. Allow to cool, and filter. Add 5 drops of methyl red TS, heat to boiling, and add 6 N ammonium hydroxide until the color of the solution just turns to deep yellow. Continue boiling for 2 minutes, and filter: the filtrate so obtained meets the requirements of the tests for *Magnesium* (191).

**C:** Wash the precipitate obtained in *Identification* test B with a hot solution of ammonium chloride (1 in 50), and dissolve the precipitate in hydrochloric acid: the solution so obtained meets the requirements for *Identification* test C under *Alumina, Magnesia, and Simethicone Oral Suspension*.

**Uniformity of dosage units** (905): meet the requirements for *Weight Variation* with respect to aluminum hydroxide and to magnesium hydroxide.

**Acid-neutralizing capacity** (301)—The acid consumed by the minimum single dose recommended in the labeling is not less than 5 mEq, and not less than the number of mEq calculated by the formula:

$$0.55(0.0385A) + 0.8(0.0343M)$$

in which 0.0385 and 0.0343 are the theoretical acid-neutralizing capacities, in mEq, of  $\text{Al}(\text{OH})_3$  and  $\text{Mg}(\text{OH})_2$ , respectively, and *A* and *M* are the quantities, in mg, of  $\text{Al}(\text{OH})_3$  and  $\text{Mg}(\text{OH})_2$  in the specimen tested, based on the labeled quantities.

**Sodium content—**

**Potassium chloride solution, Sodium chloride stock solution, and Standard preparations—**Prepare as directed in the test for *Sodium content* under *Alumina, Magnesia, and Simethicone Oral Suspension*.

**Test preparation—**Weigh and finely powder not fewer than 20 Chewable Tablets. Transfer an accurately weighed portion of the powder, equivalent to the average weight of 1 Chewable Tablet, to a 100-mL volumetric flask. Add 50 mL of 1 N hydrochloric acid, boil for 15 minutes, cool to room temperature, dilute with water to volume, and mix. Filter, discarding the first few mL of the filtrate. Transfer 5.0 mL of the filtrate to a 100-mL volumetric flask containing 10.0 mL of *Potassium chloride solution*, dilute with water to volume, and mix.

**Procedure—**Proceed as directed in the test for *Sodium content* under *Alumina, Magnesia, and Simethicone Oral Suspension*. Calculate the quantity, in mg, of sodium per Chewable Tablet taken by the formula:

$$2C$$

**Assay for aluminum hydroxide—**

**Edetate disodium titrant—**Prepare and standardize as directed in the *Assay* under *Ammonium Alum*.

**Assay preparation—**Weigh and finely powder not fewer than 20 Chewable Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 800 mg of aluminum hydroxide, to a 150-mL beaker, add 20 mL of water, stir, and slowly add 30 mL of 3 N hydrochloric acid. Heat gently, if necessary, to aid solution, cool to room temperature, and filter into a 200-mL volumetric flask. Wash the filter with water into the flask, add water to volume, and mix.

**Procedure—**Proceed as directed for *Procedure* in the *Assay for aluminum hydroxide* under *Alumina, Magnesia, and Simethicone Oral Suspension*.

**Assay for magnesium hydroxide—**

**Assay preparation—**Prepare as directed in the *Assay for aluminum hydroxide*.

**Procedure—**Proceed as directed for *Procedure* in the *Assay for magnesium hydroxide* under *Alumina, Magnesia, and Simethicone Oral Suspension*.

**Assay for polydimethylsiloxane—**Weigh and finely powder not fewer than 20 Chewable Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 33 mg of simethicone, to a suitable round, narrow-mouth, screw-capped, 120-mL bottle, add 40 mL of 0.1 N sodium hydroxide, and swirl to disperse. Add 20.0 mL of toluene, close the bottle securely with a cap having an inert liner, and shake for 30 minutes, accurately timed, on a reciprocating shaker (e.g., about 200 oscillations per minute and a stroke of  $38 \pm 2$  mm). Transfer the mixture to a 125-mL separator, and allow to separate. Remove the upper, organic layer to a screw-capped, centrifuge tube containing about 2 g of anhydrous sodium sulfate. Close the tube with a screw-cap having an inert liner, agitate vigorously, and centrifuge the mixture until a clear supernatant (*Assay preparation*) is obtained. Similarly prepare a *Standard preparation*, using about 33 mg of USP Polydimethylsiloxane RS, accurately weighed. Prepare a blank by mixing 10 mL of toluene with about 1 g of anhydrous sodium sulfate and centrifuging to obtain a clear supernatant. Concomitantly determine the absorbances of the solutions in 0.5-mm cells at the wavelength of maximum absorbance at about  $7.9 \mu\text{m}$  ( $1265.8 \text{ cm}^{-1}$ ), with a suitable IR spectrophotometer, using the blank to set the instrument. Calculate the quantity, in mg, of  $[-(\text{CH}_3)_2\text{SiO}-]_n$  in the portion of Chewable Tablets taken by the formula:

$$(W)(A_U / A_S)$$

in which *W* is the weight, in mg, of USP Polydimethylsiloxane RS used to prepare the *Standard preparation*, and *A<sub>U</sub>* and *A<sub>S</sub>* are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

---

**Alumina and Magnesium Carbonate Oral Suspension**

---

» Alumina and Magnesium Carbonate Oral Suspension contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$  and magnesium carbonate ( $\text{MgCO}_3$ ).

**Packaging and storage—**Preserve in tight containers, and avoid freezing.

**Identification—**

**A:** Place about 1 g in a flask equipped with a stopper and glass tubing, the tip of which is immersed in calcium hydroxide TS in a test tube. Add 5 mL of 3 N hydrochloric acid to the flask, and immediately insert the stopper: gas evolves in the flask and a precipitate is formed in the test tube.

**B:** To a solution of 5 g in 10 mL of 3 N hydrochloric acid add 5 drops of methyl red TS, heat to boiling, add 6 N ammonium hydroxide until the color of the solution changes to deep yellow, then continue boiling for 2 minutes, and filter: the filtrate responds to the tests for *Magnesium* (191).

**C:** Wash the precipitate obtained in *Identification* test B with a hot solution of ammonium chloride (1 in 50), and dissolve the precipitate in hydrochloric acid: the solution responds to the tests for *Aluminum* (191).

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—Its total aerobic microbial count does not exceed 100 cfu per mL, and it meets the requirements of the test for absence of *Escherichia coli*, *Salmonella* species, *Staphylococcus aureus*, and *Pseudomonas aeruginosa*.

**Acid-neutralizing capacity** (301)—Not less than 5 mEq of acid is consumed by the minimum single dose recommended in the labeling, and not less than the number of mEq calculated by the formula:

$$0.55(0.0385A) + 0.8(0.024M)$$

in which 0.0385 and 0.024 are the theoretical acid-neutralizing capacities, in mEq, of  $\text{Al}(\text{OH})_3$  and  $\text{MgCO}_3$ , respectively; and *A* and *M* are the respective quantities, in mg, of  $\text{Al}(\text{OH})_3$  and  $\text{MgCO}_3$  in the specimen tested, based on the labeled quantities.

**pH** (791): between 7.5 and 9.5.

#### **Assay for aluminum hydroxide—**

**Potassium chloride solution**—Prepare a solution containing 4.5 g of potassium chloride in each 100 mL.

**Aluminum stock solution**—Transfer 1.000 g of aluminum wire to a 1000-mL volumetric flask, and add 50 mL of 6 N hydrochloric acid. Swirl to ensure contact of the aluminum and the acid, and allow the reaction to proceed until all of the aluminum has dissolved. Dilute with water to volume, and mix.

**Standard preparations**—To separate 100-mL volumetric flasks, each containing 10 mL of *Potassium chloride solution*, transfer 9.0, 10.0, and 11.0 mL, respectively, of *Aluminum stock solution*, dilute with water to volume, and mix. These *Standard preparations* contain 90.0, 100.0, and 110.0 µg of aluminum per mL, respectively.

**Assay preparation**—Transfer an accurately measured quantity of Oral Suspension, previously shaken in its original container, equivalent to about 75 mg of aluminum hydroxide, to a suitable beaker. Add 25 mL of 6 N hydrochloric acid, and heat on a steam bath for 30 minutes, with occasional swirling. Cool, and transfer with the aid of water to a 250-mL volumetric flask containing 25 mL of *Potassium chloride solution*. Dilute with water to volume, mix, and filter.

**Procedure**—Concomitantly determine the absorbances of the *Standard preparations* and the *Assay preparation* at the aluminum emission line at 309.3 nm, with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* (851)) equipped with an aluminum hollow-cathode lamp and a nitrous oxide–acetylene flame, using water as the blank. Calculate the quantity, in mg, of  $\text{Al}(\text{OH})_3$  in the portion of Oral Suspension taken by the formula:

$$(78.00/26.98)(0.25)(A_U / R_S)$$

in which 78.00 is the molecular weight of aluminum hydroxide; 26.98 is the atomic weight of aluminum; *A<sub>U</sub>* is the absorbance of the *Assay preparation*; and *R<sub>S</sub>* is the average of the ratios of the absorbances of the *Standard preparations* to their respective concentrations, in µg of aluminum per mL.

#### **Assay for magnesium carbonate—**

**Lanthanum chloride solution**—Prepare a solution of lanthanum chloride in water containing 5 mg per mL.

**Magnesium stock solution**—Transfer 1.000 g of magnesium metal to a 1000-mL volumetric flask containing 50 mL of water, and slowly add 10 mL of hydrochloric acid. Dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix.

**Standard preparations**—To separate 100-mL volumetric flasks, each containing 10 mL of *Lanthanum chloride solution*, transfer 1.70 mL and 1.80 mL, respectively, of *Magnesium stock solution*, dilute with water to volume, and mix. These

*Standard preparations* contain 1.7 µg of magnesium per mL and 1.8 µg of magnesium per mL, respectively.

**Assay preparation**—Quantitatively dilute an accurately measured volume of the *Assay preparation* prepared as directed in the *Assay for aluminum hydroxide* with water to obtain a solution having a concentration of about 6 µg of magnesium carbonate per mL.

**Procedure**—Concomitantly determine the absorbances of the *Standard preparations* and the *Assay preparation* at the magnesium emission line at 285.2 nm, with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* (851)) equipped with a magnesium hollow-cathode lamp and an air–acetylene flame, using water as the blank. Calculate the quantity, in mg, of magnesium carbonate ( $\text{MgCO}_3$ ) in the portion of Oral Suspension taken by the formula:

$$(84.31/24.31)(L/D)(A_U / R_S)$$

in which 84.31 is the molecular weight of magnesium carbonate; 24.31 is the atomic weight of magnesium; *L* is the labeled quantity, in mg, of magnesium carbonate in the portion of Oral Suspension taken; *D* is the concentration, in µg of magnesium carbonate per mL, of the *Assay preparation*, based on the labeled amount of magnesium carbonate in the portion of Oral Suspension taken and the extent of dilution; *A<sub>U</sub>* is the absorbance of the *Assay preparation*; and *R<sub>S</sub>* is the average of the ratios of the absorbances of the *Standard preparations* to their respective concentrations, in µg of magnesium per mL.

## **Alumina and Magnesium Carbonate Tablets**

» Alumina and Magnesium Carbonate Tablets contain the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of aluminum hydroxide [ $\text{Al}(\text{OH})_3$ ] and magnesium carbonate ( $\text{MgCO}_3$ ).

**Packaging and storage**—Preserve in tight containers.

#### **Identification—**

**A:** Place about 1 g of finely powdered Tablets in a flask equipped with a stopper and glass tubing, the tip of which is immersed in calcium hydroxide TS in a test tube. Add 5 mL of 3 N hydrochloric acid to the flask, and immediately insert the stopper: gas evolves in the flask and a precipitate is formed in the test tube.

**B:** To a 7-g portion of finely powdered Tablets add 10 mL of 3 N hydrochloric acid and 5 drops of methyl red TS, heat to boiling, and add 6 N ammonium hydroxide until the color of the solution changes to deep yellow. Continue boiling for 2 minutes, and filter: the filtrate responds to the tests for *Magnesium* (191).

**C:** Wash the precipitate obtained in *Identification* test B with a hot solution of ammonium chloride (1 in 50), and dissolve the precipitate in hydrochloric acid: the solution responds to the tests for *Aluminum* (191).

**Disintegration** (701): 10 minutes, simulated gastric fluid TS being substituted for water in the test.

**Uniformity of dosage units** (905): meet the requirements for *Weight Variation* with respect to aluminum hydroxide and to magnesium carbonate.

**Acid-neutralizing capacity** (301)—Not less than 5 mEq of acid is consumed by the minimum single dose recommended in the labeling.

**Assay for aluminum hydroxide—**

*Potassium chloride solution*—Prepare a solution containing 38.1 g of potassium chloride in each 1000 mL.

*Digestion fluid*—Mix 5 mL of hydrochloric acid, 10 mL of nitric acid, and 10 mL of water, and use promptly.

*Aluminum stock solution*—Transfer 1.000 g of aluminum metal to a 1000-mL volumetric flask, and add 50 mL of 6 N hydrochloric acid. Swirl to ensure contact of the aluminum and the acid, and allow the reaction to proceed until all of the aluminum has dissolved. Dilute with water to volume, and mix.

*Standard preparations*—To separate 100-mL volumetric flasks transfer 3.0 mL, 4.0 mL, and 5.0 mL of *Aluminum stock solution*, respectively. To each flask add 10 mL of *Potassium chloride solution* and 7.5 mL of *Digestion fluid*, dilute with water to volume, and mix. These *Standard preparations* contain 30, 40, and 50 µg of aluminum per mL, respectively.

*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 30 mg of aluminum hydroxide, to a 100-mL volumetric flask, add 25-mL of *Digestion fluid*, and heat on a steam bath for 30 minutes or on a hot plate until the volume is reduced by about one-half. Cool, dilute with water to volume, and mix. Filter, discarding the first 20 mL of the filtrate. Transfer 15.0 mL of the filtrate to a 50-mL volumetric flask, add 5.0 mL of *Potassium chloride solution*, dilute with water to volume, and mix.

[NOTE—Reserve a portion of the filtrate for use in the *Assay for magnesium carbonate*.]

*Procedure*—Concomitantly determine the absorbances of the *Standard preparations* and the *Assay preparation* at the aluminum emission line at 309.3 nm, with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-scattering* (851)) equipped with an aluminum hollow-cathode lamp and a nitrous oxide-acetylene flame, using water as the blank. Plot the absorbances of the *Standard preparations* versus concentration, in µg per mL, of aluminum, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration, C, in µg per mL, of aluminum in each mL of the *Assay preparation*. Calculate the quantity, in mg, of aluminum hydroxide [Al(OH)<sub>3</sub>] in the portion of Tablets taken by the formula:

$$(78.00 / 26.98)(C / 3)$$

in which 78.00 is the molecular weight of aluminum hydroxide, and 26.98 is the atomic weight of aluminum.

**Assay for magnesium carbonate—**

*Lanthanum chloride solution*—Transfer 17.6 g of lanthanum chloride to a 1000-mL volumetric flask, add 500 mL of water, and carefully add 50 mL of hydrochloric acid. Mix, and allow to cool. Dilute with water to volume, and mix.

*Digestion fluid*—Mix 5 mL of hydrochloric acid, 10 mL of nitric acid, and 10 mL of water, and use promptly.

*Magnesium stock solution*—Transfer 1.000 g of magnesium metal to a 1000-mL volumetric flask containing 50 mL of water, and slowly add 10 mL of hydrochloric acid. Dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 500-mL volumetric flask, dilute with water to volume, and mix.

*Standard preparations*—To separate 100-mL volumetric flasks transfer 4.0, 6.0, and 8.0 mL of *Magnesium stock solution*, respectively. To each flask add 0.5 mL of *Digestion fluid* and 10 mL of *Lanthanum chloride solution*, dilute with water to volume, and mix. These *Standard preparations* contain 0.40, 0.60, and 0.80 µg of magnesium per mL, respectively.

*Assay preparation*—Transfer an accurately measured volume of the filtrate used to prepare the *Assay preparation* in the *Assay for aluminum hydroxide*, equivalent to about 0.4 mg of magnesium carbonate, to a 200-mL volumetric

flask, add 20 mL of *Lanthanum chloride solution*, dilute with water to volume, and mix.

*Procedure*—Concomitantly determine the absorbances of the *Standard preparations* and the *Assay preparation* at the magnesium emission line at 285.2 nm, with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-scattering* (851)) equipped with a magnesium hollow-cathode lamp and an air-acetylene flame, using water as the blank. Plot the absorbances of the *Standard preparations* versus concentration, in µg per mL, of magnesium, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration, C, in µg per mL, of magnesium in each mL of the *Assay preparation*. Calculate the quantity, in mg, of magnesium carbonate (MgCO<sub>3</sub>) in the portion of Tablets taken by the formula:

$$(84.31 / 24.31)(20C / V)$$

in which 84.31 is the molecular weight of magnesium carbonate; 24.31 is the atomic weight of magnesium; and V is the volume taken, in mL, of the *Assay preparation* prepared as directed in the *Assay for aluminum hydroxide*.

---

**Alumina, Magnesium Carbonate, and Magnesium Oxide Tablets**

---

» Alumina, Magnesium Carbonate, and Magnesium Oxide Tablets contain the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of aluminum hydroxide [Al(OH)<sub>3</sub>] and magnesium carbonate (MgCO<sub>3</sub>), and not less than 85.0 percent and not more than 115.0 percent of the labeled amount of magnesium oxide (MgO).

**Packaging and storage**—Preserve in tight containers.

**Identification—**

**A:** Place about 3 g of finely powdered Tablets in a flask equipped with a stopper and glass tubing, the tip of which is immersed in calcium hydroxide TS in a test tube. Add 5 mL of 3 N hydrochloric acid to the flask, and immediately insert the stopper: gas evolves in the flask and a precipitate is formed in the test tube.

**B:** To the solution in the flask obtained in *Identification* test A add 5 drops of methyl red TS, and heat to boiling. Add 6 N ammonium hydroxide until the color of the solution changes to deep yellow, continue boiling for 2 minutes, and filter through hardened filter paper. (Retain the filtrate for *Identification* test C.) Wash the precipitate with 350 mL of a hot ammonium chloride solution (1 in 50), discarding the washings: the precipitate so obtained, dissolved in 3 N hydrochloric acid, responds to the tests for *Aluminum* (191).

**C:** The filtrate obtained in *Identification* test B responds to the tests for *Magnesium* (191).

**Disintegration** (701): 10 minutes, simulated gastric fluid TS being substituted for water in the test.

**Uniformity of dosage units** (905): meet the requirements for *Weight Variation* with respect to alumina, to magnesium carbonate, and to magnesium oxide.

**Acid-neutralizing capacity** (301)—Not less than 5 mEq of acid is consumed by the minimum single dose recommended in the labeling.

**Assay for aluminum hydroxide—**

*Edetate disodium titrant*—Prepare and standardize as directed in the *Assay* under *Ammonium Alum*.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 1200 mg of aluminum hydroxide, to a 150-mL beaker, add 20 mL of water, stir, and slowly add 30 mL 3 N hydrochloric acid. Heat gently, if necessary, to aid solution, cool, and filter into a 200-mL volumetric flask. Wash the filter with water into the flask, add water to volume, and mix.

**Procedure**—Pipet 10 mL of the *Assay preparation* into a 250-mL beaker, add 20 mL of water, then add, in the order named and with continuous stirring, 25.0 mL of *Edetate disodium titrant* and 20 mL of acetic acid–ammonium acetate buffer TS, and heat near the boiling point for 5 minutes. Cool, add 50 mL of alcohol and 2 mL of dithizone TS, and mix. Titrate with 0.05 M zinc sulfate VS until the color changes from green-violet to rose-pink. Perform a blank determination, substituting 10 mL of water for the *Assay preparation*, and make any necessary correction. Each mL of 0.05 M *Edetate disodium titrant* consumed is equivalent to 3.900 mg of  $\text{Al}(\text{OH})_3$ .

**Assay for magnesium carbonate**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 750 mg of magnesium carbonate, to a 250-mL conical flask fitted with a two-hole stopper. Fill the lower transverse section of a U-shaped drying tube of about 15-mm internal diameter and 15-cm height with loosely packed glass wool. Place in one arm of the tube about 5 g of anhydrous calcium chloride, and accurately weigh the tube and the contents. Into the other arm of the tube place 9.5 g to 10.5 g of soda lime, and again weigh accurately. Insert stoppers in the open arms of the U-tube, and connect the side tube of the arm filled with soda lime to a calcium chloride drying tube, which in turn is connected to one of the holes in the stopper of the 250-mL conical flask. Attach a dropping funnel to the other hole in the stopper of the 250-mL conical flask. Add 100 mL of water and 10 mL of a mixture of hydrochloric acid and nitric acid (4:1) to the 250-mL conical flask through the dropping funnel, and close the dropping funnel. Heat the 250-mL conical flask at 95° for 1 hour, and allow the evolved carbon dioxide to pass through the U-tube. Replace the dropping funnel with a source of carbon dioxide-free air, and pass the carbon dioxide-free air through the apparatus at a rate of about 75 mL per minute for 30 minutes. Disconnect the U-tube, cool to room temperature, remove the stoppers, and weigh. The increase in weight corresponds to the quantity of carbon dioxide evolved. Calculate the quantity, in mg, of magnesium carbonate in each Tablet taken by the formula:

$$(84.31 / 44.01)(I)(W_A / W_P)$$

in which 84.31 and 44.01 are the molecular weights of magnesium carbonate and carbon dioxide, respectively; *I* is the quantity, in mg, of carbon dioxide evolved from the portion of Tablets taken;  $W_A$  is the average weight, in g, of 1 Tablet; and  $W_P$  is the weight, in g, of the portion of Tablets taken.

**Assay for magnesium oxide**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 1000 mg of magnesium carbonate and magnesium oxide combined, to a beaker, add 20 mL of water, and slowly add 40 mL of 3 N hydrochloric acid, with mixing. Heat the mixture to boiling, cool, and filter into a 200-mL volumetric flask. Wash the beaker with water, adding the washings to the filter. Add water to volume, and mix. Transfer 20.0 mL of this solution to a 400-mL beaker, add 180 mL of water and 20 mL of triethanolamine, and stir. Add 10 mL of ammonia–ammonium chloride buffer TS and 3 drops of an eriochrome black indicator solution prepared by dissolving 200 mg of eriochrome black T in a mixture of 15 mL of triethanolamine and 5 mL of dehydrated alcohol, and mix. Cool the solution to between 3° and 4° by immersion of the beaker in an ice

bath, then remove, and titrate with 0.05 M edetate disodium VS to a blue endpoint. Perform a blank determination, substituting 20 mL of water for the assay solution, and make any necessary correction. Each mL of 0.05 M edetate disodium consumed is equivalent to 1.216 mg of Mg. Calculate the quantity, in mg, of magnesium equivalent in each Tablet taken by the formula:

$$10T(W_A / W_P)$$

in which *T* is the magnesium equivalent obtained in the titration;  $W_A$  is the average weight, in g, of 1 Tablet; and  $W_P$  is the weight, in g, of the portion of Tablets taken. Calculate the quantity, in mg, of magnesium oxide in each Tablet taken by the formula:

$$(40.30 / 24.31)(A - 0.2883B)$$

in which 40.30 and 24.31 are the molecular weight of magnesium oxide and the atomic weight of magnesium, respectively; *A* is the quantity, in mg, of magnesium equivalent in each Tablet; and *B* is the quantity, in mg, of magnesium carbonate in each Tablet, as determined in the *Assay for magnesium carbonate*.

## Alumina and Magnesium Trisilicate Oral Suspension

» Alumina and Magnesium Trisilicate Oral Suspension contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of aluminum hydroxide [ $\text{Al}(\text{OH})_3$ ] and magnesium trisilicate ( $\text{Mg}_2\text{Si}_3\text{O}_8$ ).

**Packaging and storage**—Preserve in tight containers.

### Identification—

**A:** To a mixture of 5 mL in 10 mL of 3 N hydrochloric acid add 5 drops of methyl red TS, heat to boiling, add 6 N ammonium hydroxide until the color of the solution changes to deep yellow, then continue boiling for 2 minutes, and filter: the filtrate responds to the tests for *Magnesium* (191).

**B:** Wash the solids on the filter obtained in *Identification* test A with hot ammonium chloride solution (1 in 50), add 10 mL of 3 N hydrochloric acid, and filter: the filtrate responds to the tests for *Aluminum* (191).

**C:** Transfer the filter paper and contents from *Identification* test B to a small platinum dish, ignite, cool in a desiccator, and weigh. Moisten the residue with water and add 6 mL of hydrofluoric acid. Evaporate to dryness, ignite for 5 minutes, cool in a desiccator, and weigh: a loss of more than 10% in relation to the weight of the residue from the initial ignition indicates  $\text{SiO}_2$ .

**Acid-neutralizing capacity** (301)—Not less than 5 mEq of acid is consumed by the minimum single dose recommended in the labeling.

**pH** (791): between 7.5 and 8.5.

### Assay for aluminum hydroxide—

*Edetate disodium titrant*—Prepare and standardize as directed in the *Assay* under *Ammonium Alum*.

**Assay preparation**—Transfer about 10 g of well-shaken Oral Suspension to a tared beaker, and weigh accurately. Add 50 mL of water and 10 mL of hydrochloric acid, and digest on a steam bath for 1 hour. Cool, and filter into a 200-mL volumetric flask, washing the filter with water into the flask. Dilute with water to volume, and mix.

**Procedure**—Pipet 20 mL of *Assay preparation* into a 250-mL beaker, add 20 mL of water, then add, in the order

named and with continuous stirring, 25.0 mL of *Edetate disodium titrant* and 20 mL of acetic acid–ammonium acetate buffer TS, and heat near the boiling point for 5 minutes. Cool, add 50 mL of alcohol and 2 mL of dithizone TS, and mix. Titrate with 0.05 M zinc sulfate VS until the color changes from green-violet to rose-pink. Perform a blank determination, substituting 20 mL of water for the *Assay preparation*, and make any necessary correction. Each mL of 0.05 M *Edetate disodium titrant* consumed is equivalent to 3.900 mg of  $\text{Al}(\text{OH})_3$ .

#### Assay for magnesium trisilicate—

*Assay preparation*—Prepare as directed in the *Assay for aluminum hydroxide*.

*Procedure*—Pipet 20 mL of *Assay preparation* into a 400-mL beaker, add 180 mL of water and 20 mL of triethanolamine, and stir. Add 10 mL of ammonia–ammonium chloride buffer TS and 3 drops of an eriochrome black indicator solution prepared by dissolving 200 mg of eriochrome black T in a mixture of 15 mL of triethanolamine and 5 mL of dehydrated alcohol, and mix. Cool the solution to between 3° and 4° by immersion of the beaker in an ice bath, then remove and titrate with 0.05 M edetate disodium VS to a blue endpoint. Perform a blank determination, substituting 20 mL of water for the *Assay preparation*, and make any necessary correction. Each mL of 0.05 M edetate disodium consumed is equivalent to 6.521 mg of  $\text{Mg}_2\text{Si}_3\text{O}_8$ .

## Alumina and Magnesium Trisilicate Tablets

» Alumina and Magnesium Trisilicate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$  and magnesium trisilicate ( $\text{Mg}_2\text{Si}_3\text{O}_8$ ).

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—Tablets prepared with the use of *Dried Aluminum Hydroxide Gel* may be labeled to state the aluminum hydroxide content in terms of the equivalent amount of dried aluminum hydroxide gel, on the basis that each mg of dried gel is equivalent to 0.765 mg of  $\text{Al}(\text{OH})_3$ . Tablets intended for the temporary relief of heartburn (acid indigestion) due to acid reflux are so labeled. Tablets that must be chewed before swallowing are so labeled.

**Identification**—One powdered Tablet responds to the *Identification* tests under *Alumina and Magnesium Trisilicate Oral Suspension*.

**Disintegration** <701>: 10 minutes, simulated gastric fluid TS being substituted for water in the test. [NOTE—Tablets that must be chewed before swallowing are exempt from this requirement.]

**Uniformity of dosage units** <905>: meet the requirements for *Weight Variation* with respect to aluminum hydroxide and to magnesium trisilicate.

**Acid-neutralizing capacity** <301>—Not less than 5 mEq of acid is consumed by the minimum single dose recommended in the labeling. [NOTE—Tablets labeled for the temporary relief of heartburn (acid indigestion) due to acid reflux are exempt from this requirement.]

**Foam** [where Tablets are labeled for the temporary relief of heartburn (acid indigestion) due to acid reflux]—Finely powder a number of Tablets, accurately counted, equivalent to the minimum single dose recommended in the labeling, and transfer the powder to a 100-mL beaker having an inside diameter of 45 mm. Add 5 mL of alcohol and sufficient water to make 40 mL. Mix at 300 rpm for 60 seconds, using

a magnetic stirrer and a 9.5- × 38-mm polytetrafluoroethylene-coated stirring bar. Stop the stirrer, and carefully add 10 mL of 0.5 N hydrochloric acid down the side of the beaker. Stir for 30 seconds at 300 rpm. Allow to stand for 10 minutes, and measure the thickness of the foam layer above the liquid in the beaker: the thickness of the foam is not less than 10 mm.

**pH** <791> [where Tablets are labeled for the temporary relief of heartburn (acid indigestion) due to acid reflux]: not less than 4.5, determined on the foam layer obtained in the *Foam* test. [NOTE—Take care that the electrodes do not touch the liquid beneath the foam.]

#### Assay for aluminum hydroxide—

*Edetate disodium titrant*—Prepare and standardize as directed in the *Assay under Ammonium Alum*.

*Assay preparation*—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 600 mg of aluminum hydroxide, to a beaker, add 20 mL of water, stir, and slowly add 40 mL of 3 N hydrochloric acid. Heat gently, if necessary, to aid solution, cool, and transfer to a 200-mL volumetric flask. Wash the beaker with water, adding the washings to the flask, add water to volume, and mix.

*Procedure*—Pipet 10 mL of *Assay preparation* into a 250-mL beaker, add 20 mL of water, then add, in the order named and with continuous stirring, 25.0 mL of 0.05 M *Edetate disodium titrant* and 20 mL of acetic acid–ammonium acetate buffer TS, and heat the solution near the boiling temperature for 5 minutes. Cool, add 50 mL of alcohol and 2 mL of dithizone TS, and mix. Titrate with 0.05 M zinc sulfate VS until the color changes from green-violet to rose-pink. Perform a blank determination, substituting 10 mL of water for the *Assay preparation*, and make any necessary correction. Each mL of 0.05 M *Edetate disodium titrant* consumed is equivalent to 3.900 mg of  $\text{Al}(\text{OH})_3$ .

#### Assay for magnesium trisilicate—

*Potassium chloride solution*—Prepare a solution in water containing 5 g of potassium chloride per 100 mL.

*Magnesium standard solution*—Transfer 1.000 g of magnesium metal to a 1000-mL volumetric flask containing 50 mL of water, and slowly add 10 mL of hydrochloric acid. Dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 500-mL volumetric flask, dilute with water to volume, and mix.

*Standard preparations*—Transfer 16.0 mL, 18.0 mL, and 20.0 mL of *Magnesium standard solution* to separate 100-mL volumetric flasks, add 2.0 mL of *Potassium chloride solution* to each flask, dilute with water to volume, and mix. These *Standard preparations* contain 1.6, 1.8, and 2.0 µg of magnesium per mL, respectively. [NOTE—Prepare these solutions on the day of use.]

*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 5 mg of magnesium trisilicate, to a 100-mL volumetric flask, and add 10 mL of 18 N sulfuric acid. Heat on a steam bath for 30 minutes with occasional swirling. Allow to cool, dilute with water to volume, and mix. Filter this solution, discarding the first 20 mL of the filtrate. Transfer 20.0 mL of the filtrate to a second 100-mL volumetric flask, add 2.0 mL of *Potassium chloride solution*, dilute with water to volume, and mix.

*Procedure*—Concomitantly determine the absorbance of the *Standard preparations* and the *Assay preparation* at the magnesium emission line at 285.2 nm, with an atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* (851)), equipped with a magnesium hollow-cathode lamp and a nitrous oxide–acetylene flame, using water as the blank. Plot the absorbances of the *Standard preparations*, in µg per mL, of magnesium, and draw the line best fitting the three plotted points. From the graph so obtained determine the concentration, C, in µg per mL, of magnesium in the *Assay preparation*. Calculate the quantity,

in mg, of magnesium trisilicate ( $\text{Mg}_2\text{Si}_3\text{O}_8$ ) in the portion of Tablets taken by the formula:

$$0.5C(260.86 / 48.62)$$

in which 260.86 is the molecular weight of anhydrous magnesium trisilicate and 48.62 is twice the atomic weight of magnesium.

## Aluminum Acetate Topical Solution

$\text{C}_6\text{H}_9\text{AlO}_6$  204.11

Acetic acid, aluminum salt.

Aluminum acetate [139-12-8].

» Aluminum Acetate Topical Solution yields, from each 100 mL, not less than 1.20 g and not more than 1.45 g of aluminum oxide ( $\text{Al}_2\text{O}_3$ ), and not less than 4.24 g and not more than 5.12 g of acetic acid ( $\text{C}_2\text{H}_4\text{O}_2$ ), corresponding to not less than 4.8 g and not more than 5.8 g of aluminum acetate ( $\text{C}_6\text{H}_9\text{AlO}_6$ ). Aluminum Acetate Topical Solution may be stabilized by the addition of not more than 0.6 percent of Boric Acid.

Aluminum Subacetate Topical Solution . . . . .	545 mL
Glacial Acetic Acid . . . . .	15 mL
Purified Water, a sufficient quantity, to make . . . . .	1000 mL

Add the Glacial Acetic Acid to the Aluminum Subacetate Topical Solution and sufficient water to make 1000 mL. Mix, and filter, if necessary.

NOTE—Dispense only clear Aluminum Acetate Topical Solution.

**Packaging and storage**—Preserve in tight containers.

**Identification**—It responds to the tests for *Aluminum* (191) and for the ferric chloride test for *Acetate* (191) with a deep red color upon the addition of ferric chloride TS. This color is destroyed by the addition of a mineral acid.

**pH** (791): between 3.6 and 4.4.

**Limit of boric acid**—Pipet 25 mL into 75 mL of water in a conical flask. Add 3 mL of phenolphthalein TS, then add 0.5 N sodium hydroxide VS from a buret until a faint pink color is obtained. Heat to boiling, and again neutralize. Add 150 mL of glycerin to the neutralized solution, and titrate with 0.5 N sodium hydroxide VS. Perform a blank determination in a similar manner. From the volume of 0.5 N sodium hydroxide VS used after the addition of the glycerin, subtract the volume used in the blank. Each mL of 0.5 N sodium hydroxide is equivalent to 30.92 mg of  $\text{H}_3\text{BO}_3$ .

**Heavy metals** (231)—Dilute 2 mL of it with water to 25 mL: the limit is 0.001%.

**Assay for aluminum oxide**—

*Edetate disodium titrant*—Prepare and standardize as directed in the Assay under *Ammonium Alum*.

**Procedure**—Pipet 25 mL of Topical Solution into a 250-mL volumetric flask, add 5 mL of hydrochloric acid, dilute with water to volume, and mix. Pipet 25 mL of this solution into a 250-mL beaker, and add, in the order named and with continuous stirring, 25.0 mL of *Edetate disodium titrant* and 20 mL of acetic acid–ammonium acetate buffer TS, then heat the solution near the boiling point for 5 minutes. Cool, and add 50 mL of alcohol and 2 mL of dithizone TS. Titrate the solution with 0.05 M zinc sulfate VS to a bright rose-pink color. Perform a blank determination, substituting water for the sample, and make any necessary correction. Each mL of 0.05 M *Edetate disodium titrant* is equivalent to 2.549 mg of  $\text{Al}_2\text{O}_3$ .

**Assay for acetic acid**—Pipet 20 mL of Topical Solution into a Kjeldahl flask containing a mixture of 20 mL of phosphoric acid and 150 mL of water. Connect the flask to a condenser, the delivery tube from which dips beneath the surface of 50.0 mL of 0.5 N sodium hydroxide VS contained in a receiving flask. Distill about 160 mL, then remove the delivery tube from below the surface of the liquid, allow the distilling flask to cool, add 50 mL of water, and distill an additional 40 to 45 mL into the receiving flask. Add phenolphthalein TS to the distillate, and titrate the excess 0.5 N sodium hydroxide VS with 0.5 N sulfuric acid VS. Each mL of 0.5 N sodium hydroxide is equivalent to 30.03 mg of  $\text{C}_2\text{H}_4\text{O}_2$ .

## Aluminum Chloride

$\text{AlCl}_3 \cdot 6\text{H}_2\text{O}$  241.43

Aluminum chloride, hexahydrate.

Aluminum chloride hexahydrate [7784-13-6].

Anhydrous 133.34 [7446-70-0].

» Aluminum Chloride contains not less than 95.0 percent and not more than 102.0 percent of  $\text{AlCl}_3$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**Identification**—A solution (1 in 10) responds to the tests for *Aluminum* (191) and for *Chloride* (191).

**Water**, *Method I* (921): between 42.0% and 48.0%.

**Sulfate**—The addition of 0.2 mL of barium chloride TS to 10 mL of a solution (1 in 100) produces no turbidity within 1 minute.

**Limit of alkalies and alkaline earths**—To a boiling solution of 1.0 g in 150 mL of water add a few drops of methyl red TS, then add 6 N ammonium hydroxide until the color of the solution just changes to a distinct yellow. Add hot water to restore the volume to 150 mL, and filter while hot. Evaporate 75 mL of the filtrate to dryness, and ignite to constant weight: the weight of the residue does not exceed 2.5 mg (0.5%).

**Heavy metals**, *Method I* (231)—Dissolve 1 g in 1 mL of 1 N acetic acid and sufficient water to make 25 mL: the limit is 0.002%.

**Iron** (241)—Dissolve 1.0 g in 45 mL of water, and add 2 mL of hydrochloric acid: the limit is 0.001%.

**Assay**—

*Edetate disodium titrant*—Prepare and standardize as directed in the Assay under *Ammonium Alum*.

**Procedure**—Transfer to a 250-mL volumetric flask about 5 g of Aluminum Chloride, accurately weighed, dissolve in and dilute with water to volume, and mix. Transfer 10.0 mL of the solution to a 250-mL beaker, and add, in the order named and with continuous stirring, 25.0 mL of *Edetate disodium titrant*, and 20 mL of acetic acid–ammonium acetate buffer TS, and boil gently for 5 minutes. Cool, and add 50 mL of alcohol and 2 mL of dithizone TS. Titrate with 0.05 M zinc sulfate VS to a bright rose-pink color. Perform a

blank determination, substituting 10 mL of water for the assay preparation, and make any necessary correction. Each mL of 0.05 M *Eдетate disodium titrant* is equivalent to 6.667 mg of  $\text{AlCl}_3$ .

## Aluminum Chlorohydrate

$\text{Al}_x(\text{OH})_{3y-z}\text{Cl}_z \cdot \text{H}_2\text{O}$

Aluminum chlorohydroxide.

Aluminum hydroxychloride.

Dihydrate [12042-91-0].

Anhydrous [1327-41-9].

Aluminum chlorohydroxide, dihydrate.

Aluminum hydroxychloride, dihydrate.

Dihydrate 210.48 [12042-91-0].

Anhydrous 174.45 [1327-41-9].

» Aluminum Chlorohydrate consists of complex basic aluminum chloride that is polymeric and loosely hydrated and encompasses a range of aluminum-to-chloride atomic ratios between 1.91:1 and 2.10:1. It contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous aluminum chlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—The label states the content of anhydrous aluminum chlorohydrate.

**Identification**—A solution (1 in 10) responds to the tests for *Aluminum* (191) and for *Chloride* (191).

**pH** (791): between 3.0 and 5.0, in a solution [15 in 100 (w/w)].

**Arsenic**, *Method I* (211): 2 µg per g.

**Heavy metals**, *Method I* (231): 0.002%.

**Limit of iron**—

*Standard preparation*—Transfer 2.0 mL of *Standard Iron Solution*, prepared as directed under *Iron* (241), to a 50-mL beaker.

*Test preparation*—Transfer 2.7 g of Aluminum Chlorohydrate to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 50-mL beaker.

*Procedure*—To each of the beakers containing the *Standard preparation* and the *Test preparation* add 5 mL of 6 N nitric acid, cover with a watch glass, and boil on a hot plate for 3 to 5 minutes. Allow to cool, add 5 mL of *Ammonium Thiocyanate Solution*, prepared as directed under *Iron* (241), transfer to separate 50-mL color comparison tubes, dilute with water to volume, and mix: the color of the solution from the *Test preparation* is not darker than that of the solution from the *Standard preparation* (150 µg per g).

**Content of aluminum**—

*Eдетate disodium titrant*—Prepare and standardize as directed in the *Assay* under *Ammonium Alum*, except to use 37.2 g of edetate disodium instead of 18.6 g.

*Test solution*—Transfer about 200 mg of Aluminum Chlorohydrate, accurately weighed, to a 250-mL beaker, add 20 mL of water and 5 mL of hydrochloric acid, boil on a hot plate for not less than 5 minutes, and allow to cool.

*Procedure*—To the *Test solution* add 25.0 mL of *Eдетate disodium titrant*, and adjust with 2.5 N ammonium hydroxide or 1 N acetic acid to a pH of  $4.7 \pm 0.1$ . Add 20 mL of acetic acid-ammonium acetate buffer TS, 50 mL of alcohol, and 5 mL of dithizone TS. The pH of this solution should be  $4.7 \pm 0.1$ . Titrate with 0.1 M zinc sulfate VS until the color changes from green-violet to rose-pink. Perform a blank ti-

tration, and make any necessary correction. Each mL of 0.1 M *Eдетate disodium titrant* consumed is equivalent to 2.698 mg of aluminum (Al). Use the aluminum content thus obtained to calculate the *Aluminum/chloride atomic ratio*.

**Content of chloride**—Transfer about 700 mg of Aluminum Chlorohydrate, accurately weighed, to a 250-mL beaker, and add 100 mL of water and 10 mL of diluted nitric acid with stirring. Titrate with 0.1 N silver nitrate VS using a glass silver-silver chloride electrode and a silver billet electrode system, determining the endpoint potentiometrically. Each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of chloride (Cl). Use the chloride content thus obtained to calculate the *Aluminum/chloride atomic ratio*.

**Aluminum/chloride atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of chloride found in the test for *Content of chloride*, and multiply by 35.453/26.98, in which 35.453 and 26.98 are the atomic weights of chlorine and aluminum, respectively: the ratio is between 1.91:1 and 2.10:1.

**Assay**—Calculate the percentage of anhydrous aluminum chlorohydrate in the Aluminum Chlorohydrate by the formula:

$$\text{Al} \{ 26.98x + [17.01(3x - 1)] + 35.453 \} / 26.98x$$

in which *Al* is the percentage of aluminum as obtained in the test for *Content of aluminum*, *x* is the aluminum/chloride atomic ratio, 26.98 is the atomic weight of aluminum, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Chlorohydrate Solution

» Aluminum Chlorohydrate Solution consists of complex basic aluminum chloride that is polymeric and encompasses a range of aluminum-to-chloride ratios between 1.91:1 and 2.10:1. The following solvents may be used: water, propylene glycol, dipropylene glycol, or alcohol. It contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled concentration of anhydrous aluminum chlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—Label Solution to state the solvent used and the claimed concentration of anhydrous aluminum chlorohydrate contained therein.

**Identification**—

**A:** A solution containing the equivalent of about 100 mg of anhydrous aluminum chlorohydrate per mL responds to the tests for *Aluminum* (191) and for *Chloride* (191).

**B:** *Identification of propylene glycol* (where stated on the label)—Add about 10 mL of isopropyl alcohol to 2 g of Solution, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath: the IR spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of propylene glycol.

**C:** *Identification of dipropylene glycol* (where stated on the label)—Add about 10 mL of isopropyl alcohol to 2 g of Solution, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath: the IR spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of dipropylene glycol.

**D: Identification of alcohol** (where stated on the label)—In a small beaker mix 5 drops of Solution with 1 mL of potassium permanganate solution (1 in 100) and 5 drops of 2 N sulfuric acid. Immediately cover the beaker with filter paper moistened with a freshly prepared solution of 0.1 g of sodium nitroferrocyanide and 0.25 g of piperazine in 5 mL of water: an intense blue color is produced on the filter paper, the color fading after a few minutes.

**pH** (791): between 3.0 and 5.0, in a solution prepared by diluting 3 g of the solution with water to obtain 10 mL.

**Arsenic, Method I** (211)—Prepare the *Test Preparation* using an accurately weighed quantity of the Solution. The limit is 2 ppm.

**Heavy metals, Method I** (231)—Prepare the *Test Preparation* using an accurately weighed quantity of the Solution. The limit is 0.001%.

#### Limit of iron—

**Standard preparation**—Transfer 2.0 mL of *Standard Iron Solution*, prepared as directed under *Iron* (241), to a 50-mL beaker.

**Test preparation**—Transfer 5.3 g of the Solution to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 50-mL beaker.

**Procedure**—To each of the beakers containing the *Standard preparation* and the *Test preparation* add 5 mL of 6 N nitric acid, cover with a watch glass, and boil on a hot plate for 3 to 5 minutes. Allow to cool, add 5 mL of *Ammonium Thiocyanate Solution*, prepared as directed under *Iron* (241), transfer to separate 50-mL color comparison tubes, dilute with water to volume, and mix: the color of the solution from the *Test preparation* is not darker than that of the solution from the *Standard preparation* (75 µg per g).

#### Content of aluminum—

**Edetate disodium titrant**—Prepare and standardize as directed in the *Assay* under *Ammonium Alum*, except to use 37.2 g of edetate disodium, instead of 18.6 g.

**Test solution**—Transfer about 400 mg of the Solution, accurately weighed, to a 250-mL beaker, add 20 mL of water and 5 mL of hydrochloric acid, and boil on a hot plate for not less than 5 minutes, and allow to cool.

**Procedure**—To the *Test solution* add 25.0 mL of *Edetate disodium titrant*, and adjust with 2.5 N ammonium hydroxide or 1 N acetic acid to a pH of  $4.7 \pm 0.1$ . Add 20 mL of acetic acid-ammonium acetate buffer TS, 50 mL of alcohol, and 5 mL of dithizone TS. The pH of this solution should be  $4.7 \pm 0.1$ . Titrate with 0.1 M zinc sulfate VS until the color changes from green-violet to rose-pink. Perform a blank titration, and make any necessary correction. Each mL of 0.1 M *Edetate disodium titrant* consumed is equivalent to 2.698 mg of aluminum (Al). Calculate the percentage of aluminum (Al) found, and use this value to calculate the *Aluminum/chloride atomic ratio*.

**Content of chloride**—Transfer about 1.4 g of the Solution, accurately weighed, to a 250-mL beaker, and add 100 mL of water and 10 mL of diluted nitric acid with stirring. Titrate with 0.1 N silver nitrate VS using a silver-silver chloride glass electrode and a silver billet electrode system, determining the endpoint potentiometrically. Each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of chloride (Cl). Calculate the percentage of chloride (Cl) found, and use this value to calculate the *Aluminum/chloride atomic ratio*.

**Aluminum/chloride atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of chloride found in the test for *Content of chloride* and multiply by 35.453/26.98, in which 35.453 and 26.98 are the atomic weights of chlorine and aluminum, respectively: the ratio is between 1.91:1 and 2.10:1.

**Assay**—Calculate the percentage of anhydrous aluminum chlorohydrate in the Solution by the formula:

$$Al\{[26.98x + (17.01)(3x-1) + 35.453] / 26.98x\}$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *x* is the aluminum/chloride atomic ratio, 26.98 is the atomic weight of aluminum, 17.01 is the molecular weight of the hydroxide ion (OH), and 35.453 is the atomic weight of chloride (Cl).

## Aluminum Chlorohydrate Polyethylene Glycol

$Al_x(OH)_{3y-z}Cl_z \cdot nH_2O \cdot mH(OCH_2CH_2)_nOH$   
Aluminum chlorohydroxide polyethylene glycol complex.  
Aluminum hydroxychloride polyethylene glycol complex.

» Aluminum Chlorohydrate Polyethylene Glycol consists of aluminum chlorohydrate in which some of the waters of hydration have been replaced by polyethylene glycol. It encompasses a range of aluminum-to-chloride atomic ratios between 1.91:1 and 2.10:1. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous aluminum chlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—The label states the content of anhydrous aluminum chlorohydrate.

#### Identification—

**A:** A solution (1 in 10) responds to the tests for *Aluminum* (191) and for *Chloride* (191).

**B:** *Infrared Absorption* (197F)—

**Test specimen**—Dissolve 0.5 g in about 40 mL of water, and while mixing adjust with 2.5 N sodium hydroxide to a pH of  $9.55 \pm 0.05$ . Filter the suspension of precipitate thus obtained. Evaporate about 15 mL of the filtrate to about 1 mL on a hot plate. Deposit this solution on a silver chloride disk.

**Standard specimen:** a similar preparation of polyethylene glycol.

**pH** (791): between 3.0 and 5.0, in a solution [15 in 100 (w/w)].

**Arsenic, Method I** (211): 2 µg per g.

**Heavy metals, Method I** (231): 20 µg per g.

**Limit of iron**—Using Aluminum Chlorohydrate Polyethylene Glycol instead of Aluminum Chlorohydrate, proceed as directed in the test for *Limit of iron* under *Aluminum Chlorohydrate*. The limit is 150 µg per g.

**Content of aluminum**—Using Aluminum Chlorohydrate Polyethylene Glycol instead of Aluminum Chlorohydrate, proceed as directed in the test for *Content of aluminum* under *Aluminum Chlorohydrate*. Use the result obtained to calculate the *Aluminum/chloride atomic ratio*.

**Content of chloride**—Using Aluminum Chlorohydrate Polyethylene Glycol instead of Aluminum Chlorohydrate, proceed as directed in the test for *Content of chloride* under *Aluminum Chlorohydrate*. Use the result obtained to calculate the *Aluminum/chloride atomic ratio*.

**Aluminum/chloride atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of chloride found in the test for *Content of chloride*, and multiply by 35.453/26.98, in which 35.453

and 26.98 are the atomic weights of chlorine and aluminum, respectively: the ratio is between 1.91:1 and 2.10:1.

**Assay**—Calculate the percentage of anhydrous aluminum chlorohydrate in the Aluminum Chlorohydrate Polyethylene Glycol by the formula:

$$Al\{26.98x + [17.01(3x - 1)] + 35.453\} / 26.98x$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *x* is the aluminum/chloride atomic ratio found in the test for *Aluminum/chloride atomic ratio*, 26.98 is the atomic weight of aluminum, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Chlorohydrate Propylene Glycol

$Al_x(OH)_{3y-z}Cl_z \cdot nH_2O \cdot mC_3H_8O_2$

$Al_2(H_2O)_{y-z}(OH)_{6-n}(Cl)_n(C_3H_8O_2)_z$

Aluminum chlorohydroxide, hydrate: propylene glycol complex (1:1).

Aluminum hydroxychloride, hydrate: propylene glycol complex (1:1) [53026-85-0].

» Aluminum Chlorohydrate Propylene Glycol is a complex of aluminum chlorohydrate and propylene glycol in which some of the waters of hydration of the aluminum chlorohydrate have been replaced by propylene glycol. It contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous aluminum chlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—The label states the content of anhydrous aluminum chlorohydrate.

### Identification—

**A:** A solution (1 in 10) responds to the tests for *Aluminum* (191) and for *Chloride* (191).

**B:** *Infrared Absorption* (197F)—

**Test specimen**—Dissolve 0.5 g in about 40 mL of water, and while mixing adjust with 2.5 N sodium hydroxide to a pH of  $9.55 \pm 0.05$ . Filter the suspension of precipitate thus obtained. Evaporate about 15 mL of the filtrate to about 1 mL on a hot plate. Deposit this solution on a silver chloride disk.

**Standard specimen:** a similar preparation of propylene glycol.

**pH** (791): between 3.0 and 5.0, in a solution [15 in 100 (w/w)].

**Arsenic, Method I** (211): 2 µg per g.

**Heavy metals, Method I** (231): 20 µg per g.

**Limit of iron**—Using Aluminum Chlorohydrate Propylene Glycol instead of Aluminum Chlorohydrate, proceed as directed in the test for *Limit of iron* under *Aluminum Chlorohydrate*. The limit is 150 µg per g.

### Content of aluminum—

**EDETATE DISODIUM TITRANT**—Prepare and standardize as directed in the *Assay* under *Ammonium Alum*, except to use 37.2 g of edetate disodium instead of 18.6 g.

**Test solution**—Transfer about 1.6 g of Aluminum Chlorohydrate Propylene Glycol, accurately weighed, to a 100-mL beaker, add 15 to 20 mL of water and 5 to 6 mL of hydrochloric acid, and boil on a hot plate for 15 to 20 minutes. Cool the solution, and with the aid of water transfer to

a 100-mL volumetric flask. Dilute with water to volume, and mix.

**Procedure**—Transfer 5.0 mL of the *Test solution* to a 250-mL beaker, add 10 to 15 mL of water, and adjust with 1 N sodium hydroxide to a pH of  $1.5 \pm 0.5$ . Add 10.0 mL of *EDETATE DISODIUM TITRANT*, and heat to boiling. Cool the solution and carefully introduce a magnetic stirring bar into the beaker. Add 10 to 15 mL of acetic acid–ammonium acetate buffer TS, 40 to 50 mL of alcohol, and while stirring adjust with glacial acetic acid to a pH of  $4.6 \pm 0.1$ . Add 1 to 2 mL of dithizone TS and 40 to 50 mL of alcohol, and titrate with 0.1 M zinc sulfate VS until the color changes from a green-violet to a rose-pink. Perform a blank titration, and make any necessary correction. Each mL of 0.1 M *EDETATE DISODIUM TITRANT* consumed is equivalent to 2.698 mg of aluminum (Al). Use the aluminum content thus obtained to calculate the *Aluminum/chloride atomic ratio*.

**Content of chloride**—Using Aluminum Chlorohydrate Propylene Glycol instead of Aluminum Chlorohydrate, proceed as directed in the test for *Content of chloride* under *Aluminum Chlorohydrate*. Use the chloride content thus obtained to calculate the *Aluminum/chloride atomic ratio*.

**Aluminum/chloride atomic ratio**—Divide the percentage of aluminum found in the *Assay* by the percentage of chloride found in the test for *Content of chloride*, and multiply by 35.453/26.98, in which 35.453 and 26.98 are the atomic weights of chlorine and aluminum, respectively: the ratio is between 1.91:1 and 2.1:1.

**Assay**—Calculate the percentage of anhydrous aluminum chlorohydrate in the Aluminum Chlorohydrate Propylene Glycol by the formula:

$$Al\{26.98x + [17.01(3x - 1)] + 35.453\} / 26.98x$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *x* is the aluminum/chloride atomic ratio, 26.98 is the atomic weight of aluminum, 17.01 is the molecular weight of the hydroxide ion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Dichlorohydrate

$Al_x(OH)_{3y-z}Cl_z \cdot nH_2O$

Aluminum chlorohydroxide.

Aluminum hydroxychloride.

» Aluminum Dichlorohydrate consists of complex basic aluminum chloride that is polymeric and loosely hydrated and encompasses a range of aluminum-to-chloride atomic ratios between 0.90:1 and 1.25:1. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous aluminum dichlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—The label states the content of anhydrous aluminum dichlorohydrate.

**Identification**—A solution (1 in 10) responds to the tests for *Aluminum* (191) and for *Chloride* (191).

**pH** (791): between 3.0 and 5.0, in a solution [15 in 100 (w/w)].

**Arsenic, Method I** (211): 2 µg per g.

**Heavy metals, Method I** (231): 20 µg per g.

**Limit of iron**—Using Aluminum Dichlorohydrate instead of Aluminum Chlorohydrate, proceed as directed in the test for *Limit of iron* under *Aluminum Chlorohydrate*. The limit is 150 µg per g.

**Content of aluminum**—Using Aluminum Dichlorohydrate instead of Aluminum Chlorohydrate, proceed as directed in the test for *Content of aluminum* under *Aluminum Chlorohydrate*. Use the result obtained to calculate the *Aluminum/chloride atomic ratio*.

**Content of chloride**—Using Aluminum Dichlorohydrate instead of Aluminum Chlorohydrate, proceed as directed in the test for *Content of chloride* under *Aluminum Chlorohydrate*. Use the result obtained to calculate the *Aluminum/chloride atomic ratio*.

**Aluminum/chloride atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of chloride found in the test for *Content of chloride* and multiply by 35.453/26.98, in which 35.453 and 26.98 are the atomic weights of chlorine and aluminum, respectively: the ratio is between 0.90:1 and 1.25:1.

**Assay**—Calculate the percentage of anhydrous aluminum dichlorohydrate in the Aluminum Dichlorohydrate by the formula:

$$Al\{26.98x + [17.01(3x - 1)] + 35.453\} / 26.98x$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *x* is the aluminum/chloride atomic ratio, 26.98 is the atomic weight of aluminum, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Dichlorohydrate Solution

» Aluminum Dichlorohydrate Solution consists of complex basic aluminum chloride that is polymeric and encompasses a range of aluminum-to-chloride atomic ratios between 0.90:1 and 1.25:1. The following solvents may be used: water, propylene glycol, dipropylene glycol, or alcohol. It contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled concentration of anhydrous aluminum dichlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—Label Solution to state the solvent used and the claimed concentration of anhydrous aluminum dichlorohydrate contained therein.

### Identification—

**A:** A solution containing the equivalent of about 100 mg of anhydrous aluminum dichlorohydrate per mL responds to the tests for *Aluminum* (191) and for *Chloride* (191).

**B:** *Infrared Absorption* (197F) (where propylene glycol is indicated on the label)—

*Test specimen*—Add about 10 mL of isopropyl alcohol to 2 g of Solution, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath. Deposit this solution on a silver chloride disk.

*Standard specimen:* a similar preparation of propylene glycol.

**C:** *Infrared Absorption* (197F) (where dipropylene glycol is indicated on the label)—

*Test specimen*—Add about 10 mL of isopropyl alcohol to 2 g of Solution, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath. Deposit this solution on a silver chloride disk.

*Standard specimen:* a similar preparation of dipropylene glycol.

**D:** *Identification of alcohol* (where stated on the label)—Mix 5 drops of Solution in a small beaker with 1 mL of potassium permanganate solution (1 in 100) and 5 drops of 2 N sulfuric acid, and cover the beaker immediately with filter paper moistened with a freshly prepared solution of 0.1 g of sodium nitroferrocyanide and 0.25 g of piperazine in 5 mL of water: an intense blue color is produced on the filter paper, the color becoming paler after a few minutes.

**pH** (791): between 3.0 and 5.0, in a solution prepared by diluting 3 g of the Solution with water to obtain 10 mL.

**Arsenic, Method I** (211)—Prepare the *Test Preparation* using an accurately weighed quantity of the Solution. The limit is 2 µg per g.

**Heavy metals, Method I** (231)—Prepare the *Test Preparation* using an accurately weighed quantity of the Solution. The limit is 10 µg per g.

**Limit of iron**—Using Aluminum Dichlorohydrate Solution instead of Aluminum Chlorohydrate Solution, proceed as directed in the test for the *Limit of iron* under *Aluminum Chlorohydrate Solution*. The limit is 75 µg per g.

**Content of aluminum**—Using Aluminum Dichlorohydrate Solution instead of Aluminum Chlorohydrate Solution, proceed as directed in the test for the *Content of aluminum* under *Aluminum Chlorohydrate Solution*. Use the result to calculate the *Aluminum/chloride atomic ratio*.

**Content of chloride**—Using Aluminum Dichlorohydrate Solution instead of Aluminum Chlorohydrate Solution, proceed as directed in the test for the *Content of chloride* under *Aluminum Chlorohydrate Solution*. Use the result to calculate the *Aluminum/chloride atomic ratio*.

**Aluminum/chloride atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of chloride found in the test for *Content of chloride*, and multiply by 35.453/26.98, in which 35.453 and 26.98 are the atomic weights of chlorine and aluminum respectively: the ratio is between 0.90:1 and 1.25:1.

**Assay**—Calculate the percentage of anhydrous aluminum dichlorohydrate in the Solution by the formula:

$$Al\{26.98x + [17.01(3x - 1)] + 35.453\} / 26.98x$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *x* is the aluminum/chloride atomic ratio found in the test for *aluminum/chloride atomic ratio*, 26.98 is the atomic weight of aluminum, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Dichlorohydrate Polyethylene Glycol

$Al_x(OH)_{3y-z}Cl_z \cdot nH_2O \cdot mH(OCH_2CH_2)_nOH$   
Aluminum chlorohydroxide polyethylene glycol complex.  
Aluminum hydroxychloride polyethylene glycol complex.

» Aluminum Dichlorohydrate Polyethylene Glycol consists of aluminum dichlorohydrate in which some of the waters of hydration have been replaced by polyethylene glycol. It encompasses a range of aluminum-to-chloride atomic ratios between 0.90:1 and 1.25:1. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous aluminum dichlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—The label states the content of anhydrous aluminum dichlorohydrate.

**Identification**—

**A:** A solution (1 in 10) responds to the tests for *Aluminum* (191) and for *Chloride* (191).

**B:** *Infrared Absorption* (197F)—

*Test specimen*—Dissolve 0.5 g in about 40 mL of water, and while mixing adjust with 2.5 N sodium hydroxide to a pH of  $9.55 \pm 0.05$ . Filter the suspension of precipitate thus obtained. Evaporate about 15 mL of the filtrate to about 1 mL on a hot plate. Deposit this solution on a silver chloride disk.

*Standard specimen:* a similar preparation of polyethylene glycol.

**pH** (791): between 3.0 and 5.0, in a solution [15 in 100 (w/w)].

**Arsenic**, *Method I* (211): 2 µg per g.

**Heavy metals**, *Method I* (231): 20 µg per g.

**Limit of iron**—Using Aluminum Dichlorohydrate Propylene Glycol instead of Aluminum Chlorohydrate, proceed as directed in the test for *Limit of iron* under *Aluminum Chlorohydrate*. The limit is 150 µg per g.

**Content of aluminum**—Using Aluminum Dichlorohydrate Propylene Glycol instead of Aluminum Chlorohydrate, proceed as directed in the test for *Content of aluminum* under *Aluminum Chlorohydrate*. Use the result obtained to calculate the *Aluminum/chloride atomic ratio*.

**Content of chloride**—Using Aluminum Dichlorohydrate Propylene Glycol instead of Aluminum Chlorohydrate, proceed as directed in the test for *Content of chloride* under *Aluminum Chlorohydrate*. Use the result obtained to calculate the *Aluminum/chloride atomic ratio*.

**Aluminum/chloride atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of chloride found in the test for *Content of chloride*, and multiply by 35.453/26.98, in which 35.453 and 26.98 are the atomic weights of chlorine and aluminum, respectively: the ratio is between 0.90:1 and 1.25:1.

**Assay**—Calculate the percentage of anhydrous aluminum dichlorohydrate in the Aluminum Dichlorohydrate Propylene Glycol by the formula:

$$Al\{26.98x + [17.01(3x - 1)] + 35.453\} / 26.98x$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *x* is the aluminum-to-chloride atomic ratio, 26.98 is the atomic weight of aluminum, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Dichlorohydrate Propylene Glycol

$Al_3(OH)_{3y-z}Cl_z \cdot nH_2O \cdot mC_3H_8O_2$

Aluminum chlorohydroxide propylene glycol complex.

Aluminum hydroxychloride propylene glycol complex.

» Aluminum Dichlorohydrate Propylene Glycol consists of aluminum dichlorohydrate in which some of the waters of hydration have been replaced by propylene glycol. It encompasses a range of aluminum-to-chloride atomic ratios between 0.90:1 and 1.25:1. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous aluminum dichlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—The label states the content of anhydrous aluminum dichlorohydrate.

**Identification**—

**A:** A solution (1 in 10) responds to the tests for *Aluminum* (191) and for *Chloride* (191).

**B:** Dissolve 0.5 g in about 40 mL of water, and while mixing adjust with 2.5 N sodium hydroxide to a pH of  $9.55 \pm 0.05$ . Filter the suspension of precipitate thus obtained. Evaporate about 15 mL of the filtrate to about 1 mL on a hot plate: the IR absorption spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of propylene glycol.

**pH** (791): between 3.0 and 5.0, in a solution [15 in 100 (w/w)].

**Arsenic**, *Method I* (211): 2 µg per g.

**Heavy metals**, *Method I* (231): 20 µg per g.

**Limit of iron**—Using Aluminum Dichlorohydrate Propylene Glycol instead of Aluminum Chlorohydrate, proceed as directed in the test for *Limit of iron* under *Aluminum Chlorohydrate*. The limit is 150 µg per g.

**Content of aluminum**—Using Aluminum Dichlorohydrate Propylene Glycol instead of Aluminum Chlorohydrate, proceed as directed in the test for *Content of aluminum* under *Aluminum Chlorohydrate*. Use the result obtained to calculate the *Aluminum/chloride atomic ratio*.

**Content of chloride**—Using Aluminum Dichlorohydrate Propylene Glycol instead of Aluminum Chlorohydrate, proceed as directed in the test for *Content of chloride* under *Aluminum Chlorohydrate*. Use the result obtained to calculate the *Aluminum/chloride atomic ratio*.

**Aluminum/chloride atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of chloride found in the test for *Content of chloride*, and multiply by 35.453/26.98, in which 35.453 and 26.98 are the atomic weights of chlorine and aluminum, respectively: the ratio is between 0.90:1 and 1.25:1.

**Assay**—Calculate the percentage of anhydrous aluminum dichlorohydrate in the Aluminum Dichlorohydrate Propylene Glycol by the formula:

$$Al\{26.98x + [17.01(3x - 1)] + 35.453\} / 26.98x$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *x* is the aluminum-to-chloride atomic ratio, 26.98 is the atomic weight of aluminum, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Hydroxide Gel

$Al(OH)_3$  78.00

Aluminum hydroxide.

Aluminum hydroxide [21645-51-2].

» Aluminum Hydroxide Gel is a suspension of amorphous aluminum hydroxide in which there is a partial substitution of carbonate for hydroxide. It contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled amount of aluminum hydroxide  $[Al(OH)_3]$ . It may contain Peppermint Oil, Glycerin, Sorbitol, Sucrose, Saccharin, or other suitable flavors, and it may contain suitable antimicrobial agents.

**Packaging and storage**—Preserve in tight containers, and avoid freezing.

**Identification**—

**A:** Place about 1 g in a flask equipped with a stopper and glass tubing, the tip of which is immersed in calcium hydroxide TS in a test tube. Add 5 mL of 3 N hydrochloric acid to the flask, and immediately insert the stopper: gas evolves in the flask and a precipitate is formed in the test tube.

**B:** The solution remaining in the flask responds to the tests for *Aluminum* (191).

**Microbial enumeration tests (61) and Tests for specified microorganisms (62)**—Its total aerobic microbial count does not exceed 100 cfu per mL, and it meets the requirements of the test for the absence of *Escherichia coli*.

**Acid-neutralizing capacity (301)**—Not less than 65.0% of the expected mEq value, calculated from the results of the *Assay*, is obtained. Each mg of  $\text{Al}(\text{OH})_3$  has an expected acid-neutralizing capacity value of 0.0385 mEq.

**pH (791):** between 5.5 and 8.0, determined potentiometrically.

**Chloride**—Transfer an accurately measured quantity of the Gel, equivalent to 0.6 g of  $\text{Al}(\text{OH})_3$ , to a porcelain dish. Add 0.1 mL of potassium chromate TS and 25 mL of water. Stir, and add 0.10 N silver nitrate until a faint, persistent pink color is obtained: not more than 8.0 mL of 0.10 N silver nitrate is required [4.7%, based on the  $\text{Al}(\text{OH})_3$  content].

**Sulfate (221)**—Add 5.0 mL of 3 N hydrochloric acid to an accurately measured quantity of the Gel, equivalent to 0.3 g of  $\text{Al}(\text{OH})_3$ , and heat to dissolve the specimen under test. Cool, dilute with water to 250 mL, and filter if necessary: a 20-mL portion of the filtrate shows no more sulfate than corresponds to 0.20 mL of 0.020 N sulfuric acid [0.8%, based on the  $\text{Al}(\text{OH})_3$  content].

**Arsenic, Method I (211)**—Prepare a *Standard Preparation* as directed in the test for *Arsenic* (211), except to prepare it to contain 5  $\mu\text{g}$  of arsenic instead of 3  $\mu\text{g}$ . Prepare the *Test Preparation* as follows. Dissolve an accurately measured quantity of the Gel, equivalent to 0.5 g of  $\text{Al}(\text{OH})_3$ , in 20 mL of 7 N sulfuric acid. The limit is 0.001%, based on the  $\text{Al}(\text{OH})_3$  content.

**Heavy metals (231)**—Dissolve an accurately measured quantity of the Gel, equivalent to 0.24 g of  $\text{Al}(\text{OH})_3$ , in 10 mL of 3 N hydrochloric acid with the aid of heat, filter, if necessary, and dilute with water to 25 mL: the limit is 0.0083%, based on the  $\text{Al}(\text{OH})_3$  content.

**Assay**—

*Edetate disodium titrant*—Prepare and standardize as directed in the *Assay* under *Ammonium Alum*.

**Procedure**—Transfer an accurately measured quantity of Gel, equivalent to about 1.5 g of  $\text{Al}(\text{OH})_3$ , to a beaker, add 15 mL of hydrochloric acid, and heat gently until solution is complete. Cool, transfer to a 500-mL volumetric flask, dilute with water to volume, and mix. Pipet 20 mL of this solution into a 250-mL beaker, and add, in the order named and with continuous stirring, 25.0 mL of *Edetate disodium titrant* and 20 mL of acetic acid–ammonium acetate buffer TS, then heat the solution near the boiling point for 5 minutes. Cool, and add 50 mL of alcohol and 2 mL of dithizone TS. Titrate the solution with 0.05 M zinc sulfate VS until the color changes from green-violet to rose-pink. Perform a blank determination, substituting 20 mL of water for the sample, and make any necessary correction. Each mL of 0.05 M *Edetate disodium titrant* consumed is equivalent to 3.900 mg of  $\text{Al}(\text{OH})_3$ .

## Dried Aluminum Hydroxide Gel

$\text{Al}(\text{OH})_3$  78.00

Aluminum hydroxide [21645-51-2].

» Dried Aluminum Hydroxide Gel is an amorphous form of aluminum hydroxide in which there is a partial substitution of carbonate for hydroxide. It contains the equivalent of not less than 76.5 percent of  $\text{Al}(\text{OH})_3$ , and it may contain varying quantities of basic aluminum carbonate and bicarbonate.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Where the quantity of dried aluminum hydroxide gel equivalent is stated in the labeling of any preparation, this shall be understood to be on the basis that each mg of dried gel is equivalent to 0.765 mg of  $\text{Al}(\text{OH})_3$ .

**USP Reference standards (11)**—

USP Dried Aluminum Hydroxide Gel RS

**Identification**—

**A: Infrared Absorption (197K).**

**B:** Dissolve 500 mg in 10 mL of 3 N hydrochloric acid, with gentle warming: the solution responds to the tests for *Aluminum* (191).

**Acid-neutralizing capacity (301):** not less than 25.0 mEq per g, 400 mg being tested as directed for *Powders* under *Test Preparation*.

**pH (791):** not higher than 10.0, in an aqueous dispersion (1 in 25).

**Chloride (221)**—Dissolve 1.0 g in 30 mL of 2 N nitric acid, heat to boiling, add water to make 100 mL, and filter: a 5.0-mL portion of the filtrate, diluted with an equal volume of water, shows no more chloride than corresponds to 0.60 mL of 0.020 N hydrochloric acid (0.85%).

**Sulfate (221)**—Dissolve 330 mg in 15 mL of 3 N hydrochloric acid, heat to boiling, add water to make 250 mL, and filter: a 25-mL portion of the filtrate shows no more sulfate than corresponds to 0.20 mL of 0.020 N sulfuric acid (0.6%).

**Arsenic, Method I (211)**—Dissolve 1.5 g in 80 mL of 7 N sulfuric acid, and dilute with water to 220 mL: 55 mL of the resulting solution meets the requirements of the test, the addition of 20 mL of 7 N sulfuric acid specified under *Procedure* being omitted. The limit is 8 ppm.

**Heavy metals (231)**—Dissolve 330 mg in 10 mL of 3 N hydrochloric acid with the aid of heat, filter if necessary, and dilute with water to 25 mL: the limit is 0.006%.

**Assay**—

*Edetate disodium titrant*—Prepare and standardize as directed in the *Assay* under *Ammonium Alum*.

**Procedure**—Weigh accurately about 2 g of Gel, and dissolve in 15 mL of hydrochloric acid, with the aid of heat. Cool, transfer to a 500-mL volumetric flask, dilute with water to volume, and mix. Pipet 20 mL of this solution into a 250-mL beaker, and add, in the order named and with continuous stirring, 25.0 mL of *Edetate disodium titrant* and 20 mL of acetic acid–ammonium acetate buffer TS, then heat the solution near the boiling point for 5 minutes. Cool, and add 50 mL of alcohol and 2 mL of dithizone TS. Titrate the solution with 0.05 M zinc sulfate VS to a bright rose-pink color. Perform a blank determination, substituting 20 mL of water for the sample solution, and make any necessary correction. Each mL of 0.05 M *Edetate disodium titrant* is equivalent to 3.900 mg of  $\text{Al}(\text{OH})_3$ .

---

## Dried Aluminum Hydroxide Gel Capsules

---

» Dried Aluminum Hydroxide Gel Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$ .

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—The Capsules may be labeled to state the aluminum hydroxide content in terms of the equivalent amount of dried aluminum hydroxide gel, on the basis that each mg of dried gel is equivalent to 0.765 mg of  $\text{Al}(\text{OH})_3$ .

### Identification—

**A:** Place a portion of Capsule contents, equivalent to about 500 mg of aluminum hydroxide, in a flask equipped with a stopper and glass tubing, the tip of which is immersed in calcium hydroxide TS in a test tube. Add 10 mL of 3 N hydrochloric acid to the flask, and immediately insert the stopper: gas evolves in the flask and a precipitate is formed in the test tube.

**B:** The solution remaining in the flask responds to the tests for *Aluminum* (191).

**Disintegration** (701): 10 minutes, simulated gastric fluid TS being substituted for water in the test.

**Uniformity of dosage units** (905): meet the requirements.

**Acid-neutralizing capacity** (301)—Not less than 5 mEq of acid is consumed by the minimum single dose recommended in the labeling, and not less than 55.0% of the expected mEq value, calculated from the labeled quantity of  $\text{Al}(\text{OH})_3$ , is obtained. Each mg of  $\text{Al}(\text{OH})_3$  has an expected acid-neutralizing capacity value of 0.0385 mEq.

### Assay—

*Edetate disodium titrant*—Prepare and standardize as directed in the Assay under *Ammonium Alum*.

*Procedure*—Weigh accurately the contents of not fewer than 20 Capsules, and mix. Transfer an accurately weighed portion of the powder, equivalent to about 1.2 g of aluminum hydroxide, to a beaker, add 15 mL of hydrochloric acid, and heat until dissolved. Dilute with water to about 100 mL, mix, and filter quantitatively into a 500-mL volumetric flask, washing the filter with water. Proceed as directed in the Assay under *Dried Aluminum Hydroxide Gel*, beginning with “dilute with water to volume.” Each mL of 0.05 M *Edetate disodium titrant* is equivalent to 3.900 mg of  $\text{Al}(\text{OH})_3$ .

---

## Dried Aluminum Hydroxide Gel Tablets

---

» Dried Aluminum Hydroxide Gel Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of aluminum hydroxide  $[\text{Al}(\text{OH})_3]$ .

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—Tablets may be labeled to state the aluminum hydroxide content in terms of the equivalent amount of dried aluminum hydroxide gel, on the basis that each mg of dried gel is equivalent to 0.765 mg of  $\text{Al}(\text{OH})_3$ .

### Identification—

**A:** Place a quantity of finely ground Tablets, equivalent to about 500 mg of aluminum hydroxide, in a flask equipped

with a stopper and glass tubing, the tip of which is immersed in calcium hydroxide TS in a test tube. Add 5 mL of 3 N hydrochloric acid to the flask, and immediately insert the stopper: gas evolves in the flask and a precipitate is formed in the test tube.

**B:** The solution remaining in the flask responds to the tests for *Aluminum* (191).

**Disintegration** (701): 10 minutes, simulated gastric fluid TS being substituted for water in the test.

**Uniformity of dosage units** (905): meet the requirements for *Weight Variation*.

**Acid-neutralizing capacity** (301)—Not less than 5 mEq of acid is consumed by the minimum single dose recommended in the labeling, and not less than 55.0% of the expected mEq value, calculated from the labeled quantity of  $\text{Al}(\text{OH})_3$ , is obtained. Each mg of  $\text{Al}(\text{OH})_3$  has an expected acid-neutralizing capacity value of 0.0385 mEq.

### Assay—

*Edetate disodium titrant*—Prepare and standardize as directed in the Assay under *Ammonium Alum*.

*Procedure*—Weigh and finely powder not fewer than 20 Tablets. Weigh accurately a portion of the powder, equivalent to about 1.2 g of aluminum hydroxide, add 15 mL of hydrochloric acid, and heat until dissolved. Dilute with water to about 100 mL, mix, and filter quantitatively into a 500-mL volumetric flask, washing the filter with water. Proceed as directed in the Assay under *Dried Aluminum Hydroxide Gel*, beginning with “dilute with water to volume.” Each mL of 0.05 M *Edetate disodium titrant* is equivalent to 3.900 mg of  $\text{Al}(\text{OH})_3$ .

---

## Aluminum Phosphate Gel

---

Phosphoric acid, aluminum salt (1:1).  
Aluminum phosphate (1:1) [7784-30-7].

» Aluminum Phosphate Gel is a water suspension containing not less than 4.0 percent and not more than 5.0 percent (w/w) of aluminum phosphate ( $\text{AlPO}_4$ ). It may contain sodium benzoate, benzoic acid, or other suitable agent, in an amount not exceeding 0.5 percent, as a preservative.

**Packaging and storage**—Preserve in tight containers.

### Identification—

**A:** A solution of it in hydrochloric acid meets the requirements of the tests for *Aluminum* (191).

**B:** A solution of it in 2 N nitric acid meets the requirements of the tests for *Phosphate* (191).

**pH** (791): between 6.0 and 7.2.

**Soluble phosphate**—Filter 20 g, and wash the residue with 30 mL of water. Add to the filtrate 2 mL of nitric acid, heat to 60°, and add 20 mL of ammonium molybdate TS. Heat at 50° for 30 minutes, filter, wash the precipitate with dilute nitric acid (1 in 36), then wash with potassium nitrate solution (1 in 100) until the last portion of the filtrate is not acid to litmus paper. Dissolve the precipitate in 50.0 mL of 0.5 N sodium hydroxide VS, add phenolphthalein TS, and titrate the excess alkali with 0.5 N hydrochloric acid VS. Each mL of 0.5 N sodium hydroxide is equivalent to 2.065 mg of  $\text{PO}_4$ . The soluble phosphate, calculated as  $\text{PO}_4$ , does not exceed 0.30%.

**Sulfate** (221)—Add 10 mL of 3 N hydrochloric acid to 10 g of Gel, and heat to boiling. Cool, dilute with water to 250 mL, and filter, if necessary. A 10-mL portion of the solution shows no more sulfate than corresponds to 0.20 mL of 0.020 N sulfuric acid: not more than 0.05% is found.

**Arsenic, Method I** (211)—Prepare the *Test Preparation* by dissolving 5.0 g of Gel in the smallest necessary volume of 3 N hydrochloric acid. The limit is 0.6 ppm.

**Heavy metals, Method I** (231)—Proceed as directed in the chapter, except to make the following modifications.

*Standard Preparation*—Into a 50-mL color-comparison tube pipet 4.0 mL of *Standard Lead Solution*, dilute with water to 25 mL, adjust with 6 N ammonium hydroxide to a pH between 1.9 and 2.1, dilute with water to 40 mL, and mix.

*Test Preparation*—Dissolve 8.0 g in 5 mL of 3 N hydrochloric acid, warming if necessary, dilute with water to 25 mL, and adjust with 6 N ammonium hydroxide to a pH between 1.9 and 2.1. Transfer to a 50-mL color-comparison tube, dilute with water to 40 mL, and mix.

*Monitor Preparation*—Into a 50-mL color-comparison tube place 25 mL of the *Test Preparation*, add 4.0 mL of *Standard Lead Solution*, adjust with 1 N acetic acid or 6 N ammonium hydroxide to a pH between 1.9 and 2.1, dilute with water to 40 mL, and mix.

*Procedure*—Proceed as directed in the chapter, except to omit the addition of 2 mL of pH 3.5 Acetate Buffer. Not more than 5 µg per g is found.

**Chloride**—Transfer 25 g to a beaker with the aid of about 50 mL of water, add 5 mL of nitric acid, mix, then add, with stirring, 30.0 mL of 0.1 N silver nitrate VS. Warm on a steam bath for 30 minutes, filter, and wash the precipitate with water acidified with nitric acid. To the filtrate add ferric ammonium sulfate TS, and titrate the excess silver nitrate with 0.1 N ammonium thiocyanate VS. Each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of Cl. Not more than 0.16% of chloride is found.

**Assay**—To about 20 g of Gel, accurately weighed, in a 100-mL volumetric flask, add nitric acid to effect solution, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a 400-mL beaker, dilute with water to 100 mL, heat to 60°, add an excess of ammonium molybdate TS, and maintain at 50° for 30 minutes. Filter, and wash the precipitate with dilute nitric acid (1 in 36), then with potassium nitrate solution (1 in 100) until the last portion of the filtrate is not acid to litmus paper. Dissolve the precipitate in 50.0 mL of 0.5 N sodium hydroxide VS, add phenolphthalein TS, and titrate the excess sodium hydroxide with 0.5 N sulfuric acid VS. Each mL of 0.5 N sodium hydroxide is equivalent to 2.651 mg of  $\text{AlPO}_4$ .

## Aluminum Sesquichlorohydrate

$\text{Al}_2(\text{OH})_3\text{Cl}_2 \cdot n\text{H}_2\text{O}$

Aluminum chlorohydroxide.

Aluminum hydroxychloride [11097-68-0].

» Aluminum Sesquichlorohydrate consists of complex basic aluminum chloride that is polymeric and loosely hydrated and encompasses a range of aluminum-to-chloride atomic ratios between 1.26:1 and 1.90:1. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous aluminum sesquichlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—The label states the content of anhydrous aluminum sesquichlorohydrate.

**Identification**—A solution (1 in 10) responds to the tests for *Aluminum* (191) and for *Chloride* (191).

**pH** (791): between 3.0 and 5.0, in a solution [15 in 100 (w/w)].

**Arsenic, Method I** (211): 2 µg per g.

**Heavy metals, Method I** (231): 20 µg per g.

**Limit of iron**—Using Aluminum Sesquichlorohydrate instead of Aluminum Chlorohydrate, proceed as directed in the test for *Limit of iron* under *Aluminum Chlorohydrate*. The limit is 150 µg per g.

**Content of aluminum**—Using Aluminum Sesquichlorohydrate instead of Aluminum Chlorohydrate, proceed as directed in the test for *Content of aluminum* under *Aluminum Chlorohydrate*. Use the result obtained to calculate the *Aluminum/chloride atomic ratio*.

**Content of chloride**—Using Aluminum Sesquichlorohydrate instead of Aluminum Chlorohydrate, proceed as directed in the test for *Content of chloride* under *Aluminum Chlorohydrate*. Use the result obtained to calculate the *Aluminum/chloride atomic ratio*.

**Aluminum/chloride atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of chloride found in the test for *Content of chloride*, and multiply by 35.453/26.98, in which 35.453 and 26.98 are the atomic weights of chlorine and aluminum, respectively: the ratio is between 1.26:1 and 1.90:1.

**Assay**—Calculate the percentage of anhydrous aluminum sesquichlorohydrate in the Aluminum Sesquichlorohydrate by the formula:

$$Al\{26.98x + [17.01(3x - 1)] + 35.453\} / 26.98x$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *x* is the aluminum/chloride atomic ratio found in the test for *Aluminum/chloride atomic ratio*, 26.98 is the atomic weight of aluminum, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Sesquichlorohydrate Solution

» Aluminum Sesquichlorohydrate Solution consists of complex basic aluminum chloride that is polymeric and encompasses a range of aluminum-to-chloride atomic ratios between 1.26:1 and 1.90:1. The following solvents may be used: water, propylene glycol, dipropylene glycol, or alcohol. It contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled concentration of anhydrous aluminum sesquichlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—Label Solution to state the solvent used and the claimed concentration of anhydrous aluminum sesquichlorohydrate contained therein.

**Identification**—

**A:** A solution containing the equivalent of about 100 mg of anhydrous aluminum sesquichlorohydrate per mL responds to the tests for *Aluminum* (191) and for *Chloride* (191).

**B:** *Identification of propylene glycol* (where stated on the label)—Add about 10 mL of isopropyl alcohol to 2 g of Solution, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath: the IR absorption spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the

same wavelengths as that of a similar preparation of a film of propylene glycol.

**C: Identification of dipropylene glycol** (where stated on the label)—Add about 10 mL of isopropyl alcohol to 2 g of Solution, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath: the IR absorption spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of dipropylene glycol.

**D: Identification of alcohol** (where stated on the label)—Mix 5 drops of Solution in a small beaker with 1 mL of potassium permanganate solution (1 in 100) and 5 drops of 2 N sulfuric acid, and cover the beaker immediately with filter paper moistened with a freshly prepared solution of 0.1 g of sodium nitroferrocyanide and 0.25 g of piperazine in 5 mL of water: an intense blue color is produced on the filter paper, the color becoming paler after a few minutes.

**pH** {791}: between 3.0 and 5.0, in a solution prepared by diluting 3 g of the Solution with water to obtain 10 mL.

**Arsenic, Method I** {211}—Prepare the *Test Preparation* using an accurately weighed quantity of the Solution. The limit is 2 µg per g.

**Heavy metals, Method I** {231}—Prepare the *Test Preparation* using an accurately weighed quantity of the Solution. The limit is 10 µg per g.

**Limit of iron**—Using Aluminum Sesquichlorohydrate Solution instead of Aluminum Chlorohydrate Solution, proceed as directed in the test for the *Limit of iron* under *Aluminum Chlorohydrate Solution*. The limit is 75 µg per g.

**Content of aluminum**—Using Aluminum Sesquichlorohydrate Solution instead of Aluminum Chlorohydrate Solution, proceed as directed in the test for the *Content of aluminum* under *Aluminum Chlorohydrate Solution*. Use the result to calculate the *Aluminum/chloride atomic ratio*.

**Content of chloride**—Using Aluminum Sesquichlorohydrate Solution instead of Aluminum Chlorohydrate Solution, proceed as directed in the test for the *Content of chloride* under *Aluminum Chlorohydrate Solution*. Use the result to calculate the *Aluminum/chloride atomic ratio*.

**Aluminum/chloride atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of chloride found in the test for *Content of chloride*, and multiply by 35.453/26.98, in which 35.453 and 26.98 are the atomic weights of chlorine and aluminum, respectively: the ratio is between 1.26:1 and 1.90:1.

**Assay**—Calculate the percentage of anhydrous aluminum sesquichlorohydrate in the Solution by the formula:

$$Al\{26.98x + [17.01(3x - 1)] + 35.453\} / 26.98x$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *x* is the aluminum/chloride atomic ratio found in the test for *Aluminum/chloride atomic ratio*, 26.98 is the atomic weight of aluminum, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Sesquichlorohydrate Polyethylene Glycol

$Al_2(OH)_3 \cdot xCl_2 \cdot nH_2O \cdot mH(OCH_2CH_2)_nOH$   
Aluminum chlorohydroxide polyethylene glycol complex.  
Aluminum hydroxychloride polyethylene glycol complex.

» Aluminum Sesquichlorohydrate Polyethylene Glycol consists of aluminum sesquichlorohydrate in which some of the waters of hydration have been replaced by polyethylene glycol. It encompasses a range of aluminum-to-chloride atomic

ratios between 1.26:1 and 1.90:1. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous aluminum sesquichlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—The label states the content of anhydrous aluminum sesquichlorohydrate.

### Identification—

**A:** A solution (1 in 10) responds to the tests for *Aluminum* {191} and for *Chloride* {191}.

**B: Infrared Absorption** {197F}—

*Test specimen*—Dissolve 0.5 g in about 40 mL of water, and while mixing adjust with 2.5 N sodium hydroxide to a pH of  $9.55 \pm 0.05$ . Filter the suspension of precipitate thus obtained. Evaporate about 15 mL of the filtrate to about 1 mL on a hot plate. Deposit this solution on a silver chloride disk.

*Standard specimen:* a similar preparation of polyethylene glycol.

**pH** {791}: between 3.0 and 5.0, in a solution [15 in 100 (w/w)].

**Arsenic, Method I** {211}: 2 µg per g.

**Heavy metals, Method I** {231}: 20 µg per g.

**Limit of iron**—Using Aluminum Sesquichlorohydrate Polyethylene Glycol instead of Aluminum Chlorohydrate, proceed as directed in the test for *Limit of iron* under *Aluminum Chlorohydrate*. The limit is 150 µg per g.

**Content of aluminum**—Using Aluminum Sesquichlorohydrate Polyethylene Glycol instead of Aluminum Chlorohydrate, proceed as directed in the test for *Content of aluminum* under *Aluminum Chlorohydrate*. Use the result obtained to calculate the *Aluminum/chloride atomic ratio*.

**Content of chloride**—Using Aluminum Sesquichlorohydrate Polyethylene Glycol instead of Aluminum Chlorohydrate, proceed as directed in the test for *Content of chloride* under *Aluminum Chlorohydrate*. Use the result obtained to calculate the *Aluminum/chloride atomic ratio*.

**Aluminum/chloride atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of chloride found in the test for *Content of chloride*, and multiply by 35.453/26.98, in which 35.453 and 26.98 are the atomic weights of chlorine and aluminum, respectively: the ratio is between 1.26:1 and 1.90:1.

**Assay**—Calculate the percentage of anhydrous aluminum sesquichlorohydrate in the Aluminum Sesquichlorohydrate Polyethylene Glycol by the formula:

$$Al\{26.98x + [17.01(3x - 1)] + 35.453\} / 26.98x$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *x* is the aluminum/chloride atomic ratio found in the test for *Aluminum/chloride atomic ratio*, 26.98 is the atomic weight of aluminum, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Sesquichlorohydrate Propylene Glycol

$Al_2(OH)_3 \cdot xCl_2 \cdot nH_2O \cdot mC_3H_8O_2$   
Aluminum chlorohydroxide propylene glycol complex.  
Aluminum hydroxychloride propylene glycol complex.

» Aluminum Sesquichlorohydrate Propylene Glycol consists of aluminum sesquichlorohydrate in which some of the waters of hydration have

been replaced by propylene glycol. It encompasses a range of aluminum-to-chloride atomic ratios between 1.26:1 and 1.90:1. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous aluminum sesquichlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—The label states the content of anhydrous aluminum sesquichlorohydrate.

**Identification**—

**A:** A solution (1 in 10) responds to the tests for *Aluminum* (191) and for *Chloride* (191).

**B: Infrared Absorption** (197F)—

**Test specimen**—Dissolve 0.5 g in about 40 mL of water, and while mixing adjust with 2.5 N sodium hydroxide to a pH of  $9.55 \pm 0.05$ . Filter the suspension of precipitate thus obtained. Evaporate about 15 mL of the filtrate to about 1 mL on a hot plate. Deposit this solution on a silver chloride disk.

**Standard specimen:** a similar preparation of propylene glycol.

**pH** (791): between 3.0 and 5.0, in a solution [15 in 100 (w/w)].

**Arsenic, Method I** (211):  $2 \mu\text{g}$  per g.

**Heavy metals, Method I** (231):  $20 \mu\text{g}$  per g.

**Limit of iron**—Using Aluminum Sesquichlorohydrate Propylene Glycol instead of Aluminum Chlorohydrate, proceed as directed in the test for *Limit of iron* under *Aluminum Chlorohydrate*. The limit is  $150 \mu\text{g}$  per g.

**Content of aluminum**—Using Aluminum Sesquichlorohydrate Propylene Glycol instead of Aluminum Chlorohydrate, proceed as directed in the test for *Content of aluminum* under *Aluminum Chlorohydrate*. Use the result obtained to calculate the *Aluminum/chloride atomic ratio*.

**Content of chloride**—Using Aluminum Sesquichlorohydrate Propylene Glycol instead of Aluminum Chlorohydrate, proceed as directed in the test for *Content of chloride* under *Aluminum Chlorohydrate*. Use the result obtained to calculate the *Aluminum/chloride atomic ratio*.

**Aluminum/chloride atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of chloride found in the test for *Content of chloride*, and multiply by 35.453/26.98, in which 35.453 and 26.98 are the atomic weights of chlorine and aluminum, respectively: the ratio is between 1.26:1 and 1.90:1.

**Assay**—Calculate the percentage of anhydrous aluminum sesquichlorohydrate in the Aluminum Sesquichlorohydrate Propylene Glycol by the formula:

$$Al\{[26.98x + [17.01(3x - 1)] + 35.453] / 26.98x\}$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *x* is the aluminum/chloride atomic ratio found in the test for *Aluminum/chloride atomic ratio*, 26.98 is the atomic weight of aluminum, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Subacetate Topical Solution

» Aluminum Subacetate Topical Solution yields, from each 100 mL, not less than 2.30 g and not more than 2.60 g of aluminum oxide ( $\text{Al}_2\text{O}_3$ ), and not less than 5.43 g and not more than

6.13 g of acetic acid ( $\text{C}_2\text{H}_4\text{O}_2$ ). It may be stabilized by the addition of not more than 0.9 percent of boric acid.

Aluminum Subacetate Topical Solution may be prepared as follows.

Aluminum Sulfate . . . . .	145 g
Acetic Acid . . . . .	160 mL
Calcium Carbonate . . . . .	70 g
Purified Water, a sufficient quantity, to make . . . . .	1000 mL

Dissolve the Aluminum Sulfate in 600 mL of cold water, filter the solution, and add the Calcium Carbonate gradually, in several portions, with constant stirring. Then slowly add the Acetic Acid, mix, and set the mixture aside for 24 hours. Filter the product with the aid of vacuum if necessary, returning the first portion of the filtrate to the funnel. Wash the magma on the filter with small portions of cold water, until the total filtrate measures 1000 mL.

**Packaging and storage**—Preserve in tight containers.

**Identification**—It responds to the tests for *Aluminum* (191) and for the ferric chloride test for *Acetate* (191) with a deep red color upon the addition of ferric chloride TS. This color is destroyed by the addition of a mineral acid.

**pH** (791): between 3.8 and 4.6.

**Limit of boric acid**—Proceed as directed in the test for *Limit of boric acid* under *Aluminum Acetate Topical Solution*.

**Assay for aluminum oxide**—

**Edetate disodium titrant**—Prepare and standardize as directed in the Assay under *Ammonium Alum*.

**Procedure**—Pipet 20 mL of Topical Solution into a 250-mL volumetric flask, add 5 mL of hydrochloric acid, dilute with water to volume, and mix. Pipet 25 mL of this dilution into a 250-mL beaker, and proceed as directed for *Procedure in the Assay for aluminum oxide* under *Aluminum Acetate Topical Solution*, beginning with “add, in the order named.” Each mL of 0.05 M *Edetate disodium titrant* is equivalent to 2.549 mg of  $\text{Al}_2\text{O}_3$ .

**Assay for acetic acid**—Proceed as directed in the Assay for *acetic acid* under *Aluminum Acetate Topical Solution*.

## Aluminum Sulfate

$\text{Al}_2(\text{SO}_4)_3 \cdot x\text{H}_2\text{O}$ (anhydrous)	342.15
Sulfuric acid, aluminum salt (3:2), hydrate.	
Aluminum sulfate (2:3) hydrate	[17927-65-0].
Anhydrous	342.16 [10043-01-3].

» Aluminum Sulfate contains not less than 54.0 percent and not more than 59.0 percent of  $\text{Al}_2(\text{SO}_4)_3$ . It contains a varying amount of water of crystallization.

**Packaging and storage**—Preserve in well-closed containers.

**Identification**—A solution (1 in 10) responds to the tests for *Aluminum* and for *Sulfate* (191).

**pH** <791>: not less than 2.9, in a solution (1 in 20).

**Water**, Method I <921>: not less than 41.0% and not more than 46.0%.

**Heavy metals** <231>—Dissolve 1.0 g in 2 mL of 1 N acetic acid, and dilute with water to 25 mL. The limit is 20 µg per g.

**Limit of alkalies and alkaline earths**—To a boiling solution of 1.0 g in 150 mL of water add a few drops of methyl red TS and then add 6 N ammonium hydroxide just until the color of the solution changes to a distinct yellow. Add hot water to restore the volume to 150 mL, and filter while hot. Evaporate 75 mL of the filtrate to dryness, and ignite to constant weight: not more than 2 mg of residue remains (0.4%).

**Limit of ammonium salts**—Heat 1 g with 10 mL of 1 N sodium hydroxide on a steam bath for 1 minute: the odor of ammonia is not perceptible.

**Iron**—To 20 mL of a solution (1 in 150) add 0.3 mL of potassium ferrocyanide TS: no blue color is produced immediately.

#### Assay—

*Eдетate disodium titrant*—Prepare and standardize as directed in the Assay under *Ammonium Alum*.

*Procedure*—Transfer about 7.5 g of Aluminum Sulfate, accurately weighed, to a 250-mL volumetric flask, and dissolve in water. Dilute with water to volume, mix, and pipet 10 mL of the solution into a 250-mL beaker. Proceed as directed in the Assay for aluminum oxide under *Aluminum Acetate Topical Solution*, beginning with “add, in the order named.” Each mL of 0.05 M *Eдетate disodium titrant* is equivalent to 8.554 mg of  $\text{Al}_2(\text{SO}_4)_3$ .

### Aluminum Sulfate and Calcium Acetate for Topical Solution

» Aluminum Sulfate and Calcium Acetate for Topical Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of aluminum sulfate tetradecahydrate  $[\text{Al}_2(\text{SO}_4)_3 \cdot 14\text{H}_2\text{O}]$  and calcium acetate monohydrate  $(\text{C}_4\text{H}_6\text{CaO}_4 \cdot \text{H}_2\text{O})$ .

**Packaging and storage**—Preserve in single-unit containers, and protect from excessive heat.

#### Identification—

**A:** Place approximately 0.25 g of Aluminum Sulfate and Calcium Acetate for Topical Solution in a test tube. Add 10 mL of water and 0.25 g of calcium carbonate. Heat on a steam bath for 10 minutes, and filter. Add 3 to 4 drops of ferric chloride TS to the filtrate. A reddish-brown color or precipitate indicates acetate. [NOTE—After the addition of the ferric chloride TS, the solution may be heated for 1 minute to speed the reaction.]

**B:** Suspend 2 g of sample in 50 mL of water, and filter. The filtrate meets the requirements of the tests for *Sulfate* <191> and for *Calcium* <191>.

**pH** <791>: between 4.0 and 4.8 in a solution (1 in 200).

#### Assay for aluminum sulfate—

*Assay preparation*—Transfer 10 g of Aluminum Sulfate and Calcium Acetate for Topical Solution, accurately weighed, to a 1000-mL volumetric flask. Add 100 mL of 1.2 M hydrochloric acid and approximately 250 mL of water. Heat on a steam bath or hot plate until dissolved. Cool, dilute with water to volume, and mix. [NOTE—Retain a portion of this Assay preparation for the Assay for calcium acetate.]

*Procedure*—Transfer a 5.0-mL aliquot of the Assay preparation to a 250-mL conical flask. Add 40.0 mL of 0.01 M

edetate disodium VS and 20 mL of acetic acid–ammonium acetate buffer TS, and mix well. Add 50 mL of alcohol and 2 mL of dithizone TS. [NOTE—Follow the given order of addition.] Titrate with 0.02 M zinc sulfate VS until the color changes from green-violet to clear rose-pink. Perform a blank titration, substituting 5.0 mL of water for the Assay preparation. Each mL of 0.01 M edetate disodium is equivalent to 2.972 mg of aluminum sulfate tetradecahydrate  $[\text{Al}_2(\text{SO}_4)_3 \cdot 14\text{H}_2\text{O}]$ . Calculate the percentage of aluminum sulfate tetradecahydrate  $[\text{Al}_2(\text{SO}_4)_3 \cdot 14\text{H}_2\text{O}]$  by the formula:

$$[(1000)(100)C_F M(V_B - V_U)] / 5.0 M_T W$$

in which 1000/5.0 is the dilution factor; 100 is the conversion factor to percentage;  $C_F$  is the conversion factor (2.972 mg of sample per mL of 0.01 M edetate disodium);  $M$  is the actual molarity of the titrant;  $V_B$  is the blank titration volume, in mL;  $V_U$  is the sample titration volume, in mL;  $M_T$  is the theoretical molarity of the titrant (0.02); and  $W$  is the weight of the sample, in mg.

#### Assay for calcium acetate—

*Procedure*—Transfer a 5.0-mL aliquot of the Assay preparation retained from the Assay for aluminum sulfate to a 250-mL conical flask. Add 1 to 2 mL of 50% triethanolamine to mask the aluminum. Mix well. Add 100 mL of water, 15 mL of 1 N sodium hydroxide, and approximately 300 mg of hydroxy naphthol blue. [NOTE—Follow the given order of addition.] Titrate the solution with 0.01 M edetate disodium VS. The indicator will change from purple to a clear blue color at the endpoint. Each mL of 0.01 M edetate disodium is equivalent to 1.762 mg of calcium acetate monohydrate  $(\text{C}_4\text{H}_6\text{CaO}_4 \cdot \text{H}_2\text{O})$ . Calculate the percentage of calcium acetate monohydrate  $(\text{C}_4\text{H}_6\text{CaO}_4 \cdot \text{H}_2\text{O})$  by the formula:

$$[(1000)(100)V_U C_F M] / 5.0 M_T W$$

in which 1000/5.0 is the dilution factor; 100 is the conversion factor to percentage;  $V_U$  is the sample titration volume, in mL;  $C_F$  is the conversion factor (1.762 mg of sample per mL of 0.01 M edetate disodium);  $M$  is the actual molarity of the titrant;  $M_T$  is the theoretical molarity of the titrant (0.01); and  $W$  is the weight of the sample, in mg.

### Aluminum Sulfate and Calcium Acetate Tablets for Topical Solution

» Aluminum Sulfate and Calcium Acetate Tablets for Topical Solution contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of aluminum sulfate tetradecahydrate  $[\text{Al}_2(\text{SO}_4)_3 \cdot 14\text{H}_2\text{O}]$  and calcium acetate monohydrate  $(\text{C}_4\text{H}_6\text{CaO}_4 \cdot \text{H}_2\text{O})$ .

**Packaging and storage**—Preserve in tight containers, and avoid excessive heat.

#### Identification—

**A:** Suspend 2 g of ground Tablet powder in 50 mL of water, and filter. Mix 2 mL of the filtrate with 2 mL of water and 2 drops of 3 N hydrochloric acid: the solution responds to the ammonium hydroxide test for *Aluminum* <191>. [NOTE—Retain the remaining filtrate for Identification test B.]

**B:** A portion of the filtrate retained from Identification test A responds to the tests for *Sulfate* <191> and for *Calcium* <191>.

**Disintegration** <701>: 10 minutes.

**Uniformity of dosage units** <905>: meet the requirements for *Weight Variation*.

**pH** (791): between 4.0 and 4.8, in a solution (2 g of ground Tablet powder in 500 mL of water).

**Loss on drying** (731)—Dry ground Tablet powder at 150° for 15 minutes: it loses not more than 18% of its weight.

**Assay for aluminum sulfate—**

**Assay preparation**—Finely powder and mix not fewer than 20 Tablets. Weigh accurately a portion of the powder, equivalent to about 2.8 g of aluminum sulfate, and transfer to a 1000-mL volumetric flask. Add 100 mL of 1.2 N hydrochloric acid and 100 mL of water, and heat on a steam bath, with occasional swirling, to dissolve the powder. Allow the solution to cool, dilute with water to volume, and mix. [NOTE—Retain a portion of this Assay preparation for the Assay for calcium acetate.]

**Procedure**—Transfer 25.0 mL of the Assay preparation to a 250-mL conical flask. Add 40.0 mL of 0.01 M edetate disodium VS and 20 mL of acetic acid–ammonium acetate buffer TS, and mix by swirling. Add 50 mL of alcohol and 2 mL of dithizone TS, and titrate with 0.02 M zinc sulfate VS until the color changes from green-violet to a clear rose-pink. Perform a blank determination, substituting 25 mL of water for the Assay preparation, and make any necessary correction. Each mL of 0.01 M edetate disodium is equivalent to 2.972 mg of  $\text{Al}_2(\text{SO}_4)_3 \cdot 14\text{H}_2\text{O}$ .

**Assay for calcium acetate**—Transfer 20.0 mL of the Assay preparation retained from the Assay for aluminum sulfate to a 125-mL conical flask. With constant stirring, add in the order named, about 0.5 mL of triethylamine, 10 mL of ammonia–ammonium chloride buffer TS, and 3 drops of a solution prepared by dissolving 500 mg of eriochrome black T in 10 mL of methanol, and titrate with 0.01 M edetate disodium VS to a violet endpoint. Each mL of 0.01 M edetate disodium is equivalent to 1.762 mg of  $\text{C}_4\text{H}_6\text{CaO}_4 \cdot \text{H}_2\text{O}$ .

## Aluminum Zirconium Octachlorohydrate

$\text{Al}_x\text{Zr}(\text{OH})_{3y+4-x}\text{Cl}_x \cdot n\text{H}_2\text{O}$

» Aluminum Zirconium Octachlorohydrate is a polymeric, loosely hydrated complex of basic aluminum zirconium chloride that encompasses a range of aluminum-to-zirconium atomic ratios between 6.0:1 and 10.0:1, and a range of (aluminum plus zirconium)-to-chloride atomic ratios between 1.5:1 and 0.9:1. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous aluminum zirconium octachlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—The label states the content of anhydrous aluminum zirconium octachlorohydrate.

**Identification**—A solution (1 in 10) responds to the test for Chloride (191).

**pH** (791): between 3.0 and 5.0, in a solution [15 in 100 (w/w)].

**Arsenic, Method I** (211): 2 µg per g.

**Heavy metals, Method I** (231)—Proceed as directed in the chapter, except to use the following modifications.

**Test Preparation**—Prepare as directed in the chapter. If the solution is not clear after dilution to 40 mL, heat for several minutes between 60° and 80°, and cool to room temperature. If the solution remains cloudy, repeat from the beginning with the following modification: add 3 mL of hy-

drochloric acid prior to adjustment of the pH with 6 N ammonium hydroxide.

**Monitor Preparation**—Prepare as directed in the chapter, using the same modifications described for Test Preparation if necessary.

**Procedure**—To each of the three tubes containing the Standard Preparation, the Test Preparation, and the Monitor Preparation, add 2 mL of pH 3.5 Acetate Buffer, and heat gently to between 60° and 80°. To the Standard Preparation add 6 drops of sodium sulfide TS. To the Test Preparation and the Monitor Preparation add 12 drops of sodium sulfide TS. Cool to room temperature, and dilute the contents of each tube with water to 50 mL. Gently mix each tube by inverting twice. Allow to stand for 5 minutes, and view downward over a white surface. The color of the solution from the Test Preparation is not darker than that of the solution from the Standard Preparation, and the color of the solution from the Monitor Preparation is the same as or darker than the color of the solution from the Standard Preparation. If the color of the solution from the Monitor Preparation is lighter than the color of the solution from the Standard Preparation, repeat the procedure with the following modification: after the heating step, to the Monitor Preparation and the Test Preparation add 1.0 mL, instead of 12 drops, of sodium sulfide TS. Not more than 20 µg per g is found.

**Limit of iron—**

**Standard preparation**—Transfer 2.0 mL of Standard Iron Solution, prepared as directed under Iron (241), to a 50-mL beaker.

**Test preparation**—Transfer 2.7 g of Aluminum Zirconium Octachlorohydrate to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 50-mL beaker.

**Procedure**—To each of the beakers containing the Standard preparation and the Test preparation add 5 mL of 6 N nitric acid, cover with a watch glass, and boil on a hot plate for 3 to 5 minutes. Allow to cool, add 5 mL of Ammonium Thiocyanate Solution, prepared as directed under Iron (241), transfer to separate 50-mL color comparison tubes, dilute with water to volume, and mix: the color of the solution from the Test preparation is not darker than that of the solution from the Standard preparation (150 µg per g).

**Content of aluminum**—Transfer about 0.15 g of Aluminum Zirconium Octachlorohydrate, accurately weighed, to a 150-mL beaker, and add 5 mL of water and 15 mL of hydrochloric acid. Heat this solution to boiling, and continue boiling for 5 minutes. Add 40 mL of water and 15.0 mL of 0.1 M edetate disodium VS. Heat the solution to boiling, and continue boiling for 5 minutes. Allow the solution to cool, add 10 to 15 mL of acetic acid–ammonium acetate buffer TS, and adjust with ammonium hydroxide to a pH of  $4.5 \pm 0.1$ . Add 20 mL of alcohol, and adjust with ammonium hydroxide to a pH of  $4.6 \pm 0.1$ . Add 5 to 10 drops of dithizone TS, and titrate with 0.1 M zinc sulfate VS until the first permanent purple-pink color appears. Perform a blank determination, and make any necessary correction. Calculate the percentage of aluminum (Al) in the Aluminum Zirconium Octachlorohydrate by the formula:

$$2.698[15.0 M_e - (z M_z + Z_e)] / W$$

in which  $M_e$  is the molarity of the edetate disodium VS;  $z$  is the volume, in mL, of zinc sulfate VS consumed;  $M_z$  is the molarity of the zinc sulfate VS;  $W$  is the quantity, in g, of Aluminum Zirconium Octachlorohydrate taken;  $Z_e$  is the equivalent volume, in mL, of edetate disodium VS consumed by the zirconium moiety, calculated as follows:

$$(Zr/M_e)(W/92.97)$$

in which  $Zr$  is the percentage of zirconium as determined in the test for Content of zirconium, 92.97 is the atomic weight

of zirconium corrected for 2% hafnium content, and the other terms are as defined above. Use the result obtained to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Content of zirconium**—Transfer about 250 mg of Aluminum Zirconium Octachlorohydrate, accurately weighed, to a 150-mL beaker, and add 5 mL of water and 15 mL of hydrochloric acid. Heat this solution to boiling, and continue boiling for 6 to 8 minutes. Add 30 to 40 mL of water and 5 mL of hydrochloric acid, and heat to boiling. Add 1 drop of xylenol orange TS, and, while still hot, titrate with 0.1 M edetate disodium VS until the color of the solution changes from pink to yellow. Perform a blank determination, and make any necessary correction. Each mL of 0.1 M edetate disodium is equivalent to 9.297 mg of zirconium (Zr). Use the result obtained to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Aluminum/zirconium atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of zirconium found in the test for *Content of zirconium*, and multiply by 92.97/26.98, in which 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, and 26.98 is the atomic weight of aluminum: the ratio is between 6.0:1 and 10.0:1.

**Content of chloride**—Transfer about 250 mg of Aluminum Zirconium Octachlorohydrate, accurately weighed, to a 250-mL beaker, add 100 to 120 mL of water and 20 mL of diluted nitric acid, and swirl to dissolve. Titrate with 0.05 N silver nitrate VS using a calomel electrode and a silver billet electrode system, determining the endpoint potentiometrically. Each mL of 0.05 N silver nitrate is equivalent to 1.773 mg of chloride (Cl). Use the result obtained to calculate the *(Aluminum plus zirconium)/chloride atomic ratio*.

**(Aluminum plus zirconium)/chloride atomic ratio**—Calculate the (aluminum plus zirconium)/chloride atomic ratio by the formula:

$$[(Al/26.98) + (Zr/92.97)] / (Cl/35.453)$$

in which *Al*, *Zr*, and *Cl* are the percentages of aluminum, zirconium, and chloride as determined in the tests for *Content of aluminum*, *Content of zirconium*, and *Content of chloride*, respectively; 26.98 is the atomic weight of aluminum; 92.97 is the atomic weight of zirconium corrected for 2% hafnium content; and 35.453 is the atomic weight of chlorine: the ratio is between 1.5:1 and 0.9:1.

**Assay**—Calculate the percentage of anhydrous aluminum zirconium octachlorohydrate in the Aluminum Zirconium Octachlorohydrate by the formula:

$$Al\{26.98y + 92.97 + 17.01[3y + 4 - (y + 1)/z] + 35.453(y + 1) / z\} / 26.98y$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *y* is the aluminum/zirconium atomic ratio found in the test for *Aluminum/zirconium atomic ratio*, *z* is the (aluminum plus zirconium)/chloride atomic ratio found in the test for *(Aluminum plus zirconium)/chloride atomic ratio*, 26.98 is the atomic weight of aluminum, 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Zirconium Octachlorohydrate Solution

» Aluminum Zirconium Octachlorohydrate Solution consists of complex basic aluminum chloride

that is polymeric and encompasses a range of aluminum-to-zirconium atomic ratios between 6.0:1 and 10.0:1, and a range of (aluminum plus zirconium)-to-chloride atomic ratios between 1.5:1 and 0.9:1. The following solvents may be used: water, propylene glycol, or dipropylene glycol. It contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled concentration of anhydrous aluminum zirconium octachlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—Label Solution to state the solvent used and the claimed concentration of anhydrous aluminum zirconium octachlorohydrate.

### Identification—

**A:** A solution containing the equivalent of about 100 mg of anhydrous aluminum zirconium octachlorohydrate per mL responds to the test for *Chloride* (191).

**B:** *Identification of propylene glycol* (where stated on the label)—Add about 10 mL of isopropyl alcohol to 2 g of Solution, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath: the IR absorption spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of propylene glycol.

**C:** *Identification of dipropylene glycol* (where stated on the label)—Add about 10 mL of isopropyl alcohol to 2 g of Solution, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath: the IR absorption spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of dipropylene glycol.

**pH** (791): between 3.0 and 5.0, in a solution prepared by diluting 3 g of the Solution with water to obtain 10 mL.

**Arsenic, Method I** (211): Prepare the *Test Preparation* using an accurately weighed quantity of the Solution. The limit is 2 µg per g.

**Heavy metals, Method I** (231)—Proceed as directed in the chapter, except to use the following modifications.

**Test Preparation**—Prepare as directed in the chapter, using an accurately weighed quantity of Solution. If the solution is not clear after dilution to 40 mL, heat for several minutes between 60° and 80°, and cool to room temperature. If the solution remains cloudy, repeat from the beginning with the following modification: add 3 mL of hydrochloric acid prior to adjustment of the pH with 6 N ammonium hydroxide.

**Monitor Preparation**—Prepare as directed in the chapter, using the same modifications described for *Test Preparation* if necessary.

**Procedure**—To each of the three tubes containing the *Standard Preparation*, the *Test Preparation*, and the *Monitor Preparation*, add 2 mL of pH 3.5 Acetate Buffer, and heat gently to between 60° and 80°. To the *Standard Preparation* add 6 drops of sodium sulfide TS. To the *Test Preparation* and the *Monitor Preparation* add 12 drops of sodium sulfide TS. Cool to room temperature, and dilute the contents of each tube with water to 50 mL. Gently mix each tube by inverting twice. Allow to stand for 5 minutes, and view downward over a white surface. The color of the solution from the *Test Preparation* is not darker than that of the solution from the *Standard Preparation*, and the color of the solution from the *Monitor Preparation* is the same as or darker than the color of the solution from the *Standard Preparation*. If the color of the solution from the *Monitor Preparation* is lighter than the color of the solution from the *Standard Preparation*, repeat the procedure with the following modification: after the heating step, to the *Monitor Prep-*

aration and the *Test Preparation* add 1.0 mL, instead of 12 drops, of sodium sulfide TS. Not more than 10 µg per g is found.

**Limit of iron**—Using Aluminum Zirconium Octachlorohydrate Solution instead of Aluminum Chlorohydrate Solution, proceed as directed in the test for the *Limit of iron* under *Aluminum Chlorohydrate Solution*. The limit is 75 µg per g.

**Content of aluminum**—Using about 0.3 g of Aluminum Zirconium Octachlorohydrate Solution, accurately weighed, instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of aluminum* under *Aluminum Zirconium Octachlorohydrate*. Use the result to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Content of zirconium**—Using about 500 mg of Aluminum Zirconium Octachlorohydrate Solution, accurately weighed, instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of zirconium* under *Aluminum Zirconium Octachlorohydrate*. Use the result to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Aluminum/zirconium atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of zirconium found in the test for *Content of zirconium*, and multiply by 92.97/26.98, in which 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, and 26.98 is the atomic weight of aluminum: the ratio is between 6.0:1 and 10.0:1.

**Content of chloride**—Using about 500 mg of Aluminum Zirconium Octachlorohydrate Solution, accurately weighed, instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of chloride* under *Aluminum Zirconium Octachlorohydrate*. Use the result to calculate the *(Aluminum plus zirconium)/chloride atomic ratio*.

**(Aluminum plus zirconium)/chloride atomic ratio**—Calculate the (aluminum plus zirconium)/chloride atomic ratio by the formula:

$$[(Al/26.98) + (Zr/92.97)]/(Cl/35.453)$$

in which *Al*, *Zr*, and *Cl* are the percentages of aluminum, zirconium, and chloride as determined in the tests for *Content of aluminum*, *Content of zirconium*, and *Content of chloride*, respectively; 26.98 is the atomic weight of aluminum; 92.97 is the atomic weight of zirconium corrected for 2% hafnium content; and 35.453 is the atomic weight of chlorine: the ratio is between 1.5:1 and 0.9:1.

**Assay**—Calculate the percentage of anhydrous aluminum zirconium octachlorohydrate in the Solution by the formula:

$$Al\{26.98y + 92.97 + 17.01[3y + 4 - (y + 1)/z] + 35.453(y + 1)/z\}/26.98y$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *y* is the aluminum/zirconium atomic ratio found in the test for *Aluminum/zirconium atomic ratio*, *z* is the (aluminum plus zirconium)/chloride atomic ratio found in the test for *(Aluminum plus zirconium)/chloride atomic ratio*, 26.98 is the atomic weight of aluminum, 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Zirconium Octachlorohydrate Gly

» Aluminum Zirconium Octachlorohydrate Gly is a derivative of Aluminum Zirconium Octachlorohydrate in which some of the water molecules have

been displaced by glycine, calcium glycinate, magnesium glycinate, potassium glycinate, sodium glycinate, or zinc glycinate. It encompasses a range of aluminum-to-zirconium atomic ratios between 6.0:1 and 10.0:1, and a range of (aluminum plus zirconium)-to-chloride atomic ratios between 1.5:1 and 0.9:1. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous aluminum zirconium octachlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—The label states the form of glycine used and the claimed content of anhydrous aluminum zirconium octachlorohydrate.

### Identification—

**A:** A solution (1 in 10) responds to the test for *Chloride* (191).

**B:** Place about 0.5 g of it in a 50-mL beaker, add about 20 mL of water, and swirl to dissolve. Heat to boiling on a hot plate, and add about 60 mg of ninhydrin: a deep violet color immediately develops.

**pH** (791): between 3.0 and 5.0, in a solution [15 in 100 (w/w)].

**Arsenic, Method I** (211): 2 µg per g.

**Heavy metals, Method I** (231)—Proceed as directed in the chapter, except to use the following modifications.

**Test Preparation**—Prepare as directed in the chapter. If the solution is not clear after dilution to 40 mL, heat for several minutes between 60° and 80°, and cool to room temperature. If the solution remains cloudy, repeat from the beginning with the following modification: add 3 mL of hydrochloric acid prior to adjustment of the pH with 6 N ammonium hydroxide.

**Monitor Preparation**—Prepare as directed in the chapter, using the same modifications described for *Test Preparation* if necessary.

**Procedure**—To each of the three tubes containing the *Standard Preparation*, the *Test Preparation*, and the *Monitor Preparation*, add 2 mL of pH 3.5 Acetate Buffer, and heat gently to between 60° and 80°. To the *Standard Preparation* add 6 drops of sodium sulfide TS. To the *Test Preparation* and the *Monitor Preparation* add 12 drops of sodium sulfide TS. Cool to room temperature, and dilute the contents of each tube with water to 50 mL. Gently mix each tube by inverting twice. Allow to stand for 5 minutes, and view downward over a white surface. The color of the solution from the *Test Preparation* is not darker than that of the solution from the *Standard Preparation*, and the color of the solution from the *Monitor Preparation* is the same as or darker than the color of the solution from the *Standard Preparation*. If the color of the solution from the *Monitor Preparation* is lighter than the color of the solution from the *Standard Preparation*, repeat the procedure with the following modification: after the heating step, to the *Monitor Preparation* and the *Test Preparation* add 1.0 mL, instead of 12 drops, of sodium sulfide TS. Not more than 20 µg per g is found.

**Limit of iron**—Using Aluminum Zirconium Octachlorohydrate Gly instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Limit of iron* under *Aluminum Zirconium Octachlorohydrate*. The specified result is obtained (150 µg per g limit).

**Content of aluminum**—Using Aluminum Zirconium Octachlorohydrate Gly instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of aluminum* under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the *Aluminum/zirconium*

atomic ratio and the (Aluminum plus zirconium)/chloride atomic ratio.

**Content of zirconium**—Using Aluminum Zirconium Octachlorohydrate Gly instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of zirconium* under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the (Aluminum/zirconium atomic ratio and the (Aluminum plus zirconium)/chloride atomic ratio.

**Aluminum/zirconium atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of zirconium found in the test for *Content of zirconium*, and multiply by 92.97/26.98, in which 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, and 26.98 is the atomic weight of aluminum: the ratio is between 6.0:1 and 10.0:1.

**Content of chloride**—Using Aluminum Zirconium Octachlorohydrate Gly instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of chloride* under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the (Aluminum plus zirconium)/chloride atomic ratio.

**(Aluminum plus zirconium)/chloride atomic ratio**—Calculate the (aluminum plus zirconium)/chloride atomic ratio by the formula:

$$[(Al/26.98) + (Zr/92.97)]/(Cl/35.453)$$

in which *Al*, *Zr*, and *Cl* are the percentages of aluminum, zirconium, and chloride as determined in the tests for *Content of aluminum*, *Content of zirconium*, and *Content of chloride*, respectively; 26.98 is the atomic weight of aluminum; 92.97 is the atomic weight of zirconium corrected for 2% hafnium content; and 35.453 is the atomic weight of chlorine: the ratio is between 1.5:1 and 0.9:1.

**Assay**—Calculate the percentage of anhydrous aluminum zirconium octachlorohydrate in the Aluminum Zirconium Octachlorohydrate Gly by the formula:

$$Al\{26.98y + 92.97 + 17.01[3y + 4 - (y + 1)/z] + 35.453(y + 1)/z\}/26.98y$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *y* is the aluminum/zirconium atomic ratio found in the test for *Aluminum/zirconium atomic ratio*, *z* is the (aluminum plus zirconium)/chloride atomic ratio found in the test for (Aluminum plus zirconium)/chloride atomic ratio, 26.98 is the atomic weight of aluminum, 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Zirconium Octachlorohydrate Gly Solution

» Aluminum Zirconium Octachlorohydrate Gly Solution is a solution of Aluminum Zirconium Octachlorohydrate in which some of the waters of hydration have been displaced by glycine, calcium glycinate, magnesium glycinate, potassium glycinate, sodium glycinate, or zinc glycinate. It encompasses a range of aluminum-to-zirconium ratios between 6.0:1 and 10.0:1, and a range of (aluminum plus zirconium)-to-chloride atomic ratios between 1.5:1 and 0.9:1. The following solvents may be used: water, propylene glycol, or dipropylene glycol. It contains the equivalent of

not less than 90.0 percent and not more than 110.0 percent of the labeled concentration of anhydrous aluminum zirconium octachlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—Label Solution to state the solvent and form of glycine used and the claimed concentration of anhydrous aluminum zirconium octachlorohydrate.

### Identification—

**A:** A solution containing the equivalent of about 100 mg of anhydrous aluminum zirconium octachlorohydrate per mL responds to the test for *Chloride* (191).

**B:** *Identification of propylene glycol* (where stated on the label)—Add about 10 mL of isopropyl alcohol to 2 g of Solution, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath: the IR absorption spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of propylene glycol.

**C:** *Identification of dipropylene glycol* (where stated on the label)—Add about 10 mL of isopropyl alcohol to 2 g of Solution, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath: the IR absorption spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of dipropylene glycol.

**D:** *Identification of glycine*—Place about 1 g of Solution in a 50-mL beaker, add about 20 mL of water, and swirl to dissolve. Heat to boiling on a hot plate, and add about 60 mg of ninhydrin: a deep violet color immediately develops.

**pH** (791): between 3.0 and 5.0, in a solution prepared by diluting 3 g of the Solution with water to obtain 10 mL.

**Arsenic, Method I** (211)—Prepare the *Test Preparation* using an accurately weighed quantity of the Solution. The limit is 2 µg per g.

**Heavy metals, Method I** (231)—Proceed as directed in the chapter, except to use the following modifications.

**Test Preparation**—Prepare as directed in the chapter, using an accurately weighed quantity of Solution. If the solution is not clear after dilution to 40 mL, heat for several minutes between 60° and 80°, and cool to room temperature. If the solution remains cloudy, repeat from the beginning with the following modification: add 3 mL of hydrochloric acid prior to adjustment of the pH with 6 N ammonium hydroxide.

**Monitor Preparation**—Prepare as directed in the chapter, using the same modifications described for *Test Preparation* if necessary.

**Procedure**—To each of the three tubes containing the *Standard Preparation*, the *Test Preparation*, and the *Monitor Preparation*, add 2 mL of pH 3.5 Acetate Buffer, and heat gently to between 60° and 80°. To the *Standard Preparation* add 6 drops of sodium sulfide TS. To the *Test Preparation* and the *Monitor Preparation* add 12 drops of sodium sulfide TS. Cool to room temperature, and dilute the contents of each tube with water to 50 mL. Gently mix each tube by inverting twice. Allow to stand for 5 minutes, and view downward over a white surface. The color of the solution from the *Test Preparation* is not darker than that of the solution from the *Standard Preparation*, and the color of the solution from the *Monitor Preparation* is the same as or darker than the color of the solution from the *Standard Preparation*. If the color of the solution from the *Monitor Preparation* is lighter than the color of the solution from the *Standard Preparation*, repeat the procedure with the following modification: after the heating step, to the *Monitor Preparation* and the *Test Preparation* add 1.0 mL, instead of 12 drops, of sodium sulfide TS. Not more than 10 µg per g is found.

**Limit of iron**—Using about 5.4 g of Aluminum Zirconium Octachlorohydrate Gly Solution, accurately weighed, instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Limit of iron* under *Aluminum Zirconium Octachlorohydrate*. The limit is 75 µg per g.

**Content of aluminum**—Using about 0.3 g of Aluminum Zirconium Octachlorohydrate Gly Solution instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of aluminum* under *Aluminum Zirconium Octachlorohydrate*. Use the result to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Content of zirconium**—Using about 500 mg of Aluminum Zirconium Octachlorohydrate Gly Solution, accurately weighed, instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of zirconium* under *Aluminum Zirconium Octachlorohydrate*. Use the result to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Aluminum/zirconium atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of zirconium found in the test for *Content of zirconium*, and multiply by 92.97/26.98, in which 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, and 26.98 is the atomic weight of aluminum: the ratio is between 6.0:1 and 10.0:1.

**Content of chloride**—Using about 500 mg of Aluminum Zirconium Octachlorohydrate Gly Solution, accurately weighed, instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of chloride* under *Aluminum Zirconium Octachlorohydrate*. Use the result to calculate the *(Aluminum plus zirconium)/chloride atomic ratio*.

**(Aluminum plus zirconium)/chloride atomic ratio**—Calculate the (aluminum plus zirconium)/chloride atomic ratio by the formula:

$$[(Al/26.98) + (Zr/92.97)]/(Cl/35.453)$$

in which *Al*, *Zr*, and *Cl* are the percentages of aluminum, zirconium, and chloride found in the tests for *Content of aluminum*, *Content of zirconium*, and *Content of chloride*, respectively; 26.98 is the atomic weight of aluminum; 92.97 is the atomic weight of zirconium corrected for 2% hafnium content; and 35.453 is the atomic weight of chlorine: the ratio is between 1.5:1 and 0.9:1.

**Assay**—Calculate the percentage of anhydrous aluminum zirconium octachlorohydrate in the Solution by the formula:

$$Al\{26.98y + 92.97 + 17.01[3y + 4 - (y + 1)/z] + 35.453(y + 1)/z\}/26.98y$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *y* is the aluminum/zirconium atomic ratio found in the test for *Aluminum/zirconium atomic ratio*, *z* is the (aluminum plus zirconium)/chloride atomic ratio found in the test for *(Aluminum plus zirconium)/chloride atomic ratio*, 26.98 is the atomic weight of aluminum, 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Zirconium Pentachlorohydrate

$Al_3Zr(OH)_{3y+4-x}Cl_x \cdot nH_2O$

» Aluminum Zirconium Pentachlorohydrate is a polymeric, loosely hydrated complex of basic aluminum zirconium chloride that encompasses a

range of aluminum-to-zirconium atomic ratios between 6.0:1 and 10.0:1, and a range of (aluminum plus zirconium)-to-chloride atomic ratios between 2.1:1 and 1.51:1. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous aluminum zirconium pentachlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—The label states the content of anhydrous aluminum zirconium pentachlorohydrate.

**Identification**—A solution (1 in 10) responds to the test for *Chloride* (191).

**pH** (791): between 3.0 and 5.0, in a solution [15 in 100 (w/w)].

**Arsenic, Method I** (211): 2 µg per g.

**Heavy metals, Method I** (231)—Proceed as directed in the chapter, except to use the following modifications.

**Test Preparation**—Prepare as directed in the chapter. If the solution is not clear after dilution to 40 mL, heat for several minutes between 60° and 80°, and cool to room temperature. If the solution remains cloudy, repeat from the beginning with the following modification: add 3 mL of hydrochloric acid prior to adjustment of the pH with 6 N ammonium hydroxide.

**Monitor Preparation**—Prepare as directed in the chapter, using the same modifications described for *Test Preparation* if necessary.

**Procedure**—To each of the three tubes containing the *Standard Preparation*, the *Test Preparation*, and the *Monitor Preparation*, add 2 mL of pH 3.5 Acetate Buffer, and heat gently to between 60° and 80°. To the *Standard Preparation* add 6 drops of sodium sulfide TS. To the *Test Preparation* and the *Monitor Preparation* add 12 drops of sodium sulfide TS. Cool to room temperature, and dilute the contents of each tube with water to 50 mL. Gently mix each tube by inverting twice. Allow to stand for 5 minutes, and view downward over a white surface. The color of the solution from the *Test Preparation* is not darker than that of the solution from the *Standard Preparation*, and the color of the solution from the *Monitor Preparation* is the same as or darker than the color of the solution from the *Standard Preparation*. If the color of the solution from the *Monitor Preparation* is lighter than the color of the solution from the *Standard Preparation*, repeat the procedure with the following modification: after the heating step, to the *Monitor Preparation* and the *Test Preparation* add 1.0 mL, instead of 12 drops, of sodium sulfide TS. Not more than 20 µg per g is found.

**Limit of iron**—Using Aluminum Zirconium Pentachlorohydrate instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Limit of iron* under *Aluminum Zirconium Octachlorohydrate*. The specified result is obtained (150 µg per g limit).

**Content of aluminum**—Using Aluminum Zirconium Pentachlorohydrate instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of aluminum* under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Content of zirconium**—Using Aluminum Zirconium Pentachlorohydrate instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of zirconium* under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Aluminum/zirconium atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of zirconium found in the test for *Content of zirconium*, and multiply by 92.97/26.98, in which 92.97 is

the atomic weight of zirconium corrected for 2% hafnium content, and 26.98 is the atomic weight of aluminum: the ratio is between 6.0:1 and 10.0:1.

**Content of chloride**—Using Aluminum Zirconium Pentachlorohydrate instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of chloride* under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the *(Aluminum plus zirconium)/chloride atomic ratio*.

**(Aluminum plus zirconium)/chloride atomic ratio**—Calculate the (aluminum plus zirconium)/chloride atomic ratio by the formula:

$$[(Al/26.98) + (Zr/92.97)]/(Cl/35.453)$$

in which *Al*, *Zr*, and *Cl* are the percentages of aluminum, zirconium, and chloride, as determined in the tests for *Content of aluminum*, *Content of zirconium*, and *Content of chloride*, respectively; 26.98 is the atomic weight of aluminum; 92.97 is the atomic weight of zirconium corrected for 2% hafnium content; and 35.453 is the atomic weight of chlorine: the ratio is between 2.1:1 and 1.51:1.

**Assay**—Calculate the percentage of anhydrous aluminum zirconium pentachlorohydrate in the Aluminum Zirconium Pentachlorohydrate by the formula:

$$Al\{26.98y + 92.97 + 17.01[3y + 4 - (y + 1)/z] + 35.453(y + 1)/z\}/26.98y$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *y* is the aluminum/zirconium atomic ratio found in the test for *Aluminum/zirconium atomic ratio*, *z* is the (aluminum plus zirconium)/chloride atomic ratio, 26.98 is the atomic weight of aluminum, 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Zirconium Pentachlorohydrate Solution

» Aluminum Zirconium Pentachlorohydrate Solution is a polymeric, loosely hydrated complex of basic aluminum zirconium chloride that encompasses a range of aluminum-to-zirconium atomic ratios between 6.0:1 and 10.0:1 and a range of (aluminum plus zirconium)-to-chloride atomic ratios between 2.1:1 and 1.51:1. The following solvents may be used: water, propylene glycol, or dipropylene glycol. It contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled concentration of anhydrous aluminum zirconium pentachlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—Label Solution to state the solvent used and the claimed concentration of anhydrous aluminum zirconium pentachlorohydrate.

### Identification—

**A:** A solution containing the equivalent of about 100 mg of anhydrous aluminum zirconium pentachlorohydrate per mL responds to the test for *Chloride* (191).

**B:** *Identification of propylene glycol* (where stated on the label)—Add about 10 mL of isopropyl alcohol to 2 g of Solu-

tion, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath: the IR spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of propylene glycol.

**C:** *Identification of dipropylene glycol* (where stated on the label)—Add about 10 mL of isopropyl alcohol to 2 g of Solution, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath: the IR spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of dipropylene glycol.

**pH** (791): between 3.0 and 5.0, in a solution prepared by diluting 3 g of the Solution with water to obtain 10 mL.

**Arsenic, Method I** (211)—Prepare the *Test Preparation* using an accurately weighed quantity of the Solution. The limit is 2 µg per g.

**Heavy metals, Method I** (231)—Proceed as directed in the chapter, except to use the following modifications.

**Test Preparation**—Prepare as directed in the chapter, using an accurately weighed quantity of Solution. If the solution is not clear after dilution to 40 mL, heat for several minutes between 60° and 80°, and cool to room temperature. If the solution remains cloudy, repeat from the beginning with the following modification: add 3 mL of hydrochloric acid prior to adjustment of the pH with 6 N ammonium hydroxide.

**Monitor Preparation**—Prepare as directed in the chapter, using the same modifications described for *Test Preparation* if necessary.

**Procedure**—To each of the three tubes containing the *Standard Preparation*, the *Test Preparation*, and the *Monitor Preparation*, add 2 mL of pH 3.5 Acetate Buffer, and heat gently to between 60° and 80°. To the *Standard Preparation* add 6 drops of sodium sulfide TS. To the *Test Preparation* and the *Monitor Preparation* add 12 drops of sodium sulfide TS. Cool to room temperature, and dilute the contents of each tube with water to 50 mL. Gently mix each tube by inverting twice. Allow to stand for 5 minutes, and view downward over a white surface. The color of the solution from the *Test Preparation* is not darker than that of the solution from the *Standard Preparation*, and the color of the solution from the *Monitor Preparation* is the same as or darker than the color of the solution from the *Standard Preparation*. If the color of the solution from the *Monitor Preparation* is lighter than the color of the solution from the *Standard Preparation*, repeat the procedure with the following modification: after the heating step, to the *Monitor Preparation* and the *Test Preparation* add 1.0 mL, instead of 12 drops, of sodium sulfide TS. Not more than 10 µg per g is found.

**Limit of iron**—Using about 5.4 g of Aluminum Zirconium Pentachlorohydrate Solution, accurately weighed, instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Limit of iron* under *Aluminum Zirconium Octachlorohydrate*. The limit is 75 µg per g.

**Content of aluminum**—Using about 0.3 g of Aluminum Zirconium Pentachlorohydrate Solution instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of aluminum* under *Aluminum Zirconium Octachlorohydrate*. Use the result to calculate the *Aluminum/chloride atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Content of zirconium**—Using about 500 mg of Aluminum Zirconium Pentachlorohydrate Solution, accurately weighed, instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of zirconium* under *Aluminum Zirconium Octachlorohydrate*. Use the result to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Aluminum/zirconium atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum*

by the percentage of zirconium found in the test for *Content of zirconium*, and multiply by 92.97/26.98, in which 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, and 26.98 is the atomic weight of aluminum: the ratio is between 6.0:1 and 10.0:1.

**Content of chloride**—Using about 500 mg of Aluminum Zirconium Pentachlorohydrate Solution, accurately weighed, instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of chloride* under *Aluminum Zirconium Octachlorohydrate*. Use the result to calculate the (Aluminum plus zirconium)/chloride atomic ratio.

**(Aluminum plus zirconium)/chloride atomic ratio**—Calculate the (aluminum plus zirconium)/chloride atomic ratio by the formula:

$$[(Al/26.98) + (Zr/92.97)]/(Cl/35.453)$$

in which *Al*, *Zr*, and *Cl* are the percentages of aluminum, zirconium, and chloride found in the test for *Content of aluminum*, *Content of zirconium*, and *Content of chloride*, respectively; 26.98 is the atomic weight of aluminum; 92.97 is the atomic weight of zirconium corrected for 2% hafnium content; and 35.453 is the atomic weight of chlorine: the ratio is between 2.1:1 and 1.51:1.

**Assay**—Calculate the percentage of anhydrous aluminum zirconium pentachlorohydrate in the Solution by the formula:

$$Al\{[26.98y + 92.97 + (17.01)(3y + 4 - (y + 1)/z) + 35.453(y + 1)/z]/26.98y\}$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *y* is the aluminum/zirconium atomic ratio found in the test for *Aluminum/zirconium atomic ratio*, *z* is the (aluminum plus zirconium)/chloride atomic ratio found in the test for (Aluminum plus zirconium)/chloride atomic ratio, 26.98 is the atomic weight of aluminum, 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Zirconium Pentachlorohydrate Gly

» Aluminum Zirconium Pentachlorohydrate Gly is a derivative of Aluminum Zirconium Pentachlorohydrate in which some of the water molecules have been displaced by glycine, calcium glycinate, magnesium glycinate, potassium glycinate, sodium glycinate, or zinc glycinate. It encompasses a range of aluminum-to-zirconium atomic ratios between 6.0:1 and 10.0:1 and a range of (aluminum plus zirconium)-to-chloride atomic ratios between 2.1:1 and 1.51:1. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous aluminum zirconium pentachlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—The label states the form of glycine used and the claimed content of anhydrous aluminum zirconium pentachlorohydrate.

### Identification—

**A:** A solution (1 in 10) responds to the test for *Chloride* (191).

**B:** Place about 0.5 g of it in a 50-mL beaker, add about 20 mL of water, and swirl to dissolve. Heat to boiling on a hot plate, and add about 60 mg of ninhydrin: a deep violet color immediately develops.

**pH** (791): between 3.0 and 5.0, in a solution [15 in 100 (w/w)].

**Arsenic, Method I** (211): 2 µg per g.

**Heavy metals, Method I** (231)—Proceed as directed in the chapter, except to use the following modifications.

**Test Preparation**—Prepare as directed in the chapter. If the solution is not clear after dilution to 40 mL, heat for several minutes between 60° and 80°, and cool to room temperature. If the solution remains cloudy, repeat from the beginning with the following modification: add 3 mL of hydrochloric acid prior to adjustment of the pH with 6 N ammonium hydroxide.

**Monitor Preparation**—Prepare as directed in the chapter, using the same modifications described for *Test Preparation* if necessary.

**Procedure**—To each of the three tubes containing the *Standard Preparation*, the *Test Preparation*, and the *Monitor Preparation*, add 2 mL of pH 3.5 Acetate Buffer, and heat gently to between 60° and 80°. To the *Standard Preparation* add 6 drops of sodium sulfide TS. To the *Test Preparation* and the *Monitor Preparation* add 12 drops of sodium sulfide TS. Cool to room temperature, and dilute the contents of each tube with water to 50 mL. Gently mix each tube by inverting twice. Allow to stand for 5 minutes, and view downward over a white surface. The color of the solution from the *Test Preparation* is not darker than that of the solution from the *Standard Preparation*, and the color of the solution from the *Monitor Preparation* is the same as or darker than the color of the solution from the *Standard Preparation*. If the color of the solution from the *Monitor Preparation* is lighter than the color of the solution from the *Standard Preparation*, repeat the procedure with the following modification: after the heating step, to the *Monitor Preparation* and the *Test Preparation* add 1.0 mL, instead of 12 drops, of sodium sulfide TS. Not more than 20 µg per g is found.

**Limit of iron**—Using Aluminum Zirconium Pentachlorohydrate Gly instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Limit of iron* under *Aluminum Zirconium Octachlorohydrate*. The specified result is obtained (150 µg per g limit).

**Content of aluminum**—Using Aluminum Zirconium Pentachlorohydrate Gly instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of aluminum* under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the Aluminum/zirconium atomic ratio and the (Aluminum plus zirconium)/chloride atomic ratio.

**Content of zirconium**—Using Aluminum Zirconium Pentachlorohydrate Gly instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of zirconium* under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the Aluminum/zirconium atomic ratio and the (Aluminum plus zirconium)/chloride atomic ratio.

**Aluminum/zirconium atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of zirconium found in the test for *Content of zirconium*, and multiply by 92.97/26.98, in which 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, and 26.98 is the atomic weight of aluminum: the ratio is between 6.0:1 and 10.0:1.

**Content of chloride**—Using Aluminum Zirconium Pentachlorohydrate Gly instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of chloride* under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the (Aluminum plus zirconium)/chloride atomic ratio.

**(Aluminum plus zirconium)/chloride atomic ratio—**Calculate the (aluminum plus zirconium)/chloride atomic ratio by the formula:

$$[(Al/26.98) + (Zr/92.97)]/(Cl/35.453)$$

in which *Al*, *Zr*, and *Cl* are the percentages of aluminum, zirconium, and chloride as determined in the tests for *Content of aluminum*, *Content of zirconium*, and *Content of chloride*, respectively; 26.98 is the atomic weight of aluminum; 92.97 is the atomic weight of zirconium corrected for 2% hafnium content; and 35.453 is the atomic weight of chlorine: the ratio is between 2.1:1 and 1.51:1.

**Assay—**Calculate the percentage of anhydrous aluminum zirconium pentachlorohydrate in the Aluminum Zirconium Pentachlorohydrate Gly by the formula:

$$Al\{26.98y + 92.97 + 17.01[3y + 4 - (y + 1)/z] + 35.453(y + 1)/z\}/26.98y$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *y* is the aluminum/zirconium atomic ratio found in the test for *Aluminum/zirconium atomic ratio*, *z* is the (aluminum plus zirconium)/chloride atomic ratio found in the test for *(Aluminum plus zirconium)/chloride atomic ratio*, 26.98 is the atomic weight of aluminum, 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Zirconium Pentachlorohydrate Gly Solution

» Aluminum Zirconium Pentachlorohydrate Gly Solution is a solution of Aluminum Zirconium Pentachlorohydrate in which some of the waters of hydration have been displaced by glycine, calcium glycinate, magnesium glycinate, potassium glycinate, sodium glycinate, or zinc glycinate. It encompasses a range of aluminum-to-zirconium ratios between 6.0:1 and 10.0:1 and a range of (aluminum plus zirconium)-to-chloride atomic ratios between 2.1:1 and 1.51:1. The following solvents may be used: water, propylene glycol, or dipropylene glycol. It contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled concentration of anhydrous aluminum zirconium pentachlorohydrate.

**Packaging and storage—**Preserve in well-closed containers.

**Labeling—**Label Solution to state the solvent and form of glycine used and the claimed concentration of anhydrous aluminum zirconium pentachlorohydrate.

### Identification—

**A:** A solution containing the equivalent of about 100 mg of anhydrous aluminum zirconium pentachlorohydrate per mL responds to the test for *Chloride* (191).

**B:** *Identification of propylene glycol* (where stated on the label)—Add about 10 mL of isopropyl alcohol to 2 g of Solution, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath: the IR spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of propylene glycol.

**C:** *Identification of dipropylene glycol* (where stated on the label)—Add about 10 mL of isopropyl alcohol to 2 g of Solution, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath: the IR spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of dipropylene glycol.

**D:** *Identification of glycine*—Place about 1 g of Solution in a 50-mL beaker, add about 20 mL of water, and swirl to dissolve. Heat to boiling on a hot plate, and add about 60 mg of ninhydrin: a deep violet color immediately develops.

**pH** (791): between 3.0 and 5.0, in a solution prepared by diluting 3 g of the Solution with water to obtain 10 mL.

**Arsenic, Method I** (211)—Prepare the *Test Preparation* using an accurately weighed quantity of the Solution. The limit is 2 µg per g.

**Heavy metals, Method I** (231)—Proceed as directed in the chapter, except to use the following modifications.

*Test Preparation*—Prepare as directed in the chapter, using an accurately weighed quantity of Solution. If the solution is not clear after dilution to 40 mL, heat for several minutes between 60° and 80°, and cool to room temperature. If the solution remains cloudy, repeat from the beginning with the following modification: add 3 mL of hydrochloric acid prior to adjustment of the pH with 6 N ammonium hydroxide.

*Monitor Preparation*—Prepare as directed in the chapter, using the same modifications described for *Test Preparation* if necessary.

*Procedure*—To each of the three tubes containing the *Standard Preparation*, the *Test Preparation*, and the *Monitor Preparation*, add 2 mL of pH 3.5 Acetate Buffer, and heat gently to between 60° and 80°. To the *Standard Preparation* add 6 drops of sodium sulfide TS. To the *Test Preparation* and the *Monitor Preparation* add 12 drops of sodium sulfide TS. Cool to room temperature, and dilute the contents of each tube with water to 50 mL. Gently mix each tube by inverting twice. Allow to stand for 5 minutes, and view downward over a white surface. The color of the solution from the *Test Preparation* is not darker than that of the solution from the *Standard Preparation*, and the color of the solution from the *Monitor Preparation* is the same as or darker than the color of the solution from the *Standard Preparation*. If the color of the solution from the *Monitor Preparation* is lighter than the color of the solution from the *Standard Preparation*, repeat the procedure with the following modification: after the heating step, to the *Monitor Preparation* and the *Test Preparation* add 1.0 mL, instead of 12 drops, of sodium sulfide TS. Not more than 10 µg per g is found.

**Limit of iron—**Using about 5.4 g of Aluminum Zirconium Pentachlorohydrate Gly Solution, accurately weighed, instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Limit of iron* under *Aluminum Zirconium Octachlorohydrate*. The limit is 75 µg per g.

**Content of aluminum—**Using about 0.3 g of Aluminum Zirconium Pentachlorohydrate Gly Solution instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of aluminum* under *Aluminum Zirconium Octachlorohydrate*. Use the result to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Content of zirconium—**Using about 500 mg of Aluminum Zirconium Pentachlorohydrate Gly Solution, accurately weighed, instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of zirconium* under *Aluminum Zirconium Octachlorohydrate*. Use the result to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Aluminum/zirconium atomic ratio—**Divide the percentage of aluminum found in the test for *Content of aluminum*

by the percentage of zirconium found in the test for *Content of zirconium*, and multiply by 92.97/26.98, in which 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, and 26.98 is the atomic weight of aluminum: the ratio is between 6.0:1 and 10.0:1.

**Content of chloride**—Using about 500 mg of Aluminum Zirconium Pentachlorohydrate Gly Solution, accurately weighed, instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of chloride* under *Aluminum Zirconium Octachlorohydrate*. Use the result to calculate the (Aluminum plus zirconium)/chloride atomic ratio.

**(Aluminum plus zirconium)/chloride atomic ratio**—Calculate the (aluminum plus zirconium)/chloride atomic ratio by the formula:

$$[(Al/26.98) + (Zr/92.97)]/(Cl/35.453)$$

in which *Al*, *Zr*, and *Cl* are the percentages of aluminum, zirconium, and chloride found in the test for *Content of aluminum*, *Content of zirconium*, and *Content of chloride*, respectively; 26.98 is the atomic weight of aluminum; 92.97 is the atomic weight of zirconium corrected for 2% hafnium content; and 35.453 is the atomic weight of chlorine: the ratio is between 2.1:1 and 1.51:1.

**Assay**—Calculate the percentage of anhydrous aluminum zirconium pentachlorohydrate in the Solution by the formula:

$$Al\{[26.98y + 92.97 + (17.01)(3y + 4 - (y + 1)/z) + 35.453(y + 1)/z]/26.98y\}$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *y* is the aluminum/zirconium atomic ratio found in the test for *Aluminum/zirconium atomic ratio*, *z* is the (aluminum plus zirconium)/chloride atomic ratio found in the test for *(Aluminum plus zirconium)/chloride atomic ratio*, 26.98 is the atomic weight of aluminum, 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Zirconium Tetrachlorohydrate

» Aluminum Zirconium Tetrachlorohydrate is a polymeric, loosely hydrated complex of basic aluminum zirconium chloride that encompasses a range of aluminum-to-zirconium atomic ratios between 2.0:1 and 5.99:1 and a range of (aluminum plus zirconium)-to-chloride atomic ratios between 1.5:1 and 0.9:1. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous aluminum zirconium tetrachlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—The label states the content of anhydrous aluminum zirconium tetrachlorohydrate.

**Identification**—A solution (1 in 10) responds to the test for *Chloride* (191).

**pH** (791): between 3.0 and 5.0, in a solution [15 in 100 (w/w)].

**Arsenic, Method I** (211): 2 µg per g.

**Heavy metals, Method I** (231)—Proceed as directed in the chapter, except to use the following modifications.

**Test Preparation**—Prepare as directed in the chapter. If the solution is not clear after dilution to 40 mL, heat for several minutes between 60° and 80°, and cool to room temperature. If the solution remains cloudy, repeat from the beginning with the following modification: add 3 mL of hydrochloric acid prior to adjustment of the pH with 6 N ammonium hydroxide.

**Monitor Preparation**—Prepare as directed in the chapter, using the same modifications described for *Test Preparation* if necessary.

**Procedure**—To each of the three tubes containing the *Standard Preparation*, the *Test Preparation*, and the *Monitor Preparation*, add 2 mL of pH 3.5 Acetate Buffer, and heat gently to between 60° and 80°. To the *Standard Preparation* add 6 drops of sodium sulfide TS. To the *Test Preparation* and the *Monitor Preparation* add 12 drops of sodium sulfide TS. Cool to room temperature, and dilute the contents of each tube with water to 50 mL. Gently mix each tube by inverting twice. Allow to stand for 5 minutes, and view downward over a white surface. The color of the solution from the *Test Preparation* is not darker than that of the solution from the *Standard Preparation*, and the color of the solution from the *Monitor Preparation* is the same as or darker than the color of the solution from the *Standard Preparation*. If the color of the solution from the *Monitor Preparation* is lighter than the color of the solution from the *Standard Preparation*, repeat the procedure with the following modification: after the heating step, to the *Monitor Preparation* and the *Test Preparation* add 1.0 mL, instead of 12 drops, of sodium sulfide TS. Not more than 20 µg per g is found.

**Limit of iron**—Using Aluminum Zirconium Tetrachlorohydrate instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Limit of iron* under *Aluminum Zirconium Octachlorohydrate*. The specified result is obtained (150 µg per g limit).

**Content of aluminum**—Using Aluminum Zirconium Tetrachlorohydrate instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of aluminum* under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the *Aluminum/zirconium atomic ratio* and the (Aluminum plus zirconium)/chloride atomic ratio.

**Content of zirconium**—Using Aluminum Zirconium Tetrachlorohydrate instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of zirconium* under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the *Aluminum/zirconium atomic ratio* and the (Aluminum plus zirconium)/chloride atomic ratio.

**Aluminum/zirconium atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of zirconium found in the test for *Content of zirconium*, and multiply by 92.97/26.98, in which 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, and 26.98 is the atomic weight of aluminum: the ratio is between 2.0:1 and 5.99:1.

**Content of chloride**—Using Aluminum Zirconium Tetrachlorohydrate instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of chloride* under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the (Aluminum plus zirconium)/chloride atomic ratio.

**(Aluminum plus zirconium)/chloride atomic ratio**—Calculate the (aluminum plus zirconium)/chloride atomic ratio by the formula:

$$[(Al/26.98) + (Zr/92.97)]/(Cl/35.453)$$

in which *Al*, *Zr*, and *Cl* are the percentages of aluminum, zirconium, and chloride as determined in the tests for *Content of aluminum*, *Content of zirconium*, and *Content of chlo-*

ride, respectively; 26.98 is the atomic weight of aluminum; 92.97 is the atomic weight of zirconium corrected for 2% hafnium content; and 35.453 is the atomic weight of chlorine: the ratio is between 1.5:1 and 0.9:1.

**Assay**—Calculate the percentage of anhydrous aluminum zirconium tetrachlorohydrate in the Aluminum Zirconium Tetrachlorohydrate by the formula:

$$Al\{26.98y + 92.97 + 17.01[3y + 4 - (y + 1)/z] + 35.453(y + 1)/z\}/26.98y$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *y* is the aluminum/zirconium atomic ratio found in the test for *Aluminum/zirconium atomic ratio*, *z* is the (aluminum plus zirconium)/chloride atomic ratio found in the test for *(Aluminum plus zirconium)/chloride atomic ratio*, 26.98 is the atomic weight of aluminum, 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Zirconium Tetrachlorohydrate Solution

» Aluminum Zirconium Tetrachlorohydrate Solution is a polymeric, loosely hydrated complex of basic aluminum zirconium chloride that encompasses a range of aluminum-to-zirconium atomic ratios between 2.0:1 and 5.99:1 and a range of (aluminum plus zirconium)-to-chloride atomic ratios between 1.5:1 and 0.9:1. The following solvents may be used: water, propylene glycol, or dipropylene glycol. It contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled concentration of anhydrous aluminum zirconium tetrachlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—Label Solution to state the solvent used and the claimed concentration of anhydrous aluminum zirconium tetrachlorohydrate.

### Identification—

**A:** A solution containing the equivalent of about 100 mg of anhydrous aluminum zirconium tetrachlorohydrate per mL responds to the test for *Chloride* (191).

**B:** *Identification of propylene glycol* (where stated on the label)—Add about 10 mL of isopropyl alcohol to 2 g of Solution, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath: the IR spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of propylene glycol.

**C:** *Identification of dipropylene glycol* (where stated on the label)—Add about 10 mL of isopropyl alcohol to 2 g of Solution, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath: the IR spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of dipropylene glycol.

**pH** (791): between 3.0 and 5.0, in a solution prepared by diluting 3 g of the Solution with water to obtain 10 mL.

**Arsenic, Method I** (211)—Prepare the *Test Preparation* using an accurately weighed quantity of the Solution. The limit is 2 µg per g.

**Heavy metals, Method I** (231)—Proceed as directed in the chapter, except to use the following modifications.

**Test Preparation**—Prepare as directed in the chapter, using an accurately weighed quantity of Solution. If the solution is not clear after dilution to 40 mL, heat for several minutes between 60° and 80°, and cool to room temperature. If the solution remains cloudy, repeat from the beginning with the following modification: add 3 mL of hydrochloric acid prior to adjustment of the pH with 6 N ammonium hydroxide.

**Monitor Preparation**—Prepare as directed in the chapter, using the same modifications described for *Test Preparation* if necessary.

**Procedure**—To each of the three tubes containing the *Standard Preparation*, the *Test Preparation*, and the *Monitor Preparation*, add 2 mL of pH 3.5 Acetate Buffer, and heat gently to between 60° and 80°. To the *Standard Preparation* add 6 drops of sodium sulfide TS. To the *Test Preparation* and the *Monitor Preparation* add 12 drops of sodium sulfide TS. Cool to room temperature, and dilute the contents of each tube with water to 50 mL. Gently mix each tube by inverting twice. Allow to stand for 5 minutes, and view downward over a white surface. The color of the solution from the *Test Preparation* is not darker than that of the solution from the *Standard Preparation*, and the color of the solution from the *Monitor Preparation* is the same as or darker than the color of the solution from the *Standard Preparation*. If the color of the solution from the *Monitor Preparation* is lighter than the color of the solution from the *Standard Preparation*, repeat the procedure with the following modification: after the heating step, to the *Monitor Preparation* and the *Test Preparation* add 1.0 mL, instead of 12 drops, of sodium sulfide TS. Not more than 10 µg per g is found.

**Limit of iron**—Using about 5.4 g of Aluminum Zirconium Tetrachlorohydrate Solution, accurately weighed, instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Limit of iron* under *Aluminum Zirconium Octachlorohydrate*. The limit is 75 µg per g.

**Content of aluminum**—Using about 0.3 g of Aluminum Zirconium Tetrachlorohydrate Solution instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of aluminum* under *Aluminum Zirconium Octachlorohydrate*. Use the result to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Content of zirconium**—Using about 500 mg of Aluminum Zirconium Tetrachlorohydrate Solution, accurately weighed, instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of zirconium* under *Aluminum Zirconium Octachlorohydrate*. Use the result to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Aluminum/zirconium atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of zirconium found in the test for *Content of zirconium* and multiply by 92.97/26.98, in which 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, and 26.98 is the atomic weight of aluminum: the ratio is between 2.0:1 and 5.99:1.

**Content of chloride**—Using about 500 mg of Aluminum Zirconium Tetrachlorohydrate Solution, accurately weighed, instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of chloride* under *Aluminum Zirconium Octachlorohydrate*. Use the result to calculate the *(Aluminum plus zirconium)/chloride atomic ratio*.

**(Aluminum plus zirconium)/chloride atomic ratio**—Calculate the (aluminum plus zirconium)/chloride atomic ratio by the formula:

$$[(Al/26.98) + (Zr/92.97)]/(Cl/35.453)$$

in which *Al*, *Zr*, and *Cl* are the percentages of aluminum, zirconium, and chloride found in the test for *Content of aluminum*, *Content of zirconium*, and *Content of chloride*, respec-

tively; 26.98 is the atomic weight of aluminum; 92.97 is the atomic weight of zirconium corrected for 2% hafnium content; and 35.453 is the atomic weight of chlorine: the ratio is between 1.5:1 and 0.9:1.

**Assay**—Calculate the percentage of anhydrous aluminum zirconium tetrachlorohydrate in the Solution by the formula:

$$Al\{26.98y + 92.97 + 17.01[3y + 4 - (y + 1)/z] + 35.453(y + 1)/z\}/26.98y$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *y* is the aluminum/zirconium atomic ratio found in the test for *Aluminum/zirconium atomic ratio*, *z* is the (aluminum plus zirconium)/chloride atomic ratio found in the test for *(Aluminum plus zirconium)/chloride atomic ratio*, 26.98 is the atomic weight of aluminum, 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Zirconium Tetrachlorohydrate Gly

» Aluminum Zirconium Tetrachlorohydrate Gly is a derivative of Aluminum Zirconium Tetrachlorohydrate in which some of the water molecules have been displaced by glycine, calcium glycinate, magnesium glycinate, potassium glycinate, sodium glycinate, or zinc glycinate. It encompasses a range of aluminum-to-zirconium atomic ratios between 2.0:1 and 5.99:1 and a range of (aluminum plus zirconium)-to-chloride atomic ratios between 1.5:1 and 0.9:1. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous aluminum zirconium tetrachlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—The label states the form of glycine used and the claimed content of anhydrous aluminum zirconium tetrachlorohydrate.

### Identification—

**A:** A solution (1 in 10) responds to the test for *Chloride* (191).

**B:** Place about 0.5 g of it in a 50-mL beaker, add about 20 mL of water, and swirl to dissolve. Heat to boiling on a hot plate, and add about 60 mg of ninhydrin: a deep violet color immediately develops.

**pH** (791): between 3.0 and 5.0, in a solution [15 in 100 (w/w)].

**Arsenic, Method I** (211): 2 µg per g.

**Heavy metals, Method I** (231)—Proceed as directed in the chapter, except to use the following modifications.

**Test Preparation**—Prepare as directed in the chapter. If the solution is not clear after dilution to 40 mL, heat for several minutes between 60° and 80°, and cool to room temperature. If the solution remains cloudy, repeat from the beginning with the following modification: add 3 mL of hydrochloric acid prior to adjustment of the pH with 6 N ammonium hydroxide.

**Monitor Preparation**—Prepare as directed in the chapter, using the same modifications described for *Test Preparation* if necessary.

**Procedure**—To each of the three tubes containing the *Standard Preparation*, the *Test Preparation*, and the *Monitor*

*Preparation*, add 2 mL of pH 3.5 Acetate Buffer, and heat gently to between 60° and 80°. To the *Standard Preparation* add 6 drops of sodium sulfide TS. To the *Test Preparation* and the *Monitor Preparation* add 12 drops of sodium sulfide TS. Cool to room temperature, and dilute the contents of each tube with water to 50 mL. Gently mix each tube by inverting twice. Allow to stand for 5 minutes, and view downward over a white surface. The color of the solution from the *Test Preparation* is not darker than that of the solution from the *Standard Preparation*, and the color of the solution from the *Monitor Preparation* is the same as or darker than the color of the solution from the *Standard Preparation*. If the color of the solution from the *Monitor Preparation* is lighter than the color of the solution from the *Standard Preparation*, repeat the procedure with the following modification: after the heating step, to the *Monitor Preparation* and the *Test Preparation* add 1.0 mL, instead of 12 drops, of sodium sulfide TS. Not more than 20 µg per g is found.

**Limit of iron**—Using Aluminum Zirconium Tetrachlorohydrate Gly instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Limit of iron* under *Aluminum Zirconium Octachlorohydrate*. The specified result is obtained (150 µg per g limit).

**Content of aluminum**—Using Aluminum Zirconium Tetrachlorohydrate Gly instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of aluminum* under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Content of zirconium**—Using Aluminum Zirconium Tetrachlorohydrate Gly instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of zirconium* under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Aluminum/zirconium atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of zirconium found in the test for *Content of zirconium*, and multiply by 92.97/26.98, in which 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, and 26.98 is the atomic weight of aluminum: the ratio is between 2.0:1 and 5.99:1.

**Content of chloride**—Using Aluminum Zirconium Tetrachlorohydrate Gly instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of chloride* under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the *(Aluminum plus zirconium)/chloride atomic ratio*.

**(Aluminum plus zirconium)/chloride atomic ratio**—Calculate the (aluminum plus zirconium)/chloride atomic ratio by the formula:

$$[(Al/26.98) + (Zr/92.97)]/(Cl/35.453)$$

in which *Al*, *Zr*, and *Cl* are the percentages of aluminum, zirconium, and chloride as determined in the tests for *Content of aluminum*, *Content of zirconium*, and *Content of chloride*, respectively; 26.98 is the atomic weight of aluminum; 92.97 is the atomic weight of zirconium corrected for 2% hafnium content; and 35.453 is the atomic weight of chlorine: the ratio is between 1.5:1 and 0.9:1.

**Assay**—Calculate the percentage of anhydrous aluminum zirconium tetrachlorohydrate in the Aluminum Zirconium Tetrachlorohydrate Gly by the formula:

$$Al\{26.98y + 92.97 + 17.01[3y + 4 - (y + 1)/z] + 35.453(y + 1)/z\}/26.98y$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *y* is the aluminum/zirconium

atomic ratio found in the test for *Aluminum/zirconium atomic ratio*,  $z$  is the (aluminum plus zirconium)/chloride atomic ratio found in the test for *(Aluminum plus zirconium)/chloride atomic ratio*, 26.98 is the atomic weight of aluminum, 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Zirconium Tetrachlorohydrate Gly Solution

» Aluminum Zirconium Tetrachlorohydrate Gly Solution is a solution of Aluminum Zirconium Tetrachlorohydrate in which some of the waters of hydration have been displaced by glycine, calcium glycinate, magnesium glycinate, potassium glycinate, sodium glycinate, or zinc glycinate. It encompasses a range of aluminum-to-zirconium ratios between 2.0:1 and 5.99:1 and a range of (aluminum plus zirconium)-to-chloride atomic ratios between 1.5:1 and 0.9:1. The following solvents may be used: water, propylene glycol, or dipropylene glycol. It contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled concentration of anhydrous aluminum zirconium tetrachlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—Label Solution to state the solvent and form of glycine used and the claimed concentration of anhydrous aluminum zirconium tetrachlorohydrate.

### Identification—

**A:** A solution containing the equivalent of about 100 mg of anhydrous aluminum zirconium tetrachlorohydrate per mL responds to the test for *Chloride* (191).

**B:** *Identification of propylene glycol* (where stated on the label)—Add about 10 mL of isopropyl alcohol to 2 g of Solution, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath: the IR spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of propylene glycol.

**C:** *Identification of dipropylene glycol* (where stated on the label)—Add about 10 mL of isopropyl alcohol to 2 g of Solution, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath: the IR spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of dipropylene glycol.

**D:** *Identification of glycine*—Place about 1 g of Solution in a 50-mL beaker, add about 20 mL of water, and swirl to dissolve. Heat to boiling on a hot plate, and add about 60 mg of ninhydrin: a deep violet color immediately develops.

**pH** (791): between 3.0 and 5.0, in a solution prepared by diluting 3 g of the Solution with water to obtain 10 mL.

**Arsenic, Method I** (211)—Prepare the *Test Preparation* using an accurately weighed quantity of the Solution. The limit is 2 µg per g.

**Heavy metals, Method I** (231)—Proceed as directed in the chapter, except to use the following modifications.

**Test Preparation**—Prepare as directed in the chapter, using an accurately weighed quantity of Solution. If the solution is not clear after dilution to 40 mL, heat for several minutes between 60° and 80°, and cool to room tempera-

ture. If the solution remains cloudy, repeat from the beginning with the following modification: add 3 mL of hydrochloric acid prior to adjustment of the pH with 6 N ammonium hydroxide.

**Monitor Preparation**—Prepare as directed in the chapter, using the same modifications described for *Test Preparation* if necessary.

**Procedure**—To each of the three tubes containing the *Standard Preparation*, the *Test Preparation*, and the *Monitor Preparation*, add 2 mL of pH 3.5 Acetate Buffer, and heat gently to between 60° and 80°. To the *Standard Preparation* add 6 drops of sodium sulfide TS. To the *Test Preparation* and the *Monitor Preparation* add 12 drops of sodium sulfide TS. Cool to room temperature, and dilute the contents of each tube with water to 50 mL. Gently mix each tube by inverting twice. Allow to stand for 5 minutes, and view downward over a white surface. The color of the solution from the *Test Preparation* is not darker than that of the solution from the *Standard Preparation*, and the color of the solution from the *Monitor Preparation* is the same as or darker than the color of the solution from the *Standard Preparation*. If the color of the solution from the *Monitor Preparation* is lighter than the color of the solution from the *Standard Preparation*, repeat the procedure with the following modification: after the heating step, to the *Monitor Preparation* and the *Test Preparation* add 1.0 mL, instead of 12 drops, of sodium sulfide TS. Not more than 10 µg per g is found.

**Limit of iron**—Using about 5.4 g of Aluminum Zirconium Tetrachlorohydrate Gly Solution, accurately weighed, instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Limit of iron* under *Aluminum Zirconium Octachlorohydrate*. The limit is 75 µg per g.

**Content of aluminum**—Using about 0.3 g of Aluminum Zirconium Tetrachlorohydrate Gly Solution instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of aluminum* under *Aluminum Zirconium Octachlorohydrate*. Use the result to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Content of zirconium**—Using about 500 mg of Aluminum Zirconium Tetrachlorohydrate Gly Solution, accurately weighed, instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of zirconium* under *Aluminum Zirconium Octachlorohydrate*. Use the result to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Aluminum/zirconium atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of zirconium found in the test for *Content of zirconium*, and multiply by 92.97/26.98, in which 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, and 26.98 is the atomic weight of aluminum: the ratio is between 2.0:1 and 5.99:1.

**Content of chloride**—Using about 500 mg of Aluminum Zirconium Tetrachlorohydrate Gly Solution, accurately weighed, instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of chloride* under *Aluminum Zirconium Octachlorohydrate*. Use the result to calculate the *(Aluminum plus zirconium)/chloride atomic ratio*.

**(Aluminum plus zirconium)/chloride atomic ratio**—Calculate the (aluminum plus zirconium)/chloride atomic ratio by the formula:

$$[(Al/26.98) + (Zr/92.97)]/(Cl/35.453)$$

in which *Al*, *Zr*, and *Cl* are the percentages of aluminum, zirconium, and chloride found in the tests for *Content of aluminum*, *Content of zirconium*, and *Content of chloride*, respectively; 26.98 is the atomic weight of aluminum; 92.97 is the atomic weight of zirconium corrected for 2% hafnium

content; and 35.453 is the atomic weight of chlorine: the ratio is between 1.5:1 and 0.9:1.

**Assay**—Calculate the percentage of anhydrous aluminum zirconium tetrachlorohydrate in the Solution by the formula:

$$Al\{26.98y + 92.97 + 17.01[3y + 4 - (y + 1)/z] + 35.453(y + 1)/z\}/26.98y$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *y* is the aluminum/zirconium atomic ratio found in the test for *Aluminum/zirconium atomic ratio*, *z* is the (aluminum plus zirconium)/chloride atomic ratio found in the test for *(Aluminum plus zirconium)/chloride atomic ratio*, 26.98 is the atomic weight of aluminum, 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

### Aluminum Zirconium Trichlorohydrate

$Al_xZr(OH)_{3y+4-x}Cl_x \cdot nH_2O$

» Aluminum Zirconium Trichlorohydrate is a polymeric, loosely hydrated complex of basic aluminum zirconium chloride that encompasses a range of aluminum-to-zirconium atomic ratios between 2.0:1 and 5.99:1 and a range of (aluminum plus zirconium)-to-chloride atomic ratios between 2.1:1 and 1.51:1. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous aluminum zirconium trichlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—The label states the content of anhydrous aluminum zirconium trichlorohydrate.

**Identification**—A solution (1 in 10) responds to the test for *Chloride* (191).

**pH** (791): between 3.0 and 5.0, in a solution [15 in 100 (w/w)].

**Arsenic, Method I** (211): 2 µg per g.

**Heavy metals, Method I** (231)—Proceed as directed in the chapter, except to use the following modifications.

**Test Preparation**—Prepare as directed in the chapter. If the solution is not clear after dilution to 40 mL, heat for several minutes between 60° and 80°, and cool to room temperature. If the solution remains cloudy, repeat from the beginning with the following modification: add 3 mL of hydrochloric acid prior to adjustment of the pH with 6 N ammonium hydroxide.

**Monitor Preparation**—Prepare as directed in the chapter, using the same modifications described for *Test Preparation* if necessary.

**Procedure**—To each of the three tubes containing the *Standard Preparation*, the *Test Preparation*, and the *Monitor Preparation*, add 2 mL of pH 3.5 Acetate Buffer, and heat gently to between 60° and 80°. To the *Standard Preparation* add 6 drops of sodium sulfide TS. To the *Test Preparation* and the *Monitor Preparation* add 12 drops of sodium sulfide TS. Cool to room temperature, and dilute the contents of each tube with water to 50 mL. Gently mix each tube by inverting twice. Allow to stand for 5 minutes, and view downward over a white surface. The color of the solution from the *Test Preparation* is not darker than that of the solution from the *Standard Preparation*, and the color of the solution from the *Monitor Preparation* is the same as or

darker than the color of the solution from the *Standard Preparation*. If the color of the solution from the *Monitor Preparation* is lighter than the color of the solution from the *Standard Preparation*, repeat the procedure with the following modification: after the heating step, to the *Monitor Preparation* and the *Test Preparation* add 1.0 mL, instead of 12 drops, of sodium sulfide TS. Not more than 20 µg per g is found.

**Limit of iron**—Using Aluminum Zirconium Trichlorohydrate instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Limit of iron* under *Aluminum Zirconium Octachlorohydrate*. The specified result is obtained (150 µg per g limit).

**Content of aluminum**—Using Aluminum Zirconium Trichlorohydrate instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of aluminum* under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Content of zirconium**—Using Aluminum Zirconium Trichlorohydrate instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of zirconium* under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Aluminum/zirconium atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of zirconium found in the test for *Content of zirconium*, and multiply by 92.97/26.98, in which 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, and 26.98 is the atomic weight of aluminum: the ratio is between 2.0:1 and 5.99:1.

**Content of chloride**—Using Aluminum Zirconium Trichlorohydrate instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of chloride* under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the *(Aluminum plus zirconium)/chloride atomic ratio*.

**(Aluminum plus zirconium)/chloride atomic ratio**—Calculate the (aluminum plus zirconium)/chloride atomic ratio by the formula:

$$[(Al/26.98) + (Zr/92.97)]/(Cl/35.453)$$

in which *Al*, *Zr*, and *Cl* are the percentages of aluminum, zirconium, and chloride as determined in the tests for *Content of aluminum*, *Content of zirconium*, and *Content of chloride*, respectively; 26.98 is the atomic weight of aluminum; 92.97 is the atomic weight of zirconium corrected for 2% hafnium content; and 35.453 is the atomic weight of chlorine: the ratio is between 2.1:1 and 1.51:1.

**Assay**—Calculate the percentage of anhydrous aluminum zirconium trichlorohydrate in the Aluminum Zirconium Trichlorohydrate by the formula:

$$Al\{26.98y + 92.97 + 17.01[3y + 4 - (y + 1)/z] + 35.453(y + 1)/z\}/26.98y$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *y* is the aluminum/zirconium atomic ratio found in the test for *Aluminum/zirconium atomic ratio*, *z* is the (aluminum plus zirconium)/chloride atomic ratio found in the test for *(Aluminum plus zirconium)/chloride atomic ratio*, 26.98 is the atomic weight of aluminum, 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Zirconium Trichlorohydrate Solution

» Aluminum Zirconium Trichlorohydrate Solution is a polymeric, loosely hydrated complex of basic aluminum zirconium chloride that encompasses a range of aluminum-to-zirconium atomic ratios between 2.0:1 and 5.99:1 and a range of (aluminum plus zirconium)-to-chloride atomic ratios between 2.1:1 and 1.51:1. The following solvents may be used: water, propylene glycol, or dipropylene glycol. It contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled concentration of anhydrous aluminum zirconium trichlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—Label Solution to state the solvent used and the claimed concentration of anhydrous aluminum zirconium trichlorohydrate.

### Identification—

**A:** A solution containing the equivalent of about 100 mg of anhydrous aluminum zirconium trichlorohydrate per mL responds to the test for *Chloride* (191).

**B:** *Identification of propylene glycol* (where stated on the label)—Add about 10 mL of isopropyl alcohol to 2 g of Solution, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath: the IR spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of propylene glycol.

**C:** *Identification of dipropylene glycol* (where stated on the label)—Add about 10 mL of isopropyl alcohol to 2 g of Solution, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath: the IR spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of dipropylene glycol.

**pH** (791): between 3.0 and 5.0, in a solution prepared by diluting 3 g of the Solution with water to obtain 10 mL.

**Arsenic, Method I** (211)—Prepare the *Test Preparation* using an accurately weighed quantity of the Solution. The limit is 2 µg per g.

**Heavy metals, Method I** (231)—Proceed as directed in the chapter, except to use the following modifications.

**Test Preparation**—Prepare as directed in the chapter, using an accurately weighed quantity of Solution. If the solution is not clear after dilution to 40 mL, heat for several minutes between 60° and 80°, and cool to room temperature. If the solution remains cloudy, repeat from the beginning with the following modification: add 3 mL of hydrochloric acid prior to adjustment of the pH with 6 N ammonium hydroxide.

**Monitor Preparation**—Prepare as directed in the chapter, using the same modifications described for *Test Preparation* if necessary.

**Procedure**—To each of the three tubes containing the *Standard Preparation*, the *Test Preparation*, and the *Monitor Preparation*, add 2 mL of pH 3.5 Acetate Buffer, and heat gently to between 60° and 80°. To the *Standard Preparation* add 6 drops of sodium sulfide TS. To the *Test Preparation* and the *Monitor Preparation* add 12 drops of sodium sulfide TS. Cool to room temperature, and dilute the contents of each tube with water to 50 mL. Gently mix each tube by inverting twice. Allow to stand for 5 minutes, and view downward over a white surface. The color of the solution from the *Test Preparation* is not darker than that of the solu-

tion from the *Standard Preparation*, and the color of the solution from the *Monitor Preparation* is the same as or darker than the color of the solution from the *Standard Preparation*. If the color of the solution from the *Monitor Preparation* is lighter than the color of the solution from the *Standard Preparation*, repeat the procedure with the following modification: after the heating step, to the *Monitor Preparation* and the *Test Preparation* add 1.0 mL, instead of 12 drops, of sodium sulfide TS. Not more than 10 µg per g is found.

**Limit of iron**—Using about 5.4 g of Aluminum Zirconium Trichlorohydrate Solution, accurately weighed, instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Limit of iron* under *Aluminum Zirconium Octachlorohydrate*. The limit is 75 µg per g.

**Content of aluminum**—Using about 0.3 g of Aluminum Zirconium Trichlorohydrate Solution instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of aluminum* under *Aluminum Zirconium Octachlorohydrate*. Use the result to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Content of zirconium**—Using about 500 mg of Aluminum Zirconium Trichlorohydrate Solution, accurately weighed, instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of zirconium* under *Aluminum Zirconium Octachlorohydrate*. Use the result to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Aluminum/zirconium atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of zirconium found in the test for *Content of zirconium* and multiply by 92.97/26.98, in which 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, and 26.98 is the atomic weight of aluminum: the ratio is between 2.0:1 and 5.99:1.

**Content of chloride**—Using about 500 mg of Aluminum Zirconium Trichlorohydrate Solution, accurately weighed, instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of chloride* under *Aluminum Zirconium Octachlorohydrate*. Use the result to calculate the *(Aluminum plus zirconium)/chloride atomic ratio*.

**(Aluminum plus zirconium)/chloride atomic ratio**—Calculate the (aluminum plus zirconium)/chloride atomic ratio by the formula:

$$[(Al/26.98) + (Zr/92.97)]/(Cl/35.453)$$

in which *Al*, *Zr*, and *Cl* are the percentages of aluminum, zirconium, and chloride found in the test for *Content of aluminum*, *Content of zirconium*, and *Content of chloride*, respectively; 26.98 is the atomic weight of aluminum; 92.97 is the atomic weight of zirconium corrected for 2% hafnium content; and 35.453 is the atomic weight of chlorine: the ratio is between 2.1:1 and 1.51:1.

**Assay**—Calculate the percentage of anhydrous aluminum zirconium trichlorohydrate in the Solution by the formula:

$$Al\{26.98y + 92.97 + 17.01[3y + 4 - (y + 1)/z] + 35.453(y + 1)/z\}/26.98y$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *y* is the aluminum/zirconium atomic ratio as determined in the test for *Aluminum/zirconium atomic ratio*, *z* is the (aluminum plus zirconium)/chloride ratio determined in the test for *(Aluminum plus zirconium)/chloride atomic ratio*, 26.98 is the atomic weight of aluminum, 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Zirconium Trichlorohydrate Gly

» Aluminum Zirconium Trichlorohydrate Gly is a derivative of Aluminum Zirconium Trichlorohydrate in which some of the water molecules have been displaced by glycine, calcium glycinate, magnesium glycinate, potassium glycinate, sodium glycinate, or zinc glycinate. It encompasses a range of aluminum-to-zirconium atomic ratios between 2.0:1 and 5.99:1 and a range of (aluminum plus zirconium)-to-chloride atomic ratios between 2.1:1 and 1.51:1. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous aluminum zirconium trichlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—The label states the form of glycine used and the claimed content of anhydrous aluminum zirconium trichlorohydrate.

### Identification—

**A:** A solution (1 in 10) responds to the test for *Chloride* (191).

**B:** Place about 0.5 g of it in a 50-mL beaker, add about 20 mL of water, and swirl to dissolve. Heat to boiling on a hot plate, and add about 60 mg of ninhydrin: a deep violet color immediately develops.

**pH** (791): between 3.0 and 5.0, in a solution [15 in 100 (w/w)].

**Arsenic, Method I** (211): 2 µg per g.

**Heavy metals, Method I** (231)—Proceed as directed in the chapter, except to use the following modifications.

**Test Preparation**—Prepare as directed in the chapter. If the solution is not clear after dilution to 40 mL, heat for several minutes between 60° and 80°, and cool to room temperature. If the solution remains cloudy, repeat from the beginning with the following modification: add 3 mL of hydrochloric acid prior to adjustment of the pH with 6 N ammonium hydroxide.

**Monitor Preparation**—Prepare as directed in the chapter, using the same modifications described for *Test Preparation* if necessary.

**Procedure**—To each of the three tubes containing the *Standard Preparation*, the *Test Preparation*, and the *Monitor Preparation*, add 2 mL of pH 3.5 *Acetate Buffer*, and heat gently to between 60° and 80°. To the *Standard Preparation* add 6 drops of sodium sulfide TS. To the *Test Preparation* and the *Monitor Preparation* add 12 drops of sodium sulfide TS. Cool to room temperature, and dilute the contents of each tube with water to 50 mL. Gently mix each tube by inverting twice. Allow to stand for 5 minutes, and view downward over a white surface. The color of the solution from the *Test Preparation* is not darker than that of the solution from the *Standard Preparation*, and the color of the solution from the *Monitor Preparation* is the same as or darker than the color of the solution from the *Standard Preparation*. If the color of the solution from the *Monitor Preparation* is lighter than the color of the solution from the *Standard Preparation*, repeat the procedure with the following modification: after the heating step, to the *Monitor Preparation* and the *Test Preparation* add 1.0 mL, instead of 12 drops, of sodium sulfide TS. Not more than 20 µg per g is found.

**Limit of iron**—Using Aluminum Zirconium Trichlorohydrate Gly instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Limit of iron* under *Aluminum*

*Zirconium Octachlorohydrate*. The specified result is obtained (150 µg per g limit).

**Content of aluminum**—Using Aluminum Zirconium Trichlorohydrate Gly instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of aluminum* under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Content of zirconium**—Using Aluminum Zirconium Trichlorohydrate Gly instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of zirconium* under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Aluminum/zirconium atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of zirconium found in the test for *Content of zirconium*, and multiply by 92.97/26.98, in which 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, and 26.98 is the atomic weight of aluminum: the ratio is between 2.0:1 and 5.99:1.

**Content of chloride**—Using Aluminum Zirconium Trichlorohydrate Gly instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for *Content of chloride* under *Aluminum Zirconium Octachlorohydrate*. Use the result obtained to calculate the *(Aluminum plus zirconium)/chloride atomic ratio*.

**(Aluminum plus zirconium)/chloride atomic ratio**—Calculate the (aluminum plus zirconium)/chloride atomic ratio by the formula:

$$[(Al/26.98) + (Zr/92.97)]/(Cl/35.453)$$

in which *Al*, *Zr*, and *Cl* are the percentages of aluminum, zirconium, and chloride as determined in the tests for *Content of aluminum*, *Content of zirconium*, and *Content of chloride*, respectively; 26.98 is the atomic weight of aluminum; 92.97 is the atomic weight of zirconium corrected for 2% hafnium content; and 35.453 is the atomic weight of chlorine: the ratio is between 2.1:1 and 1.51:1.

**Assay**—Calculate the percentage of anhydrous aluminum zirconium trichlorohydrate in the Aluminum Zirconium Trichlorohydrate Gly by the formula:

$$Al\{26.98y + 92.97 + 17.01[3y + 4 - (y + 1)/z] + 35.453(y + 1)/z\}/26.98y$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *y* is the aluminum/zirconium atomic ratio found in the test for *Aluminum/zirconium atomic ratio*, *z* is the (aluminum plus zirconium)/chloride atomic ratio found in the test for *(Aluminum plus zirconium)/chloride atomic ratio*, 26.98 is the atomic weight of aluminum, 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Aluminum Zirconium Trichlorohydrate Gly Solution

» Aluminum Zirconium Trichlorohydrate Gly Solution is a solution of Aluminum Zirconium Trichlorohydrate in which some of the waters of hydration have been displaced by glycine, calcium glycinate, magnesium glycinate, potassium glycinate, sodium glycinate, or zinc glycinate. It

encompasses a range of aluminum-to-zirconium ratios between 2.0:1 and 5.99:1 and a range of (aluminum plus zirconium)-to-chloride atomic ratios between 2.1:1 and 1.51:1. The following solvents may be used: water, propylene glycol, or dipropylene glycol. It contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled concentration of anhydrous aluminum zirconium trichlorohydrate.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—Label Solution to state the solvent and form of glycine used and the claimed concentration of anhydrous aluminum zirconium trichlorohydrate.

**Identification**—

**A:** A solution containing the equivalent of about 100 mg of anhydrous aluminum zirconium trichlorohydrate per mL responds to the test for *Chloride* (191).

**B:** *Identification of propylene glycol* (where stated on the label)—Add about 10 mL of isopropyl alcohol to 2 g of Solution, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath: the IR spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of propylene glycol.

**C:** *Identification of dipropylene glycol* (where stated on the label)—Add about 10 mL of isopropyl alcohol to 2 g of Solution, mix, and filter. Evaporate the filtrate to about 1 mL on a steam bath: the IR spectrum of a film of this solution on a silver chloride disk exhibits maxima only at the same wavelengths as that of a similar preparation of a film of dipropylene glycol.

**D:** *Identification of glycine*—Place about 1 g of Solution in a 50-mL beaker, add about 20 mL of water, and swirl to dissolve. Heat to boiling on a hot plate, and add about 60 mg of ninhydrin: a deep violet color immediately develops.

**pH** (791): between 3.0 and 5.0, in a solution prepared by diluting 3 g of the Solution with water to obtain 10 mL.

**Arsenic**, *Method I* (211)—Prepare the *Test Preparation* using an accurately weighed quantity of the Solution. The limit is 2 µg per g.

**Heavy metals**, *Method I* (231)—Proceed as directed in the chapter, except to use the following modifications.

**Test Preparation**—Prepare as directed in the chapter, using an accurately weighed quantity of Solution. If the solution is not clear after dilution to 40 mL, heat for several minutes between 60° and 80°, and cool to room temperature. If the solution remains cloudy, repeat from the beginning with the following modification: add 3 mL of hydrochloric acid prior to adjustment of the pH with 6 N ammonium hydroxide.

**Monitor Preparation**—Prepare as directed in the chapter, using the same modifications described for *Test Preparation* if necessary.

**Procedure**—To each of the three tubes containing the *Standard Preparation*, the *Test Preparation*, and the *Monitor Preparation*, add 2 mL of pH 3.5 Acetate Buffer, and heat gently to between 60° and 80°. To the *Standard Preparation* add 6 drops of sodium sulfide TS. To the *Test Preparation* and the *Monitor Preparation* add 12 drops of sodium sulfide TS. Cool to room temperature, and dilute the contents of each tube with water to 50 mL. Gently mix each tube by inverting twice. Allow to stand for 5 minutes, and view downward over a white surface. The color of the solution from the *Test Preparation* is not darker than that of the solution from the *Standard Preparation*, and the color of the solution from the *Monitor Preparation* is the same as or

darker than the color of the solution from the *Standard Preparation*. If the color of the solution from the *Monitor Preparation* is lighter than the color of the solution from the *Standard Preparation*, repeat the procedure with the following modification: after the heating step, to the *Monitor Preparation* and the *Test Preparation* add 1.0 mL, instead of 12 drops, of sodium sulfide TS. Not more than 10 µg per g is found.

**Limit of iron**—Using about 5.4 g of Aluminum Zirconium Trichlorohydrate Gly Solution, accurately weighed, instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Limit of iron* under *Aluminum Zirconium Octachlorohydrate*. The limit is 75 µg per g.

**Content of aluminum**—Using about 0.3 g of Aluminum Zirconium Trichlorohydrate Gly Solution instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of aluminum* under *Aluminum Zirconium Octachlorohydrate*. Use the result to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Content of zirconium**—Using about 500 mg of Aluminum Zirconium Trichlorohydrate Gly Solution, accurately weighed, instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of zirconium* under *Aluminum Zirconium Octachlorohydrate*. Use the result to calculate the *Aluminum/zirconium atomic ratio* and the *(Aluminum plus zirconium)/chloride atomic ratio*.

**Aluminum/zirconium atomic ratio**—Divide the percentage of aluminum found in the test for *Content of aluminum* by the percentage of zirconium found in the test for *Content of zirconium* and multiply by 92.97/26.98, in which 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, and 26.98 is the atomic weight of aluminum: the ratio is between 2.0:1 and 5.99:1.

**Content of chloride**—Using about 500 mg of Aluminum Zirconium Trichlorohydrate Gly Solution, accurately weighed, instead of Aluminum Zirconium Octachlorohydrate, proceed as directed in the test for the *Content of chloride* under *Aluminum Zirconium Octachlorohydrate*. Use the result to calculate the *(Aluminum plus zirconium)/chloride atomic ratio*.

**(Aluminum plus zirconium)/chloride atomic ratio**—Calculate the (aluminum plus zirconium)/chloride atomic ratio by the formula:

$$[(Al/26.98) + (Zr/92.97)]/(Cl/35.453)$$

in which *Al*, *Zr*, and *Cl* are the percentages of aluminum, zirconium, and chloride found in the tests for *Content of aluminum*, *Content of zirconium*, and *Content of chloride*, respectively; 26.98 is the atomic weight of aluminum; 92.97 is the atomic weight of zirconium corrected for 2% hafnium content; and 35.453 is the atomic weight of chlorine: the ratio is between 2.1:1 and 1.51:1.

**Assay**—Calculate the percentage of anhydrous aluminum zirconium trichlorohydrate in the Solution by the formula:

$$Al\{26.98y + 92.97 + 17.01[3y + 4 - (y + 1)/z] + 35.453(y + 1)/z\}/26.98y$$

in which *Al* is the percentage of aluminum found in the test for *Content of aluminum*, *y* is the aluminum/zirconium atomic ratio, as determined in the test for *Aluminum/zirconium atomic ratio*, *z* is the (aluminum plus zirconium)/chloride atomic ratio as determined in the test for *(Aluminum plus zirconium)/chloride atomic ratio*, 26.98 is the atomic weight of aluminum, 92.97 is the atomic weight of zirconium corrected for 2% hafnium content, 17.01 is the molecular weight of the hydroxide anion (OH), and 35.453 is the atomic weight of chlorine (Cl).

## Amantadine Hydrochloride

$C_{10}H_{17}N \cdot HCl$  187.71  
Tricyclo[3.3.1.1<sup>3,7</sup>]decan-1-amine, hydrochloride;  
1-Adamantanamine hydrochloride [665-66-7].

### DEFINITION

Amantadine Hydrochloride contains NLT 98.5% and NMT 101.5% of  $C_{10}H_{17}N \cdot HCl$ .

### IDENTIFICATION

#### • A. INFRARED ABSORPTION (197S)

Cell: 1 mm

**Sample solution:** 50 mg in 10 mL of 0.1 N hydrochloric acid, and filter. Transfer the filtrate to a suitable separator, add 1 mL of 5 N sodium hydroxide, and extract with 5 mL of methylene chloride.

**Acceptance criteria:** Meets the requirements

### ASSAY

#### • PROCEDURE

**Sample:** Dissolve 120 mg of Amantadine Hydrochloride in a mixture of 30 mL of glacial acetic acid and 10 mL of mercuric acetate TS.

**Analysis:** Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically, using suitable electrodes. Perform a blank determination. Each mL of 0.1 N perchloric acid is equivalent to 18.77 mg of amantadine hydrochloride ( $C_{10}H_{17}N \cdot HCl$ ).

**Acceptance criteria:** 98.5%–101.5%

### IMPURITIES

#### • HEAVY METALS, Method I (231)

**Test preparation:** Use 1 mL of 1 N acetic acid.

**Acceptance criteria:** NMT 10 ppm

#### • ORGANIC IMPURITIES

**Internal standard solution:** 50 mg/mL of adamantane in dichloromethane

**Standard solution:** Transfer 10 mg of USP Amantadine Hydrochloride RS to a separator. Add 20 mL of 5.0 N sodium hydroxide and 18 mL of dichloromethane, and shake for 10 min. Remove the water layer, dry the organic layer by swirling with anhydrous sodium sulfate, and allow to stand for a few min to ensure that all remaining water has been removed. Filter, collect the filtrate in a 20-mL volumetric flask, add 0.2 mL of *Internal standard solution*, and dilute with dichloromethane to volume.

**Sample solution:** Transfer 1.0 g of Amantadine Hydrochloride to a separator. Add 20 mL of 5.0 N sodium hydroxide and 18 mL of dichloromethane, and shake for 10 min. Remove the water layer, dry the organic layer by swirling with anhydrous sodium sulfate, and allow to stand for a few min to ensure that all remaining water has been removed. Filter, collect the filtrate in a 20-mL volumetric flask, add 0.2 mL of *Internal standard solution*, and dilute with dichloromethane to volume.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Detector temperature:** 300°

**Column:** 0.53-mm  $\times$  30-m fused-silica column coated with 1.0- $\mu$ m G27 stationary phase

Column temperature: See *Table 1*.

**Table 1**

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
70	0	70	5
70	10	250	At least 17

**Carrier gas:** Helium

**Flow rate:** 4 mL/min

**Injection size:** 2  $\mu$ L

**Injector temperature:** 220°

**Injection type:**

**Split flow:** 200 mL/min

**Split flow ratio:** 50:1

**System suitability**

**Sample:** *Standard solution*

[NOTE—The relative retention times for adamantane and amantadine are about 0.7 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 20 between adamantane and amantadine

**Relative standard deviation:** NMT 5.0% determined from the peak response ratios of amantadine to adamantane

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of amantadine hydrochloride ( $C_{10}H_{17}N \cdot HCl$ ) taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratio of each impurity to adamantane from the *Sample solution*

$R_S$  = peak response ratio of amantadine to adamantane from the *Standard solution*

$C_S$  = concentration of USP Amantadine Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of the *Sample solution* (mg/mL)

**Acceptance criteria**

**Individual impurities:** NMT 0.3%

**Total impurities:** NMT 1.0%

### SPECIFIC TESTS

#### • pH (791)

**Sample:** 0.2 g/mL in water

**Acceptance criteria:** 3.0–5.5

#### • CLARITY AND COLOR OF SOLUTION

**Sample:** Dissolve 2 g in 10 mL of water.

**Acceptance criteria:** Solution is clear and nearly colorless.

### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• **USP REFERENCE STANDARDS (11)**

USP Amantadine Hydrochloride RS

## Amantadine Hydrochloride Capsules

### DEFINITION

Amantadine Hydrochloride Capsules contain NLT 95.0% and NMT 105.0% of the labeled amount of amantadine hydrochloride ( $C_{10}H_{17}N \cdot HCl$ ).

**IDENTIFICATION**• **INFRARED ABSORPTION** <197S>

Cell: 1 mm

**Sample solution:** Place the contents of Capsules, equivalent to 200 mg of amantadine hydrochloride, in a vessel, dissolve in 0.1 N hydrochloric acid, and filter. Transfer the filtrate to a separator, add 1 mL of 5 N sodium hydroxide, and extract with 5 mL of methylene chloride. Filter the extract through anhydrous sodium sulfate, and rinse the anhydrous sodium sulfate with 2 mL of methylene chloride.

**ASSAY**• **PROCEDURE**

**Internal standard solution:** 0.4 mg/mL of naphthalene in hexane

**Standard stock solution:** 2 mg/mL of USP Amantadine Hydrochloride RS in water

**Standard solution:** Pipet 25.0 mL of *Standard stock solution* into a 250-mL separator, and add 25 mL of 2.0 N sodium hydroxide and 50.0 mL of *Internal standard solution*. Shake for 60 min, and collect the hexane layer (*Standard solution*).

**Sample solution:** Transfer NLT 20 Capsules to a 200-mL volumetric flask. Add 40 mL of 0.1 N hydrochloric acid, and heat gently to achieve complete dissolution. Cool, and dilute with water to volume. Pipet 5.0 mL of the solution into a 250-mL separator, and add 40 mL of 1.0 N sodium hydroxide and 50.0 mL of *Internal standard solution*. Shake for 60 min, and collect the hexane layer (*Sample solution*).

**Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)**Mode:** GC**Detector:** Flame ionization**Column:** 2-mm  $\times$  1.22-m; glass column packed with 10% phase G1 on 100- to 120-mesh support S1A**Temperature****Column:** 115°**Injector:** 250°**Detector block:** 250°**Injection size:** 1  $\mu$ L**System suitability****Sample:** *Standard solution***Suitability requirements****Resolution:** NLT 2 between naphthalene and amantadine**Tailing factor:** NMT 2.0 for the analyte peak**Relative standard deviation:** NMT 2.0%**Analysis****Samples:** *Standard solution* and *Sample solution*Calculate the percentage of  $C_{10}H_{17}N \cdot HCl$  in the portion taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

 $R_U$  = peak response ratios from the *Sample solution* $R_S$  = peak response ratios from the *Standard solution* $C_S$  = concentration of USP Amantadine Hydrochloride RS in the *Standard solution* (mg/mL) $C_U$  = nominal concentration of the *Sample solution* (mg/mL)**Acceptance criteria:** 95.0%–105.0%**PERFORMANCE TESTS**• **DISSOLUTION** <711>**Test 1:** Procedure for a Pooled Sample**Medium:** Water; 900 mL**Apparatus 1:** 100 rpm**Time:** 45 min**Internal standard solution:** 0.054 mg/mL of naphthalene in hexane**Standard stock solution:** 0.1 mg/mL of USP

Amantadine Hydrochloride RS in water

**Standard solution:** Pipet 15.0 mL of *Standard stock solution* into a 50-mL screw-capped test tube, add 5.0 mL of 5 N sodium hydroxide and 10.0 mL of *Internal standard solution*, and shake for 60 min. Collect the hexane layer.

**Sample solution:** Filter 15.0 mL of the solution under test, and place into a 50-mL screw-capped test tube. Pipet 5.0 mL of 5 N sodium hydroxide and 10.0 mL of the *Internal standard solution* into the test tube, and shake for 60 min. Collect the hexane layer (*Sample solution*).

**Chromatographic system:** Proceed as directed in the *Assay*.

**Injection size:** 2.5  $\mu$ L**Analysis****Samples:** *Standard solution* and *Sample solution***Tolerances:** NLT 75% (Q) of the labeled amount of  $C_{10}H_{17}N \cdot HCl$  is dissolved.**Test 2:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.**Medium:** Water; 900 mL

**Apparatus 2:** 75 rpm, with sinkers. [NOTE—A suitable sinker is available as catalog number CAPWHT-2S from www.qia-llc.com or www.tabletdissolution.com or www.labhut.com.]

**Time:** 45 min**Internal standard solution:** 0.06 mg/mL of naphthalene in hexanes**Standard stock solution:** 0.12 mg/mL of USPAmantadine Hydrochloride RS in *Medium*

**Standard solution:** Transfer 60.0 mL of the *Standard stock solution* to a 200-mL volumetric flask. Add 20 mL of 5 N sodium hydroxide and 40.0 mL of *Internal standard solution*. Shake the flask for approximately 10 min, and allow the layers to separate. Use the top layer for injection. The final concentration is about 0.18 mg/mL.

**Sample solution:** Transfer 3.0 mL of the solution under test to a centrifuge tube. Add 1.0 mL of 5 N sodium hydroxide and 2.0 mL of *Internal standard solution*. Shake the tube for approximately 10 min, and allow the layers to separate. Use the top layer for injection.

**Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)**Mode:** GC**Detector:** Flame ionization**Column:** 0.32-mm  $\times$  30-cm, 0.25- $\mu$ m film, phase G1**Temperature****Oven:** 100° for 3 min, to 200° at 10°/min, held at 200° for 2 min**Injector:** 250°**Detector:** 300°**Carrier gas:** Helium, 1.4 mL/min**Flow rate:** 20 mL/min**Injection size:** 2  $\mu$ L**System suitability****Sample:** *Standard solution***Suitability requirements****Resolution:** NLT 2 between naphthalene and amantadine hydrochloride**Tailing factor:** NMT 2.0 for amantadine hydrochloride**Relative standard deviation:** NMT 2.0%**Analysis****Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of amantadine hydrochloride released:

$$\text{Result} = (R_U/R_S) \times (C_S/L) \times V \times 100$$

 $R_U$  = ratio of the peak areas from the *Sample solution*

- $R_S$  = average ratio of the peak areas from the *Standard solution*  
 $C_S$  = concentration of amantadine hydrochloride in the *Standard stock solution* (mg/mL)  
 $L$  = label claim (mg/capsule)  
 $V$  = volume of *Medium*, 900 mL

**Tolerances:** NLT 75% (Q) of the labeled amount of amantadine hydrochloride is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS (11)**  
USP Amantadine Hydrochloride RS

### Amantadine Hydrochloride Oral Solution

» Amantadine Hydrochloride Oral Solution contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of amantadine hydrochloride ( $C_{10}H_{17}N \cdot HCl$ ).

**Packaging and storage**—Preserve in tight containers.

#### USP Reference standards (11)—

USP Amantadine Hydrochloride RS

#### Identification, Infrared Absorption (197S)—

*Cell:* 1 mm.

*Solution*—Place a volume of Oral Solution, equivalent to about 200 mg of amantadine hydrochloride, in a vessel, dissolve in 0.1 N hydrochloric acid, and filter. Transfer the filtrate to a separator, add 10 mL of 0.5 N sodium hydroxide, and extract with 5 mL of methylene chloride. Filter the extract through anhydrous sodium sulfate, and rinse the anhydrous sodium sulfate with 2 mL of methylene chloride.

#### Assay—

*Internal standard solution, Standard preparation, and Chromatographic system*—Proceed as directed in the Assay under *Amantadine Hydrochloride Capsules*.

*Assay preparation*—Pipet 5.0 mL of the Oral Solution into a 250-mL conical flask, and add 45 mL of 1.0 N sodium hydroxide and 50.0 mL of *Internal standard solution*. Shake for 60 minutes, and collect the hexane layer (*Assay preparation*).

*Procedure*—Proceed as directed in the Assay under *Amantadine Hydrochloride Capsules*. Calculate the quantity, in mg, of amantadine hydrochloride ( $C_{10}H_{17}N \cdot HCl$ ) in the portion of Oral Solution taken by the formula:

$$50C(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Amantadine Hydrochloride RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

### Amcinonide

$C_{28}H_{35}FO_7$  502.57

Pregna-1,4-diene-3,20-dione, 21-(acetyloxy)-16,17-[cyclopentylidenebis(oxy)]-9-fluoro-11-hydroxy-, (11 $\beta$ , 16 $\alpha$ )-.

9-Fluoro-11 $\beta$ ,16 $\alpha$ ,17,21-tetrahydroxypregna-1,4-diene-3,20-dione cyclic 16,17-acetal with cyclopentanone, 21-acetate [51022-69-6].

» Amcinonide contains not less than 97.0 percent and not more than 102.0 percent of  $C_{28}H_{35}FO_7$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

#### USP Reference standards (11)—

USP Amcinonide RS

#### Identification—

**A:** *Infrared Absorption* (197K).

**B:** *Ultraviolet Absorption* (197U)—

*Solution:* 40  $\mu$ g per mL.

*Medium:* methanol.

Absorptivities at 238 nm, calculated on the dried basis, do not differ by more than 3.0%.

**Specific rotation** (781S): between +89.4° and +94.0°.

*Test solution:* 10 mg per mL, in chloroform.

**Loss on drying** (731)—Dry it at 105° for 4 hours; it loses not more than 1.0% of its weight.

**Heavy metals, Method II** (231): 0.002%.

#### Assay—

*Solution A*—Prepare a filtered and degassed mixture of water and acetonitrile (13:7).

*Solution B*—Prepare a filtered and degassed mixture of acetonitrile and water (7:3).

*Mobile phase*—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments to either *Solution* as necessary (see *System Suitability* under *Chromatography* (621)).

*System suitability solution*—Dissolve suitable quantities of butylparaben and USP Amcinonide RS in *Solution B* to obtain separate solutions containing 12.5  $\mu$ g per mL and 20  $\mu$ g per mL, respectively.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Amcinonide RS in *Solution B*, and dilute quantitatively, and stepwise if necessary, with *Solution B* to obtain a solution having a known concentration of about 0.02 mg per mL.

*Assay preparation*—Transfer about 20 mg of Amcinonide, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Solution B* to volume, sonicate for 5 minutes, and mix. Transfer 5 mL of this solution to a 50-mL volumetric flask, dilute with *Solution B* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L1, and is programmed to provide variable mixtures of *Solution A* and *Solution B*. The flow rate is about 2 mL per minute. Equilibrate the system with *Solution A*. From 2.5 minutes to 10 minutes after injection, linearly increase the amount of *Solution B* to 100%. Chromatograph the *System suitability*

solution, and record the peak responses as directed under *Procedure*: the relative retention times are about 0.78 for butylparaben and 1.0 for amcinonide, and the resolution,  $R$ , between butylparaben and amcinonide is not less than 8.0. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 1.5, and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation*. Record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{28}H_{35}FO_7$  in the portion of Amcinonide taken by the formula:

$$1000C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Amcinonide RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Amcinonide Cream

» Amcinonide Cream is Amcinonide in a suitable cream base. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of amcinonide ( $C_{28}H_{35}FO_7$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Amcinonide RS

**Identification**—Place 2 g of the Cream in a 150-mL beaker, add 50 mL of chloroform and 15 g of anhydrous sodium sulfate, and stir with a glass rod to dissolve the specimen. Filter the solution, and clarify the filtrate, if necessary, by the further addition of anhydrous sodium sulfate and a second filtration. Evaporate the filtrate to dryness, and dissolve the residue in chloroform to obtain a solution containing about 100  $\mu$ g of amcinonide per mL. Apply 25  $\mu$ L of this solution, and 25  $\mu$ L of a solution of USP Amcinonide RS in chloroform containing 100  $\mu$ g per mL, on a line parallel to and about 3 cm from the bottom edge of a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel. Place the plate in a developing chamber containing and equilibrated with ether. Develop the chromatogram until the solvent front has moved about 12 cm above the line of application. Remove the plate, allow the solvent to evaporate, and locate the spots on the plate by viewing under short-wavelength UV light: the intensity and the  $R_f$  value of the principal spot obtained from the solution under test are similar to those of the spot obtained from the Standard solution.

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**Minimum fill** (755): meets the requirements.

**pH** (791): between 3.5 and 5.2.

**Assay**—

*Solution A, Solution B, Mobile phase, System suitability solution, Standard preparation, and Chromatographic system*—Proceed as directed in the *Assay under Amcinonide*.

*Assay preparation*—Transfer an accurately weighed quantity of Cream, equivalent to about 10 mg of Amcinonide, to a 50-mL volumetric flask, add 5 mL of *Solution B* and 15 mL of acetonitrile, and heat over a steam bath until dissolved.

Add 20 mL of *Solution B* while hot, cool to room temperature, dilute with *Solution B* to volume, and refrigerate for 30 minutes. Vigorously shake the solution to disperse the mixture, and filter while cold. Transfer 5 mL of this solution to a 50-mL volumetric flask, dilute with *Solution B* to volume, and mix.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation*. Record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of amcinonide ( $C_{28}H_{35}FO_7$ ) in the portion of Cream taken by the formula:

$$500C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Amcinonide RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Amcinonide Ointment

» Amcinonide Ointment is Amcinonide in a suitable ointment base. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of amcinonide ( $C_{28}H_{35}FO_7$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Amcinonide RS

**Identification**—It meets the requirements for the *Identification test under Amcinonide Cream*.

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**Minimum fill** (755): meets the requirements.

**Assay**—

*Solution A, Solution B, Mobile phase, System suitability solution, Standard preparation, and Chromatographic system*—Proceed as directed in the *Assay under Amcinonide*, except to use a 240-nm detector.

*Assay preparation*—Dissolve an accurately weighed quantity of Ointment in a suitable volume of a mixture of acetonitrile and chloroform (4:1) by heating in a hot water bath, cooling, and adjusting quantitatively with the same solvent mixture to obtain a solution having a concentration of about 0.2 mg of amcinonide per mL. Cool to room temperature, dilute with acetonitrile to volume, and filter. Transfer 5 mL of this solution to a 50-mL volumetric flask, dilute with *Solution B* to volume, and mix.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of amcinonide ( $C_{28}H_{35}FO_7$ ) in the portion of Ointment taken by the formula:

$$500C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Amcinonide RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Amifostine

$C_5H_{15}N_2O_3PS \cdot 3H_2O$  268.27  
 Ethanethiol, 2-[(3-aminopropyl)amino]-, dihydrogen phosphate (ester), trihydrate;  
 S-[2-(3-Aminopropyl)amino]ethyl]dihydrogen phosphorothioate, trihydrate [112901-68-5].

### DEFINITION

Amifostine contains NLT 78.0% and NMT 82.0% of  $C_5H_{15}N_2O_3PS$ , calculated on the as-is basis.

### IDENTIFICATION

- A. INFRARED ABSORPTION** <197K>
- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

**Buffer:** 0.94 g/L of sodium 1-hexanesulfonate. Adjust with phosphoric acid to a pH of 3.0.

**Mobile phase:** Methanol and *Buffer* (7:18)

**Standard solution:** 3 mg/mL of USP Amifostine RS in water. [NOTE—Inject immediately after preparation.]

**Sample solution:** 3 mg/mL of Amifostine in water.

[NOTE—Inject immediately after preparation.]

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 220 nm

**Column:** 4.6-mm × 25-cm; 5-μm packing L7

**Autosampler temperature:** 4°

**Flow rate:** 1.0 mL/min

**Injection size:** 10 μL

#### System suitability

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 2.0

**Column efficiency:** NLT 100 theoretical plates

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_5H_{15}N_2O_3PS$  in the portion of Amifostine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Amifostine RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Amifostine in the *Sample solution* (mg/mL)

**Acceptance criteria:** 78.0%–82.0% on the as-is basis

### IMPURITIES

#### Inorganic Impurities

- HEAVY METALS**, *Method II* <231>: NMT 20 ppm

#### Organic Impurities

#### PROCEDURE

**Mobile phase and Chromatographic system:** Proceed as directed in the *Assay*.

**Standard solution:** 70 μg/mL of USP Amifostine Thiol RS and 16 μg/mL of USP Amifostine RS in water.

[NOTE—Inject immediately after preparation.]

**System suitability solution:** Use the *Standard solution* as described in the *Assay*. [NOTE—Inject immediately after preparation.]

**Sample solution:** 15 mg/mL of Amifostine in water.

[NOTE—Inject immediately after preparation.]

#### System suitability

**Samples:** *Standard solution* and *System suitability solution*

#### Suitability requirements

**Column efficiency:** NLT 1000 theoretical plates, *System suitability solution*

**Tailing factor:** NMT 2.0, *System suitability solution*

**Relative standard deviation:** NMT 15.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of amifostine thiol in the portion of Amifostine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$r_U$  = peak response of amifostine thiol from the *Sample solution*

$r_S$  = peak response of amifostine thiol from the *Standard solution*

$C_S$  = concentration of USP Amifostine Thiol RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of amifostine in the *Sample solution* (mg/mL)

$M_{r1}$  = molecular weight of amifostine thiol, 134.24

$M_{r2}$  = molecular weight of amifostine thiol dihydrochloride, 207.17

Calculate the percentage of any other individual impurity in the portion of Amifostine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of each individual impurity in the *Sample solution*

$r_S$  = peak response of amifostine in the *Standard solution*

$C_S$  = concentration of USP Amifostine RS in the *Standard solution* (μg/mL)

$C_U$  = concentration of the *Sample solution* (μg/mL)

#### Acceptance criteria

**Amifostine thiol:** NMT 0.3%

**Any individual impurity, excluding amifostine thiol:** NMT 0.1%

**Total impurities including amifostine thiol:** NMT 0.3%

### SPECIFIC TESTS

- PH** <791>: 6.5–7.5, in a solution (5 in 100)

- WATER DETERMINATION**, *Method Ic* <921>

**Sample solution:** To 100.0 mg of Amifostine, contained in a stoppered centrifuge tube, add 10.0 mL of the solution of *N*-ethylmaleimide in methanol (4 in 100), and sonicate for 15 min. Shake to disperse, and sonicate for an additional 15 min. Use 1.0 mL of the supernatant.

**Acceptance criteria:** 19.2%–21.2%

### ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store in a refrigerator.

- USP REFERENCE STANDARDS** <11>

USP Amifostine RS

USP Amifostine Thiol RS

Ethanethiol, 2-[(3-aminopropyl)amino]-, dihydrochloride.

$C_5H_{16}N_2SCL_2$  207.17

## Amifostine for Injection

### DEFINITION

Amifostine for Injection is a sterile, crystalline substance suitable for parenteral use. It contains NLT 90.0% and NMT 110.0% of the labeled amount of amifostine ( $C_5H_{15}N_2O_3PS$ ).

### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

### ASSAY

#### • PROCEDURE

**Buffer:** 0.94 g/L of sodium 1-hexanesulfonate. Adjust with phosphoric acid to a pH of 3.0.

**Mobile phase:** Methanol and *Buffer* (7:18)

**Standard solution:** 3 mg/mL of USP Amifostine RS in water. [NOTE—Inject immediately after preparation, or refrigerate until use.]

**Sample solution:** 3 mg/mL of amifostine from Amifostine for Injection, in water. [NOTE—Inject immediately after preparation, or refrigerate until use.]

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 220 nm

**Column:** 4.6-mm × 25-cm; 5-μm packing L7

**Autosampler temperature:** 4°

**Flow rate:** 1.0 mL/min

**Injection size:** 10 μL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Column efficiency:** NLT 1000 theoretical plates

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_5H_{15}N_2O_3PS$  in the portion of Amifostine for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak responses from the *Sample solution*

$r_S$  = peak responses from the *Standard solution*

$C_S$  = concentration of USP Amifostine RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of amifostine in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

### PERFORMANCE TESTS

- **UNIFORMITY OF DOSAGE UNITS** (905): Meets the requirements

### IMPURITIES

#### Organic Impurities

##### • PROCEDURE 1

**Mobile phase and Chromatographic system:** Proceed as directed in the Assay.

**Standard solution 1:** 70 μg/mL of USP Amifostine Thiol RS in water

**Standard solution 2:** 15 μg/mL of sodium thiophosphate and 13 μg/mL of *N,N*-dimethylformamide in water. [NOTE—The retention times of sodium thiophosphate and *N,N*-dimethylformamide are about 2 min and about 3.6 min, respectively.]

**Sample solution:** 2.4 mg/mL of amifostine from Amifostine for Injection in water. [NOTE—Inject immediately after preparation.]

#### System suitability

**Samples:** *Standard solution 1* and *Standard solution 2*

#### Suitability requirements

**Relative standard deviation:** NMT 10.0%, *Standard solution 1*; NMT 4.0%, *Standard solution 2*

#### Analysis

**Samples:** *Standard solution 1*, *Standard solution 2*, and *Sample solution*

Calculate the percentage of amifostine thiol in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$r_U$  = peak response of amifostine thiol from the *Sample solution*

$r_S$  = peak response of amifostine thiol from *Standard solution 1*

$C_S$  = concentration of USP Amifostine Thiol RS in *Standard solution 1* (mg/mL)

$C_U$  = concentration of amifostine in the *Sample solution* (mg/mL)

$M_{r1}$  = molecular weight of amifostine thiol, 134.24

$M_{r2}$  = molecular weight of amifostine thiol dihydrochloride, 207.17

Calculate the percentage of sodium thiophosphate or *N,N*-dimethylformamide in the portion of sample taken, if present:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of sodium thiophosphate or *N,N*-dimethylformamide from the *Sample solution*

$r_S$  = peak response of sodium thiophosphate or *N,N*-dimethylformamide from *Standard solution 2*

$C_S$  = concentration of sodium thiophosphate or *N,N*-dimethylformamide in *Standard solution 2* (mg/mL)

$C_U$  = concentration of amifostine in the *Sample solution* (mg/mL)

Calculate the percentage of any other individual, unspecified impurity in the portion of sample taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response of each individual impurity in the *Sample solution*

$r_T$  = total of all peak responses in the *Sample solution*

**Acceptance criteria:** NMT 0.1% of sodium thiophosphate; NMT 0.088% of *N,N*-dimethylformamide; NMT 0.1% of any other individual unspecified impurity

##### • PROCEDURE 2

**Buffer:** 0.4 g/L of sodium 1-octanesulfonate. Adjust with trifluoroacetic acid to a pH of  $2.5 \pm 0.1$ .

**Mobile phase:** Acetonitrile and *Buffer* (1:3)

**Standard solution:** 46 μg/mL of USP Amifostine Disulfide RS in water

**Sample solution:** Dilute a quantity of Amifostine for Injection in water to prepare a solution equivalent to 10 mg/mL. [NOTE—Inject immediately after preparation.]

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 247 nm

**Column:** 4.6-mm × 25-cm; 5-μm packing L1

**Autosampler temperature:** 4°

**Flow rate:** 1.0 mL/min

**Injection size:** 10 μL

**System suitability****Sample:** *Standard solution***Suitability requirements****Tailing factor:** NMT 2.5**Relative standard deviation:** NMT 4.0%**Analysis****Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of amifostine disulfide in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

 $r_U$  = peak response of amifostine disulfide from the *Sample solution* $r_S$  = peak response of amifostine disulfide from the *Standard solution* $C_S$  = concentration of USP Amifostine Disulfide RS in the *Standard solution* (mg/mL) $C_U$  = concentration of amifostine in the *Sample solution* (mg/mL) $M_{r1}$  = molecular weight of amifostine disulfide, 266.47 $M_{r2}$  = molecular weight of amifostine disulfide tetrahydrochloride, 412.31**Acceptance criteria:** NMT 2.0% of total impurities, including amifostine thiol and amifostine disulfide**SPECIFIC TESTS**

- **CONSTITUTED SOLUTION:** At the time of use, it meets the requirements for *Injections* <1>, *Constituted Solutions*. When constituted with 0.9% *Sodium Chloride Injection*, the solution must completely dissolve in 45 s.
- **X-RAY DIFFRACTION** <941>: Its X-ray diffraction pattern conforms to that of USP Amifostine RS, similarly determined.
- **STERILITY TESTS** <71>: It meets the requirements when tested as directed for *Test for Sterility of the Product to be Examined*, *Membrane Filtration*.
- **pH** <791>: 6.5–7.5, in a solution constituted as directed in the labeling
- **WATER DETERMINATION, Method 1c** <921>  
**Sample solution:** To 100.0 mg of Amifostine for Injection, contained in a stoppered centrifuge tube, add 10.0 mL of a solution of *N*-ethylmaleimide in methanol (4 in 100), and sonicate for 15 min. Shake to disperse, and sonicate for an additional 15 min. Use 1.0 mL of the supernatant.

**Acceptance criteria:** 18.0%–22.0%

- **PARTICULATE MATTER IN INJECTIONS** <788>: Meets the requirements for small-volume injections
- **BACTERIAL ENDOTOXINS TEST** <85>: Contains NMT 0.2 USP Endotoxin Unit/mg of amifostine
- **OTHER REQUIREMENTS:** Meets the requirements for *Injections* <1>, *Labeling*.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight *Containers for Sterile Solids* as described under *Injections* <1>, and store at controlled room temperature.
- **USP REFERENCE STANDARDS** <11>  
USP Amifostine RS  
USP Amifostine Disulfide RS  
1,3-Propanediamine, *N,N*-(dithiodi-2,1-ethanediyl)bis, tetrahydrochloride.

USP Endotoxin RS

**Amikacin** $C_{22}H_{43}N_5O_{13}$  585.60D-Streptamine, O-3-amino-3-deoxy-α-D-glucopyranosyl-(1→6)-O-[6-amino-6-deoxy-α-D-glucopyranosyl(1→4)]-N<sup>1</sup>-(4-amino-2-hydroxy-1-oxobutyl)-2-deoxy-, (S)-, O-3-Amino-3-deoxy-α-D-glucopyranosyl(1→4)-O-[6-amino-6-deoxy-α-D-glucopyranosyl(1→6)]-N<sup>3</sup>-(4-amino-L-2-hydroxybutyl)-2-deoxy-L-streptamine [37517-28-5].» Amikacin has a potency of not less than 900 μg of  $C_{22}H_{43}N_5O_{13}$  per mg, calculated on the anhydrous basis.**Packaging and storage**—Preserve in tight containers.**USP Reference standards** <11>—

USP Amikacin RS

USP Kanamycin Sulfate RS

**Identification**—**A: Thin-Layer Chromatographic Identification Test** <201>—**Test solution:** 6 mg per mL, in water. Apply 3 μL.**Standard solution:** 6 mg per mL, in water. Apply 3 μL.**Mixed solution:** a mixture of the *Test solution* and the *Standard solution* (1:1). Apply 3 μL.**Developing solvent system:** a mixture of methanol, ammonium hydroxide, and chloroform (60:35:25).**Spray reagent:** a 1 in 100 solution of ninhydrin in a mixture of butyl alcohol and pyridine (100:1).**Procedure**—Proceed as directed in the chapter, except to develop the chromatogram by continuous flow for 5.5 hours. Remove the plate from the chamber, allow the solvent to evaporate, and heat the plate at 110° for 15 minutes. Spray the plate with *Spray reagent*, and immediately locate the spots: amikacin appears as a pink spot, and the spots obtained from the *Test solution* and the *Mixed solution* correspond in distance from the origin to that obtained from the *Standard solution*.**B:** The retention time of the peak for amikacin in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.**Specific rotation** <781S>: between +97° and +105°.**Test solution:** 20 mg per mL, in water.**Crystallinity** <695>: meets the requirements.**pH** <791>: between 9.5 and 11.5, in a solution containing 10 mg per mL.**Water, Method 1** <921>: not more than 8.5%.**Residue on ignition** <281>: not more than 1.0%, the charred residue being moistened with 2 mL of nitric acid and 5 drops of sulfuric acid.**Assay**—**Mobile phase**—Use 0.115 N sodium hydroxide. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).**System suitability solution**—Prepare a solution in water containing about 0.02 mg of USP Amikacin RS per mL and 0.008 mg of USP Kanamycin Sulfate RS per mL.**Standard preparation**—Quantitatively dissolve an accurately weighed quantity of USP Amikacin RS in water to ob-

tain a solution having a known concentration of about 0.02 mg per mL.

**Assay preparation**—Transfer about 50 mg of Amikacin, accurately weighed, to a 250-mL volumetric flask, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with an electrochemical detector, a gold working electrode, and a pH silver-silver chloride reference electrode, a guard column that contains packing L47, and a 4-mm × 25-cm analytical column that contains packing L47. The electrochemical detector is used in the integrated amperometric mode with a range of 300 nC, an output of 1 V full scale, a rise time of 0.5 second, positive polarity, potential  $E = 0.04$  V;  $t_1 = 200$  ms;  $E_2 = 0.8$  V;  $t_2 = 190$  ms;  $E_3 = -0.8$  V;  $t_3 = 190$  ms. The flow rate is about 0.5 mL per minute. Chromatograph the *System suitability solution*, and measure the peak areas as directed for *Procedure*: the relative retention times are about 0.8 for kanamycin and 1.0 for amikacin; and the resolution,  $R$ , between kanamycin and amikacin is not less than 3. Chromatograph the *Standard preparation*, and measure the peak areas as directed for *Procedure*: the tailing factor is not more than 2; and the relative standard deviation for replicate injections is not more than 3%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in  $\mu$ g, of  $C_{22}H_{43}N_5O_{13}$  in each mg of Amikacin taken by the formula:

$$2500(CE / W)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Amikacin RS in the *Standard preparation*;  $E$  is the designated amikacin content, in  $\mu$ g per mg, of USP Amikacin RS;  $W$  is the weight, in mg, of Amikacin taken to prepare the *Assay preparation*; and  $r_U$  and  $r_S$  are the amikacin peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.

lated on the dried basis; Amikacin Sulfate having a molar ratio of amikacin to  $H_2SO_4$  of 1:1.8 contains the equivalent of not less than 691  $\mu$ g and not more than 806  $\mu$ g of amikacin ( $C_{22}H_{43}N_5O_{13}$ ) per mg, calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Label it to indicate whether its molar ratio of amikacin to  $H_2SO_4$  is 1:2 or 1:1.8.

**USP Reference standards** <11>—

USP Amikacin RS

USP Kanamycin Sulfate RS

**Identification**—It responds to the *Identification* tests under *Amikacin*.

**Specific rotation** <781S>: between  $+76^\circ$  and  $+84^\circ$ .

*Test solution*: 20 mg per mL, in water.

**Crystallinity** <695>: meets the requirements.

**pH** <791>: between 2.0 and 4.0 (1:2 salt), or between 6.0 and 7.3 (1:1.8 salt), in a solution containing 10 mg per mL.

**Loss on drying** <731>—Dry about 100 mg, accurately weighed, in vacuum at a pressure not exceeding 5 mm of mercury at  $110^\circ$  for 3 hours: it loses not more than 13.0% of its weight.

**Residue on ignition** <281>: not more than 1.0%, the charred residue being moistened with 2 mL of nitric acid and 5 drops of sulfuric acid.

**Assay**—

*Mobile phase*, *System suitability solution*, *Standard preparation*, and *Chromatographic system*—Proceed as directed in the *Assay* under *Amikacin*.

**Assay preparation**—Transfer an accurately weighed quantity of Amikacin Sulfate, equivalent to about 50 mg of amikacin ( $C_{22}H_{43}N_5O_{13}$ ), to a 250-mL volumetric flask, add about 50 mL of water, and swirl to dissolve. Dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix.

**Procedure**—Proceed as directed in the *Assay* under *Amikacin*. Calculate the quantity, in  $\mu$ g, of amikacin ( $C_{22}H_{43}N_5O_{13}$ ) in each mg of Amikacin Sulfate taken by the formula:

$$2500(CE / W)(r_U / r_S)$$

in which  $W$  is the weight, in mg, of Amikacin Sulfate taken to prepare the *Assay preparation*; and the other terms are as defined therein.

## Amikacin Sulfate

$C_{22}H_{43}N_5O_{13} \cdot H_2SO_4$  762.15

$C_{22}H_{43}N_5O_{13} \cdot 2H_2SO_4$  781.76

D-Streptamine, O-3-amino-3-deoxy- $\alpha$ -D-glucopyranosyl(1 $\rightarrow$ 6)-O-[6-amino-6-deoxy- $\alpha$ -D-glucopyranosyl(1 $\rightarrow$ 4)]-N<sup>1</sup>-(4-amino-2-hydroxy-1-oxobutyl)-2-deoxy-, (S)-, sulfate (1:2 or 1:1.8) (salt).  
O-3-Amino-3-deoxy- $\alpha$ -D-glucopyranosyl(1 $\rightarrow$ 4)-O-[6-amino-6-deoxy- $\alpha$ -D-glucopyranosyl(1 $\rightarrow$ 6)]-N<sup>3</sup>-(4-amino-L-2-hydroxybutyl)-2-deoxy-L-streptamine sulfate (1:2 or 1:1.8) [39831-55-5].

» Amikacin Sulfate having a molar ratio of amikacin to  $H_2SO_4$  of 1:2 contains the equivalent of not less than 674  $\mu$ g and not more than 786  $\mu$ g of amikacin ( $C_{22}H_{43}N_5O_{13}$ ) per mg, calcu-

## Amikacin Sulfate Injection

» Amikacin Sulfate Injection is a sterile solution of Amikacin Sulfate in Water for Injection, or of Amikacin in Water for Injection prepared with the aid of Sulfuric Acid. It contains not less than 90.0 percent and not more than 120.0 percent of the labeled amount of amikacin ( $C_{22}H_{43}N_5O_{13}$ ).

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers, preferably of Type I or Type III glass.

**USP Reference standards** <11>—

USP Amikacin RS

USP Endotoxin RS

USP Kanamycin Sulfate RS

**Identification—**

**A:** Dilute it with water to obtain a solution containing 6 mg per mL: the resulting solution meets the requirements of *Identification test A* under *Amikacin*.

**B:** The retention time of the peak for amikacin in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Bacterial endotoxins** (85)—It contains not more than 0.33 USP Endotoxin Unit per mg of amikacin.

**pH** (791): between 3.5 and 5.5.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay—**

*Mobile phase, System suitability solution, Standard preparation, and Chromatographic system*—Proceed as directed in the *Assay* under *Amikacin*.

*Assay preparation*—Dilute an accurately measured volume of Injection quantitatively, and stepwise if necessary, with water to obtain a solution having a concentration of about 0.02 mg of amikacin ( $C_{22}H_{43}N_5O_{13}$ ) per mL.

*Procedure*—Proceed as directed in the *Assay* for *Amikacin*. Calculate the quantity, in mg, of amikacin ( $C_{22}H_{43}N_5O_{13}$ ) in each mL of the Injection taken by the formula:

$$(L / D)(CE / 1000)(r_U / r_S)$$

in which *L* is the labeled quantity, in mg, of amikacin in each mL of Injection; *D* is the concentration, in mg per mL, of amikacin ( $C_{22}H_{43}N_5O_{13}$ ) in the *Assay preparation*, on the basis of the labeled quantity per mL and the extent of dilution; and the other terms are as defined therein.

## Amiloride Hydrochloride

$C_6H_8ClN_7O \cdot HCl \cdot 2H_2O$  302.12  
 Pyrazinecarboxamide, 3,5-diamino-*N*-(aminoiminomethyl)-6-chloro-, monohydrochloride dihydrate;  
*N*-Amidino-3,5-diamino-6-chloropyrazinecarboxamide monohydrochloride dihydrate [17440-83-4].

**DEFINITION**

Amiloride Hydrochloride contains NLT 98.0% and NMT 101.0% of  $C_6H_8ClN_7O \cdot HCl$ , calculated on the dried basis.

**IDENTIFICATION**

- A. INFRARED ABSORPTION** (197M)

- B. ULTRAVIOLET ABSORPTION** (197U)

**Sample:** 600 µg/mL of water, diluted quantitatively and stepwise with 0.1 N hydrochloric acid to a concentration of about 9.6 µg/mL

**Acceptance criteria:** Meets the requirements

- C. IDENTIFICATION TESTS—GENERAL, Chloride** (191): Meets the requirements

**ASSAY**

- PROCEDURE**

**Sample:** 450 mg

**Analysis:** Dissolve the *Sample* in 100 mL of glacial acetic acid, add 10 mL of mercuric acetate TS and 15 mL of dioxane. Add crystal violet TS. Titrate with 0.1 N perchloric acid VS to a blue endpoint. Perform a blank determination (see *Titrimetry* (541)). Each mL of 0.1 N

perchloric acid is equivalent to 26.61 mg of  $C_6H_8ClN_7O \cdot HCl$ .

**Acceptance criteria:** 98.0%–101.0% on the dried basis

**IMPURITIES**

- RESIDUE ON IGNITION** (281): NMT 0.1%

- HEAVY METALS, Method II** (231): NMT 20 ppm

- ORGANIC IMPURITIES**

**Standard solutions:** Prepare a series of solutions, *A*, *B*, *C*, *D*, *E*, and *F*, of USP Amiloride Hydrochloride RS in a mixture of methanol and chloroform (4:1) having concentrations of 4000, 40, 20, 8, 4, and 2 µg/mL, respectively.

**Sample solution:** 4 mg/mL of Amiloride Hydrochloride in methanol and chloroform (4:1)

**Chromatographic system**

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

**Mode:** TLC

**Adsorbent:** 0.25-mm layer of chromatographic silica gel previously washed with methanol

**Application volume:** 5 µL

**Developing solvent system:** Tetrahydrofuran and 3 N ammonium hydroxide (15:2)

**Analysis**

**Samples:** *Standard solutions A*, *B*, *C*, *D*, *E*, and *F* and *Sample solution*

Proceed as directed in the chapter. Dry the spots with a stream of nitrogen, and develop the chromatograms in the solvent system, until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, allow to air-dry, and examine the plate under long-wavelength UV light: the *R<sub>f</sub>* value of the principal spot of the *Sample solution* corresponds to that of *Standard solution A*. Estimate the levels of any additional spots observed in the chromatogram of the *Sample solution* by comparison with the principal spots in the chromatograms of *Standard solutions B*, *C*, *D*, *E*, and *F*.

**Acceptance criteria:** The sum of the intensities of any additional spots observed is NMT that of the principal spot obtained from *Standard solution B* (equivalent to 1%).

**SPECIFIC TESTS**

- ACIDITY**

**Sample:** 1.0 g

**Analysis:** Dissolve the *Sample* in 100 mL of a mixture of methanol and water (1:1). Titrate with 0.10 N sodium hydroxide to a potentiometric endpoint.

**Acceptance criteria:** NMT 0.30 mL is required (0.1% as HCl).

- LOSS ON DRYING**

(See *Thermal Analysis* (891).)

[NOTE—The quantity taken for the determination may be adjusted, if necessary, for instrument sensitivity.]

**Sample:** 10 mg

**Analysis:** Determine the percentage of volatile substances by thermogravimetric analysis on an appropriately calibrated instrument using the *Sample*. Heat the specimen at the rate of 10°/min between ambient temperature and 225° in an atmosphere of nitrogen at a flow rate of 40 mL/min. From the thermogram determine the accumulated loss in weight between ambient temperature and about 200° on the plateau.

**Acceptance criteria:** 11.0%–13.0%

**ADDITIONAL REQUIREMENTS**

- PACKAGING AND STORAGE:** Preserve in well-closed containers.

- USP REFERENCE STANDARDS** (11)

USP Amiloride Hydrochloride RS

## Amiloride Hydrochloride Tablets

» Amiloride Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of amiloride hydrochloride ( $C_6H_8ClN_7O \cdot HCl$ ).

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—  
USP Amiloride Hydrochloride RS

### Identification—

**A:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**B:** Transfer an amount of finely ground Tablets, equivalent to 5 mg of amiloride hydrochloride, to a 25-mL volumetric flask, add methanol to volume, mix, and filter. Separately apply 10  $\mu$ L each of the filtrate and a Standard solution of USP Amiloride Hydrochloride RS in methanol, containing 0.2 mg per mL, to a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Develop the chromatogram in a solvent system consisting of a mixture of tetrahydrofuran and 3 N ammonium hydroxide (22:3) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, air-dry, and examine under short-wavelength UV light: the  $R_F$  value of the principal spot in the chromatogram of the test solution corresponds to that obtained from the Standard solution.

### Dissolution (711)—

*Medium:* 0.1 N hydrochloric acid; 900 mL.

*Apparatus 2:* 50 rpm.

*Time:* 30 minutes.

*Procedure*—Determine the amount of  $C_6H_8ClN_7O \cdot HCl$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 363 nm on filtered portions of the solution under test, suitably diluted with 0.1 N hydrochloric acid, in comparison with a Standard solution having a known concentration of USP Amiloride Hydrochloride RS in the same *Medium*. An amount of methanol not to exceed 2% of the total volume of the Standard solution may be used to dissolve the amiloride hydrochloride.

*Tolerances*—Not less than 80% (Q) of the labeled amount of  $C_6H_8ClN_7O \cdot HCl$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

*Procedure for content uniformity*—Transfer 1 finely powdered Tablet to a 100-mL volumetric flask, add 60 mL of 0.1 N hydrochloric acid, and shake by mechanical means for 30 minutes. Dilute with 0.1 N hydrochloric acid to volume, mix, and centrifuge a portion of the mixture. Dilute an accurately measured portion of the clear supernatant quantitatively to obtain a solution containing about 10  $\mu$ g of amiloride hydrochloride per mL. Concomitantly determine the absorbances of this solution and a Standard solution of USP Amiloride Hydrochloride RS in the same medium having a known concentration of about 10  $\mu$ g per mL, at the wavelength of maximum absorbance at about 363 nm, with a suitable spectrophotometer, using 0.1 N hydrochloric acid as the blank. Calculate the quantity, in mg, of  $C_6H_8ClN_7O \cdot HCl$  in the Tablet taken by the formula:

$$(TC / D)(A_U / A_S)$$

in which  $T$  is the labeled quantity, in mg, of amiloride hydrochloride in the Tablet,  $C$  is the concentration, in  $\mu$ g per mL, of USP Amiloride Hydrochloride RS, corrected for loss in

weight in the Standard solution;  $D$  is the concentration, in  $\mu$ g per mL, of amiloride hydrochloride in the solution from the Tablet, based upon the labeled quantity per Tablet and the extent of dilution; and  $A_U$  and  $A_S$  are the absorbances of the solution from the Tablets and the Standard solution, respectively.

### Assay—

*Buffer solution*—Dissolve 136 g of monobasic potassium phosphate in 800 mL of water, and adjust by the addition of phosphoric acid, with mixing, to a pH of 3.0. Dilute with water to 1000 mL, and mix.

*Mobile phase*—Prepare a suitable degassed mixture of water, methanol, and *Buffer solution* (71:25:4).

*Standard preparation*—Dissolve a suitable quantity of USP Amiloride Hydrochloride RS in methanol to obtain a solution having a known concentration of about 1.0 mg of amiloride hydrochloride per mL. Transfer 5.0 mL of the solution to a 50-mL volumetric flask, and add 10.0 mL of methanol and 2.0 mL of 0.1 N hydrochloric acid. Dilute with water to volume, and mix. The concentration of USP Amiloride Hydrochloride RS in the *Standard preparation* is about 0.1 mg per mL.

*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 5 mg of amiloride hydrochloride, to a 50-mL volumetric flask containing 15.0 mL of methanol and 2.0 mL of 0.1 N hydrochloric acid. Sonicate for 10 minutes, dilute with water to volume, sonicate for an additional 10 minutes, mix, and filter.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 286-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph five replicate injections of the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor of the major peak is not more than 2.0; and the relative standard deviation is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of amiloride hydrochloride ( $C_6H_8ClN_7O \cdot HCl$ ) in the portion of Tablets taken by the formula:

$$50C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Amiloride Hydrochloride RS, corrected for loss in weight in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Amiloride Hydrochloride and Hydrochlorothiazide Tablets

### DEFINITION

Amiloride Hydrochloride and Hydrochlorothiazide Tablets contain NLT 90.0% and NMT 110.0% of the labeled amounts of amiloride hydrochloride ( $C_6H_8ClN_7O \cdot HCl$ ) and hydrochlorothiazide ( $C_7H_8ClN_3O_4S_2$ ).

### IDENTIFICATION

- A.** The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.
- B. THIN-LAYER CHROMATOGRAPHY**  
**Standard solution A:** 0.2 mg/mL of USP Amiloride Hydrochloride RS in methanol  
**Standard solution B:** 2 mg/mL of USP Hydrochlorothiazide RS in methanol

**Sample solution:** Equivalent to 0.2 mg/mL of amiloride hydrochloride from ground Tablets in methanol. Filter.

**Chromatographic system**

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

**Mode:** TLC

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture

**Application volume:** 10  $\mu$ L

**Developing solvent system:** Tetrahydrofuran and 3 N ammonium hydroxide (22:3)

**Analysis**

**Samples:** *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop the chromatogram until the solvent has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, air-dry, and examine under short-wavelength UV light.

**Acceptance criteria:** The  $R_f$  values of the amiloride hydrochloride and hydrochlorothiazide spots of the *Sample solution* correspond to those of the corresponding *Standard solutions*.

**ASSAY**

• **PROCEDURE**

**Buffer:** 136 g of monobasic potassium phosphate in 800 mL of water. Adjust with phosphoric acid to a pH of 3.0. Dilute with water to 1000 mL.

**Mobile phase:** Methanol, water, and *Buffer* (25:71:4)

**Standard stock solution:** 1.0 mg/mL of USP Amiloride Hydrochloride RS in methanol

**Standard solution:** 0.1 mg/mL of USP Amiloride Hydrochloride RS and 1 mg/mL of USP Hydrochlorothiazide RS, prepared by transferring 10.0 mL of the *Standard stock solution* to a 100-mL volumetric flask containing 100 mg of USP Hydrochlorothiazide RS and 20.0 mL of methanol. Add 4.0 mL of 1 N hydrochloric acid, and dilute with water to volume.

**Sample solution:** Transfer an equivalent to 5 mg of amiloride hydrochloride from powdered Tablets (NLT 20) to a 50-mL volumetric flask. Add 15.0 mL of methanol and 2.0 mL of 1 N hydrochloric acid. Sonicate for 10 min, dilute with water to volume, sonicate for an additional 10 min, and filter.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 286 nm

**Column:** 3.9-mm  $\times$  30-cm; packing L1

**Flow rate:** 1 mL/min

**Injection volume:** 10  $\mu$ L

**System suitability**

**Sample:** *Standard solution*

[NOTE—The relative retention times for hydrochlorothiazide and amiloride hydrochloride are about 0.7 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 2.0 between hydrochlorothiazide and amiloride hydrochloride

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of amiloride hydrochloride ( $C_6H_8ClN_7O \cdot HCl$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of amiloride hydrochloride from the *Sample solution*

$r_S$  = peak response of amiloride hydrochloride from the *Standard solution*

$C_S$  = concentration of USP Amiloride Hydrochloride RS, corrected for loss in weight in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of amiloride hydrochloride in the *Sample solution* (mg/mL)

Calculate the percentage of the labeled amount of hydrochlorothiazide ( $C_7H_8ClN_3O_4S_2$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of hydrochlorothiazide from the *Sample solution*

$r_S$  = peak response of hydrochlorothiazide from the *Standard solution*

$C_S$  = concentration of USP Hydrochlorothiazide RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of hydrochlorothiazide in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0% of the labeled amounts of  $C_6H_8ClN_7O \cdot HCl$  and  $C_7H_8ClN_3O_4S_2$

**PERFORMANCE TESTS**

• **DISSOLUTION** <711>

**Medium:** 0.1 N hydrochloric acid; 900 mL

**Apparatus 2:** 50 rpm

**Time:** 30 min

Determine the amount of amiloride hydrochloride and hydrochlorothiazide dissolved using *Analytical procedure 1* or *procedure 2*.

**Analytical procedure 1**

**Amiloride standard solution:** 60 mg of USP Amiloride Hydrochloride RS (equivalent to 52 mg of anhydrous amiloride hydrochloride) in a 200-mL volumetric flask. Dissolve in and dilute with methanol to volume. Transfer 2.0 mL of this solution to a 100-mL volumetric flask, and dilute with *Medium* to volume.

**Hydrochlorothiazide standard solution:** Transfer 100 mg of USP Hydrochlorothiazide RS to a 100-mL volumetric flask. Dissolve in and dilute with methanol to volume. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, and dilute with *Medium* to volume. Transfer 10.0 mL of the resulting solution to a 50-mL volumetric flask, and dilute with *Medium* to volume.

**Sample solution A:** Pass a portion of the solution under test through a glass fiber filter of 0.45- $\mu$ m pore size.

**Sample solution B:** Transfer 5.0 mL of *Sample solution A* to a 25-mL volumetric flask, and dilute with *Medium* to volume.

**Detector:** UV 363 nm for amiloride hydrochloride, 270 nm for hydrochlorothiazide

**Blank:** *Medium*

**Analysis**

**Samples:** *Amiloride standard solution*, *Hydrochlorothiazide standard solution*, *Sample solution A*, and *Sample solution B*

Calculate the percentage of amiloride hydrochloride ( $C_6H_8ClN_7O \cdot HCl$ ) dissolved:

$$\text{Result} = [(A_U \times C_S \times V)/(A_S \times L)] \times 100$$

$A_U$  = absorbance of *Sample solution A*

$C_S$  = concentration of the *Amiloride standard solution* (mg/mL)

$V$  = volume of *Medium*, 900 mL

$A_S$  = absorbance of the *Amiloride standard solution*

$L$  = label claim of amiloride (mg/Tablet)

Calculate the correction for the interference of amiloride:

$$A_{UC} = A_{U270} - [(A_{U363} \times F)/5]$$

$A_{UC}$  = corrected absorbance of *Sample solution A*, 270 nm

$A_{U270}$  = absorbance of *Sample solution B*, 270 nm

$A_{U363}$  = absorbance of *Sample solution A*, 363 nm

$$F = A_5 \text{ at } 270 \text{ nm} / A_5 \text{ at } 363 \text{ nm}$$

$A_5$  = absorbance of the *Amiloride standard solution*  
Calculate the percentage of hydrochlorothiazide ( $C_7H_8ClN_3O_4S_2$ ) dissolved:

$$\text{Result} = [(A_{UC} \times C_S \times V \times D) / (A_5 \times L)] \times 100$$

$A_{UC}$  = corrected absorbance of *Sample solution A*, 270 nm

$C_S$  = concentration of the *Hydrochlorothiazide standard solution* (mg/mL)

$V$  = volume of *Medium*, 900 mL

$D$  = dilution factor of *Sample solution B*, 25/5

$A_5$  = absorbance of the *Hydrochlorothiazide standard solution*

$L$  = label claim of hydrochlorothiazide (mg/Tablet)

#### Analytical procedure 2

**Buffer and Mobile phase:** Prepare as directed in the *Assay*.

**Standard stock solution:** Use the *Standard solution* from the *Assay*.

**Standard solution:** 5 µg/mL of amiloride hydrochloride and 50 µg/mL of hydrochlorothiazide from the *Standard stock solution*, in *Medium*

**Sample solution:** Pass a portion of the solution under test through a filter of 0.45-µm pore size.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 286 nm

**Column:** 4.6-mm × 25-cm; packing L1

**Flow rate:** 1 mL/min

**Injection volume:** 50 µL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Resolution:** NLT 2.0% between hydrochlorothiazide and amiloride

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the amount of amiloride hydrochloride ( $C_6H_8ClN_7O \cdot HCl$ ) and hydrochlorothiazide ( $C_7H_8ClN_3O_4S_2$ ) dissolved:

$$\text{Result} = (r_U / r_S) \times (C_S / L) \times V \times 100$$

$r_U$  = peak response of amiloride or hydrochlorothiazide from the *Sample solution*

$r_S$  = peak response of amiloride or hydrochlorothiazide from the *Standard solution*

$C_S$  = concentration of amiloride hydrochloride or hydrochlorothiazide in the *Standard solution* (mg/mL)

$L$  = label claim of amiloride hydrochloride or hydrochlorothiazide (mg/Tablet)

$V$  = volume of *Medium*, 900 mL

**Tolerances:** NLT 80% (Q) of the labeled amount of  $C_6H_8ClN_7O \cdot HCl$  and NLT 75% (Q) of the labeled amount of  $C_7H_8ClN_3O_4S_2$  are dissolved.

- **UNIFORMITY OF DOSAGE UNITS**, *Content Uniformity* <905>: Meet the requirements with respect to amiloride hydrochloride and hydrochlorothiazide

#### IMPURITIES

##### • ORGANIC IMPURITIES

**Buffer, Mobile phase, and Sample solution:** Prepare as directed in the *Assay*.

**Standard solution:** 10 µg/mL of USP Benzothiadiazine Related Compound A RS in *Mobile phase*

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 286 nm

**Column:** 3.9-mm × 30-cm; packing L1

**Flow rate:** 1 mL/min

**Injection volume:** 20 µL

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for hydrochlorothiazide and amiloride hydrochloride are about 0.7 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 2.0 between hydrochlorothiazide and amiloride hydrochloride

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Sample solution* and *Standard solution*  
Calculate the percentage of benzothiadiazine related compound A in the portion of Tablets taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times F \times 100$$

$r_U$  = peak response of benzothiadiazine related compound A from the *Sample solution*

$r_S$  = peak response of benzothiadiazine related compound A from the *Standard solution*

$C_S$  = concentration of USP Benzothiadiazine Related Compound A RS in the *Standard solution* (µg/mL)

$C_U$  = nominal concentration of benzothiadiazine in the *Sample solution* (mg/mL)

$F$  = unit conversion factor, 0.001 mg/µg

**Acceptance criteria:** NMT 1.0%

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** <11>
  - USP Amiloride Hydrochloride RS
  - USP Benzothiadiazine Related Compound A RS
  - 4-Amino-6-chloro-1,3-benzenedisulfonamide.
  - $C_6H_8ClN_3O_4S_2$  285.73
  - USP Hydrochlorothiazide RS

## Amiloxate

$C_{15}H_{20}O_3$

248.32

4-Methoxycinnamic acid, isoamyl ester;

3-Methylbutyl 3-(4-methoxyphenyl)-(E)-2-propenoate [71617-10-2].

#### DEFINITION

Amiloxate contains NLT 98.0% and NMT 102.0% of  $C_{15}H_{20}O_3$ .

#### IDENTIFICATION

- **A. INFRARED ABSORPTION** <197F>

- **B. ULTRAVIOLET ABSORPTION** <197U>

**Sample solution:** 5.0 µg/mL in alcohol

**Acceptance criteria:** Absorptivities, calculated on the as-is basis, do not differ by more than 3.0%.

#### ASSAY

- **PROCEDURE**

**Standard solution:** 20 mg/mL of USP Amiloxate RS in *tert*-butyl methyl ether

**Sample solution:** 20 mg/mL of Amiloxate in *tert*-butyl methyl ether

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 0.32-mm × 25-m, coated with a 0.1-μm film of phase G1

**Temperature**

**Injector port:** 240°

**Detector:** 260°

**Column:** See *Table 1*.

**Table 1**

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
60	8	240	10

**Carrier gas:** Helium

**Flow rate:** 6 mL/min

**Injection size:** 1 μL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Relative standard deviation:** NMT 1.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of amiloxate (C<sub>15</sub>H<sub>20</sub>O<sub>3</sub>) in the portion of Amiloxate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Amiloxate RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0%

**IMPURITIES**

• **ORGANIC IMPURITIES**

**Standard solution, Sample solution, Chromatographic system, and System suitability:** Proceed as directed in the *Assay*.

**Analysis**

**Sample:** *Sample solution*

Calculate the percentage of each impurity in the portion of Amiloxate taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response for each impurity

$r_T$  = sum of the responses of all the peaks excluding solvent peak

**Acceptance criteria**

**Individual impurities:** NMT 0.5%

**Total impurities:** NMT 2.0%

**SPECIFIC TESTS**

• **SPECIFIC GRAVITY** <841>: 1.037–1.041

• **REFRACTIVE INDEX** <831>: 1.556–1.560 at 20°

• **ACIDITY**

**Sample solution:** Transfer 50 mL of alcohol to a suitable container. Add 1 mL of phenolphthalein TS and sufficient 0.1 N sodium hydroxide to obtain a persistent pink color. Transfer 50 mL of this solution to a suitable container, and add 5.0 mL of Amiloxate.

**Analysis:** Titrate with 0.1 N sodium hydroxide.

**Acceptance criteria:** NMT 0.2 mL of titrant per mL of Amiloxate is required for neutralization.

**ADDITIONAL REQUIREMENTS**

• **PACKAGING AND STORAGE:** Preserve in tight containers.

• **USP REFERENCE STANDARDS** <11>

USP Amiloxate RS

## Aminobenzoate Potassium

» Aminobenzoate Potassium contains not less than 98.5 percent and not more than 101.0 percent of C<sub>7</sub>H<sub>6</sub>KNO<sub>2</sub>, calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** <11>—

USP Aminobenzoate Potassium RS

**Identification**—

**A:** *Ultraviolet Absorption* <197U>—

*Solution:* 10 μg per mL.

*Medium:* 0.001 N sodium hydroxide.

**B:** Dissolve about 400 mg in 10 mL of water, add 1 mL of 3 N hydrochloric acid, filter, and wash the precipitate with two 5-mL portions of cold water. Recrystallize from alcohol the precipitate so obtained, and dry at 110° for 1 hour: the *p*-aminobenzoic acid so obtained melts between 186° and 189°.

**C:** A solution (1 in 100) meets the requirements of the flame test for *Potassium* <191>.

**pH** <791>: between 8.0 and 9.0, in a solution (1 in 20).

**Loss on drying** <731>—Dry it at 105° for 2 hours: it loses not more than 1.0% of its weight.

**Volatile diazotizable substances**—

**Standard preparation**—Dissolve 10 mg of *p*-toluidine in 5 mL of methanol in a 100-mL volumetric flask, add water to volume, and mix. Transfer 1 mL to a 100-mL volumetric flask, dilute with water to volume, and mix.

**Test preparation**—Transfer 5.0 g of Aminobenzoate Potassium to a suitable flask, and add a volume of 1.25 N sodium hydroxide that is just sufficient to dissolve the test specimen and to render the solution just alkaline to phenolphthalein TS. Dilute with water to 50 mL, and steam-distill the solution, collecting about 95 mL of the distillate in a 100-mL volumetric flask. Add water to volume, and mix.

**Procedure**—Transfer 20.0-mL portions of the *Standard preparation* and the *Test preparation* to separate 100-mL beakers, and transfer 20.0 mL of water to a third 100-mL beaker to provide the blank. Treat each as follows. Add 5.0 mL of 1 N hydrochloric acid, and cool in an ice bath. Add 2.0 mL of 0.1 M sodium nitrite dropwise, with stirring, allow to stand for 5 minutes for the diazotization reaction to be complete, add quickly to 10.0 mL of a cold solution of guaiacol (freshly prepared by dissolving 0.20 g of guaiacol in 100 mL of 1 N sodium hydroxide), mix, and allow to stand for 30 minutes. Concomitantly determine the absorbances of the solutions at the wavelength of maximum absorbance at about 405 nm, with a suitable spectrophotometer, using the blank to set the instrument: the absorbance of the solution obtained from the *Test preparation* does not exceed that of the solution obtained from the *Standard preparation*, corresponding to not more than 0.002% of volatile diazotizable substances, as *p*-toluidine.

**Chloride** <221>—A 1.4-g portion shows no more chloride than corresponds to 0.4 mL of 0.020 N hydrochloric acid (0.02%).

**Sulfate** <221>—A 1.4-g portion shows no more sulfate than corresponds to 0.3 mL of 0.020 N sulfuric acid (0.02%).

**Heavy metals, Method II** (231): 0.002%.

**Assay**—Transfer about 500 mg of Aminobenzoate Potassium, accurately weighed, to a suitable vessel, add 25 mL of water and 25 mL of 3 N hydrochloric acid, mix, and cool in an ice bath. Titrate with 0.1 M sodium nitrite VS, determining the endpoint potentiometrically, using a calomel-platinum electrode system. Each mL of 0.1 M sodium nitrite is equivalent to 17.52 mg of  $C_7H_6KNO_2$ .

## Aminobenzoate Potassium Capsules

» Aminobenzoate Potassium Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of aminobenzoate potassium ( $C_7H_6KNO_2$ ).

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—  
USP Aminobenzoate Potassium RS

**Identification**—Dissolve about 1 g of the Capsule contents in 25 mL of water, add 5 mL of 3 N hydrochloric acid, and wash the precipitate with two 5-mL portions of cold water. Recrystallize from alcohol the precipitate so obtained, and dry at 110° for 1 hour: the *p*-aminobenzoic acid so obtained melts between 186° and 189°.

**Dissolution** (711)—

*Medium*: water; 900 mL.

*Apparatus 1*: 100 rpm.

*Time*: 45 minutes.

**Procedure**—Determine the amount of  $C_7H_6KNO_2$  dissolved by employing UV absorption at the wavelength of maximum absorbance at about 270 nm on filtered portions of the solution under test, suitably diluted with *Medium*, in comparison with a Standard solution having a known concentration of USP Aminobenzoate Potassium RS in the same *Medium*.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_7H_6KNO_2$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—

**Standard preparation**—Prepare a solution of USP Aminobenzoate Potassium RS having a known concentration of about 5 µg per mL.

**Assay preparation**—Remove as completely as possible, and combine, the contents of not fewer than 20 Capsules. Transfer an accurately weighed portion of the combined contents, equivalent to about 100 mg of aminobenzoate potassium, to a 200-mL volumetric flask, add 150 mL of water, shake by mechanical means for 30 minutes, dilute with water to volume, mix, and filter. Pipet 2 mL of the filtrate into a 200-mL volumetric flask, dilute with water to volume, and mix.

**Procedure**—Concomitantly determine the absorbances of the *Standard preparation* and the *Assay preparation* at the wavelength of maximum absorbance at about 270 nm, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg, of aminobenzoate potassium ( $C_7H_6KNO_2$ ) in the portion of Capsule contents taken by the formula:

$$20C(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Aminobenzoate Potassium RS in the *Standard preparation*; and

$A_U$  and  $A_S$  are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

## Aminobenzoate Potassium for Oral Solution

» Aminobenzoate Potassium for Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of aminobenzoate potassium ( $C_7H_6KNO_2$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—  
USP Aminobenzoate Potassium RS

**Identification**—

**A**: *Ultraviolet Absorption* (197U)—

*Solution*: 50 µg per mL.

*Medium*: water.

**B**: Dissolve about 400 mg in 10 mL of water, add 1 mL of 3 N hydrochloric acid, filter, and wash the precipitate with two 5-mL portions of cold water. Recrystallize from alcohol the precipitate so obtained, and dry at 110° for 1 hour: the *p*-aminobenzoic acid so obtained melts between 186° and 189°.

**Minimum fill** (755)—

FOR SOLID PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

**Uniformity of dosage units** (905)—

FOR SOLID PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**pH** (791): between 7.0 and 9.0, in a solution (1 in 10).

**Assay**—Transfer about 100 mg of Aminobenzoate Potassium for Oral Solution, accurately weighed, to a suitable vessel, add 5 mL of hydrochloric acid and 50 mL of water, mix, cool to 15°, and add 25 g of crushed ice. Titrate with 0.1 M sodium nitrite VS, determining the endpoint potentiometrically, using a calomel-platinum electrode system. Each mL of 0.1 M sodium nitrite is equivalent to 17.52 mg of aminobenzoate potassium ( $C_7H_6KNO_2$ ).

## Aminobenzoate Potassium Tablets

» Aminobenzoate Potassium Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of aminobenzoate potassium ( $C_7H_6KNO_2$ ).

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—  
USP Aminobenzoate Potassium RS

**Identification**—Proceed as directed for *Aminobenzoate Potassium Capsules*, using 1 g of finely powdered Tablets.

**Dissolution** (711)—

*Medium*: water; 900 mL.

*Apparatus 1*: 100 rpm.

*Time*: 45 minutes.

**Procedure**—Determine the amount of  $C_7H_6KNO_2$  dissolved by employing UV absorption at the wavelength of maximum absorbance at about 270 nm on filtered portions of the solution under test, suitably diluted with *Medium*, in comparison with a Standard solution having a known con-

centration of USP Aminobenzoate Potassium RS in the same Medium.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_7H_6KNO_2$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—

**Standard preparation**—Prepare a solution of USP Aminobenzoate Potassium RS having a known concentration of about 5 µg per mL.

**Assay preparation and Procedure**—Weigh and finely powder not fewer than 20 Tablets. Using a portion of the powdered Tablets, equivalent to about 100 mg of aminobenzoate potassium, proceed as directed in the Assay under *Aminobenzoate Potassium Capsules*.

## Aminobenzoate Sodium

» Aminobenzoate Sodium contains not less than 98.5 percent and not more than 101.0 percent of  $C_7H_6NNaO_2$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—  
USP Aminobenzoate Sodium RS

**Identification**—

**A: Ultraviolet Absorption** (197U)—

**Solution:** 1 in 100,000.

**Medium:** 0.001 N sodium hydroxide.

**B:** Dissolve about 400 mg in 10 mL of water, add 1 mL of 3 N hydrochloric acid, filter, and wash the precipitate with two 5-mL portions of cold water. Recrystallize from alcohol the precipitate so obtained, and dry at 110° for 1 hour: the *p*-aminobenzoic acid so obtained melts between 186° and 189°.

**C:** A solution (1 in 100) meets the requirements of the flame test for *Sodium* (191).

**pH** (791): between 8.0 and 9.0, in a solution (1 in 20).

**Loss on drying** (731)—Dry it at 105° for 2 hours: it loses not more than 1.0% of its weight.

**Volatile diazotizable substances**—

**Standard solution**—Dissolve 10 mg of *p*-toluidine in 5 mL of methanol in a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 1 mL to a 100-mL volumetric flask, dilute with water to volume, and mix.

**Test solution**—Transfer 5.0 g of Aminobenzoate Sodium to a suitable flask, and add a volume of 1.25 N sodium hydroxide that is just sufficient to dissolve the test specimen and to render the solution just alkaline to phenolphthalein TS. Dilute with water to 50 mL, and steam-distill the solution, collecting about 95 mL of the distillate in a 100-mL volumetric flask. Dilute with water to volume, and mix.

**Procedure**—Transfer 20.0-mL portions of the *Standard solution* and the *Test solution* to separate 100-mL beakers, and transfer 20.0 mL of water to a third 100-mL beaker to provide the blank. Treat each as follows. Add 5.0 mL of 1 N hydrochloric acid, and cool in an ice bath. Add 2.0 mL of 0.1 M sodium nitrite dropwise, with stirring, allow to stand for 5 minutes for the diazotization reaction to be complete, add quickly to 10.0 mL of a cold solution of guaiacol (freshly prepared by dissolving 0.20 g of guaiacol in 100 mL of 1 N sodium hydroxide), mix, and allow to stand for 30 minutes. Concomitantly determine the absorbances of the solutions at the wavelength of maximum absorbance at about 405 nm, with a suitable spectrophotometer, using the blank to set the instrument: the absorbance of the solution

obtained from the *Test solution* does not exceed that of the solution obtained from the *Standard solution*, corresponding to not more than 0.002% of volatile diazotizable substances, as *p*-toluidine.

**Chloride** (221)—A 1.4-g portion shows no more chloride than corresponds to 0.4 mL of 0.020 N hydrochloric acid (0.02%).

**Sulfate** (221)—A 1.4-g portion shows no more sulfate than corresponds to 0.3 mL of 0.020 N sulfuric acid (0.02%).

**Heavy metals, Method II** (231): 0.002%.

**Assay**—Transfer about 500 mg of Aminobenzoate Sodium, accurately weighed, to a suitable vessel, add 25 mL of water and 25 mL of 3 N hydrochloric acid, mix, and cool in an ice bath. Titrate with 0.1 M sodium nitrite VS, determining the endpoint potentiometrically, using a calomel-platinum electrode system. Each mL of 0.1 M sodium nitrite is equivalent to 15.91 mg of  $C_7H_6NNaO_2$ .

## Aminobenzoic Acid

$C_7H_7NO_2$  137.14

Benzoic acid, 4-amino.

*p*-Aminobenzoic acid [150-13-0].

» Aminobenzoic Acid contains not less than 98.5 percent and not more than 101.5 percent of  $C_7H_7NO_2$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—  
USP Aminobenzoic Acid RS

**Identification**—

**A: Infrared Absorption** (197K).

**B: Ultraviolet Absorption** (197U)—

**Solution:** 5 µg per mL.

**Medium:** 0.001 N sodium hydroxide.

**Melting range** (741): between 186° and 189°.

**Loss on drying** (731)—Dry it at 105° for 2 hours: it loses not more than 0.2% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Volatile diazotizable substances**—

**Standard preparation**—Dissolve 10 mg of *p*-toluidine in 5 mL of methanol in a 100-mL volumetric flask, dilute water to volume, and mix. Transfer 1 mL to a 100-mL volumetric flask, dilute with water to volume, and mix.

**Test preparation**—Transfer 5.0 g of Aminobenzoic Acid to a suitable flask, and add a volume of 1.25 N sodium hydroxide that is just sufficient to dissolve the test specimen and to render the solution just alkaline to phenolphthalein TS. Dilute with water to 50 mL, and steam-distill the solution, collecting about 95 mL of the distillate in a 100-mL volumetric flask. Add water to volume, and mix.

**Procedure**—Transfer 20.0-mL portions of the *Standard preparation* and the *Test preparation* to separate 100-mL beakers, and transfer 20.0 mL of water to a third 100-mL beaker to provide the blank. Treat each as follows. Add 5.0 mL of 1 N hydrochloric acid, and cool in an ice bath. Add 2.0 mL of 0.1 M sodium nitrite dropwise, with stirring, allow to stand for 5 minutes in order for the diazotization reaction to be complete, add quickly to 10.0 mL of a cold solution of guaiacol (freshly prepared by dissolving 0.20 g of

guaiacol in 100 mL of 1 N sodium hydroxide), mix, and allow to stand for 30 minutes. Concomitantly determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 450 nm, using the blank to set the instrument: the absorbance of the solution obtained from the *Test preparation* does not exceed that of the solution obtained from the *Standard preparation*, corresponding to not more than 0.002% of volatile diazotizable substances, as *p*-toluidine.

**Heavy metals, Method II** (231): 0.002%.

**Ordinary impurities** (466)—

*Test solution:* alcohol.

*Standard solution:* alcohol.

*Eluant:* a mixture of toluene, ethyl acetate, and alcohol (60:20:20), in a nonequilibrated chamber.

*Visualization:* 1.

**Assay**—Weigh accurately about 250 mg of Aminobenzoic Acid, and proceed as directed under *Nitrite Titration* (451). Each mL of 0.1 M sodium nitrite is equivalent to 13.71 mg of  $C_7H_7NO_2$ .

## Aminobenzoic Acid Gel

» Aminobenzoic Acid Gel contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of aminobenzoic acid ( $C_7H_7NO_2$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Aminobenzoic Acid RS

**Identification**—

**A:** *Infrared Absorption* (197K).

**B:** *Ultraviolet Absorption* (197U)—

*Solution:* 5 µg per mL.

*Medium:* alcohol.

**Minimum fill** (755): meets the requirements.

**pH** (791): between 4.0 and 6.0.

**Alcohol content, Method II** (611): between 42.3% and 54.0% (w/w) of  $C_2H_5OH$ .

**Assay**—

*Mobile phase*—Mix 300 mL of methanol and 10 mL of glacial acetic acid with 690 mL of water. Allow the mixture to cool, and filter, if necessary, through a suitable micro-porous membrane filter. Degas the solution.

*Internal standard solution*—Dissolve salicylic acid in methanol, by sonicating, to obtain a solution having a concentration of about 7 mg per mL.

*Standard preparation*—Dissolve, by sonicating, an accurately weighed quantity of USP Aminobenzoic Acid RS in methanol, quantitatively dilute with methanol to obtain a solution having a known concentration of about 0.42 mg per mL, and mix. Pipet 5 mL of this solution and 5 mL of the *Internal standard solution* into a 50-mL volumetric flask, dilute with methanol to volume, and mix. Pass through 0.6-µm filter paper. Throughout the preparation, protect against actinic light.

*Assay preparation*—Transfer an accurately weighed quantity of Gel, equivalent to about 4.2 mg of aminobenzoic acid, to a 100-mL volumetric flask, and add 10.0 mL of *Internal standard preparation* and about 50 mL of methanol. Shake or sonicate, as necessary, dilute with methanol to volume, and mix. Filter, if necessary, through filter paper (Whatman No. 41 or equivalent). Pass through 0.6-µm filter

paper. Throughout this preparation, protect against actinic light.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 3.9-mm × 30-cm column that contains packing L11. The flow rate is about 1.0 mL per minute. Chromatograph replicate 15-µL injections of *Standard preparation* until the response ratio variability is within 1.0% of average. The resolution factor is not less than 3.0 between aminobenzoic acid and salicylic acid.

*Procedure*—Separately inject equal volumes (about 15 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The retention time of salicylic acid is about 3.0 relative to that of aminobenzoic acid as 1.0. Calculate the quantity, in mg, of aminobenzoic acid ( $C_7H_7NO_2$ ) in the portion of Gel taken by the formula:

$$100C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of USP Aminobenzoic Acid RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the ratios of the peak responses of the aminobenzoic acid peak to the salicylic acid peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Aminobenzoic Acid Topical Solution

» Aminobenzoic Acid Topical Solution contains, in each mL, not less than 45 mg and not more than 55 mg of aminobenzoic acid ( $C_7H_7NO_2$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

**Identification**—

**A:** To 1 mL of Topical Solution add 1 mL of 1 N sodium hydroxide, and add, in the order named, 0.5 mL of potassium iodide TS, 0.5 mL of 3 N hydrochloric acid, and 0.5 mL of sodium hypochlorite TS: a brown precipitate is formed.

**B:** To 1 mL of Topical Solution add 2 mL of 3 N hydrochloric acid, and cool to about 10°. Add 1 mL of sodium nitrite solution (1 in 100), then add a solution prepared by mixing 50 mg of 2-naphthol with 3 mL of sodium hydroxide solution (1 in 10): a red color is produced.

**Specific gravity** (841): not less than 0.895 and not more than 0.905.

**Alcohol content** (611): between 65% and 75% of  $C_2H_5OH$ .

**Assay**—Transfer 5 mL of Topical Solution, accurately measured, to a suitable open vessel, evaporate on a steam bath to dryness, and proceed as directed under *Nitrite Titration* (451), beginning with "Add 20 mL of hydrochloric acid." Each mL of 0.1 M sodium nitrite is equivalent to 13.71 mg of  $C_7H_7NO_2$ .

## Aminocaproic Acid

$C_6H_{13}NO_2$  131.17

Hexanoic acid, 6-amino-

6-Aminohexanoic acid [60-32-2].

» Aminocaproic Acid contains not less than 98.5 percent and not more than 101.5 percent of  $C_6H_{13}NO_2$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers. Store at room temperature.

**USP Reference standards** (11)—

USP Aminocaproic Acid RS

**Identification**, *Infrared Absorption* (197K).

**Water**, *Method I* (921): not more than 0.5%.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals**, *Method II* (231): 0.002%.

**Assay**—

*Solution A*—Transfer 0.55 g of sodium 1-heptanesulfonate to a 1000-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

*Mobile phase*—Transfer 10 g of monobasic potassium phosphate to a 1000-mL beaker, dissolve in 300 mL of *Solution A*, add 250 mL of methanol, followed by another 300 mL of *Solution A*, and mix. Adjust the mixture with phosphoric acid to a pH of 2.2. Transfer the whole mixture to a 1000-mL volumetric flask, dilute with *Solution A* to volume, and mix. Filter and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Internal standard solution*—Prepare a solution of methionine in water containing 1.25 mg per mL.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Aminocaproic Acid RS in water to obtain a *Stock solution* having a known concentration of 12.5 mg per mL. Transfer 5.0 mL of the *Stock solution* to a 100-mL volumetric flask, add 2.0 mL of the *Internal standard solution*, dilute with water to volume, and mix.

*Assay preparation*—Transfer an accurately weighed quantity of 1.25 g of Aminocaproic Acid to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, add 2.0 mL of *Internal standard solution*, dilute with water to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm  $\times$  15-cm column that contains packing L1 and is maintained at 30°. The flow rate is about 0.7 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.76 for aminocaproic acid and 1.0 for methionine; the resolution,  $R$ , between aminocaproic acid and methionine is not less than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, and allow the *Assay preparation* to elute for not less than two times the retention time of aminocaproic acid. Record the chromatograms, and measure all the peak responses. Calculate the quantity, in g, of  $C_6H_{13}NO_2$  in the portion of Aminocaproic Acid taken by the formula:

$$2C(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Aminocaproic Acid RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the ratios of the aminocaproic acid peak response to the internal standard peak response obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Aminocaproic Acid Injection

» Aminocaproic Acid Injection is a sterile solution of Aminocaproic Acid in Water for Injection. It contains not less than 95.0 percent and not more than 107.5 percent of the labeled amount of aminocaproic acid ( $C_6H_{13}NO_2$ ).

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I glass.

**USP Reference standards** (11)—

USP Aminocaproic Acid RS

USP Endotoxin RS

**Identification**—Mix 2 mL of Injection, added dropwise, with 100 mL of acetone, rapidly stirring the mixture with a glass rod to induce crystallization. Allow the mixture to stand for 15 minutes, and pass through a medium-porosity, sintered-glass filter. Wash the crystals with 25 mL of acetone, apply vacuum to remove the solvent, dry at 105° for 30 minutes, and cool: the residue so obtained responds to the *Identification* test under *Aminocaproic Acid*.

**Bacterial endotoxins** (85)—It contains not more than 0.05 USP Endotoxin Unit per mg of aminocaproic acid.

**pH** (791): between 6.0 and 7.6.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—

*Mobile phase*—Transfer 11 g of sodium 1-pentanesulfonate and 40 g of anhydrous sodium sulfate to a 2-L volumetric flask, and dissolve in about 500 mL of water. Add 20 mL of 1 N sulfuric acid and 30 mL of acetonitrile, dilute with water to volume, and mix. Filter and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Aminocaproic Acid RS in *Mobile phase* to obtain a solution having a known concentration of about 2.5 mg per mL.

*Resolution solution*—Mix 20  $\mu$ L of benzyl alcohol with 100 mL of water. Dilute 1.0 mL of this solution with the *Standard preparation* to 10 mL.

*Assay preparation*—Transfer an accurately measured volume of Injection, equivalent to about 1.25 g of aminocaproic acid, to a 50-mL volumetric flask, dilute with water to volume, and mix. Transfer 5.0 mL of the resulting solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 210-nm detector and a 4-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Resolution solution* as directed for *Procedure*: the resolution,  $R$ , between benzyl alcohol and aminocaproic acid is not less than 7.0. The aminocaproic acid peak elutes prior to the benzyl alcohol peak. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 1.0%.

*Procedure*—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of aminocaproic acid ( $C_6H_{13}NO_2$ ) in each mL of the Injection taken by the formula:

$$500(C / V)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Aminocaproic Acid RS in the *Standard preparation*;  $V$  is the vol-

ume, in mL, of Injection taken; and  $r_U$  and  $r_S$  are the aminocaproic acid peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Aminocaproic Acid Oral Solution

» Aminocaproic Acid Oral Solution contains not less than 95.0 percent and not more than 115.0 percent of the labeled amount of aminocaproic acid ( $C_6H_{13}NO_2$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Aminocaproic Acid RS

**Identification**—Mix about 1 g of ion-exchange resin (strongly acidic styrene-divinylbenzene cation-exchange resin) with about 10 mL of 1 N hydrochloric acid in a 100-mL beaker. Decant and discard the hydrochloric acid, and wash the resin with five 10-mL portions of water, decanting and discarding the liquid following each washing. Place the washed resin in a glass-stoppered, 125-mL conical flask, and add a volume of Oral Solution, equivalent to about 250 mg of aminocaproic acid, and 10 mL of water. Insert the stopper in the flask, and shake by mechanical means for 30 minutes. Transfer the resin slurry to a medium-porosity, sintered-glass funnel, wash with about 100 mL of water, apply suction to filter, and discard the washing. Place a 100-mL beaker under the stem of the funnel, add 10 mL of 1 N hydrochloric acid to the resin, stir for 4 to 5 minutes, and filter by applying suction. Evaporate the filtrate on a steam bath to dryness, dry at 105° for 1 hour, and cool: the residue so obtained meets the requirements for the *Identification* test under *Aminocaproic Acid*.

**pH** (791): between 6.0 and 6.5.

**Assay**—Transfer an accurately measured volume of Oral Solution, equivalent to about 250 mg of aminocaproic acid, to a 250-mL beaker, add 80 mL of glacial acetic acid, and mix. Add 10 drops of a 1 in 500 solution of crystal violet in chlorobenzene, and titrate with 0.1 N perchloric acid in dioxane VS to a blue endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 13.12 mg of aminocaproic acid. ( $C_6H_{13}NO_2$ )

## Aminocaproic Acid Tablets

» Aminocaproic Acid Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of aminocaproic acid ( $C_6H_{13}NO_2$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Aminocaproic Acid RS

**Identification**—Triturate 2 Tablets with 10 mL of water, and filter into 100 mL of acetone. Swirl the mixture, and allow to stand for 15 minutes to complete crystallization. Filter through a medium-porosity, sintered-glass filter, and wash the crystals with 25 mL of acetone. Apply vacuum to remove the solvent, then dry at 105° for 30 minutes, and cool: the residue so obtained responds to the *Identification* test under *Aminocaproic Acid*.

**Dissolution** (711)—

*Medium*: water; 900 mL.

*Apparatus 1*: 100 rpm.

*Time*: 45 minutes.

*pH 9.5 Borate buffer*—Dissolve 6.185 g of boric acid and 7.930 g of potassium chloride in about 1000 mL of water, add 60 mL of 1.0 N sodium hydroxide, and mix. Dilute with water to 2000 mL, mix, and add 1.0 N sodium hydroxide, if necessary, to adjust to a pH of  $9.5 \pm 0.1$ .

*Standard preparation*—Dissolve an accurately weighed quantity of USP Aminocaproic Acid RS in water, and quantitatively dilute with water to obtain a solution having a known concentration of about 0.5 mg per mL.

*Procedure*—Into three separate 50-mL volumetric flasks pipet (a) 1 mL of a filtered portion of the solution under test, (b) 1 mL of the *Standard preparation*, and (c) 1 mL of water to provide a blank. Add 20.0 mL of *pH 9.5 Borate buffer* and 3.0 mL of freshly prepared  $\beta$ -naphthoquinone-4-sodium sulfonate solution (1 in 500) to each, swirl to mix, and place the 3 flasks in a water bath maintained at a temperature of  $65 \pm 5^\circ$  for 45 minutes. Cool, dilute each with water to volume, and mix. Determine the amount of  $C_6H_{13}NO_2$  dissolved from absorbances, at the wavelength of maximum absorbance at about 460 nm, obtained from the test solution in comparison with those obtained from the *Standard* solution, using the blank to set the instrument.

*Tolerances*—Not less than 75% (Q) of the labeled amount of  $C_6H_{13}NO_2$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 500 mg of aminocaproic acid, to a beaker, add about 100 mL of glacial acetic acid, heat gently to effect solution, and cool. Add 10 drops of a 1 in 500 solution of crystal violet in chlorobenzene, and titrate with 0.1 N perchloric acid in dioxane VS to a blue endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 13.12 mg of aminocaproic acid ( $C_6H_{13}NO_2$ ).

## Aminogluthethimide

$C_{13}H_{16}N_2O_2$

2,6-Piperidinedione, 3-(4-aminophenyl)-3-ethyl-; 2-(*p*-Aminophenyl)-2-ethylglutarimide [125-84-8].

232.28

### DEFINITION

Aminogluthethimide contains NLT 98.0% and NMT 102.0% of aminogluthethimide ( $C_{13}H_{16}N_2O_2$ ), calculated on the dried basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197M)
- **B. ULTRAVIOLET ABSORPTION** (197U)

**Analytical wavelength**: 242 nm

**Medium**: Methanol

**Sample solution**: 10  $\mu$ g/mL

**Acceptance criteria**: Absorptivities, calculated on a dried basis, differ by NMT 2.0%.

**ASSAY****• PROCEDURE**

**Buffer:** Add 120 mL of 0.1 N acetic acid to 100 mL of 0.1 N potassium hydroxide in a 1000-mL volumetric flask, and add 250 mL of water. Adjust by the addition of either 1 N acetic acid or 1 N potassium hydroxide to a pH of  $5.0 \pm 0.1$ . Dilute with water to volume.

**Mobile phase:** Methanol and *Buffer* (27:73)

**Diluent:** Methanol and *Buffer* (1:1)

**Standard solution:** 0.5 mg/mL of USP Aminoglutethimide RS in *Diluent*

**Sample solution:** 0.5 mg/mL of Aminoglutethimide in *Diluent*. Pass through a filter of 0.45- $\mu$ m or finer pore size filter, discarding the first 5 mL of the filtrate.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 240 nm

**Column:** 3.9-mm  $\times$  15-cm; 4- $\mu$ m packing L1

**Column temperature:** 40°

**Flow rate:** 1.3 mL/min

**Injection volume:** 10  $\mu$ L

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 1.7

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of aminoglutethimide ( $C_{13}H_{16}N_2O_2$ ) in the portion of Aminoglutethimide taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area from the *Sample solution*

$r_S$  = peak area from the *Standard solution*

$C_S$  = concentration of USP Aminoglutethimide RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Aminoglutethimide in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the dried basis

**IMPURITIES**

**• RESIDUE ON IGNITION** <281>: NMT 0.1%

**• HEAVY METALS**, *Method II* <231>: NMT 10 ppm

**• LIMIT OF AZO-AMINOGLUTETHIMIDE**

[NOTE—Use low-actinic glassware. Conduct this test promptly under subdued light. Wear protective gloves resistant to dimethyl sulfoxide to prevent contact with skin. Use shaking, not sonication or heat, to dissolve the USP Azo-aminoglutethimide RS and the *Sample*.]

**Buffer:** 150 mL of 0.1 N acetic acid and 50 mL of 0.1 N potassium hydroxide, diluted in water to 1000 mL

**Mobile phase:** Dissolve 100 mg of edetate disodium in 350 mL of *Buffer*. Add 650 mL of methanol, and cool to room temperature. Adjust with glacial acetic acid to a pH of  $5.0 \pm 0.1$ .

**Standard solution:** 0.5  $\mu$ g/mL of USP Azo-aminoglutethimide RS in dimethyl sulfoxide

**Sample solution:** 1 mg/mL of Aminoglutethimide in dimethyl sulfoxide

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 328 nm

**Column:** 3.9-mm  $\times$  15-cm; packing L1

**Flow rate:** 1 mL/min

**Injection volume:** 10  $\mu$ L

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 1.2

**Capacity factor:** 2.0–5.0

**Column efficiency:** NLT 800 theoretical plates

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

[NOTE—The aminoglutethimide elutes with the dimethyl sulfoxide.]

Calculate the percentage of azo-aminoglutethimide in the specimen of Aminoglutethimide taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Azo-aminoglutethimide RS in the *Standard solution* ( $\mu$ g/mL)

$C_U$  = concentration of Aminoglutethimide in the *Sample solution* (mg/mL)

**Acceptance criteria:** NMT 0.03% of 3,3'-(azodi-4,1-phenylene)-3,3'-dimethylbis-[2,6-piperidinedione] (corresponding to azo-aminoglutethimide)

**• ORGANIC IMPURITIES**

**Buffer, Mobile phase, Diluent, Chromatographic system, and System suitability:** Proceed as directed in the *Assay*.

**Standard solution:** 10  $\mu$ g/mL of USP *m*-Aminoglutethimide RS in *Diluent*

**Sample solution:** 1 mg/mL of Aminoglutethimide in *Diluent*. Pass through a filter of 0.45- $\mu$ m or finer pore size, discarding the first 5 mL of the filtrate.

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

[NOTE—The relative retention times for aminoglutethimide and *m*-aminoglutethimide are about 0.8 and 1.0, respectively.]

Calculate the percentage of *m*-aminoglutethimide in the portion of Aminoglutethimide taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP *m*-Aminoglutethimide RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Aminoglutethimide in the *Sample solution* (mg/mL)

**Acceptance criteria:** NMT 2.0% of *m*-aminoglutethimide

Calculate the percentage of each peak, other than the main peak and the *m*-aminoglutethimide peak, in the portion of Aminoglutethimide taken, if present:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = response of each peak

$r_T$  = sum of the responses of all the peaks from the *Sample solution*

**Acceptance criteria:** NMT 1.0% total impurities, other than *m*-aminoglutethimide

**SPECIFIC TESTS****• SULFATE**

**Sample solution:** 1 mg/mL in dilute methanol (1 in 20)

**Analysis:** To 100 mL of *Sample solution* add 1.0 mL of 3 N hydrochloric acid and 2.0 mL of barium chloride TS.

**Acceptance criteria:** No turbidity is produced.

**• pH** <791>

**Sample solution:** 1 mg/mL in dilute methanol (1 in 20)

**Acceptance criteria:** 6.2–7.3

**• LOSS ON DRYING** <731>

**Analysis:** Dry at 105° to constant weight.

**Acceptance criteria:** NMT 0.5%

**ADDITIONAL REQUIREMENTS**

**• PACKAGING AND STORAGE:** Preserve in well-closed containers.

- **USP REFERENCE STANDARDS** <11>  
USP Aminoglutethimide RS  
USP *m*-Aminoglutethimide RS  
USP Azo-aminoglutethimide RS

## Aminoglutethimide Tablets

### DEFINITION

Aminoglutethimide Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of aminoglutethimide ( $C_{13}H_{16}N_2O_2$ ).

### IDENTIFICATION

- **A. INFRARED ABSORPTION** <197M>  
**Sample:** Transfer 500 mg of finely powdered Tablets to a suitable container. Add 25 mL of acetone, mix, and filter. Evaporate the filtrate at room temperature to dryness, and dry the residue under vacuum over silica gel for 2 h.  
**Acceptance criteria:** Meet the requirements

### ASSAY

- **PROCEDURE**  
**Buffer:** Add 120 mL of 0.1 N acetic acid to 100 mL of 0.1 N potassium hydroxide in a 1000-mL volumetric flask, and add 250 mL of water. Adjust by the addition of either 1 N acetic acid or 1 N potassium hydroxide to a pH of  $5.0 \pm 0.1$ . Dilute with water to volume.  
**Mobile phase:** Methanol and *Buffer* (27:73)  
**Diluent:** Methanol and *Buffer* (1:1)  
**Standard solution:** 0.5 mg/mL of USP Aminoglutethimide RS in *Diluent*  
**Sample solution:** Nominally 0.5 mg/mL of aminoglutethimide in *Diluent* prepared as follows. Transfer an equivalent to 200 mg of aminoglutethimide, from finely powdered Tablets (NLT 20), to a 200-mL volumetric flask. Add 130 mL of *Diluent*, and sonicate for 5 min. Shake by mechanical means for 30 min, and dilute with *Diluent* to volume. Centrifuge this solution, transfer 25.0 mL of the clear supernatant to a 50-mL volumetric flask, and dilute with *Diluent* to volume. Pass through a filter of 0.45- $\mu$ m or finer pore size, discarding the first 5 mL of the filtrate.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC  
**Detector:** UV 240 nm  
**Column:** 3.9-mm  $\times$  15-cm; 4- $\mu$ m packing L1  
**Column temperature:** 40°  
**Flow rate:** 1.3 mL/min  
**Injection volume:** 10  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** NMT 1.7  
**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of aminoglutethimide ( $C_{13}H_{16}N_2O_2$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area from the *Sample solution*  
 $r_S$  = peak area from the *Standard solution*  
 $C_S$  = concentration of USP Aminoglutethimide RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of aminoglutethimide in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

### PERFORMANCE TESTS

- **DISSOLUTION** <711>  
**Medium:** Dilute hydrochloric acid (7 in 1000); 1000 mL  
**Apparatus 1:** 100 rpm  
**Time:** 30 min  
**Instrumental conditions**  
(See *Spectrophotometry and Light-Scattering* <851>.)  
**Mode:** UV  
**Analytical wavelength:** 237 nm  
**Standard solution:** USP Aminoglutethimide RS in a mixture of dilute hydrochloric acid and pH 7.5 phosphate buffer, having a ratio similar to the *Sample solution*  
**Sample solution:** Sample per *Dissolution* <711>. Dilute with pH 7.5 phosphate buffer to a concentration that is similar to the *Standard solution*.  
**Analysis**  
**Samples:** *Standard solution* and *Sample solution*  
**Tolerances:** NLT 70% (Q) of the labeled amount of aminoglutethimide ( $C_{13}H_{16}N_2O_2$ ) is dissolved.
- **UNIFORMITY OF DOSAGE UNITS** <905>: Meet the requirements

### IMPURITIES

- **ORGANIC IMPURITIES**  
**Buffer, Mobile phase, Diluent, and Chromatographic system:** Proceed as directed in the *Assay*.  
**Standard solution:** 10  $\mu$ g/mL of USP *m*-Aminoglutethimide RS in *Diluent*  
**Sample solution:** Transfer an equivalent to 200 mg of aminoglutethimide, from finely powdered Tablets (NLT 20), to a 200-mL volumetric flask. Add 130 mL of *Diluent*, and sonicate for 5 min. Shake by mechanical means for 30 min, and dilute with *Diluent* to volume. Pass through a filter of 0.45- $\mu$ m or finer pore size, discarding the first 5 mL of the filtrate.  
**System suitability**  
**Samples:** *Standard solution* and *Sample solution*  
[NOTE—The relative retention times for aminoglutethimide and *m*-aminoglutethimide are 0.8 and 1.0, respectively.]  
**Suitability requirements**  
**Tailing factor:** NMT 1.7, *Sample solution*  
**Relative standard deviation:** NMT 2.0%, *Sample solution*

#### Analysis

**Sample:** *Sample solution*

Calculate the percentage of each peak, other than the main peak and the *m*-aminoglutethimide peak, if present in the portion of Tablets taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response of each impurity in the *Sample solution*

$r_T$  = sum of the responses of all of the peaks, excluding that of the *m*-aminoglutethimide peak in the *Sample solution*

**Acceptance criteria:** NMT 2.0% total impurities, other than *m*-aminoglutethimide

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **USP REFERENCE STANDARDS** <11>  
USP Aminoglutethimide RS  
USP *m*-Aminoglutethimide RS

## Aminohippurate Sodium Injection

$C_9H_9N_2NaO_3$  216.17

Glycine, *N*-(4-aminobenzoyl)-, monosodium salt.  
Monosodium *p*-aminohippurate [94-16-6].

» Aminohippurate Sodium Injection is a sterile solution of Aminohippuric Acid in Water for Injection prepared with the aid of Sodium Hydroxide. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of  $C_9H_9N_2NaO_3$ .

**Packaging and storage**—Preserve in single-dose or multi-dose containers, preferably of Type I glass.

**USP Reference standards** (11)—

USP Endotoxin RS

**Identification**—

**A:** A volume of Injection, equivalent to 100 mg of aminohippuric acid, diluted to 50 mL and acidified with hydrochloric acid, responds to *Identification* test *B* under *Aminohippuric Acid*.

**B:** Transfer a volume of Injection, equivalent to about 200 mg of aminohippurate sodium, to a test tube, and add, in the order named, 2 mL of potassium iodide TS, 10 mL of water, and 5 mL of sodium hypochlorite TS: a red color is produced.

**C:** It responds to the flame test for *Sodium* (191).

**Bacterial endotoxins** (85)—It contains not more than 0.04 USP Endotoxin Unit per mg of aminohippurate sodium.

**pH** (791): between 6.7 and 7.6.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—Transfer to a 200-mL volumetric flask an accurately measured volume of Injection, equivalent to about 1 g of aminohippurate sodium, and dilute with water to volume. Transfer 50.0 mL of the solution to a suitable container, add 5 mL of hydrochloric acid, and proceed as directed under *Nitrite Titration* (451), beginning with “cool to about 15°.” Each mL of 0.1 M sodium nitrite is equivalent to 21.62 mg of  $C_9H_9N_2NaO_3$ .

## Aminohippuric Acid

$C_9H_9N_2O_3$  194.19

Glycine, *N*-(4-aminobenzoyl)-.  
*p*-Aminohippuric acid [61-78-9].

» Aminohippuric Acid contains not less than 98.0 percent and not more than 100.5 percent of  $C_9H_9N_2O_3$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Aminohippuric Acid RS

**Identification**—

**A:** *Infrared Absorption* (197K).

**B:** Dissolve about 10 mg in 5 mL of water, and add 0.5 mL of 3 N hydrochloric acid, 0.5 mL of sodium nitrite solution (1 in 10), and a solution of 0.20 g of 2-naphthol in 10 mL of 6 N ammonium hydroxide: a red color is produced.

**Loss on drying** (731)—Dry it at 105° for 2 hours: it loses not more than 0.25% of its weight.

**Residue on ignition** (281): not more than 0.25%.

**Heavy metals**, *Method II* (231): 0.001%.

**Assay**—Transfer about 150 mg, accurately weighed, of Aminohippuric Acid to a beaker or a casserole. Add 5 mL of hydrochloric acid and 50 mL of water, and proceed as directed under *Nitrite Titration* (451), beginning with “stir until dissolved.” Each mL of 0.1 M sodium nitrite is equivalent to 19.42 mg of  $C_9H_9N_2O_3$ .

## Aminopentamide Sulfate

$C_{19}H_{24}N_2O \cdot H_2SO_4$  394.49

$\alpha$ -[2-(Dimethylamino)propyl]- $\alpha$ -phenylbenzeneacetamide sulfate [60-46-8].

» Aminopentamide Sulfate contains not less than 95.0 percent and not more than 103.0 percent of  $C_{19}H_{24}N_2O \cdot H_2SO_4$ .

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

**Labeling**—Label it to indicate that it is for veterinary use only.

**USP Reference standards** (11)—

USP Aminopentamide Sulfate RS

**Clarity and color of solution**—Dissolve 0.5 g in 10 mL of water: the solution is clear and colorless.

**Identification**—

**A:** *Infrared Absorption* (197K).

**B:** It meets the requirements of the tests for *Sulfate* (191).

**Melting range** (741): between 179° and 186°.

**pH** (791): between 1.2 and 3.0, in a solution (2.5 in 100).

**Loss on drying** (731)—Dry it at 105° for 4 hours: it loses not more than 4.4% of its weight.

**Residue on ignition** (281): not more than 0.5%.

**Assay**—Dissolve about 500 mg of Aminopentamide Sulfate, accurately weighed, in 100 mL of dimethylformamide in a suitable container. Add 5 drops of thymol blue TS, and titrate with 0.1 N lithium methoxide VS in toluene to a deep blue endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N lithium methoxide is equivalent to 19.72 mg of  $C_{19}H_{24}N_2O \cdot H_2SO_4$ .

## Aminopentamide Sulfate Injection

» Aminopentamide Sulfate Injection is a sterile solution of Aminopentamide Sulfate in Water for Injection. It contains not less than 90.0 percent

and not more than 110.0 percent of the labeled amount of aminopentamide sulfate ( $C_{19}H_{24}N_2O \cdot H_2SO_4$ ).

**Packaging and storage**—Preserve in tight, single-dose or multiple-dose *Containers for Injections*, as described under *Injections* (1). Store at controlled room temperature.

**Labeling**—Label Injection to indicate that it is for veterinary use only.

**USP Reference standards** (11)—

USP Aminopentamide Sulfate RS

USP Endotoxin RS

**Identification**—Transfer 10 mL of the Injection to a separator, add sodium hydroxide TS until alkaline to litmus, and extract with 25 mL of chloroform. Transfer a few drops of the chloroform extract to a KRS-5 plate, and allow to dry. Record the IR absorption spectrum by the attenuated total reflectance technique (see *Spectrophotometry and Light-Scattering* (851)). The spectrum thus obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Aminopentamide Sulfate RS, concomitantly measured.

**Bacterial endotoxins** (85)—It contains not more than 25 USP Endotoxin Units per mg of aminopentamide sulfate.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration under Test for Sterility of the Product to be Examined*.

**pH** (791): between 2.5 and 4.5.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—

*Mobile phase*—Transfer 14.4 g of sodium lauryl sulfate to a 500-mL volumetric flask, add 100 mL of glacial acetic acid, dilute with water to volume, mix, and pass through a filter having a 0.5- $\mu$ m or finer porosity. Transfer 50 mL of this solution to a 1000-mL volumetric flask, add 350 mL of methanol and 350 mL of acetonitrile, dilute with water to volume, and mix. Filter and degas before use. Make adjustments if necessary (see *System Suitability under Chromatography* (621)).

*Standard preparation*—Quantitatively dissolve an accurately weighed quantity of USP Aminopentamide Sulfate RS in water to obtain a solution having a known concentration equivalent to the labeled concentration of aminopentamide sulfate in the Injection.

*Assay preparation*—Use the undiluted Injection.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1 and is maintained at a constant temperature of about 40°. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 2.5; and the relative standard deviation for replicate injections is not more than 2%.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of aminopentamide sulfate ( $C_{19}H_{24}N_2O \cdot H_2SO_4$ ) in each mL of the Injection taken by the formula:

$$C(r_u / r_s)$$

in which C is the concentration, in mg per mL, of USP Aminopentamide Sulfate RS in the *Standard preparation*; and  $r_u$  and  $r_s$  are the aminopentamide peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Aminopentamide Sulfate Tablets

» Aminopentamide Sulfate Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of aminopentamide sulfate ( $C_{19}H_{24}N_2O \cdot H_2SO_4$ ).

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

**Labeling**—Label Tablets to indicate that they are for veterinary use only.

**USP Reference standards** (11)—

USP Aminopentamide Sulfate RS

**Identification**—Transfer a portion of ground Tablet powder, equivalent to about 2 mg of aminopentamide, to a separator, add 20 mL of water and 3 mL of 10 N sodium hydroxide, and mix. Extract with two 20-mL portions of methylene chloride, and evaporate the combined methylene chloride extracts to a volume of about 0.5 mL. Transfer a few drops of the chloroform concentrate to a KRS-5 plate, and allow to dry. Record the IR absorption spectrum by the attenuated total reflectance technique (see *Spectrophotometry and Light-Scattering* (851)). The spectrum thus obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Aminopentamide Sulfate RS, concomitantly measured.

**Disintegration** (701): not more than 10 minutes, simulated gastric fluid TS being substituted for water in the test.

**Uniformity of dosage units** (905): meet the requirements.

**Loss on drying** (731)—Dry about 1 g of powdered Tablets, accurately weighed, in vacuum at a pressure of 5 mm of mercury or less at 60° for 3 hours: it loses not more than 4.0% of its weight.

**Assay**—

*Mobile phase*—Transfer 14.4 g of sodium lauryl sulfate to a 500-mL volumetric flask, add 100 mL of glacial acetic acid, dilute with water to volume, mix, and pass through a filter having a 0.5- $\mu$ m or finer porosity. Transfer 50 mL of this solution to a 1000-mL volumetric flask, add 350 mL of methanol and 350 mL of acetonitrile, dilute with water to volume, and mix. Filter and degas before use. Make adjustments if necessary (see *System Suitability under Chromatography* (621)).

*Standard preparation*—Quantitatively dissolve an accurately weighed quantity of USP Aminopentamide Sulfate RS in *Mobile phase* to obtain a solution having a known concentration of about 0.02 mg per mL.

*Assay preparation*—Weigh and finely powder not fewer than 10 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 0.2 mg of aminopentamide, to a suitable flask. Add 10.0 mL of *Mobile phase*, sonicate for 5 minutes, and stir by mechanical means for about 10 minutes. Pass this mixture through a filter having a 0.5- $\mu$ m or finer porosity, discarding the first 5 mL of the filtrate. Use the clear filtrate as the *Assay preparation*.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1, and is maintained at a constant temperature of about 40°. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 900 theoretical plates; and the relative standard deviation for replicate injections is not more than 2%.

*Procedure*—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in

mg, of aminopentamide sulfate ( $C_{19}H_{24}N_2O \cdot H_2SO_4$ ) in the portion of Tablets taken by the formula:

$$10C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Aminopentamide Sulfate RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the aminopentamide peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Aminophylline

$C_{16}H_{24}N_4O_4$  (anhydrous) 420.43  
 1*H*-Purine-2,6-dione, 3,7-dihydro-1,3-dimethyl-, compd. with 1,2-ethanediamine (2:1).  
 Theophylline compound with ethylenediamine (2:1) [317-34-0].  
 Dihydrate 456.46 [5897-66-5].

» Aminophylline is anhydrous or contains not more than two molecules of water of hydration. It contains not less than 84.0 percent and not more than 87.4 percent of anhydrous theophylline ( $C_7H_8N_4O_2$ ), calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Label it to indicate whether it is anhydrous or hydrous and also to state the content of anhydrous theophylline.

**USP Reference standards** (11)—

USP Theophylline RS

**Identification**—

**A:** Dissolve about 500 mg in 20 mL of water, add, with constant stirring, 1 mL of 3 N hydrochloric acid, filter (retain the filtrate), wash the precipitate with small portions of cold water, and dry at 105° for 1 hour: the precipitate of theophylline so obtained melts between 270° and 274°.

**B:** To about 10 mg of the dried precipitate obtained in *Identification test A*, contained in a porcelain dish, add 1 mL of hydrochloric acid and 100 mg of potassium chlorate, evaporate on a steam bath to dryness, and invert the dish over a vessel containing a few drops of 6 N ammonium hydroxide: the residue acquires a purple color, which is destroyed by solutions of fixed alkalies.

**C:** To the filtrate obtained in *Identification test A* add 0.5 mL of benzenesulfonyl chloride and 5 mL of 1 N sodium hydroxide to render alkaline, shake by mechanical means for 10 minutes, add 5 mL of 3 N hydrochloric acid to acidify, chill, collect the precipitated disulfonamide of ethylenediamine, wash with water, recrystallize from water, and dry at 105° for 1 hour: the dried precipitate melts between 164° and 171°.

**Water, Method I** (921): not more than 0.75% (anhydrous form) and not more than 7.9% (hydrous form), determined on 1.5 g of it, a mixture of 25 mL of chloroform and 25 mL of methanol being used in place of the methanol solvent.

**Residue on ignition** (281): not more than 0.15%.

**Ethylenediamine content**—Dissolve about 500 mg of Aminophylline, accurately weighed, in 30 mL of water, add methyl orange TS, and titrate with 0.1 N hydrochloric acid

VS. Each mL of 0.1 N hydrochloric acid is equivalent to 3.005 mg of  $C_2H_8N_2$ . The content of ethylenediamine ( $C_2H_8N_2$ ) is between 157 mg and 175 mg per g of  $C_7H_8N_4O_2$  found in the *Assay*.

**Assay**—

**Mobile phase**—Mix 200 mL of methanol, 960 mg of sodium 1-pentanesulfonate, and sufficient water to make 1 L. Adjust with glacial acetic acid to a pH of  $2.9 \pm 0.1$ , filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Diluent**: a mixture of water and methanol (4:1).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Theophylline RS in *Diluent*, and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.08 mg per mL.

**Resolution solution**—Dissolve a suitable quantity of theobromine in the *Standard preparation* to obtain a solution containing about 0.08 mg per mL. Transfer 20.0 mL of this solution to a 25-mL volumetric flask, dilute with *Diluent* to volume, and mix.

**Assay preparation**—Transfer about 24 mg of Aminophylline, accurately weighed, to a 250-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  15-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.65 for theobromine and 1.0 for theophylline; the tailing factor for the theophylline peak is not more than 2.0; and the resolution, *R*, between theobromine and theophylline is not less than 3.0. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of theophylline ( $C_7H_8N_4O_2$ ) in the portion of Aminophylline taken by the formula:

$$250C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Theophylline RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the theophylline peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Aminophylline Injection

» Aminophylline Injection is a sterile solution of Aminophylline in Water for Injection, or is a sterile solution of Theophylline in Water for Injection prepared with the aid of Ethylenediamine. It contains, in each mL, an amount of aminophylline equivalent to not less than 93.0 percent and not more than 107.0 percent of the labeled amount of anhydrous theophylline ( $C_7H_8N_4O_2$ ).

Aminophylline Injection may contain an excess of Ethylenediamine, but no other substance may be added for the purpose of pH adjustment.

**NOTE**—Do not use the Injection if crystals have separated.

**Packaging and storage**—Preserve in single-dose containers from which carbon dioxide has been excluded, preferably of Type I glass, protected from light.

**Labeling**—Label the Injection to state the content of anhydrous theophylline.

**USP Reference standards** (11)—

USP Endotoxin RS

USP Theophylline RS

**Identification**—

**A:** Dilute a volume of Injection, equivalent to about 500 mg of aminophylline, with water to about 20 mL, and add, with constant stirring, 1 mL of 3 N hydrochloric acid or enough to precipitate the theophylline completely. Filter: the filtrate responds to *Identification* test C under *Aminophylline*.

**B:** Wash the precipitate of theophylline with a small portion of cold water, and dry at 105° for 1 hour: the theophylline so obtained melts between 270° and 274°, and responds to *Identification* test B under *Aminophylline*.

**Bacterial endotoxins** (85)—It contains not more than 1.0 USP Endotoxin Unit per mg of aminophylline.

**pH** (791): between 8.6 and 9.0.

**Particulate matter** (788): meets the requirements for small-volume Injections.

**Ethylenediamine content**—Accurately measure a volume of Injection, equivalent to about 500 mg of aminophylline, and dilute with water, if necessary, to make about 30 mL. Add methyl orange TS, and titrate with 0.1 N hydrochloric acid VS. Each mL of 0.1 N hydrochloric acid is equivalent to 3.005 mg of C<sub>2</sub>H<sub>8</sub>N<sub>2</sub>. The Injection contains between 166 mg and 192 mg of ethylenediamine (C<sub>2</sub>H<sub>8</sub>N<sub>2</sub>) per g of C<sub>7</sub>H<sub>8</sub>N<sub>4</sub>O<sub>2</sub> found in the Assay.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—

*Mobile phase, Diluent, Standard preparation, Resolution solution, and Chromatographic system*—Proceed as directed in the Assay under *Aminophylline*.

*Assay preparation*—Transfer an accurately measured volume of Injection, equivalent to about 100 mg of theophylline, to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix. Pipet 4 mL of this solution into a 50-mL volumetric flask, dilute with *Diluent* to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the Assay under *Aminophylline*. Calculate the quantity, in mg, of theophylline (C<sub>7</sub>H<sub>8</sub>N<sub>4</sub>O<sub>2</sub>) in the portion of Injection taken by the formula:

$$1250C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Theophylline RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the theophylline peak responses obtained from the Assay *preparation* and the *Standard preparation*, respectively.

## Aminophylline Oral Solution

» Aminophylline Oral Solution is an aqueous solution of Aminophylline, prepared with the aid of Ethylenediamine. It contains an amount of aminophylline equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous theophylline (C<sub>7</sub>H<sub>8</sub>N<sub>4</sub>O<sub>2</sub>).

Aminophylline Oral Solution may contain an excess of ethylenediamine, but no other sub-

stance may be added for the purpose of pH adjustment.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Label the Oral Solution to state the content of anhydrous theophylline.

**USP Reference standards** (11)—

USP Theophylline RS

**Identification**—

**A:** Place a volume of Oral Solution, equivalent to about 500 mg of aminophylline, in a suitable container, and add, with constant stirring, 1 mL of 3 N hydrochloric acid or an amount sufficient to precipitate the theophylline completely. Filter (retain the filtrate), wash the precipitate with small portions of cold water until free from chloride, and dry at 105° for 1 hour: the theophylline so obtained melts between 270° and 274°.

**B:** The filtrate from *Identification* test A responds to *Identification* test C under *Aminophylline*.

**pH** (791): between 8.5 and 9.7.

**Ethylenediamine content**—Accurately measure a volume of Oral Solution, equivalent to about 500 mg of aminophylline, and dilute with water, if necessary, to make about 30 mL. Add methyl orange TS, and titrate with 0.1 N hydrochloric acid VS. Each mL of 0.1 N hydrochloric acid is equivalent to 3.005 mg of C<sub>2</sub>H<sub>8</sub>N<sub>2</sub>. The Oral Solution contains between 176 mg and 283 mg of ethylenediamine (C<sub>2</sub>H<sub>8</sub>N<sub>2</sub>) per g of C<sub>7</sub>H<sub>8</sub>N<sub>4</sub>O<sub>2</sub> found in the Assay.

**Assay**—

*Mobile phase, Diluent, Standard preparation, Resolution solution, and Chromatographic system*—Prepare as directed in the Assay under *Aminophylline*.

*Assay preparation*—Transfer an accurately measured volume of Oral Solution, equivalent to about 18 mg of anhydrous theophylline, to a 250-mL volumetric flask, dilute with *Diluent* to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the Assay under *Aminophylline*. Calculate the quantity, in mg, of theophylline (C<sub>7</sub>H<sub>8</sub>N<sub>4</sub>O<sub>2</sub>) in each mL of the Oral Solution taken by the formula:

$$250(C / V)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Theophylline RS in the *Standard preparation*; V is the volume, in mL, of Oral Solution taken; and  $r_U$  and  $r_S$  are the theophylline peak responses obtained from the Assay *preparation* and the *Standard preparation*, respectively.

## Aminophylline Rectal Solution

» Aminophylline Rectal Solution is an aqueous solution of Aminophylline, prepared with the aid of Ethylenediamine. It contains an amount of aminophylline equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous theophylline (C<sub>7</sub>H<sub>8</sub>N<sub>4</sub>O<sub>2</sub>).

Aminophylline Rectal Solution may contain an excess of ethylenediamine, but no other substance may be added for the purpose of pH adjustment.

**Packaging and storage**—Preserve in tight, single-dose or multiple-dose containers, at controlled room temperature.

**Labeling**—Label the Rectal Solution to state the content of anhydrous theophylline.

**USP Reference standards** (11)—

USP Theophylline RS

**Identification**—Dilute a volume of Rectal Solution, equivalent to about 500 mg of aminophylline, with water to about 20 mL, and add, with constant stirring, 1 mL of 3 N hydrochloric acid or sufficient to precipitate the theophylline completely. Filter, wash with small portions of cold water until free from chloride, and dry at 105° for 4 hours. Use the precipitate and the filtrate for the following tests.

**A:** *Infrared Absorption* (197K).

**B:** The filtrate obtained as directed above meets the requirements for *Identification* test C under *Aminophylline*.

**pH** (791): between 9.0 and 9.5.

**Ethylenediamine content**—Measure accurately a volume of Rectal Solution, equivalent to about 500 mg of aminophylline, and dilute with water, if necessary, to make about 30 mL. Add methyl orange TS, and titrate with 0.1 N hydrochloric acid VS. Each mL of 0.1 N hydrochloric acid is equivalent to 3.005 mg of C<sub>2</sub>H<sub>8</sub>N<sub>2</sub>. The Rectal Solution contains between 218 mg and 267 mg of ethylenediamine (C<sub>2</sub>H<sub>8</sub>N<sub>2</sub>) per g of anhydrous theophylline (C<sub>7</sub>H<sub>8</sub>N<sub>4</sub>O<sub>2</sub>) found in the Assay.

**Assay**—

**Standard preparation**—Dissolve an accurately weighed quantity of USP Theophylline RS in dilute hydrochloric acid (1 in 100), and dilute quantitatively and stepwise with the same solvent to obtain a solution having a known concentration of about 8 µg per mL.

**Assay preparation**—Pipet an accurately measured volume of Rectal Solution, equivalent to about 500 mg of aminophylline, into a 500-mL volumetric flask, dilute with water to volume, and mix. Pipet 5 mL of this solution into a second 500-mL volumetric flask, add 50 mL of dilute hydrochloric acid (1 in 10), dilute with water to volume, and mix.

**Procedure**—Concomitantly determine the absorbances of the *Standard preparation* and the *Assay preparation* in 1-cm cells at the wavelength of maximum absorbance at about 270 nm, with a suitable spectrophotometer, using dilute hydrochloric acid (1 in 100) as the blank. Calculate the quantity, in mg, of anhydrous theophylline (C<sub>7</sub>H<sub>8</sub>N<sub>4</sub>O<sub>2</sub>) in each mL of the Rectal Solution taken by the formula:

$$50(C/V)(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Theophylline RS in the *Standard preparation*; V is the volume, in mL, of Rectal Solution taken; and A<sub>U</sub> and A<sub>S</sub> are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

## Aminophylline Suppositories

» Aminophylline Suppositories contain an amount of aminophylline equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous theophylline (C<sub>7</sub>H<sub>8</sub>N<sub>4</sub>O<sub>2</sub>).

**Packaging and storage**—Preserve in well-closed containers, in a cold place.

**Labeling**—Label the Suppositories to state the content of anhydrous theophylline.

**Identification**—

**A:** Evaporate to about one-half its volume on a steam bath a portion, equivalent to about 500 mg of aminophyl-

line, of the water solution prepared in the Assay. Adjust with 1 N sodium hydroxide to a pH of 7.0, chill, and filter the crystals of theophylline. Save the filtrate, free from the washings, for use in *Identification* test B: the crystals, after being washed with small portions of ice-cold water and dried at 105° for 1 hour, melt between 270° and 274°, and respond to *Identification* test B under *Aminophylline*.

**B:** The filtrate from *Identification* test A responds to *Identification* test C under *Aminophylline*.

**Ethylenediamine content**—Accurately weigh a portion of the stirred, congealed mass of the Suppositories used for the Assay, equivalent to about 500 mg of aminophylline, and place in a 500-mL conical flask. Add 150 mL of a mixture of equal volumes of alcohol and ether, and warm gently under reflux for 30 minutes, with occasional swirling. Cool to room temperature, and titrate with 0.1 N hydrochloric acid VS, using a glass-modified calomel electrode system (replace the saturated potassium chloride solution of the calomel electrode with methanol saturated with lithium chloride). Each mL of 0.1 N hydrochloric acid is equivalent to 3.005 mg of C<sub>2</sub>H<sub>8</sub>N<sub>2</sub>. The Suppositories contain between 152 mg and 190 mg of ethylenediamine (C<sub>2</sub>H<sub>8</sub>N<sub>2</sub>) per g of C<sub>7</sub>H<sub>8</sub>N<sub>4</sub>O<sub>2</sub> found in the Assay.

**Assay**—Tare a small dish and a glass rod, place in the dish not less than 5 Suppositories, and heat on a steam bath until melted. Mix the melt by stirring it with the rod, cool while stirring, and weigh. Weigh accurately a portion of the mass, equivalent to about 1 g of aminophylline, place it in a beaker, add 60 mL of hot water and 3 mL of nitric acid, and heat on a steam bath for 15 minutes with frequent stirring. Cool, transfer to a separator with the aid of 40 mL of ether, shake well, and allow to separate, using a few mL of alcohol, if necessary, to bring about separation of any emulsion that has formed. Draw the water layer into a 100-mL volumetric flask, wash the ether with two 15-mL portions of water, adding the washings to the volumetric flask, dilute with water to volume, and mix. Transfer an accurately measured portion of the solution, equivalent to about 250 mg of aminophylline, to a 250-mL conical flask, add 10 mL of 6 N ammonium hydroxide and about 20 mL of 0.1 N silver nitrate VS, and heat on a steam bath for 15 minutes. Cool to between 5° and 10° for 20 minutes, then filter, preferably through a filtering crucible of fine porosity under reduced pressure, and wash the precipitate with small portions of water until the last washing gives not more than a faint opalescence with hydrochloric acid. Dissolve the precipitate by pouring over it small volumes of warm 2 N nitric acid, receiving the solution in a conical flask. Wash the filtering crucible a few times with warm water acidified with nitric acid, receiving the washings in the same flask. Cool, add 2 mL of ferric ammonium sulfate TS, and titrate with 0.1 N ammonium thiocyanate VS. Each mL of 0.1 N ammonium thiocyanate is equivalent to 18.02 mg of theophylline (C<sub>7</sub>H<sub>8</sub>N<sub>4</sub>O<sub>2</sub>).

## Aminophylline Tablets

» Aminophylline Tablets contain an amount of aminophylline equivalent to not less than 93.0 percent and not more than 107.0 percent of the labeled amount of anhydrous theophylline (C<sub>7</sub>H<sub>8</sub>N<sub>4</sub>O<sub>2</sub>).

**NOTE**—The ammoniacal odor present in the vapor space above Aminophylline Tablets is often quite strong, especially when bottles having suitably tight closures are newly opened. This is due to ethylenediamine vapor pressure build-up, a natural condition in the case of aminophylline.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Label the Tablets to state the content of anhydrous theophylline.

**USP Reference standards** (11)—

USP Theophylline RS

**Identification**—

**A:** Macerate a quantity of Tablets, equivalent to about 500 mg of aminophylline, with 25 mL of water, and filter: the filtrate is alkaline to litmus. To the filtrate add 1 mL of 3 N hydrochloric acid, stir, and chill, if necessary, to precipitate the theophylline. Filter, and retain the filtrate, free from washings. Wash the crystals on the filter with small quantities of ice-cold water, and dry at 105° for 1 hour: the theophylline so obtained responds to *Identification* test *B* under *Aminophylline*, and when recrystallized from water and dried at 105° for 1 hour, melts between 270° and 274°.

**B:** The filtrate obtained in *Identification* test *A* responds to *Identification* test *C* under *Aminophylline*.

**Dissolution** (711)—

FOR UNCOATED OR PLAIN COATED TABLETS—

*Medium:* water; 900 mL.

*Apparatus 2:* 50 rpm.

*Time:* 45 minutes.

**Procedure**—Determine the amount of anhydrous theophylline ( $C_7H_8N_4O_2$ ) dissolved from UV absorbances at the wavelength of maximum absorbance at about 269 nm on filtered portions of the solution under test, suitably diluted with water, if necessary, in comparison with a Standard solution having a known concentration of USP Theophylline RS in the same *Medium*.

**Tolerances**—Not less than 75% (*Q*) of the labeled amount of  $C_7H_8N_4O_2$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Procedure for content uniformity**—Place 1 Tablet in a 250-mL volumetric flask, add about 200 mL of water, and shake by mechanical means until disintegration is complete. Add water to volume, and mix. Filter a portion of the mixture, discarding the first 20 mL of the filtrate. Concomitantly determine the absorbances of this solution, quantitatively diluted, if necessary, and a Standard solution of USP Theophylline RS having a known concentration of about 10 µg per mL, in 1-cm cells at the wavelength of maximum absorbance at about 269 nm, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg, of anhydrous theophylline ( $C_7H_8N_4O_2$ ) in the Tablet taken by the formula:

$$(TC/D)(A_U / A_S)$$

in which *T* is the labeled quantity, in mg, of anhydrous theophylline in the Tablet, *D* is the concentration, in µg per mL, of theophylline in the solution from the Tablet, based on the labeled quantity per Tablet and the extent of dilution, *C* is the concentration, in µg per mL, of USP Theophylline RS in the Standard solution, and *A<sub>U</sub>* and *A<sub>S</sub>* are the absorbances of the solution from the Tablet and the Standard solution, respectively.

**Ethylenediamine content**—Accurately weigh a portion of the powdered Tablets prepared in the *Assay*, equivalent to about 350 mg of aminophylline, transfer to a 100-mL conical flask, add 20 mL of water, and digest at 50°, with frequent shaking, for 30 minutes. Cool, filter into a 250-mL conical flask, and wash with water until the last washing is neutral to litmus. To the combined filtrate and washings add methyl orange TS, and titrate with 0.1 N hydrochloric acid VS. Each mL of 0.1 N hydrochloric acid is equivalent to 3.005 mg of  $C_2H_8N_2$ . The Tablets contain between 140 mg and 190 mg of ethylenediamine ( $C_2H_8N_2$ ) per g of  $C_7H_8N_4O_2$  found in the *Assay*.

**Assay**—Weigh and finely powder not fewer than 20 Tablets. Transfer a portion of the powder, equivalent to about 2 g of aminophylline, to a 200-mL volumetric flask with the aid of a mixture of 50 mL of water and 15 mL of 6 N ammonium hydroxide, and allow to stand for 30 minutes with frequent shaking, warming to about 50°, if necessary, to dissolve the aminophylline. Cool the mixture to room temperature if it has been warmed, add water to volume, and mix. Centrifuge about 50 mL of the mixture, and pipet a portion of the clear supernatant, equivalent to about 250 mg of aminophylline, into a 250-mL conical flask, and dilute with water, if necessary, to make about 40 mL. Add 8 mL of 6 N ammonium hydroxide and 20.0 mL of 0.1 N silver nitrate VS, mix, heat to boiling, and continue boiling for 15 minutes. Cool to between 5° and 10° for 20 minutes, then filter, preferably through a filtering crucible under reduced pressure, and wash the precipitate with three 10-mL portions of water. Acidify the combined filtrate and washings with nitric acid, and add an additional 3 mL of the acid. Cool, add 2 mL of ferric ammonium sulfate TS, and titrate the excess silver nitrate with 0.1 N ammonium thiocyanate VS. Each mL of 0.1 N silver nitrate is equivalent to 18.02 mg of  $C_7H_8N_4O_2$ .

## Aminophylline Delayed-Release Tablets

» Aminophylline Delayed-Release Tablets contain an amount of aminophylline equivalent to not less than 93.0 percent and not more than 107.0 percent of the labeled amount of anhydrous theophylline ( $C_7H_8N_4O_2$ ).

**NOTE**—The ammoniacal odor present in the vapor space above Aminophylline Delayed-Release Tablets is often quite strong, especially when bottles having suitably tight closures are newly opened. This is due to ethylenediamine vapor pressure build-up, a natural condition in the case of aminophylline.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Label the Tablets to state the content of anhydrous theophylline.

**USP Reference standards** (11)—

USP Theophylline RS

**Disintegration** (701): 30 minutes, determined as directed under *Delayed-Release (enteric coated) Tablets*.

**Other requirements**—Tablets respond to the *Identification* tests and meet the requirements for *Uniformity of dosage units*, *Ethylenediamine content* and *Assay* under *Aminophylline Tablets*.

## Aminosaliclylate Sodium

$C_7H_6NNaO_3 \cdot 2H_2O$  211.15

Benzoic acid, 4-amino-2-hydroxy-, monosodium salt, dihydrate.

Monosodium 4-aminosalicylate dihydrate [6018-19-5].

Anhydrous 175.12 [133-10-8].

» Aminosaliclylate Sodium contains not less than 98.0 percent and not more than 101.0 percent of  $C_7H_6NNaO_3$ , calculated on the anhydrous basis.

**Caution**—Prepare solutions of Aminosaliclylate Sodium within 24 hours of administration. Under

no circumstances use a solution if its color is darker than that of a freshly prepared solution.

**Packaging and storage**—Preserve in tight, light-resistant containers, protected from excessive heat.

**USP Reference standards** (11)—

USP Aminosalicylic Acid RS

USP *m*-Aminophenol RS

**Clarity and color of solution**—One g dissolves in 10 mL of water to give a clear solution that has not more than a faint yellow color. One g dissolves in a freshly prepared mixture of 5 mL of nitric acid and 45 mL of water to give a clear solution that has not more than a slight color.

**Identification**—

**A:** Dissolve 250 mg in 3 mL of 1 N sodium hydroxide, transfer to a 500-mL volumetric flask, dilute with water to volume, and mix. Transfer a 5-mL aliquot to a 250-mL volumetric flask containing 12.5 mL of pH 7 phosphate buffer (see under *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*), dilute with water to volume, and mix. This solution, when compared in a suitable spectrophotometer against a blank of the same buffer in the same concentration, exhibits absorbance maxima at  $265 \pm 2$  nm and  $299 \pm 2$  nm, and the ratio  $A_{265}/A_{299}$  is between 1.50 and 1.56.

**B:** Place about 1 g in a small, round-bottom flask, and add 10 mL of acetic anhydride. Heat the flask on a steam bath for 30 minutes, add 40 mL of water, mix, filter, cool, and allow to stand until the diacetyl derivative has crystallized. Collect the precipitate on a filter, wash with water, and dry at  $105^\circ$  for 1 hour: the diacetyl derivative so obtained melts between  $191^\circ$  and  $197^\circ$ .

**C:** Dissolve 50 mg in 5 mL of water, add 1 mL of 3 N hydrochloric acid, and filter if necessary. To the filtrate add 1 drop of ferric chloride TS: a violet color is produced.

**D:** A solution of it responds to the tests for *Sodium* (191).

**pH** (791): between 6.5 and 8.5, in a solution (1 in 50).

**Water, Method I** (921): between 16.0% and 18.0%.

**Chloride** (221)—Dissolve 0.50 g in a mixture of 5 mL of nitric acid and 15 mL of water: the solution shows no more chloride than corresponds to 0.30 mL of 0.020 N hydrochloric acid (0.042%).

**Heavy metals, Method II** (231): 0.003%.

**Limit of *m*-aminophenol**—

*Mobile phase*—Prepare as directed in the Assay under Aminosalicylic Acid.

*Internal standard solution, Standard preparation, and Chromatographic system*—Prepare as directed in the test for Limit of *m*-aminophenol under Aminosalicylic Acid.

*Test preparation*—Use the Assay preparation, prepared as directed in the Assay.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the Standard preparation and the Test preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.66 for sulfanilamide and 1.0 for *m*-aminophenol. Calculate the percentage of *m*-aminophenol, in relation to the quantity of aminosalicylate sodium in the portion of Aminosalicylate Sodium taken by the formula:

$$10(C / W)(R_U / R_S)$$

in which C is the concentration, in  $\mu$ g per mL, of USP *m*-Aminophenol RS in the Standard preparation; W is the quantity of aminosalicylate sodium, in mg, in the portion of Aminosalicylate Sodium taken, as determined in the Assay; and  $R_U$  and  $R_S$  are the ratios of the response of the *m*-aminophenol peak to the response of the sulfanilamide peak obtained from the Test preparation and the Standard preparation, respectively: not more than 0.25% of *m*-aminophenol is found.

**Hydrogen sulfide, sulfur dioxide, and amyl alcohol**—

Dissolve about 500 mg in 5 mL of 1 N sodium hydroxide, add 6 mL of 3 N hydrochloric acid, and stir vigorously: no odor of hydrogen sulfide or sulfur dioxide is perceptible, and not more than a faint odor of amyl alcohols is perceptible. A piece of moistened lead acetate test paper held over the mixture does not become discolored.

**Assay**—

*Mobile phase, Internal standard solution, Standard preparation, and Chromatographic system*—Prepare as directed in the Assay under Aminosalicylic Acid.

*Assay preparation*—Transfer about 69 mg of Aminosalicylate Sodium, accurately weighed, to a 100-mL low-actinic volumetric flask, add 50 mL of Mobile phase, and swirl to dissolve. Add 10.0 mL of Internal standard solution, dilute with Mobile phase to volume, and mix.

*Procedure*—Proceed as directed for Procedure in the Assay under Aminosalicylic Acid. Calculate the quantity of  $C_7H_6NNaO_3$ , in mg, in the Aminosalicylate Sodium taken by the formula:

$$(175.12 / 153.14)(100C)(R_U / R_S)$$

in which 175.12 and 153.14 are the molecular weights of anhydrous aminosalicylate sodium and aminosalicylic acid, respectively; C is the concentration, in mg per mL, of USP Aminosalicylic Acid RS in the Standard preparation; and  $R_U$  and  $R_S$  are the ratios of the response of the aminosalicylic acid peak to the response of the acetaminophen peak obtained from the Assay preparation and the Standard preparation, respectively.

## Aminosalicylate Sodium Tablets

» Aminosalicylate Sodium Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of  $C_7H_6NNaO_3 \cdot 2H_2O$ .

**Packaging and storage**—Preserve in tight, light-resistant containers, protected from excessive heat.

**USP Reference standards** (11)—

USP Aminosalicylic Acid RS

USP *m*-Aminophenol RS

**Identification**—Digest a quantity of powdered Tablets, equivalent to about 3 g of aminosalicylate sodium, with 40 mL of water, and filter. Add to the filtrate 15 mL of 1 N acetic acid, and allow to stand until precipitation has occurred. Collect the precipitate on a filter, wash well with water, and dry at  $105^\circ$  for 30 minutes: the residue responds to the following tests.

**A:** Place about 1 g in a small, round-bottom flask, and add 10 mL of acetic anhydride. Heat the flask on a steam bath for 30 minutes, add 40 mL of water, mix, filter, cool, and allow to stand until the diacetyl derivative has crystallized. Collect the precipitate on a filter, wash well with water, and dry at  $105^\circ$  for 1 hour: the diacetyl derivative so obtained melts between  $191^\circ$  and  $197^\circ$ .

**B:** Shake 0.1 g with 10 mL of water, and filter. To 5 mL of the filtrate add 1 drop of ferric chloride TS: a violet color is produced.

**Dissolution, Procedure for a Pooled Sample** (711)—

*Medium:* water; 900 mL.

*Apparatus 1:* 100 rpm.

*Time:* 45 minutes.

*Procedure*—Determine the amount of  $C_7H_6NNaO_3 \cdot 2H_2O$  dissolved, employing the procedure set forth in the Assay, making any necessary modifications.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_7H_6NNaO_3 \cdot 2H_2O$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Limit of *m*-aminophenol—**

**Mobile phase**—Prepare as directed in the Assay under Aminosalicyclic Acid.

**Standard solution, Internal standard solution, and Chromatographic system**—Prepare as directed in the test for Limit of *m*-aminophenol under Aminosalicyclic Acid.

**Test solution**—Use the Assay preparation, prepared as directed in the Assay.

**Procedure**—Proceed as directed for Procedure in the test for Limit of *m*-aminophenol under Aminosalicyclic Acid. Calculate the percentage of *m*-aminophenol, in relation to the quantity of aminosalicilate sodium, in the portion of Tablets taken by the formula:

$$100(C / W)(R_U / R_S)$$

in which C is the concentration, in  $\mu\text{g}$  per mL, of USP *m*-Aminophenol RS in the Standard solution; W is the quantity of aminosalicilate sodium, in mg, in the portion of Tablets taken, as determined in the Assay; and  $R_U$  and  $R_S$  are the ratios of the response of the *m*-aminophenol peak to the response of the sulfanilamide peak obtained from the Test solution and the Standard solution, respectively: not more than 1.0% of *m*-aminophenol is found.

**Assay—**

**Mobile phase, Internal standard solution, Standard preparation, and Chromatographic system**—Prepare as directed in the Assay under Aminosalicyclic Acid.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 690 mg of aminosalicilate sodium, to a 100-mL low-actinic volumetric flask. Add 50 mL of Mobile phase, and shake for about 5 minutes. Dilute with Mobile phase to volume, and mix. Filter, and transfer 10.0 mL of the clear filtrate to a low-actinic, 100-mL volumetric flask containing 10.0 mL of Internal standard solution, dilute with Mobile phase to volume, and mix.

**Procedure**—Proceed as directed for Procedure in the Assay under Aminosalicyclic Acid. Calculate the quantity, in mg, of  $C_7H_6NNaO_3 \cdot 2H_2O$  in the portion of Tablets taken by the formula:

$$(211.15 / 153.14)(1000C)(R_U / R_S)$$

in which 211.15 and 153.14 are the molecular weights of aminosalicilate sodium dihydrate and aminosalicyclic acid, respectively; C is the concentration, in mg per mL, of USP Aminosalicyclic Acid RS in the Standard preparation; and  $R_U$  and  $R_S$  are the ratios of the response of the aminosalicyclic acid peak to the response of the acetaminophen peak obtained from the Assay preparation and the Standard preparation, respectively.

## Aminosalicyclic Acid

$C_7H_7NO_3$  153.14  
Benzoic acid, 4-amino-2-hydroxy-  
4-Aminosalicyclic acid [65-49-6].

» Aminosalicyclic Acid contains not less than 98.5 percent and not more than 100.5 percent of  $C_7H_7NO_3$ , calculated on the anhydrous basis.

**Caution**—Under no circumstances use a solution prepared from Aminosalicyclic Acid if its color is darker than that of a freshly prepared solution.

**Packaging and storage**—Preserve in tight, light-resistant containers, at a temperature not exceeding 30°.

**USP Reference standards** (11)—

USP Aminosalicyclic Acid RS

USP *m*-Aminophenol RS

**Clarity and color of solution**—One g dissolves in 10 mL of sodium bicarbonate solution (1 in 15) to form a clear solution that has not more than a faint yellow color. One g dissolves in a freshly prepared mixture of 5 mL of nitric acid and 45 mL of water to form a clear solution that has not more than a slight color.

**Identification—**

**A:** Dissolve 0.25 g in 3 mL of 1 N sodium hydroxide, transfer to a 500-mL volumetric flask, dilute with water to volume, and mix. Transfer a 5-mL aliquot to a 250-mL volumetric flask containing 12.5 mL of pH 7 phosphate buffer (see Buffer Solutions in the section Reagents, Indicators, and Solutions), dilute with water to volume, and mix. This solution, when compared in a suitable spectrophotometer against a blank of the same buffer in the same concentration, exhibits absorbance maxima at  $265 \pm 2$  and  $299 \pm 2$  nm, and the ratio  $A_{265}/A_{299}$  is between 1.50 and 1.56.

**B:** Place about 1 g in a small, round-bottom flask, and add 10 mL of acetic anhydride. Heat the flask on a steam bath for 30 minutes, add 40 mL of water, mix, filter, cool, and allow to stand until the diacetyl derivative has crystallized. Collect the precipitate on a filter, wash well with water, and dry at 105° for 1 hour: the diacetyl derivative so obtained melts between 191° and 197°.

**C:** Shake 0.1 g with 10 mL of water, and filter. To 5 mL of the filtrate add 1 drop of ferric chloride TS: a violet color is produced.

**pH** (791): between 3.0 and 3.7, in a saturated solution.

**Water, Method I** (921): not more than 0.5%.

**Residue on ignition** (281): not more than 0.2%.

**Chloride** (221)—Dissolve 0.50 g in a mixture of 5 mL of nitric acid and 15 mL of water: the solution shows no more chloride than corresponds to 0.30 mL of 0.020 N hydrochloric acid (0.042%).

**Heavy metals, Method II** (231): 0.003%.

**Limit of *m*-aminophenol—**

**Mobile phase**—Prepare as directed in the Assay.

**Internal standard solution**—Prepare a solution of sulfanilamide in Mobile phase having a concentration of about 5  $\mu\text{g}$  per mL.

**Standard solution**—Dissolve an accurately weighed quantity of USP *m*-Aminophenol RS in Mobile phase to obtain a solution having a known concentration of about 12  $\mu\text{g}$  per mL. Transfer 10.0 mL of this solution and 10.0 mL of Internal standard solution to a 100-mL low-actinic volumetric flask, dilute with Mobile phase to volume, and mix.

**Test solution**—Transfer about 50 mg of Aminosalicyclic Acid, accurately weighed, to a 100-mL low-actinic volumetric flask, add 50 mL of Mobile phase, and swirl to dissolve. Add 10.0 mL of Internal standard solution, dilute with Mobile phase to volume, and mix.

**Chromatographic system** (see Chromatography (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm  $\times$  25-cm column that contains 10- $\mu\text{m}$  packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.66 for sulfanilamide and 1.0 for *m*-aminophenol;

the resolution,  $R$ , between *m*-aminophenol and sulfanilamide is not less than 2.5; and the relative standard deviation for replicate injections is not more than 7%.

**Procedure**—[NOTE—After use, wash the column for 30 minutes with a filtered and degassed mixture of methanol, water, and phosphoric acid (77:23:0.6), and then wash for 30 minutes with a filtered and degassed mixture of methanol and water (50:50).] Separately inject equal volumes (about 20  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of *m*-aminophenol, in relation to the quantity of aminosalicyclic acid in the portion of Aminosalicyclic Acid taken by the formula:

$$10(C/W)(R_U/R_S)$$

in which  $C$  is the concentration, in  $\mu$ g per mL, of USP *m*-Aminophenol RS in the *Standard solution*,  $W$  is the quantity of aminosalicyclic acid, in mg, in the portion of Aminosalicyclic Acid taken, as determined in the *Assay*; and  $R_U$  and  $R_S$  are the ratios of the response of the *m*-aminophenol peak to the response of the sulfanilamide peak obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.25% of *m*-aminophenol is found.

**Hydrogen sulfide, sulfur dioxide, and amyl alcohol**—Dissolve about 500 mg in 5 mL of 1 N sodium hydroxide, add 6 mL of 3 N hydrochloric acid, and stir vigorously: no odor of hydrogen sulfide or sulfur dioxide is perceptible, and not more than a faint odor of amyl alcohols is perceptible. A piece of moistened lead acetate test paper held over the mixture does not become discolored.

#### Assay—

**Mobile phase**—Prepare a mixture of 425 mL of 0.05 M dibasic sodium phosphate, 425 mL of 0.05 M monobasic sodium phosphate, and 150 mL of methanol containing 1.9 g of tetrabutylammonium hydroxide. Filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Internal standard solution**—Prepare a solution of acetaminophen in *Mobile phase* having a concentration of about 5 mg per mL.

**Standard preparation**—Transfer about 12.5 mg of USP Aminosalicyclic Acid RS, accurately weighed, to a 25-mL low-actinic volumetric flask, add 15 mL of *Mobile phase*, and swirl to dissolve. Add 2.5 mL of *Internal standard solution*, dilute with *Mobile phase* to volume, and mix.

**Assay preparation**—Prepare as directed for *Standard preparation*, except to use Aminosalicyclic Acid instead of USP Aminosalicyclic Acid RS.

**Chromatographic system** (see *Chromatography* (621))—The chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.83 for acetaminophen and 1.0 for aminosalicyclic acid; the resolution,  $R$ , between aminosalicyclic acid and acetaminophen is not less than 1.7; and the relative standard deviation of the ratios of the response of the aminosalicyclic acid peak to the response of the acetaminophen peak is not more than 1.0%.

**Procedure**—[NOTE—After use, wash the column for 30 minutes with a filtered and degassed mixture of methanol, water, and phosphoric acid (77:23:0.6), and then wash for 30 minutes with a filtered and degassed mixture of methanol and water (50:50).] Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks.

Calculate the quantity, in mg, of  $C_7H_7NO_3$  in the Aminosalicyclic Acid taken by the formula:

$$25C(R_U/R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Aminosalicyclic Acid RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the ratios of the response of the aminosalicyclic acid peak to the response of the acetaminophen peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Aminosalicyclic Acid Tablets

» Aminosalicyclic Acid Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of aminosalicyclic acid ( $C_7H_7NO_3$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers, at a temperature not exceeding 30°.

#### USP Reference standards (11)—

USP Aminosalicyclic Acid RS

USP *m*-Aminophenol RS

**Identification**—Macerate a portion of powdered Tablets, equivalent to about 2 g of aminosalicyclic acid, with 50 mL of a mixture of 1 volume of acetone and 2 volumes of chloroform, and filter. Evaporate the filtrate with the aid of a current of warm air to dryness: the residue so obtained responds to *Identification* tests B and C under *Aminosalicyclic Acid*.

#### Dissolution (711)—

**Medium:** pH 7.5 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*); 900 mL.

**Apparatus 1:** 100 rpm.

**Time:** 45 minutes.

**Procedure**—Determine the amount of  $C_7H_7NO_3$  dissolved, employing the procedure set forth in the *Assay*, making any necessary modifications.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_7H_7NO_3$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

#### Limit of *m*-aminophenol—

**Mobile phase and Internal standard solution**—Prepare as directed in the *Assay* under *Aminosalicyclic Acid*.

**Standard solution and Chromatographic system**—Prepare as directed in the test for *Limit of m-aminophenol* under *Aminosalicyclic Acid*.

**Test solution**—Use the *Assay preparation*, prepared as directed in the *Assay*.

**Procedure**—Proceed as directed for *Procedure* in the test for *Limit of m-aminophenol* under *Aminosalicyclic Acid*. Calculate the percentage of *m*-aminophenol, in relation to the quantity of aminosalicyclic acid in the portion of Tablets taken by the formula:

$$100(C/W)(R_U/R_S)$$

in which  $C$  is the concentration, in  $\mu$ g per mL, of USP *m*-Aminophenol RS in the *Standard solution*;  $W$  is the quantity of aminosalicyclic acid, in mg, in the portion of Tablets taken, as determined in the *Assay*; and  $R_U$  and  $R_S$  are the ratios of the response of the *m*-aminophenol peak to the response of the sulfanilamide peak obtained from the *Test solution* and the *Standard solution*, respectively: not more than 1.0% of *m*-aminophenol is found.

**Assay—**

*Mobile phase, Internal standard solution, Standard preparation, and Chromatographic system*—Prepare as directed in the Assay under Aminosalicilic Acid.

*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 500 mg of aminosalicilic acid, to a 100-mL low-actinic volumetric flask. Add 50 mL of *Mobile phase*, and shake for about 5 minutes. Dilute with *Mobile phase* to volume, and mix. Filter, and transfer 10.0 mL of the clear filtrate to a 100-mL low-actinic volumetric flask containing 10.0 mL of *Internal standard solution*, dilute with *Mobile phase* to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the Assay under Aminosalicilic Acid. Calculate the quantity, in mg, of aminosalicilic acid ( $C_7H_7NO_3$ ) in the portion of Tablets taken by the formula:

$$1000C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of USP Aminosalicilic Acid RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the ratios of the response of the aminosalicilic acid peak to the response of the acetaminophen peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Amiodarone Hydrochloride

$C_{25}H_{29}I_2NO_3 \cdot HCl$  681.77  
Methanone, (2-butyl-3-benzofuranyl)[4-[2-(diethylamino)ethoxy]-3,5-diiodophenyl]- hydrochloride; 2-Butyl-3-benzofuranyl 4-[2-(diethylamino)ethoxy]-3,5-diiodophenyl ketone hydrochloride [19774-82-4]. 2-Butyl-3-benzofuranyl 4-[2-(diethylamino)ethoxy]-3,5-diiodophenyl ketone [1951-25-3].

**DEFINITION**

Amiodarone Hydrochloride contains NLT 98.5% and NMT 101.0% of  $C_{25}H_{29}I_2NO_3 \cdot HCl$ , calculated on the dried basis.

**IDENTIFICATION**

- **A. INFRARED ABSORPTION** (197K)
- **B. IDENTIFICATION TESTS—GENERAL**, Chloride (191): Meets the requirements

**ASSAY****• PROCEDURE**

**Buffer:** Dissolve 6.80 g of monobasic potassium phosphate in 900 mL of water, and add 1.0 mL of triethylamine. Adjust with phosphoric acid to a pH of 6.00 ± 0.05, and dilute with water to 1000 mL.

**Diluent:** Acetonitrile and water (1:1)

**Mobile phase:** Acetonitrile and *Buffer* (1:1)

**Standard stock solution:** 0.5 mg/mL of USP Amiodarone Hydrochloride RS in methanol

**Standard solution:** 0.1 mg/mL USP Amiodarone Hydrochloride RS in *Diluent* from *Standard stock solution*

**Sample stock solution:** 0.5 mg/mL of Amiodarone Hydrochloride in methanol

**Sample solution:** 0.1 mg/mL of Amiodarone Hydrochloride in *Diluent* from *Sample stock solution*

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 240 nm

**Column:** 3.9-mm × 15-cm; 5-μm packing L26

**Flow rate:** 1.5 mL/min

**Injection size:** 10 μL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Column efficiency:** NLT 1000 theoretical plates

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 1.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{25}H_{29}I_2NO_3 \cdot HCl$  in the portion of Amiodarone Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of amiodarone in the *Sample solution*

$r_S$  = peak response of amiodarone in the *Standard solution*

$C_S$  = concentration of USP Amiodarone Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of Amiodarone Hydrochloride in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.5%–101.0%, on the dried basis

**IMPURITIES****Inorganic Impurities**

- **RESIDUE ON IGNITION** (281): NMT 0.1% on a 1-g sample

**• HEAVY METALS**

**Buffer:** Dissolve 25.0 g of ammonium acetate in 25 mL of water, and add 38.0 mL of 70% hydrochloric acid. Adjust, if necessary, with diluted hydrochloric acid or diluted ammonia solution to a pH of 3.5. Dilute with water to 100.0 mL.

**Lead standard stock solution (1000 ppm Pb):** 1.6 mg/mL of lead nitrate in water

**Lead standard solution:** 10 ppm of lead in water from *Lead standard stock solution*. [NOTE—Prepare immediately before use.]

**Phenolphthalein solution:** Dissolve 0.1 g of phenolphthalein in 80 mL of alcohol, and dilute with water to 100 mL.

**Thioacetamide solution:** Prepare a solution of 40 g/L of thioacetamide in water. To 0.2 mL of the freshly prepared solution, add 1 mL of a mixture of 85% glycerol, 1 M sodium hydroxide, and water (4:3:1). Heat in a water bath for 20 s.

**Sample solution:** Place about 1 g of Amiodarone Hydrochloride in a silica crucible along with 4 mL of magnesium sulfate solution (250 g/L of diluted sulfuric acid). Mix using a fine glass rod, and heat cautiously. If the mixture is a liquid, evaporate gently to dryness on a water bath. Progressively heat to ignition, and continue heating until an almost white or a mostly grayish residue is obtained. Carry out the ignition at a temperature not exceeding 800°. Allow to cool. Moisten the residue with a few drops of dilute sulfuric acid. Evaporate, ignite again, and allow to cool. The total period of ignition must not exceed 2 h. Dissolve the residue in two portions, 5 mL each, of 20% hydrochloric acid. Add 0.1 mL of *Phenolphthalein solution* followed by 25% ammonia water until a pink color is obtained. Cool, add glacial acetic acid until the solution is decolorized, and add 0.5 mL in excess. Filter if necessary, wash the filter, and dilute with water to 20 mL.

**Standard solution:** Proceed as directed for *Sample solution*, using 2 mL of *Lead standard solution* instead of

Amiodarone Hydrochloride. To 10 mL of the solution obtained, add 2 mL of the *Sample solution*.

**Monitor solution:** Proceed as directed for *Sample solution*, adding 2 mL of *Standard solution* to 1 g of Amiodarone Hydrochloride.

**Blank solution:** 10 mL of water and 2 mL of *Sample solution*

#### Analysis

**Samples:** *Standard solution*, *Sample solution*, *Blank solution*, and *Monitor solution*

To 12 mL each of the *Standard solution*, *Sample solution*, *Blank solution*, and *Monitor solution* add 2 mL of *Buffer solution*, and mix. Add 1.2 mL of *Thioacetamide solution*, and immediately mix again. Examine the solutions after 2 min. The test is invalid if the *Standard solution* does not show a slight brown color compared to the *Blank solution* or if the *Monitor solution* is not comparable with the *Standard solution*.

**Acceptance criteria:** Any brown color in the *Sample solution* is not more intense than that in the *Standard solution* (20 ppm). [NOTE—If the result is difficult to judge, pass the solutions through a membrane filter having a porosity of 3 µm. Carry out the filtration slowly and uniformly, applying moderate and constant pressure. Compare the spots on the filters obtained from the different solutions.]

#### Organic Impurities

[NOTE—The product meets the requirements for both *Procedure 1* and *Procedure 2*.]

#### • PROCEDURE 1

**Potassium iodobismuthate solution:** Dissolve 100 g of tartaric acid in 400 mL of water, and add 8.5 g of bismuth subnitrate. Shake for 1 h, add 200 mL of a 400 g/L solution of potassium iodide, and shake well. Allow to stand for 24 h, filter, and protect from light.

**Standard solution A:** 0.02 mg/mL of USP Amiodarone Related Compound H RS in methylene chloride

**Standard solution B:** *Standard solution A* and *Sample solution* (1:1).

**Sample solution:** 100 mg/mL of Amiodarone Hydrochloride in methylene chloride

#### Chromatographic system

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

**Mode:** TLC

**Adsorbent:** 0.5-mm layer of chromatographic silica gel and fluorescent indicator with maximum absorbance at 254 nm

#### Application volume

**Standard solution A:** 50 µL

**Standard solution B:** 100 µL

**Sample solution:** 50 µL

**Developing solvent system:** Methylene chloride, methanol, and anhydrous formic acid (17:2:1)

#### Analysis

**Samples:** *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop the plate in the *Developing solvent system* until the solvent front has moved NLT two-thirds the length of the plate, and dry in a current of cold air. Spray the plate with *Potassium iodobismuthate solution* and then with 3% hydrogen peroxide solution. Examine immediately in daylight: the spot from *Standard solution B* due to amiodarone related compound H is clearly visible.

**Acceptance criteria:** Any spot with the same  $R_f$  as the spot due to amiodarone related compound H from *Standard solution B* is not more intense than the spot from *Standard solution A* (0.02%).

#### • PROCEDURE 2

**Buffer:** Add 3 mL of glacial acetic acid to 800 mL of water. Adjust with diluted ammonia solution to a pH of 4.9, and dilute with water to 1000 mL.

**Mobile phase:** Acetonitrile: methanol: *Buffer* (4:3:3 v/v/v).

**Diluent:** Acetonitrile and water (1:1)

**Standard stock solution:** Dissolve equal quantities of USP Amiodarone Related Compound D RS, USP Amiodarone Related Compound E RS, and USP Amiodarone Hydrochloride RS in a known amount of methanol.

**Standard solution:** 0.01 mg/mL each of USP Amiodarone Related Compound D RS, USP Amiodarone Related Compound E RS, and USP Amiodarone Hydrochloride RS, in *Diluent* from *Standard stock solution*

**Sample solution:** 5 mg/mL of Amiodarone Hydrochloride in *Diluent*

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 240 nm

**Column:** 4.6-mm × 15-cm; 5-µm packing L1

**Column temperature:** 30°

**Flow rate:** 1 mL/min

**Injection size:** 10 µL

**Run time:** 2 times the retention time of amiodarone

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Resolution:** NLT 3.5 between amiodarone related compound D and amiodarone related compound E

#### Analysis

[NOTE—Disregard any peak that is less than 0.05%.]

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Amiodarone Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of each impurity in the *Sample solution*

$r_S$  = peak response of amiodarone in the *Standard solution*

$C_S$  = concentration of USP Amiodarone Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of Amiodarone Hydrochloride in the *Sample solution* (mg/mL)

#### Acceptance criteria

**Individual impurities:** See *Impurity Table 1*.

**Total impurities:** NMT 0.5%

**Impurity Table 1**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)

Impurity Table 1 (Continued)

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Amiodarone hydrochloride	1.00	—
Any other individual impurity	—	0.10

<sup>a</sup> (2-Butylbenzofuran-3-yl){4-[2-(diethylamino)ethoxy]phenyl}methanone.<sup>b</sup> (2-Butylbenzofuran-3-yl)(4-hydroxy-3,5-diiodophenyl)methanone.<sup>c</sup> (2-Butylbenzofuran-3-yl)(4-hydroxyphenyl)methanone.<sup>d</sup> (2-Butylbenzofuran-3-yl){4-[2-(ethylamino)ethoxy]-3,5-diiodophenyl}methanone.<sup>e</sup> (2-Butylbenzofuran-3-yl){4-[2-(diethylamino)ethoxy]-3-iodophenyl}methanone.<sup>f</sup> [2-[(1*R*S)-1-Methoxybutyl]benzofuran-3-yl][4-[2-(diethylamino)ethoxy]-3,5-diiodophenyl]methanone.<sup>g</sup> (2-Butylbenzofuran-3-yl)(4-hydroxy-3-iodophenyl)methanone.**SPECIFIC TESTS****• LIMIT OF IODIDES**

**Solution A:** Add 1.50 g of Amiodarone Hydrochloride to 40 mL of water at 80°, and shake until completely dissolved. Cool, and dilute with water to 50.0 mL.

**Standard solution:** To 15.0 mL of *Solution A* add 1.0 mL of 0.1 M hydrochloric acid, 1.0 mL of an 88.2 mg/L solution of potassium iodide, and 1.0 mL of 0.05 M potassium iodate. Dilute with water to 20.0 mL. Allow to stand protected from light for 4 h.

**Sample solution:** To 15.0 mL of *Solution A* add 1.0 mL of 0.1 M hydrochloric acid and 1.0 mL of 0.05 M potassium iodate. Dilute with water to 20.0 mL. Allow to stand protected from light for 4 h.

**Analysis:** Measure the absorbances of the *Standard solution* and the *Sample solution* at 420 nm, using a mixture of 15.0 mL of *Solution A* and 1.0 mL of 0.1 M hydrochloric acid diluted with water to 20.0 mL to serve as the blank. The absorbance of the *Sample solution* is NMT half the absorbance of the *Standard solution*.

**Acceptance criteria:** NMT 150 ppm

- PH (791):** 3.2–3.8. Dissolve 1 g of Amiodarone Hydrochloride in water by heating at 80°. Cool, and dilute with water to 20 mL.
- LOSS ON DRYING (731):** Use 1 g of sample, and dry under vacuum (NMT 0.3 kPa) at 50° for 4 h: it loses NMT 0.5% of its weight.

**ADDITIONAL REQUIREMENTS**

- PACKAGING AND STORAGE:** Preserve in light-resistant, tight containers. Store at controlled room temperature.
- USP REFERENCE STANDARDS (11)**
  - USP Amiodarone Hydrochloride RS
  - USP Amiodarone Related Compound D RS  
(2-Butylbenzofuran-3-yl)(4-hydroxy-3,5-diiodophenyl)methanone.

**Add the following:****▲Amiodarone Hydrochloride Oral Suspension****DEFINITION**

Amiodarone Hydrochloride Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of amiodarone hydrochloride (C<sub>25</sub>H<sub>29</sub>I<sub>2</sub>NO<sub>3</sub> · HCl).

Prepare Amiodarone Hydrochloride Oral Suspension 5 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Amiodarone Hydrochloride tablets <sup>a</sup> equivalent to	600 mg
Vehicle: a 1:1 mixture of Ora-Sweet <sup>b</sup> (regular or sugar-free) and Ora-Plus <sup>b</sup> , a sufficient quantity to make	120 mL

<sup>a</sup> Cordarone 200-mg tablets, Wyeth-Ayerst Laboratories, Philadelphia, PA.<sup>b</sup> Paddock Laboratories, Minneapolis, MN.

Calculate the required quantity of each ingredient for the total amount to be prepared. Place the required number of tablets in a suitable mortar and comminute to a fine powder with a pestle. Adjust the pH of the *Vehicle* to 6.5 ± 0.5 with a sodium bicarbonate 50-mg/mL solution prepared in Purified Water. Add the *Vehicle* in small portions and triturate to make a smooth paste. Add increasing volumes of the *Vehicle* to make an amiodarone hydrochloride liquid that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough of the *Vehicle* to bring to final volume and mix well.

**ASSAY****• PROCEDURE**

**Mobile phase:** Methanol, water, and 50 mM monobasic ammonium phosphate (0.5: 0.5: 99)

**Standard solution:** 2.5 mg/mL of USP Amiodarone Hydrochloride RS in *Mobile phase*

**Sample solution:** Shake thoroughly by hand each bottle of the Oral Suspension. Prepare 2.5 mg/mL of amiodarone hydrochloride from Oral Suspension and *Mobile phase*.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 230 nm

**Column:** 4.6-mm × 25-cm; 10-μm packing L1

**Flow rate:** 1.5 mL/min

**Injection size:** 10 μL

**System suitability**

**Sample:** *Standard solution*

[NOTE—The retention time for amiodarone is about 3.6 min.]

**Suitability requirements**

**Relative standard deviation:** NMT 2.1% for replicate injections

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of amiodarone hydrochloride (C<sub>25</sub>H<sub>29</sub>I<sub>2</sub>NO<sub>3</sub> · HCl) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of amiodarone hydrochloride in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of amiodarone hydrochloride in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

#### SPECIFIC TESTS

- **PH** (791): 5.8–6.8

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at controlled cold temperature or controlled room temperature.
- **LABELING:** Label it to state that it is to be well-shaken before use and to state the *Beyond-Use Date*.
- **BEYOND-USE DATE:** NMT 90 days after the date on which it was compounded when stored at controlled cold temperature; NMT 30 days when stored at controlled room temperature
- **USP REFERENCE STANDARDS** (11)

## Amitraz

$C_{19}H_{23}N_3$  293.41

Methanimidamide, *N'*-(2,4-dimethylphenyl)-[[*N*-(2,4-dimethylphenyl)imino]methyl-*N*]-methyl-

*N*-Methyl-*N'*-2,4-xylyl-*N*-(*N*-2,4-xylylformimidoyl)formamidine.

*N*-Methylbis(2,4-xylyliminomethyl)amine [33089-61-1].

» Amitraz contains not less than 95.0 percent and not more than 101.5 percent of  $C_{19}H_{23}N_3$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Amitraz RS

**Labeling**—Label it to indicate that it is for veterinary use only.

#### Identification—

**A:** *Infrared Absorption* (197M).

**B:** Proceed as directed in the test for *Related compounds*, except to prepare a test solution of Amitraz in toluene containing 2 mg per mL and a *Standard solution* of USP Amitraz RS in toluene containing 2 mg per mL: the  $R_f$  value of the principal spot in the chromatogram obtained from the test solution corresponds to that in the chromatogram obtained from the *Standard solution*.

**C:** The retention time of the major peak in the chromatogram of the *Reference solution* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Water, Method I** (921): not more than 0.1%, anhydrous pyridine being used in place of methanol in the titration vessel.

**Residue on ignition** (281): not more than 0.2%.

**Related compounds**—Prepare a test solution of Amitraz in toluene containing 100 mg per mL. Prepare a solution of USP Amitraz RS in toluene having a concentration of 2.0 mg per mL (*Standard solution 1*). Prepare a solution of 2,4-dimethylaniline in toluene having a concentration of 0.30 mg per mL (*Standard solution 2*). Prepare a thin-layer

chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture as follows. Stand the plate to a depth of 3.5 cm in a solution prepared by dissolving 35 g of acetamide in 100 mL of methanol, adding 100 mL of triethylamine, and diluting to 250 mL with methanol. Allow to stand the wet plate in a current of cold air for about 30 seconds. Immediately apply separately to the plate, at a level about 1 cm below the top of the impregnated zone, 2  $\mu$ L each of the test solution, *Standard solution 1*, and *Standard solution 2*. Promptly develop the chromatogram in a solvent system consisting of a mixture of cyclohexane, ethyl acetate, and triethylamine (5:3:2) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, allow it to air-dry, and examine it under short-wavelength UV light. Any secondary spot in the chromatogram obtained from the test solution is not more intense than the spot in the chromatogram obtained from *Standard solution 1* (2.0%). Expose the plate to the vapor of hydrochloric acid for about 10 minutes, then expose it to the vapor of nitrogen dioxide (prepared by the reaction of nitric acid and zinc) for 10 minutes, remove any excess nitric oxide by air exhaust, and spray the plate with a 0.5% solution of *N*-(1-naphthyl)ethylenediamine dihydrochloride in methanol, and examine the plate. Any secondary spot in the chromatogram obtained from the test solution corresponding to 2,4-dimethylaniline is not more intense than the spot in the chromatogram obtained from *Standard solution 2* (0.30%).

#### Assay—

**Internal standard solution**—Prepare a solution of squalane in methyl acetate containing 10 mg per mL.

**Standard preparation**—Quantitatively dissolve an accurately weighed quantity of USP Amitraz RS in *Internal standard solution* to obtain a solution having a known concentration of about 8 mg of USP Amitraz RS per mL.

**Assay preparation**—Transfer about 200 mg of Amitraz, accurately weighed, to a 25-mL volumetric flask, add about 20 mL of *Internal standard solution*, and swirl to dissolve. Dilute with *Internal standard solution* to volume, and mix.

**Reference solution**—Prepare a solution of Amitraz in methyl acetate containing about 8 mg per mL.

**Chromatographic system** (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and a 4-mm  $\times$  1.5-m column packed with 3% liquid phase G1 on support S1A. The column and detector block temperatures are maintained at about 250°. Dry nitrogen is used as the carrier gas at a flow rate of about 60 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between squalane and amitraz is not less than 3.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 5  $\mu$ L) of the *Standard preparation*, the *Assay preparation*, and the *Reference solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{19}H_{23}N_3$  in the portion of Amitraz taken by the formula:

$$25C(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Amitraz RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the ratios of the response of the amitraz peak to the response of the squalane peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Amitraz Concentrate for Dip

» Amitraz Concentrate for Dip contains Amitraz in a suitable vehicle. It may contain a suitable stabilizing agent. It contains not less than 90.0 percent and not more than 120.0 percent of the labeled amount of amitraz ( $C_{19}H_{23}N_3$ ).

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—Label it to indicate that it is for veterinary use only. The label states also that it is to be diluted before use and states the name and quantity of diluent to be used, the directions for dilution, and the conditions for storage of the constituted Dip.

**USP Reference standards** (11)—

USP Amitraz RS

**Identification**—

**A:** Proceed as directed in the test for *Related compounds* under *Amitraz*, except to prepare a test solution by diluting the Concentrate with toluene to obtain a solution containing about 5 mg of amitraz per mL and to prepare a Standard solution of USP Amitraz RS in toluene containing 5 mg per mL: the  $R_f$  value of the principal spot in the chromatogram obtained from the test solution corresponds to that in the chromatogram obtained from the Standard solution.

**B:** The retention time of the major peak in the chromatogram of the *Reference solution* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Water**, *Method I* (921): not more than 0.15%, anhydrous pyridine being used in place of methanol in the titration vessel.

**Assay**—

*Internal standard solution*, *Standard preparation*, and *Chromatographic system*—Proceed as directed in the *Assay* under *Amitraz*.

*Assay preparation*—Transfer an accurately measured volume of Concentrate, equivalent to about 80 mg of amitraz, to a 10-mL volumetric flask, dilute with *Internal standard solution* to volume, and mix.

*Reference solution*—Transfer an accurately measured volume of Concentrate, equivalent to about 80 mg of amitraz, to a 10-mL volumetric flask, dilute with methyl acetate to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Amitraz*. Calculate the quantity, in mg, of amitraz ( $C_{19}H_{23}N_3$ ) in each mL of the Concentrate taken by the formula:

$$10(C/V)(R_U/R_S)$$

in which  $V$  is the volume, in mL, of Concentrate taken to prepare the *Assay preparation*; and the other terms are as defined therein.

## Amitriptyline Hydrochloride

$C_{20}H_{23}N \cdot HCl$

313.86

1-Propanamine, 3-(10,11-dihydro-5H-dibenzo[*a,d*]cyclohepten-5-ylidene)-*N,N*-dimethyl-, hydrochloride; 10,11-Dihydro-*N,N*-dimethyl-5H-dibenzo[*a,d*]cycloheptene- $\Delta^{5,7}$ -propylamine hydrochloride [549-18-8].

### DEFINITION

Amitriptyline Hydrochloride contains NLT 98.0% and NMT 102.0% of amitriptyline hydrochloride ( $C_{20}H_{23}N \cdot HCl$ ), calculated on the dried basis.

### IDENTIFICATION

#### • A. INFRARED ABSORPTION (197K)

• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

• **C. IDENTIFICATION TESTS—GENERAL, Chloride (191):** Meets the requirements

### ASSAY

## Amitriptyline Hydrochloride Injection

#### DEFINITION

Amitriptyline Hydrochloride Injection is a sterile solution of Amitriptyline Hydrochloride in Water for Injection. It contains NLT 90.0% and NMT 110.0% of the labeled amount of amitriptyline hydrochloride ( $C_{20}H_{23}N \cdot HCl$ ).

#### IDENTIFICATION

• **A.**

**Sample solution:** Pipet 1 mL of Injection into a 125-mL separator containing 10 mL of water and 1 mL of 1 N sodium hydroxide, mix, extract with two 10-mL portions of methylene chloride, and evaporate the extracts on a steam bath just to dryness. Dissolve the residue in methanol, add 1 mL of 1.2 N hydrochloric acid, and then add methanol to make 100 mL. Dilute 10 mL of this solution with methanol to 100 mL.

**Acceptance criteria:** The UV absorption spectrum of this solution exhibits a maximum at the same wavelength as

that of a similar solution of USP Amitriptyline Hydrochloride RS, concomitantly measured.

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

#### Delete the following:

#### ▲ C. IDENTIFICATION—ORGANIC NITROGENOUS BASES <181>

**Analysis:** Pipet a volume of Injection, equivalent to 50 mg of amitriptyline hydrochloride, into a separator containing 25 mL of water. Proceed as directed in the chapter, beginning with "In a second separator," and using water in place of 0.01 N hydrochloric acid in the Reference Standard solution.

**Acceptance criteria:** The *Sample solution* so obtained meets the requirements of the test.▲<sup>USP36</sup>

#### ASSAY

##### • PROCEDURE

**Buffer:** Dissolve 11.04 g of monobasic sodium phosphate in 900 mL of water, adjust with phosphoric acid to a pH of  $2.5 \pm 0.5$ , and dilute with water to 1000 mL.

**Mobile phase:** Acetonitrile and *Buffer* (42:58)

**Standard solution:** 0.2 mg/mL of USP Amitriptyline Hydrochloride RS in water

**Sample solution:** Nominally 0.2 mg/mL of amitriptyline hydrochloride from a suitable volume of the Injection in water

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of amitriptyline hydrochloride ( $C_{20}H_{23}N \cdot HCl$ ) in each Tablet taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Amitriptyline Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of amitriptyline hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

## PERFORMANCE TESTS

### • DISSOLUTION <711>

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 1: 100 rpm

Time: 45 min

#### Instrumental conditions

Analytical wavelength: UV 239 nm

Standard solution: USP Amitriptyline Hydrochloride RS in Medium

#### Analysis

Samples: Standard solution and Sample solution

Determine the percentage of the labeled amount of amitriptyline hydrochloride ( $C_{20}H_{23}N \cdot HCl$ ) dissolved from UV absorbances of the Sample solution, suitably diluted with Medium if necessary, in comparison with a Standard solution having a known concentration.

Tolerances: NLT 75% (Q) of the labeled amount of amitriptyline hydrochloride ( $C_{20}H_{23}N \cdot HCl$ ) is dissolved.

### • UNIFORMITY OF DOSAGE UNITS <905>: Meet the requirements

## ADDITIONAL REQUIREMENTS

### • PACKAGING AND STORAGE: Preserve in well-closed containers.

### • USP REFERENCE STANDARDS <11>

USP Amitriptyline Hydrochloride RS

Add the following:

## ▲Amlodipine Oral Suspension

### DEFINITION

Amlodipine Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of amlodipine ( $C_{20}H_{25}ClN_2O_5$ ).

Prepare Amlodipine Oral Suspension 1 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* <795>).

Amlodipine tablets <sup>a</sup> equivalent to	100 mg
Vehicle: A 1:1 mixture of Ora-Sweet <sup>b</sup> and Ora-Plus <sup>b</sup> , a sufficient quantity to make	100 mL

<sup>a</sup> Norvasc 5-mg tablets, Pfizer, Inc., Groton, CT.

<sup>b</sup> Paddock Laboratories, Minneapolis, MN.

Calculate the required quantity of each ingredient for the total amount to be prepared. Place the required number of tablets in a suitable mortar and comminute to a fine powder. Add the Vehicle in small portions, and triturate to make a smooth paste. Add increasing volumes of the Vehicle to make an amlodipine liquid that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough of the Vehicle to bring to final volume, and mix well. [NOTE—To ensure component uniformity, homogenization is recommended.]

## ASSAY

### • PROCEDURE

Mobile phase: Acetonitrile, methanol, and 40 mM ammonium acetate, (50:15:35). Filter through a nylon 66 filter of 0.45-μm pore size, and degas.

**Standard stock solution:** Dissolve an appropriately weighed amount of USP Amlodipine Besylate RS in methanol, equivalent to 1.0 mg/mL of amlodipine (approximately equal to 1.4 mg/mL of amlodipine besylate).

**Standard solution:** Transfer 1.0 mL of the Standard stock solution into a 50-mL volumetric flask, and dilute with Mobile phase to volume to obtain a solution with a nominal concentration of about 20 μg/mL of amlodipine. Centrifuge.

**Sample solution:** Shake thoroughly by hand each bottle of Oral Suspension. Pipet 1.0 mL of Oral Suspension into a 50-mL volumetric flask, rinse the pipet three times with Mobile phase, and dilute with Mobile phase to volume to obtain a solution with a nominal concentration of about 20 μg/mL of amlodipine. Centrifuge.

### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 240 nm

Column: 3.0-mm × 15-cm; 5-μm packing L10

Flow rate: 0.4 mL/min

Injection size: 10 μL

### System suitability

Sample: Standard solution

[NOTE—The retention time for amlodipine is about 10.1 min.]

### Suitability requirements

Column efficiency: NLT 4000 theoretical plates

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0% for replicate injections

### Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of the labeled amount of amlodipine ( $C_{20}H_{25}ClN_2O_5$ ) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of amlodipine from the Sample solution

$r_S$  = peak response of amlodipine from the Standard solution

$C_S$  = concentration of amlodipine in the Standard solution (μg/mL)

$C_U$  = nominal concentration of amlodipine in the Sample solution (μg/mL)

Acceptance criteria: 90.0%–110.0%

## SPECIFIC TESTS

### • PH <791>: 4.0–5.0

## ADDITIONAL REQUIREMENTS

### • PACKAGING AND STORAGE: Package in tight, light-resistant containers. Store at controlled room temperature or controlled cold temperature.

### • LABELING: Label it to indicate that it is to be well-shaken before use, and to state the Beyond-Use Date.

### • BEYOND-USE DATE: NMT 90 days after the date on which it was compounded when stored at controlled cold temperature; NMT 60 days when stored at controlled room temperature

### • USP REFERENCE STANDARDS <11>

USP Amlodipine Besylate RS▲<sup>USP36</sup>

## Amlodipine Besylate

$C_{20}H_{25}ClN_2O_5 \cdot C_6H_6O_3S$  567.05

3,5-Pyridinedicarboxylic acid, 2-[(2-aminoethoxy)methyl]-4-(2-chlorophenyl)-1,4-dihydro-6-methyl-, 3-ethyl-5-methyl ester, (±)-, monobenzenesulfonate.

3-Ethyl 5-methyl (±)-2-[(2-aminoethoxy)methyl]-4-(o-chlorophenyl)-1,4-dihydro-6-methyl-3,5-pyridinedicarboxylate, monobenzenesulfonate [111470-99-6].

Monohydrate 585.07

» Amlodipine Besylate is anhydrous or hydrated and contains not less than 97.0 percent and not more than 102.0 percent of  $C_{20}H_{25}ClN_2O_5 \cdot C_6H_6O_3S$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers, protected from light. Store at room temperature.

**USP Reference standards** (11)—

USP Amlodipine Besylate RS

**Labeling**—Where it is the hydrated form, the label so indicates.

**Identification**—

**A: Infrared Absorption** (197M).

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Optical rotation** (781A): between  $-0.10^\circ$  and  $+0.10^\circ$ , measured at  $20^\circ$ .

*Test solution*: 10 mg per mL, in methanol.

**Water**, *Method I* (921): not more than 0.5% for the anhydrous form. If labeled as the hydrated form, the limit is between 3.1% and 5.0%.

**Residue on ignition** (281): not more than 0.2%.

**Heavy metals**, *Method II* (231): 0.002%.

**Related compounds**—

TEST 1—

**Adsorbent**: 0.25-mm layer of chromatographic silica gel mixture.

*Test solution*—Transfer 140 mg of Amlodipine Besylate to a 2-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix.

*System suitability solution*—Transfer about 14 mg of USP Amlodipine Besylate RS to a suitable container, dissolve in 0.2 mL of methanol, and mix.

*Standard stock solution*—Dissolve an accurately weighed quantity of USP Amlodipine Besylate RS in methanol to obtain a solution containing 7.0 mg per mL.

*Standard solution 1*—Transfer 3.0 mL of the *Standard stock solution* to a 100-mL volumetric flask, dilute with methanol to volume, and mix.

*Standard solution 2*—Transfer 1.0 mL of the *Standard stock solution* to another 100-mL volumetric flask, dilute with methanol to volume, and mix.

*Application volume*: 10  $\mu$ L.

*Developing solvent system*—Use the upper layer of a mixture of methyl isobutyl ketone, water, and glacial acetic acid (50:25:25).

*Procedure*—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* (621). Dry the plate for 15 minutes at  $80^\circ$ . Examine the plate under UV light at 254 nm and 365 nm. The chromatogram from the *System suitability solution* shows two clearly separated minor spots with  $R_F$  values of about 0.18 and 0.22. Compare the intensities of any secondary spots observed in the chromatogram of the *Test solution* with those of the principal spots in the chromatograms of the *Standard solutions*. Any spot obtained from the *Test solution*, except for the principal spot, is not greater in size than the spot obtained from *Standard solution 1* (0.3%), and at most two spots are more intense than the spot obtained from *Standard solution 2* (0.1%).

TEST 2—

*pH 3.0 Buffer* and *Mobile phase*—Prepare as directed in the *Assay*.

*System suitability solution*—Dissolve about 5 mg of Amlodipine Besylate in 5 mL of hydrogen peroxide, and heat at  $70^\circ$  for 45 minutes.

*Standard solution*—Dissolve an accurately weighed quantity of USP Amlodipine Besylate RS in *Mobile phase* to obtain a solution having a known concentration of about 0.003 mg per mL.

*Test solution*—Transfer about 50 mg of Amlodipine Besylate, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—Prepare as directed in the *Assay*. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between amlodipine impurity A and amlodipine is not less than 4.5. [NOTE—For the purpose of identification, the relative retention times are about 0.2 for benzene sulfonate, 0.5 for amlodipine impurity A, and 1.0 for amlodipine. Amlodipine impurity A is 3-ethyl 5-methyl 2-[(2-aminoethoxy)methyl]-4-(2-chlorophenyl)-6-methylpyridine-3,5-dicarboxylate.] Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the standard deviation for replicate injections is not more than 10.0%.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms for a period of time that is about 3 times the retention time of amlodipine, and measure the peak responses. Calculate the percentage of each impurity in the portion of Amlodipine Besylate taken by the formula:

$$100(1/F)(C_S/C_T)(r_i/r_s)$$

in which  $F$  is the relative response factor, which is equal to 0.5 for amlodipine impurity A and to 1.0 for other impurities;  $C_S$  and  $C_T$  are the concentrations, in mg per mL, of amlodipine besylate in the *Standard solution* and the *Test solution*, respectively;  $r_i$  is the peak response for each impurity obtained from the *Test solution*; and  $r_s$  is the peak response for amlodipine besylate obtained from the *Standard solution*: not more than 0.3% of amlodipine impurity A is found, and not more than 0.3% of total other impurities is found. Disregard any peak less than 0.03%, and disregard any peak due to benzene sulfonate.

**Assay**—

*pH 3.0 Buffer*—Dissolve 7.0 mL of triethylamine in 800 mL of water. Adjust with phosphoric acid to a pH of  $3.0 \pm 0.1$ , and dilute with water to 1 L.

*Mobile phase*—Prepare a filtered and degassed mixture of *pH 3.0 Buffer*, methanol, and acetonitrile (50:35:15). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Amlodipine Besylate RS in *Mobile phase* to obtain a solution having a known concentration of about 0.05 mg per mL.

**Assay preparation**—Transfer about 50 mg of Amlodipine Besylate, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 237-nm detector and a 3.9-mm × 15-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of  $C_{20}H_{25}ClN_2O_5 \cdot C_6H_6O_3S$  in the portion of Amlodipine Besylate taken by the formula:

$$100(C_S/C_U)(r_U/r_S)$$

in which  $C_S$  and  $C_U$  are the concentrations, in mg per mL, of amlodipine besylate in the *Standard preparation* and the *Assay preparation*, respectively; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Amlodipine Besylate Tablets

### DEFINITION

Amlodipine Besylate Tablets contain NLT 90% and NMT 110% of the labeled amount of amlodipine ( $C_{20}H_{25}N_2O_5Cl$ ).

### IDENTIFICATION

#### • A. ULTRAVIOLET ABSORPTION <197U>

**Standard solution and Sample solution:** Prepare as directed in the test for *Dissolution*.

**Acceptance criteria:** Meet the requirements

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### • PROCEDURE

**Buffer:** Add 7.0 mL of triethylamine into a 1000-mL flask containing 900 mL of water. Adjust the solution with phosphoric acid to a pH of  $3.0 \pm 0.1$ . Dilute with water to volume, and mix well.

**Mobile phase:** Methanol, acetonitrile, and *Buffer* (35:15:50)

**System suitability solution:** 0.02 mg/mL of USP Amlodipine Besylate RS and 0.002 mg/mL of USP Amlodipine Related Compound A RS in *Mobile phase*

**Standard solution:** 0.02 mg/mL of amlodipine prepared from USP Amlodipine Besylate RS in *Mobile phase*

**Sample stock solution:** Place 5 Tablets into a 500-mL volumetric flask. Add 50 mL of *Mobile phase* to the flask, and swirl to disintegrate the Tablets. Add 300 mL of *Mobile phase*, insert the stopper into the flask, and shake on a reciprocating shaker for 30 min. Dilute with *Mobile phase* to volume, and mix well.

**Sample solution:** 0.02 mg/mL of amlodipine from the *Sample stock solution* in *Mobile phase*. Pass the sample through a syringe tip filter of 0.45-µm pore size.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 237 nm

**Column:** 3.9-mm × 15-cm; 5-µm packing L1

**Flow rate:** 1 mL/min

**Injection size:** 50 µL

#### System suitability

**Sample:** *System suitability solution*

[NOTE—The run time is about three times the retention of the amlodipine peak.]

#### Suitability requirements

**Resolution:** NLT 8.5 between amlodipine and amlodipine related compound A

**Tailing factor:** NMT 2.0 for both amlodipine and amlodipine related compound A

**Relative standard deviation:** NMT 1.0% for amlodipine and NMT 5.0% for amlodipine related compound A

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of amlodipine ( $C_{20}H_{25}N_2O_5Cl$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Amlodipine Besylate RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of amlodipine in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90%–110% of the labeled amount of amlodipine ( $C_{20}H_{25}N_2O_5Cl$ )

### PERFORMANCE TESTS

#### • DISSOLUTION <711>

[NOTE—Do not expose any of the solutions to stainless steel because of the degradation of amlodipine.]

**Medium:** 0.01 N hydrochloric acid; 500 mL

**Apparatus 2:** 75 rpm. [NOTE—Use paddles covered with Teflon or made of any inert material except stainless steel.]

**Time:** 30 min

**Standard solution:** Make appropriate dilutions of USP Amlodipine Besylate RS in *Medium* to obtain the following concentrations: 0.00695 mg/mL for Tablets labeled to contain 2.5 mg; 0.0139 mg/mL for Tablets labeled to contain 5 mg; 0.0278 mg/mL for Tablets labeled to contain 10 mg. These solutions are stable for one day.

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size.

**Analysis:** Determine the amount of amlodipine ( $C_{20}H_{25}N_2O_5Cl$ ) dissolved by using UV absorption at the wavelength of maximum absorbance at about 239 nm on portions of the *Sample solution* in comparison with the *Standard solution*, using a 1-cm quartz cell and the *Medium* as blank.

Calculate the percentage of the labeled amount of amlodipine ( $C_{20}H_{25}ClN_2O_5$ ) dissolved:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times D \times (M_{r1}/M_{r2}) \times V \times 100$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$L$  = label claim (mg/Tablet)

$D$  = dilution factor of the *Sample solution*

$M_{r1}$  = molecular weight of amlodipine, 408.88

$M_{r2}$  = molecular weight of amlodipine besylate, 567.06

$V$  = volume of *Medium*, 500 mL

**Tolerances:** NLT 75% (Q) of the labeled amount of amlodipine ( $C_{20}H_{25}N_2O_5Cl$ ) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS <905>:** Meet the requirements

**IMPURITIES****• ORGANIC IMPURITIES**

**Buffer, Mobile phase, System suitability solution, Chromatographic system, and System suitability:** Proceed as directed in the Assay.

**Standard solution:** Use the *System suitability solution*.

**Sample solution:** Place a suitable number of Tablets into a 25-mL volumetric flask to obtain a solution having a final nominal concentration of 0.4 mg/mL of amlodipine. Add about 10 mL of *Mobile phase* to the flask. Swirl to disintegrate the Tablet(s), followed by sonication for 5 min to completely dissolve, and then cool the sample to room temperature. Dilute with *Mobile phase* to volume. Stir for an additional 15 min using a magnetic stir bar, and pass the sample through a syringe tip filter of 0.45-μm pore size, discarding the first 5 mL.

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of amlodipine related compound A in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

- $r_U$  = peak response of amlodipine related compound A from the *Sample solution*  
 $r_S$  = peak response of amlodipine related compound A from the *Standard solution*  
 $C_S$  = concentration of USP Amlodipine Related Compound A RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of amlodipine in the *Sample solution* (mg/mL)  
 $M_{r1}$  = molecular weight of amlodipine related compound A, 406.86  
 $M_{r2}$  = molecular weight of amlodipine related compound A fumarate, 522.93

Calculate the percentage of amlodipine glucose/galactose adduct or amlodipine lactose adduct, if present, in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

- $r_U$  = peak response of the amlodipine glucose/galactose adduct or amlodipine lactose adduct in the *Sample solution*  
 $r_S$  = peak response of amlodipine in the *Standard solution*  
 $C_S$  = concentration of USP Amlodipine Besylate RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of amlodipine in the *Sample solution* (mg/mL)  
 $M_{r1}$  = molecular weight of amlodipine, 408.9  
 $M_{r2}$  = molecular weight of amlodipine besylate, 567.05

Calculate the percentage of any other individual unspecified degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response of each impurity from the *Sample solution*  
 $r_S$  = peak response of amlodipine from the *Standard solution*  
 $C_S$  = concentration of amlodipine in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of amlodipine in the *Sample solution* (mg/mL)

Acceptance criteria: See Table 1.

**Table 1**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Amlodipine related compound A <sup>a</sup>	0.50	1.0
Amlodipine lactose adduct <sup>b</sup>	0.80	0.5
Amlodipine glucose/galactose adduct <sup>b</sup>	0.90	0.5
Amlodipine besylate	1.0	—
Any other individual unspecified degradation product	—	0.20

<sup>a</sup> 3-Ethyl, 5-methyl [2-(2-aminoethoxymethyl)-4-(2-chlorophenyl)-6-methyl-3,5-pyridinedicarboxylate].

<sup>b</sup> Formulation-specific impurities.

**ADDITIONAL REQUIREMENTS**

**• PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at controlled room temperature.

**• USP REFERENCE STANDARDS (11)**

USP Amlodipine Besylate RS  
 USP Amlodipine Related Compound A RS  
 3-Ethyl, 5-methyl [2-(2-aminoethoxymethyl)-4-(2-chlorophenyl)-6-methyl-3,5-pyridinedicarboxylate fumarate.  
 $C_{20}H_{23}ClN_2O_5 \cdot C_4H_4O_4$  522.93

**Aromatic Ammonia Spirit**

» Aromatic Ammonia Spirit is a hydroalcoholic solution that contains, in each 100 mL, not less than 1.7 g and not more than 2.1 g of total  $NH_3$ , and Ammonium Carbonate corresponding to not less than 3.5 g and not more than 4.5 g of  $(NH_4)_2CO_3$ .

**Packaging and storage**—Preserve in tight, light-resistant containers, at a temperature not exceeding 30°.

**Alcohol content, Method I** (611): between 62.0% and 68.0% of  $C_2H_5OH$ .

**Assay for total  $NH_3$** —Transfer 10.0 mL to a 250-mL conical flask containing about 50 mL of water. Add 30.0 mL of 0.5 N sulfuric acid VS, and boil until the solution becomes clear. Cool, add methyl red TS, and titrate the excess acid with 0.5 N sodium hydroxide VS. Perform a blank determination (see *Residual Titrations* under *Titrimetry* (541)). Each mL of 0.5 N sulfuric acid is equivalent to 8.515 mg of  $NH_3$ .

**Assay for ammonium carbonate**—Transfer 10.0 mL to a flask of about 300-mL capacity. Add 30 mL of 0.5 N sodium hydroxide, and boil the mixture, replacing the water lost by evaporation, until the vapors no longer turn moistened red litmus paper blue. Cool, dilute with 100 mL of cold, carbon dioxide-free water, add about 6 drops of phenolphthalein TS, then add just enough 0.5 N sulfuric acid VS to discharge the color of the phenolphthalein. Add methyl orange TS, and titrate with 0.5 N sulfuric acid VS. Perform a blank determination (see *Residual Titrations* under *Titrimetry* (541)). Each mL of 0.5 N sulfuric acid consumed in the titration with methyl orange TS is equivalent to 48.04 mg of  $(NH_4)_2CO_3$ .

## Ammonium Chloride

NH<sub>4</sub>Cl 53.49

Ammonium chloride.

Ammonium chloride [12125-02-9].

» Ammonium Chloride contains not less than 99.5 percent and not more than 100.5 percent of NH<sub>4</sub>Cl, calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**Identification**—A solution (1 in 10) responds to the tests for *Ammonium* <191> and for *Chloride* <191>.

**pH** <791>: between 4.6 and 6.0, in a solution (1 in 20).

**Loss on drying** <731>—Dry it over silica gel for 4 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** <281>—Add 1 mL of sulfuric acid to about 2 g, accurately weighed, and heat the mixture gently until volatilization is complete: the residue is white, and when ignited, not more than 0.1% of nonvolatile substance remains.

**Limit of thiocyanate**—Acidify 10 mL of a solution (1 in 10) with hydrochloric acid, and add a few drops of ferric chloride TS: no orange-red color is produced.

**Heavy metals, Method I** <231>: 0.001%.

**Assay**—Transfer about 100 mg of Ammonium Chloride, accurately weighed, to a conical flask, add 10 mL of water, and swirl to dissolve. Add 10 mL of glacial acetic acid, 75 mL of methanol, and 0.5 mL of eosin Y TS. Titrate, with shaking, with 0.1 N silver nitrate VS to a pink endpoint. Each mL of 0.1 N silver nitrate is equivalent to 5.349 mg of NH<sub>4</sub>Cl.

## Ammonium Chloride Injection

» Ammonium Chloride Injection is a sterile solution of Ammonium Chloride in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of NH<sub>4</sub>Cl. Hydrochloric acid may be added to adjust the pH.

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I or Type II glass.

**Labeling**—The label states the content of ammonium chloride in terms of weight and of milliequivalents in a given volume. The label states also the total osmolar concentration in mOsmol per L or per mL. The label states that the Injection is not for direct injection but is to be diluted with Sodium Chloride Injection to the appropriate strength before use.

**USP Reference standards** <11>—

USP Endotoxin RS

**Identification**—It responds to the tests for *Ammonium* <191> and for *Chloride* <191>.

**Bacterial endotoxins** <85>—It contains not more than 1.72 USP Endotoxin Units per mEq of chloride.

**pH** <791>: between 4.0 and 6.0, in a concentration of not more than 100 mg of ammonium chloride per mL.

**Particulate matter** <788>: meets the requirements for small-volume injections.

**Chloride content**—Transfer an accurately measured volume of Injection, evaporated, if necessary, equivalent to about 2 g of ammonium chloride, to a 200-mL volumetric flask, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a conical flask, add 10 mL of

glacial acetic acid, 75 mL of methanol, and 0.5 mL of eosin Y TS. Titrate, with shaking, with 0.1 N silver nitrate VS to a pink endpoint. Each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of Cl. The content of Cl is between 63.0% and 70.3% of the labeled amount of ammonium chloride.

**Other requirements**—It meets the requirements under *Injections* <1>.

**Assay**—Transfer an accurately measured volume of Injection, equivalent to about 200 mg of ammonium chloride, to a 500-mL Kjeldahl flask, dilute with water to 200 mL, mix, and add 50 mL of sodium hydroxide solution (2 in 5). Immediately connect the flask by means of a distillation trap to a well-cooled condenser, the delivery tube of which dips into 40 mL of boric acid solution (1 in 25) contained in a suitable receiver. Heat to boiling, and distill about 200 mL. Cool the liquid in the receiver, if necessary, then add methyl red TS, and titrate with 0.1 N sulfuric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N sulfuric acid is equivalent to 5.349 mg of NH<sub>4</sub>Cl.

## Ammonium Chloride Delayed-Release Tablets

» Ammonium Chloride Delayed-Release Tablets contain not less than 94.0 percent and not more than 106.0 percent of the labeled amount of NH<sub>4</sub>Cl. Ammonium Chloride Delayed-Release Tablets are enteric-coated.

**Packaging and storage**—Preserve in tight containers.

**Identification**—A filtered solution of finely powdered Tablets, equivalent to ammonium chloride solution (1 in 10), responds to the tests for *Ammonium* <191> and for *Chloride* <191>.

**Disintegration** <701>: 2 hours, determined as directed for *Enteric-Coated Tablets*.

**Limit of thiocyanate**—Powder and dissolve in water a sufficient number of Tablets to make about 25 mL of ammonium chloride solution (1 in 10), and filter. Acidify 10 mL of the solution with hydrochloric acid, and add a few drops of ferric chloride TS: no reddish orange color is produced.

**Assay**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 200 mg of ammonium chloride, to a 500-mL Kjeldahl flask, and add 200 mL of water and 50 mL of sodium hydroxide solution (2 in 5). Immediately connect the flask by means of a distillation trap to a well-cooled condenser, the delivery tube of which dips into 40 mL of boric acid solution (1 in 25) contained in a suitable receiver. Heat to boiling, and distill about 200 mL. Cool the liquid in the receiver, if necessary, then add methyl red TS, and titrate with 0.1 N sulfuric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N sulfuric acid is equivalent to 5.349 mg of NH<sub>4</sub>Cl.

## Ferric Ammonium Citrate

» Ferric Ammonium Citrate contains not less than 16.5 percent and not more than 18.5 percent of iron (Fe).

**Packaging and storage**—Preserve in tight, light-resistant containers, in a cool place.

**Identification—**

**A:** Ignite about 0.5 g; it chars, and leaves a residue of iron oxide.

**B:** To 10 mL of a solution of Ferric Ammonium Citrate (1 in 100) add 6 N ammonium hydroxide dropwise: the solution darkens, but no precipitate forms.

**C:** To 5 mL of a solution of Ferric Ammonium Citrate (1 in 100) add 0.3 mL of potassium permanganate TS and 4 mL of mercuric sulfate TS, and heat the mixture to boiling: a white precipitate forms.

**Ferric citrate—**To a solution of Ferric Ammonium Citrate (1 in 100) add potassium ferrocyanide TS: no blue precipitate is formed.

**Sulfate** (221)—Dissolve 100 mg in 1 mL of 2.7 N hydrochloric acid, and dilute with water to 30 mL. Add 3 mL of barium chloride TS, dilute with water to 50 mL, and mix: any turbidity formed after 10 minutes is not greater than that produced in a similarly treated control solution containing 0.31 mL of 0.020 N sulfuric acid (0.3%).

**Oxalate—**Transfer 1 g to a 125-mL separator, dissolve in 10 mL of water, add 2 mL of hydrochloric acid, and extract successively with one 50-mL portion and one 20-mL portion of ether. Transfer the combined ether extracts to a 150-mL beaker, add 10 mL of water, and remove the ether by evaporation on a steam bath. Add 1 drop of glacial acetic acid and 1 mL of calcium acetate solution (1 in 20): no turbidity is produced within 5 minutes.

**Mercury—**

*Mercury Stock Solution and Standard Mercury Solution—*Proceed as directed for *Method I* under *Mercury* (261).

*Mercury Detection Instrument, Aeration Apparatus, and Stannous Chloride Solution—*Proceed as directed for *Method IIa* and *Method IIb* under *Mercury* (261).

*Standard solutions—*Transfer 0.25, 0.50, 1.0, and 3.5 mL of *Standard Mercury Solution* to four separate glass-stoppered bottles, such as biological oxygen-demand bottles, of about 300-mL capacity. Dilute the contents of each bottle with water to 100 mL, and mix. These solutions contain the equivalent of 2.5, 5.0, 10.0, and 35.0 µg of mercury per mL, respectively.

*Test solution—*Transfer about 1.000 g of Ferric Ammonium Citrate, accurately weighed, to a 200-mL centrifuge bottle with a polytetrafluoroethylene-lined screw cap, and add 5 mL of nitric acid and 5 mL of hydrochloric acid. Close the bottle tightly, digest on a steam bath for 1 hour, and cool. Quantitatively transfer the solution to a suitable glass-stoppered bottle, dilute with water to 100 mL, and bubble air through the solution for 2 minutes. Prepare a reagent blank in the same manner.

*Procedure—*Add 5 mL of stannous chloride solution (1 in 10) to each solution, and immediately insert the bubbler of the *Aeration Apparatus*. Obtain the absorbances as directed by the instrument manufacturer's operating instructions. Perform a blank determination, and make any necessary correction. Plot the absorbances of the *Standard solutions* versus concentrations, in µg per mL, of mercury, and draw the straight line best fitting the plotted points. From the graph so obtained, determine the concentration, in µg per g, of mercury in the *Test solution*: not more than 10 µg per g is found.

**Limit of lead—**

*Standard stock solution—*Dissolve about 159.8 mg of lead nitrate, accurately weighed, in 100 mL of water containing 1 mL of nitric acid. Dilute with water to 1000.0 mL, and mix.

*Standard solution—*[NOTE—Prepare this solution on the day of use.] Transfer 10.0 mL of *Standard stock solution* to a 500-mL volumetric flask, dilute with water to volume, and mix. Each mL contains the equivalent of 2 µg of lead (Pb).

*Test solution—*Transfer about 15 g of Ferric Ammonium Citrate, accurately weighed, to a 100-mL volumetric flask

(previously rinsed with nitric acid and water), dissolve in a mixture of 50 mL of water and 1 mL of nitric acid, dilute with water to volume, and mix.

*Procedure—*Using a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* (851)) equipped with a deuterium arc background corrector, a digital readout device, and a burner head capable of handling 15% solids content, perform a blank determination with water, following the manufacturer's operating instructions. Separately aspirate portions of the *Standard solution* and the *Test solution*, and record the absorbances. Calculate the lead content, in µg per g, in the portion of Ferric Ammonium Citrate taken by the formula:

$$100(C / W)(A_U / A_S)$$

in which *C* is the concentration, in µg per mL, of lead in the *Standard solution*; *W* is the weight, in g, of Ferric Ammonium Citrate taken; and *A<sub>U</sub>* and *A<sub>S</sub>* are the absorbances of the *Test solution* and the *Standard solution*, respectively: not more than 10 µg per g is found.

**Assay—**Transfer about 1 g of Ferric Ammonium Citrate, accurately weighed, to a 250-mL conical flask, and dissolve in 25 mL of water and 5 mL of hydrochloric acid. Add 4 g of potassium iodide, insert the stopper, and allow to stand protected from light for 15 minutes. Add 100 mL of water, and titrate the liberated iodine with 0.1 N sodium thiosulfate VS, using starch TS as the indicator. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N sodium thiosulfate is equivalent to 5.585 mg of iron (Fe).

---

## Ferric Ammonium Citrate for Oral Solution

---

» Ferric Ammonium Citrate for Oral Solution contains Ferric Ammonium Citrate and an effervescent mixture of a suitable organic acid and an alkali metal bicarbonate. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of Fe. It may contain one or more suitable flavors, colors, or stabilizing agents.

**Packaging and storage—**Preserve in tight, light-resistant containers, and store in a cool place.

**Identification—**A 6-g portion dissolves in 600 mL of water with effervescence. The collected gas meets the requirements of the test for *Bicarbonate* (191), and the resulting solution meets the requirements of the tests for *Iron* (191) and for *Citrate* (191).

**Uniformity of dosage units** (905)—

FOR POWDER PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** (698)—

FOR POWDER PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

**Assay—**Transfer about 6 g of Ferric Ammonium Citrate for Oral Solution, accurately weighed, to a 250-mL conical flask, and dissolve in 100 mL of water. Allow the gas to escape, add 5 mL of hydrochloric acid and 4 g of potassium iodide, insert the stopper, and allow to stand protected from light for 15 minutes. Add 25 mL of water, and titrate the liberated iodine with 0.1 N sodium thiosulfate VS, using starch TS as the indicator. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N sodium thiosulfate is equivalent to 5.585 mg of Fe.

## Ammonium Molybdate

$(\text{NH}_4)_6\text{Mo}_7\text{O}_{24} \cdot 4\text{H}_2\text{O}$  1236.00  
Molybdate ( $\text{Mo}_7\text{O}_{24}^{6-}$ ), hexaammonium, tetrahydrate;  
Hexaammonium molybdate tetrahydrate [12054-85-2].

### DEFINITION

Ammonium Molybdate contains NLT 99.3% and NMT 101.8% of  $(\text{NH}_4)_6\text{Mo}_7\text{O}_{24} \cdot 4\text{H}_2\text{O}$ .

### IDENTIFICATION

#### • PROCEDURE

**Sample:** 0.6 g

**Analysis:** Dissolve the *Sample* in 1.4 mL of water and 1.45 mL of ammonium hydroxide. Cool this mixture, and add slowly, with mixing, 7.2 mL of a well-cooled mixture of 3.2 mL of nitric acid and 4 mL of water. Allow to stand for 24–48 h, and pass through a sintered-glass filter. To 5 mL of the filtrate add 2 mL of dibasic sodium phosphate TS.

**Acceptance criteria:** A yellow precipitate is formed, and it is soluble in an excess of 6 N ammonium hydroxide.

### ASSAY

#### • PROCEDURE

**Sample solution:** Dissolve 0.7 g of Ammonium Molybdate in 100 mL water. Adjust with dilute nitric acid to a pH of 4.0. Add saturated hexamethylenetetramine solution to achieve a pH of 5–6.

**Analysis:** Heat the *Sample solution* to 60°, and add 0.2 mL of 0.1% 4-[2-pyridylazo]resorcinol solution in alcohol. Titrate with 0.1 M lead nitrate VS from the yellow color to the first permanent pink endpoint. Carry out a blank titration. Each mL of 0.1 M lead nitrate is equivalent to 17.66 mg of  $(\text{NH}_4)_6\text{Mo}_7\text{O}_{24} \cdot 4\text{H}_2\text{O}$ .

**Acceptance criteria:** 99.3%–101.8%

### IMPURITIES

#### Inorganic Impurities

#### • ARSENATE, PHOSPHATE, AND SILICATE

**Sample solution:** Dissolve 2.5 g of the analyte in 70 mL of water in a container other than glass.

**Control solution:** Dissolve 0.5 g of the analyte in 70 mL of water in a container other than glass, and add an amount of sodium silicate solution equivalent to 0.02 mg of silica ( $\text{SiO}_2$ ).

#### Analysis

**Samples:** *Sample solution* and *Control solution*  
Adjust with 1.2 N hydrochloric acid to a pH of between 3 and 4, transfer to a glass container, add 2 mL of bromine TS, and adjust with 1.2 N hydrochloric acid to a pH of  $1.8 \pm 0.1$ . Heat almost to boiling, and cool to room temperature. Dilute with water to 90 mL, add 10 mL of hydrochloric acid, and transfer to a separator. Add 1 mL of butyl alcohol and 30 mL of 4-methyl-2-pentanone, shake vigorously, and allow the phases to separate. Discard the aqueous phase, and wash the ketone phase with three successive 10-mL portions of 1.2 N hydrochloric acid, discarding the washings. To the washed ketone phase add 10 mL of 1.2 N hydrochloric acid to which has just been added 0.2 mL of a freshly prepared solution (1 in 50) of stannous chloride in hydrochloric acid.

**Acceptance criteria:** Any blue color in the *Sample solution* does not exceed that in the *Control solution* (NMT 10 ppm).

- **CHLORIDE AND SULFATE, Chloride <221>:** A 0.5-g portion shows no more chloride than 0.30 mL of 0.001 N hydrochloric acid (NMT 20 ppm).
- **CHLORIDE AND SULFATE, Sulfate <221>:** A 0.25-g portion shows no more sulfate than corresponds to 1.0 mL of 0.001 N sulfuric acid (NMT 200 ppm).

#### • HEAVY METALS <231>

**Sample stock solution:** Dissolve 2.0 g of Ammonium Molybdate in 20 mL of water, add 10 mL of 2.5 N sodium hydroxide and 2 mL of ammonium hydroxide, and dilute with water to 40 mL.

**Control solution:** To 10 mL of *Sample stock solution* add 1.0 mL of *Standard Lead Solution*, prepared as directed under *Heavy Metals <231>*, and dilute with water to 40 mL.

**Sample solution:** Dilute the remaining 30-mL portion of the *Sample stock solution* with water to 40 mL.

**Analysis:** To both the *Sample solution* and the *Control solution* add 1.2 mL of thioacetamide–glycerin base TS and 2 mL of pH 3.5 Acetate Buffer, and allow to stand for 5 min.

**Acceptance criteria:** Any color in the *Sample solution* does not exceed that in the *Control solution* (NMT 10 ppm).

#### • INSOLUBLE SUBSTANCES

**Sample:** 20 g

**Analysis:** Dissolve the *Sample* in 200 mL of water in a beaker, heat to boiling, cover, and heat on a steam bath for 1 h. Pass the hot solution through a tared filtering crucible, wash the insoluble residue with hot water, and dry at 105° for 2 h.

**Acceptance criteria:** The weight of the residue is NMT 1 mg (0.005%).

#### • NITRATE

**Sample:** 1 g

**Analysis:** Dissolve the *Sample* in 10 mL of water containing 5 mg of sodium chloride, and add 0.10 mL of a solution (1 in 1000) of indigo carmine in 3.6 N sulfuric acid.

**Acceptance criteria:** The blue color is not completely discharged in 5 min.

#### • MAGNESIUM AND ALKALI SALTS

**Sample:** 5.0 g

**Analysis:** Dissolve the *Sample* in 50 mL of water, and filter. To the filtrate add 0.5 g of sodium carbonate and 25 mL of 2.5 N sodium hydroxide. Boil the solution gently for 5 min, cool, and pass through an ignited and tared filter. Wash the filter with 1 N ammonium hydroxide. Ignite the filter at  $800 \pm 25^\circ$  for 30 min.

**Acceptance criteria:** The weight of the residue does not exceed 1 mg (NMT 0.02%).

#### • PHOSPHATE

**Standard solution:** Dissolve 143.3 mg of dried monobasic potassium phosphate in water to make 1000 mL, and then dilute 1.0 mL of this solution with 3 N ammonium hydroxide to 100 mL.

**Sample solution:** Dissolve 20 g of the analyte in 100 mL of 3 N ammonium hydroxide.

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Add 3.5 mL of ferric nitrate solution (1 in 10), and allow to stand for 15 min. Warm gently to coagulate the precipitate, and filter. Wash the filter several times with 1.5 N ammonium hydroxide, then wash the filter with 60 mL of warm 4 N nitric acid to dissolve the residue on the filter, collecting the filtrate in a glass-stoppered, 250-mL conical flask. Add 13 mL of ammonium hydroxide, warm to 40°, add 50 mL of ammonium molybdate TS, shake for 5 min, and allow to stand at 40° for 2 h.

**Acceptance criteria:** Any yellow precipitate formed from the *Sample solution* does not exceed that from the *Standard solution* (5 ppm).

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

## Ammonium Molybdate Injection

» Ammonium Molybdate Injection is a sterile solution of Ammonium Molybdate in Water for Injection. It contains not less than 85.0 percent and not more than 115.0 percent of the labeled amount of molybdenum (Mo).

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I or Type II glass.

**Labeling**—Label the Injection to indicate that it is to be diluted to the appropriate strength with Sterile Water for Injection or other suitable fluid prior to administration.

### Identification—

**A:** The *Assay preparation*, prepared as directed in the *Assay*, exhibits an absorption maximum at about 313 nm when tested as directed for *Procedure* in the *Assay*.

**B:** Add 0.3 mL of alkaline mercuric-potassium iodide TS to 5 mL of Injection: a reddish-brown color develops.

**C:** Evaporate 50 mL of Injection on a steam bath to a volume of about 0.3 mL, and add 0.3 mL of ammonium hydroxide. Cool, and add slowly, with mixing, a well-cooled mixture of 1 mL of nitric acid and 1.2 mL of water. Allow to stand for 24 to 48 hours, and pass through a sintered-glass filter. To the filtrate add 0.5 mL of dibasic sodium phosphate TS: a yellow precipitate is formed, and it dissolves in an excess of 6 N ammonium hydroxide.

**Pyrogen** <151>—It meets the requirements, the test dose being 10 mL of Injection per kg.

**pH** <791>: between 3.0 and 6.0.

**Particulate matter** <788>: meets the requirements for small-volume injections.

**Other requirements**—It meets the requirements under *Injections* <1>.

### Assay—

**Ammonium hydroxide diluent**—Dilute 40 mL of ammonium hydroxide with water to 1000 mL. Store in a plastic bottle.

**Sodium sulfate solution**—Dissolve 1 g of sodium sulfate in water to make 100 mL.

**Molybdenum stock solution**—Transfer about 1.84 g of previously assayed Ammonium Molybdate, accurately weighed, to a 1000-mL volumetric flask, dilute with *Ammonium hydroxide diluent* to volume, and mix. This solution contains the equivalent of 1000 µg of molybdenum per mL.

**Standard preparations**—Transfer 0, 1.0, 2.0, 3.0, and 4.0 mL, respectively, of *Molybdenum stock solution* to separate 100-mL volumetric flasks, and to the respective flasks add 5.0, 4.0, 3.0, 2.0, and 1.0 mL of *Ammonium hydroxide diluent*. To each flask add 10 mL of *Sodium sulfate solution*, dilute with water to volume, and mix. These *Standard preparations* contain, respectively, 0, 10, 20, 30, and 40 µg of molybdenum per mL.

**Assay preparation**—Transfer an accurately measured volume of Injection, equivalent to about 500 µg of molybdenum, to a 25-mL volumetric flask, add 1.25 mL of *Ammonium hydroxide diluent* and 2.5 mL of *Sodium sulfate solution*, dilute with water to volume, and mix.

**Procedure**—Concomitantly determine the absorbances of the *Standard preparations* and the *Assay preparation* at the molybdenum emission line of 313.3 nm with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* <851>) equipped with a molybdenum hollow-cathode lamp and a nitrous oxide-acetylene reducing flame, using water as the blank. Plot the absorbances of the *Standard preparations* versus concentration, in µg per mL, of molybdenum, and draw the straight line best fitting the five plotted points. From the graph so obtained, deter-

mine the concentration, in µg per mL, of molybdenum in the *Assay preparation*. Calculate the quantity, in µg, of molybdenum (Mo) in each mL of the Injection taken by the formula:

$$25C / V$$

in which C is the concentration, in µg per mL, of molybdenum in the *Assay preparation*; and V is the volume, in mL, of Injection taken.

## Amobarbital Sodium

$C_{11}H_{17}N_2NaO_3$  248.25

2,4,6-(1*H*,3*H*,5*H*)-Pyrimidinetrione, 5-ethyl-5-(3-methylbutyl)-, monosodium salt.

Sodium 5-ethyl-5-isopentylbarbiturate [64-43-7].

» Amobarbital Sodium contains not less than 98.5 percent and not more than 100.5 percent of  $C_{11}H_{17}N_2NaO_3$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

### USP Reference standards <11>—

USP Amobarbital RS

USP Endotoxin RS

**Completeness of solution** <641>—Mix 1.0 g with 10 mL of carbon dioxide-free water: after 1 minute, the solution is clear and free from undissolved solid.

### Identification—

**A:** *Infrared Absorption* <197K>: of residue obtained in the *Assay*.

**B:** Ignite about 200 mg: the residue effervesces with acid and responds to the tests for *Sodium* <191>.

**pH** <791>: not more than 11.0, in the solution prepared for the test for *Completeness of solution*.

**Loss on drying** <731>—Dry about 1 g, accurately weighed, at 105° for 4 hours: it loses not more than 2.0% of its weight.

**Heavy metals, Method II** <231>: 0.003%.

**Other requirements**—Where the label states that Amobarbital Sodium is sterile, it meets the requirements for *Sterility* and *Bacterial endotoxins* under *Amobarbital Sodium for Injection*. Where the label states that Amobarbital Sodium must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Amobarbital Sodium for Injection*.

**Assay**—Dissolve about 500 mg of Amobarbital Sodium, accurately weighed, in about 15 mL of water in a separator. To the solution add 2 mL of hydrochloric acid, shake, and completely extract the liberated amobarbital with 25-mL portions of chloroform. Test for completeness of extraction by extracting with an additional 10-mL portion of chloroform and evaporating the solvent: not more than 0.5 mg of residue remains. Filter the combined extract through a glass filter funnel into a tared beaker, and wash the separator and the filter with several small portions of chloroform. Evaporate the combined filtrate and washings on a steam bath with the aid of a current of air, dry the residue at 105° for 30 minutes, cool, and weigh. The weight of the residue, multiplied by 1.097, represents the weight of  $C_{11}H_{17}N_2NaO_3$ .

## Amobarbital Sodium for Injection

» Amobarbital Sodium for Injection is Amobarbital Sodium suitable for parenteral use.

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* ⟨1⟩.

**USP Reference standards** ⟨11⟩—

USP Amobarbital RS

USP Endotoxin RS

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* ⟨1⟩.

**Bacterial endotoxins** ⟨85⟩—It contains not more than 0.4 USP Endotoxin Unit per mg of amobarbital sodium.

**Loss on drying** ⟨731⟩—Dry about 1 g, accurately weighed, at 105° for 4 hours: it loses not more than 1.0% of its weight.

**Other requirements**—It conforms to the Definition, responds to the *Identification* tests, and meets the requirements for *Completeness of solution*, *pH*, *Heavy metals*, and *Assay* under *Amobarbital Sodium*. It meets also the requirements for *Sterility Tests* ⟨71⟩, *Uniformity of Dosage Units* ⟨905⟩, and *Labeling* under *Injections* ⟨1⟩.

## Amodiaquine

$C_{20}H_{22}ClN_3O$  355.86  
Phenol, 4-[(7-chloro-4-quinolyl)amino]-2-[(diethylamino)methyl]-;  
4-[(7-Chloro-4-quinolyl)amino]-α-(diethylamino)-o-cresol [86-42-0].

### DEFINITION

Amodiaquine contains NLT 97.0% and NMT 103.0% of amodiaquine ( $C_{20}H_{22}ClN_3O$ ), calculated on the anhydrous basis.

### IDENTIFICATION

#### • A. INFRARED ABSORPTION ⟨197K⟩

**Standard:** Dissolve 20 mg of USP Amodiaquine Hydrochloride RS in 10 mL of water in a separator, add 1 mL of ammonium hydroxide, and extract by shaking with 25 mL of chloroform. Draw off and evaporate the chloroform extract, and dry the residue at 105° for 2 h.

**Acceptance criteria:** Meets the requirements

#### • B. ULTRAVIOLET ABSORPTION ⟨197U⟩

**Sample solution:** 10 µg/mL in 0.1 N hydrochloric acid

**Acceptance criteria:** Meets the requirements

### ASSAY

#### • PROCEDURE

**Standard solution:** 15 µg/mL of USP Amodiaquine Hydrochloride RS in 0.1 N hydrochloric acid

**Sample solution:** 15 µg/mL of Amodiaquine in 0.1 N hydrochloric acid

**Instrumental conditions**

(See *Spectrophotometry and Light-Scattering* ⟨851⟩.)

**Mode:** UV

**Analytical wavelength:** 342 nm

**Cell:** 1 cm

**Blank:** 0.1 N hydrochloric acid

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of amodiaquine ( $C_{20}H_{22}ClN_3O$ ) in the portion of Amodiaquine taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of USP Amodiaquine Hydrochloride RS in the *Standard solution* (µg/mL)

$C_U$  = concentration of Amodiaquine in the *Sample solution* (µg/mL)

$M_{r1}$  = molecular weight of amodiaquine, 355.86

$M_{r2}$  = molecular weight of anhydrous aminodiaquine hydrochloride, 428.79

**Acceptance criteria:** 97.0%–103.0% on the anhydrous basis

### IMPURITIES

• **RESIDUE ON IGNITION** ⟨281⟩: NMT 0.2%

#### • ORGANIC IMPURITIES

**Standard solution A:** To 20 mg of USP Amodiaquine Hydrochloride RS in a glass-stoppered test tube add 1.0 mL of chloroform (saturated with ammonium hydroxide), and shake vigorously for 2 min. Allow the solids to settle, and decant the liquid into a second test tube.

**Standard solution B:** *Standard solution A* and chloroform (saturated with ammonium hydroxide) (1 in 200)

**Sample solution:** 15 mg/mL of Amodiaquine in chloroform (saturated with ammonium hydroxide)

#### Chromatographic system

(See *Chromatography* ⟨621⟩, *Thin-Layer Chromatography*.)

**Mode:** TLC

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture

**Application volume:** 10 µL

**Developing solvent system:** Chloroform (saturated with ammonium hydroxide) and dehydrated alcohol (9:1)

### Analysis

**Samples:** *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, allow the solvent to evaporate, and examine the plate under short-wavelength UV light.

**Acceptance criteria:** The chromatograms show principal spots at about the same  $R_f$  value; and no secondary spot, if present in the chromatogram from the *Sample solution*, is more intense than the principal spot obtained from *Standard solution B*.

### SPECIFIC TESTS

• **WATER DETERMINATION**, *Method I* ⟨921⟩: NMT 0.5%

### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers.

• **USP REFERENCE STANDARDS** ⟨11⟩

USP Amodiaquine Hydrochloride RS

## Amodiaquine Hydrochloride

$C_{20}H_{22}ClN_3O \cdot 2HCl \cdot 2H_2O$

464.81

$C_{20}H_{22}ClN_3O \cdot 2HCl$

428.79

Phenol, 4-[(7-chloro-4-quinoliny)amino]-2-[(diethylamino)-methyl]-, dihydrochloride, dihydrate;  
4-[(7-Chloro-4-quinolyl)amino]- $\alpha$ -(diethylamino)-*o*-cresol dihydrochloride dihydrate [6398-98-7].  
Anhydrous [69-44-3].

**DEFINITION**

Amodiaquine Hydrochloride contains NLT 97.0% and NMT 103.0% of amodiaquine hydrochloride ( $C_{20}H_{22}ClN_3O \cdot 2HCl$ ), calculated on the anhydrous basis.

**IDENTIFICATION****A. INFRARED ABSORPTION** (197K)

**Sample:** Dissolve 20 mg of Amodiaquine Hydrochloride in 10 mL of water in a separator. Add 1 mL of ammonium hydroxide, and extract by shaking with 25 mL of chloroform. Draw off and evaporate the chloroform extract, and dry the residue at 105° for 2 h.

**Acceptance criteria:** Meets the requirements

**B. ULTRAVIOLET ABSORPTION** (197U)

**Sample solution:** 10  $\mu$ g/mL in dilute hydrochloric acid (1 in 100)

**Acceptance criteria:** Meets the requirements

**C. IDENTIFICATION TESTS—GENERAL, Chloride** (191): Meets the requirements**D.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.**ASSAY****PROCEDURE**

**Buffer:** 6.8 g/L of monobasic potassium phosphate in water. Add 1.0 mL of perchloric acid to each 1 L of solution, adjust with phosphoric acid to a pH of  $2.5 \pm 0.5$ , and pass through a filter of 0.45- $\mu$ m pore size.

**Mobile phase:** Methanol and *Buffer* (22:78)

**System suitability solution:** 0.15 mg/mL of USP

Amodiaquine Hydrochloride RS and 0.15 mg/mL of USP Chloroquine Phosphate RS in water

USP Amodiaquine Hydrochloride RS

USP Chloroquine Phosphate RS

## Amodiaquine Hydrochloride Tablets

**DEFINITION**

Amodiaquine Hydrochloride Tablets contain an amount of amodiaquine hydrochloride ( $C_{20}H_{22}ClN_3O \cdot 2HCl \cdot 2H_2O$ ) equivalent to NLT 93.0% and NMT 107.0% of the labeled amount of amodiaquine ( $C_{20}H_{22}ClN_3O$ ).

**IDENTIFICATION****A. INFRARED ABSORPTION** (197K)

**Sample:** Powder 1 or more Tablets, and transfer a portion of the powder, equivalent to 50 mg of amodiaquine, to a 125-mL separator. Add 20 mL of water, and shake for 1 min. Add 25 mL of chloroform and 1 mL of ammonium hydroxide, shake for 2 min, and when settled, filter the chloroform extract through cotton that previously has been rinsed with chloroform, collecting the extract in a vessel suitable for evaporation. Evaporate the chloroform, and dry the residue at 105° for 1 h.

**Acceptance criteria:** Meet the requirements

**B.** The retention time of the amodiaquine hydrochloride peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.**ASSAY****Change to read:****PROCEDURE**

**Buffer:** 6.8 g/L of monobasic potassium phosphate in water. Add 1.0 mL of perchloric acid to each 1 L of solution, adjust with phosphoric acid to a pH of 2.5, and pass through a filter of 0.45- $\mu$ m pore size.

**Diluent:** 1% (v/v) hydrochloric acid in water

**Mobile phase:** Methanol and *Buffer* (22:78)

**Standard solution:** 0.15 mg/mL of USP Amodiaquine Hydrochloride RS and 0.15 mg/mL of USP Chloroquine Phosphate RS in water ▲USP36

**Sample solution:** Transfer a quantity equivalent to 7.5 mg of amodiaquine hydrochloride from finely powdered Tablets (NLT 20) to a 50-mL volumetric flask, and dissolve in and dilute with *Diluent* to volume. Sonicate for 25 min at 29°. Pass 10 mL through a nylon filter of 0.2-μm pore size, discarding the first 4 mL. Use 2 mL for the analysis.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 224 nm

**Column:** 4.6-mm × 10-cm; 5-μm packing L1

**Flow rate:** 1.2 mL/min

**Injection volume:** 10 μL

#### System suitability

**Sample:** ▲Standard solution ▲USP36

[NOTE—The relative retention times for the chloroquine and amodiaquine peaks are 0.8 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 1.5 between amodiaquine hydrochloride and chloroquine phosphate

**Tailing factor:** NMT 1.5 for amodiaquine hydrochloride and chloroquine phosphate

**Relative standard deviation:** NMT 2.0% for amodiaquine hydrochloride and chloroquine phosphate

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of the labeled amount of amodiaquine (C<sub>20</sub>H<sub>22</sub>ClN<sub>3</sub>O) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of ▲amodiaquine in ▲USP36 USP Amodiaquine Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of amodiaquine ▲USP36 in the *Sample solution* (mg/mL)

**Acceptance criteria:** 93.0%–107.0%

#### PERFORMANCE TESTS

##### • DISSOLUTION <711>

**Medium:** Water; 900 mL

**Apparatus 2:** 50 rpm

**Time:** 30 min

**Detector:** UV 342 nm

**Standard solution:** USP Amodiaquine Hydrochloride RS in *Medium*

**Sample solution:** Filter portions of the solution under test, suitably diluted with water, if necessary, in comparison with a *Standard solution* having a known concentration of USP Amodiaquine Hydrochloride RS.

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Determine the amount of amodiaquine hydrochloride (C<sub>20</sub>H<sub>22</sub>ClN<sub>3</sub>O · 2HCl · 2H<sub>2</sub>O) dissolved from UV absorbances.

**Tolerances:** An amount of amodiaquine hydrochloride (C<sub>20</sub>H<sub>22</sub>ClN<sub>3</sub>O · 2HCl · 2H<sub>2</sub>O) equivalent to NLT 75% (Q) of the labeled amount of amodiaquine (C<sub>20</sub>H<sub>22</sub>ClN<sub>3</sub>O) is dissolved.

##### • UNIFORMITY OF DOSAGE UNITS <905>: Meet the requirements

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS <11>**  
USP Amodiaquine Hydrochloride RS  
USP Chloroquine Phosphate RS

## Amoxapine

C<sub>17</sub>H<sub>16</sub>ClN<sub>3</sub>O 313.78  
Dibenz[*b,f*][1,4]oxazepine, 2-chloro-11-(1-piperazinyl)-;  
2-Chloro-11-(1-piperazinyl)dibenz[*b,f*][1,4]oxazepine  
[14028-44-5].

#### DEFINITION

Amoxapine contains NLT 98.5% and NMT 101.0% of amoxapine (C<sub>17</sub>H<sub>16</sub>ClN<sub>3</sub>O), calculated on the dried basis.

#### IDENTIFICATION

- **A. INFRARED ABSORPTION <197K>**
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

#### ASSAY

##### • PROCEDURE

**Solution A:** 11.3 g of tetramethylammonium chloride in 100 mL of water

**Solution B:** Phosphoric acid (1 in 5)

**Buffer:** 1.4 g/L of monobasic sodium phosphate

**Mobile phase:** Dilute a mixture of 360 mL of acetonitrile, 20 mL of *Solution A*, and 2 mL of *Solution B* with *Buffer* to 1 L.

**System suitability solution:** 0.1 mg/mL of USP Amoxapine RS and 0.1 mg/mL of USP Loxapine Succinate RS in *Mobile phase*. Sonication may be used to aid in dissolution.

**Standard solution:** 0.1 mg/mL of USP Amoxapine RS in *Mobile phase*. Sonication may be used to aid in dissolution.

**Sample solution:** 0.1 mg/mL of Amoxapine in *Mobile phase*. Sonication may be used to aid in dissolution.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 15-cm; 5-μm packing L1

**Flow rate:** 1.0 mL/min

**Injection size:** 10 μL

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

#### Suitability requirements

[NOTE—The relative retention times for amoxapine and loxapine are 1.0 and 1.2, respectively.]

**Resolution:** NLT 2.5 between amoxapine and loxapine, *System suitability solution*

**Tailing factor:** NMT 1.8, *Standard solution*

**Relative standard deviation:** NMT 0.73%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of amoxapine (C<sub>17</sub>H<sub>16</sub>ClN<sub>3</sub>O) in the portion of Amoxapine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response of amoxapine from the *Sample solution*  
 $r_S$  = peak response of USP Amoxapine RS from the *Standard solution*  
 $C_S$  = concentration of USP Amoxapine RS in the *Standard solution* (mg/mL)  
 $C_U$  = concentration of Amoxapine in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.5%–101.0% on the dried basis

#### IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%

- **ORGANIC IMPURITIES**

**Standard solution A:** 0.5 mg/mL of USP Amoxapine RS in chloroform

**Standard solution B:** 0.25 mg/mL of USP Amoxapine RS in chloroform, from *Standard solution A*

**Sample solution:** 50 mg/mL of Amoxapine in chloroform

**Developing solvent system:** Chloroform, methanol, and ammonium hydroxide (18: 2: 0.1)

**Chromatographic system**

(See *Chromatography* (621), *Thin-Layer Chromatography*.)  
**Mode:** TLC

**Adsorbent:** 0.2-mm layer of chromatographic silica gel mixture

**Application volume:** 5  $\mu$ L

**Analysis**

**Samples:** *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop the chromatogram in the *Developing solvent system* until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the developing chamber, examine it under short-wave-length UV light, and compare the intensities of any secondary spots observed in the chromatogram of the *Sample solution* with those of the principal spots in the chromatogram of the *Standard solutions*.

**Acceptance criteria:** No secondary spot from the chromatogram of the *Sample solution* is larger or more intense than the principal spot of *Standard solution B* (0.5%), and the sum of the intensities of the secondary spots of the *Sample solution* corresponds to NMT 1.0%.

#### SPECIFIC TESTS

- **LOSS ON DRYING** (731): Dry a sample at 105° for 4 h: it loses NMT 0.5% of its weight.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

- **USP REFERENCE STANDARDS** (11)

USP Amoxapine RS

USP Loxapine Succinate RS

### Amoxapine Tablets

» Amoxapine Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of amoxapine ( $C_{17}H_{16}ClN_3O$ ).

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Amoxapine RS

**Identification, Infrared Absorption** (197K)—Prepare the test specimen as follows. Triturate a quantity of finely ground Tablets, equivalent to about 50 mg of amoxapine, with 10 mL of chloroform, and filter. Evaporate the filtrate on a steam bath to dryness (about 30 minutes).

#### Dissolution (711)—

**Medium:** simulated gastric fluid (without enzyme); 900 mL.

**Apparatus 2:** 50 rpm.

**Time:** 30 minutes.

**Procedure**—Determine the amount of  $C_{17}H_{16}ClN_3O$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 294 nm of filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a *Standard solution* having a known concentration of USP Amoxapine RS in the same *Medium*.

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_{17}H_{16}ClN_3O$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

#### Assay—

**0.01 M Monobasic sodium phosphate**—Dissolve 2.76 g of monobasic sodium phosphate in 2000 mL of water, and mix.

**1 M Tetramethylammonium chloride**—Dissolve 11.3 g of tetramethylammonium chloride in 100 mL of water, and mix.

**Mobile phase**—Transfer 40.0 mL of 1 M Tetramethylammonium chloride, 4.0 mL of dilute phosphoric acid (1 in 5), and 720 mL of acetonitrile to a 2000-mL volumetric flask. Dilute with 0.01 M Monobasic sodium phosphate to volume, mix, and filter. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Transfer about 50 mg of USP Amoxapine RS, accurately weighed, to a 50-mL volumetric flask, add 30 mL of acetonitrile, and shake by mechanical means to dissolve. Dilute with acetonitrile to volume, and mix. Quantitatively dilute a portion of this solution with *Mobile phase* to obtain a solution having a known concentration of about 0.1 mg per mL.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 50 mg of amoxapine, to a 50-mL volumetric flask, add 40 mL of *Mobile phase*, and shake vigorously by mechanical means for 20 minutes. Dilute with *Mobile phase* to volume, mix, and filter. Pipet 5.0 mL of the filtrate into a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor for the analyte peak is not more than 1.8, the column efficiency determined from the analyte peak is not less than 1200 theoretical plates, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of amoxapine ( $C_{17}H_{16}ClN_3O$ ) in the portion of Tablets taken by the formula:

$$500C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Amoxapine RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the amoxapine peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Amoxicillin

$C_{16}H_{19}N_3O_5S \cdot 3H_2O$  419.45  
 4-Thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid, 6-[[amino(4-hydroxyphenyl)acetyl]amino]-3,3-dimethyl-7-oxo-, trihydrate [2S-[2 $\alpha$ ,5 $\alpha$ ,6 $\beta$ (S\*)]]-; (2S,5R,6R)-6-[(R)-(-)-2-Amino-2-(p-hydroxyphenyl)-acetamido]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid trihydrate [61336-70-7].  
 Anhydrous 365.41  
 [26787-78-0].

### DEFINITION

Amoxicillin contains NLT 900  $\mu$ g and NMT 1050  $\mu$ g of  $C_{16}H_{19}N_3O_5S$  per mg, calculated on the anhydrous basis.

### IDENTIFICATION

- **INFRARED ABSORPTION** <197K>

### ASSAY

#### • PROCEDURE

**Diluent:** 6.8 g/L of monobasic potassium phosphate in water. Adjust with a 45% (w/w) solution of potassium hydroxide to a pH of  $5.0 \pm 0.1$ .

**Mobile phase:** Acetonitrile and *Diluent* (1:24)

**Standard solution:** 1.2 mg/mL of USP Amoxicillin RS in *Diluent*. [NOTE—Use this solution within 6 h.]

**Sample solution:** 1.2 mg/mL of Amoxicillin in *Diluent*. [NOTE—Use this solution within 6 h.]

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 230 nm

**Column:** 4-mm  $\times$  25-cm; packing L1

**Flow rate:** 1.5 mL/min

**Injection size:** 10  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** NMT 2.5

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the quantity, in  $\mu$ g/mg, of  $C_{16}H_{19}N_3O_5S$  in the portion of Amoxicillin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Amoxicillin RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of *Sample solution* (mg/mL)

$P$  = potency of amoxicillin in USP Amoxicillin RS ( $\mu$ g/mg)

**Acceptance criteria:** 900–1050  $\mu$ g of  $C_{16}H_{19}N_3O_5S$  per mg on the anhydrous basis

### IMPURITIES

#### Organic Impurities

##### • PROCEDURE

**Solution A:** 2.72 g/L of monobasic potassium phosphate. Adjust with 1 N potassium hydroxide or 20% phosphoric acid to a pH of  $5.0 \pm 0.1$ .

#### Solution B: Methanol

**Mobile phase:** See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	97	3
10	97	3
22	75	25
26	97	3

**Standard solution:** 12.5  $\mu$ g/mL of USP Amoxicillin RS in *Solution A*

**System suitability solution:** 12.5  $\mu$ g/mL each of USP Amoxicillin Related Compound A RS and USP Amoxicillin Related Compound D RS in *Solution A*

**Sample solution:** 1.25 mg/mL of Amoxicillin in *Solution A*. [NOTE—Store this solution at 4° and use within 4 h.]

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.6-mm  $\times$  10-cm; 5- $\mu$ m packing L1

**Column temperature:** 40°

**Flow rate:** 1.5 mL/min

**Injection size:** 10  $\mu$ L

**Autosampler temperature:** 4°

#### System suitability

**Samples:** *Standard solution* and *System suitability solution*

#### Suitability requirements

[NOTE— Identify peaks by the relative retention times in *Impurity Table 1*.]

**Resolution:** NLT 1.5 between amoxicillin related compound A and the second peak for amoxicillin related compound D, *System suitability solution*

**Relative standard deviation:** NMT 10%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Amoxicillin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_S$  = peak response of amoxicillin from the *Standard solution*

$C_S$  = concentration of USP Amoxicillin RS in the *Standard solution* ( $\mu$ g/mL)

$C_U$  = nominal concentration of Amoxicillin in the *Sample solution* (mg/mL)

$F$  = unit conversion factor (0.001 mg/ $\mu$ g)

#### Acceptance criteria

[NOTE—The reporting limit is 0.03% of the amoxicillin peak from the *Standard solution*.]

**Individual impurities:** See *Impurity Table 1*.

**Total impurities:** NMT 5.0%

Impurity Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Amoxicillin related compound I <sup>a</sup> (D-hydroxyphenylglycine)	0.32	1.0
Amoxicillin related compound D <sup>b,c</sup> (amoxicillin open ring)	0.53	1.0
	0.68	1.0
Amoxicillin related compound A <sup>d</sup> (6-aminopenicillanic acid)	0.78	0.5
Amoxicillin related compound B <sup>e,f</sup> (L-amoxicillin)	0.87	—
Amoxicillin	1.0	—
Amoxicillin related compound G <sup>g</sup> (D-hydroxyphenyl-glycylamoxicillin)	2.9	1.0
Amoxicillin related compound E <sup>h,i</sup> (amoxicillin penilloic derivative)	4.5	1.0
Amoxicillin related compound M <sup>i</sup> (N-(penicillan-6-yl) open ring amoxicillinamide)	6.0	1.0
Amoxicillin related compound F <sup>e,k</sup> (phenylpyrazinediol)	6.3	—
Amoxicillin related compound C <sup>l</sup> (amoxicillin rearrangement product)	6.4	1.0
Amoxicillin related compound E <sup>h,i</sup> (amoxicillin penilloic derivative)	6.7	1.0
Amoxicillin related compound J <sup>m</sup> (amoxicillin open ring dimer)	8.8	1.0
Amoxicillin related compound L <sup>n</sup> (N-(penicillan-6-yl) amoxicillinamide)	9.0	1.0
Any unspecified individual impurity	—	1.0

<sup>a</sup> (R)-2-Amino-2-(4-hydroxyphenyl)acetic acid.

<sup>b</sup> The chromatographic system resolves two penicilloic acids from each other.

<sup>c</sup> (4S)-2-[[[(R)-2-Amino-2-(4-hydroxyphenyl)acetamido](carboxy)methyl]-5,5-dimethylthiazolidine-4-carboxylic acid.

<sup>d</sup> (2S,5R,6R)-6-Amino-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid.

<sup>e</sup> These compounds are listed for information only and are not to be reported.

<sup>f</sup> (2S,5R,6R)-6-[(S)-2-Amino-2-(4-hydroxyphenyl)acetamido]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid.

<sup>g</sup> (2S,5R,6R)-6-[(R)-2-[(R)-2-Amino-2-(4-hydroxyphenyl)acetamido]-2-(4-hydroxyphenyl)acetamido]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid.

<sup>h</sup> The chromatographic system resolves two penilloic acids from each other.

<sup>i</sup> (4S)-2-[[[(R)-2-Amino-2-(4-hydroxyphenyl)acetamido]methyl]-5,5-dimethylthiazolidine-4-carboxylic acid.

<sup>j</sup> (2S,5R,6R)-6-(2-[(R)-2-Amino-2-(4-hydroxyphenyl)acetamido]-2-[(4S)-4-carboxy-5,5-dimethylthiazolidin-2-yl]acetamido)-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid.

<sup>k</sup> 3-(4-Hydroxyphenyl)pyrazin-2-ol.

<sup>l</sup> (4S)-2-[5-(4-Hydroxyphenyl)-3,6-dioxopiperazin-2-yl]-5,5-dimethylthiazolidine-4-carboxylic acid.

<sup>m</sup> (2S,5R,6R)-6-[(2R)-2-[(R)-2-Amino-2-(4-hydroxyphenyl)acetamido]-2-[(4S)-4-carboxy-5,5-dimethylthiazolidin-2-yl]acetamido]-2-(4-hydroxyphenyl)acetamido)-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid.

<sup>n</sup> (2S,5R,6R)-6-[(2S,5R,6R)-6-[(R)-2-Amino-2-(4-hydroxyphenyl)acetamido]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxamido]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid.

## SPECIFIC TESTS

- **CRYSTALLINITY** <695>: Meets the requirements
- **DIMETHYLANILINE** <223>: Meets the requirement
- **PH** <791>: 3.5–6.0  
Sample solution: 2 mg/mL
- **WATER DETERMINATION, Method I** <921>: 11.5%–14.5%
- **STERILITY TESTS** <71>: Where the label states that Amoxicillin is sterile, it meets the requirements when tested as

directed in *Test for Sterility of the Product to Be Examined, Direct Inoculation of the Culture Medium*, except to use Fluid Thioglycollate Medium containing polysorbate 80 solution (5 mg/mL) and an amount of sterile penicillinase sufficient to inactivate the amoxicillin in each tube, to use Soybean–Casein Digest Medium containing polysorbate 80 solution (5 mg/mL) and an amount of sterile penicillinase sufficient to inactivate the amoxicillin in each tube, and to shake the tubes once daily.

- **BACTERIAL ENDOTOXINS TEST** <85>: Where the label states that Amoxicillin is sterile or Amoxicillin must be subjected to further processing during the preparation of injectable dosage forms, it contains NMT 0.25 USP Endotoxin Unit/mg of amoxicillin.

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- **LABELING:** Where it is intended for use in preparing injectable dosage forms, the label states that it is intended for veterinary use only and that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms. Label all other Amoxicillin to indicate that it is to be used in the manufacture of nonparenteral drugs only.
- **USP REFERENCE STANDARDS** <11>
  - USP Amoxicillin RS
  - USP Amoxicillin Related Compound A RS  
(2S,5R,6R)-6-Amino-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid; 6-aminopenicillanic acid.  
C<sub>8</sub>H<sub>12</sub>N<sub>2</sub>O<sub>3</sub>S 216.26
  - USP Amoxicillin Related Compound D RS  
(4S)-2-[[[(R)-2-Amino-2-(4-hydroxyphenyl)acetamido](carboxy)methyl]-5,5-dimethylthiazolidine-4-carboxylic acid; amoxicillin open ring.  
C<sub>16</sub>H<sub>21</sub>N<sub>3</sub>O<sub>6</sub>S 383.42
  - USP Endotoxin RS

## Amoxicillin Boluses

» Amoxicillin Boluses contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of amoxicillin (C<sub>16</sub>H<sub>19</sub>N<sub>3</sub>O<sub>5</sub>S).

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

**Labeling**—Label Boluses to indicate that they are for veterinary use only.

**USP Reference standards** <11>—

USP Amoxicillin RS

**Identification**—

*Test solution*—To a portion of powdered Boluses add 0.1 N hydrochloric acid to obtain a *Test solution* containing about 4 mg of amoxicillin per mL. Use within 10 minutes after preparation.

*Application volume, Developing solvent system, Procedure*—Proceed as directed for the *Identification* test under *Amoxicillin Tablets*.

**Disintegration** <701>: 30 minutes, simulated gastric fluid being used instead of water.

**Water, Method I** (921): not more than 7.5%.

#### Assay—

*Diluent, Mobile phase, Standard preparation, and Chromatographic system*—Prepare as directed in the Assay under Amoxicillin.

*Assay preparation*—Weigh and finely powder not fewer than 5 Boluses. Transfer an accurately weighed portion of the powder, equivalent to about 250 mg of amoxicillin, to a 250-mL volumetric flask, add *Diluent* to volume, and mix. Sonicate if necessary to ensure complete dissolution of the amoxicillin. Pass a portion of this solution through a filter of 1- $\mu$ m or finer porosity, and use the filtrate as the *Assay preparation*. [NOTE—Use this solution within 6 hours.]

*Procedure*—Proceed as directed for *Procedure* in the Assay under Amoxicillin. Calculate the quantity, in mg, of amoxicillin ( $C_{16}H_{19}N_3O_5S$ ) in the portion of Boluses taken by the formula:

$$0.25CP(r_U / r_S)$$

in which the terms are as defined therein.

## Amoxicillin Capsules

### DEFINITION

Amoxicillin Capsules contain the equivalent of NLT 90.0% and NMT 120.0% of the labeled amount of amoxicillin ( $C_{16}H_{19}N_3O_5S$ ).

### IDENTIFICATION

- The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

### ASSAY

#### • PROCEDURE

**Buffer:** Dissolve 6.8 g/L of monobasic potassium phosphate in water. Adjust with a 45% (w/w) solution of potassium hydroxide to a pH of  $5.0 \pm 0.1$ .

**Mobile phase:** Acetonitrile and *Buffer* (1:24)

**Standard solution:** 1.2 mg/mL of USP Amoxicillin RS in *Buffer*. [NOTE—Use this solution within 6 h.]

**Sample solution:** Remove, as completely as possible, the contents of NLT 20 Capsules. Mix the combined contents, and transfer a quantity, equivalent to 200 mg of anhydrous amoxicillin, to a 200-mL volumetric flask. Add *Buffer* to volume. Sonicate if necessary to ensure complete dissolution. [NOTE—Use this solution within 6 h.]

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 230 nm

**Column:** 4-mm  $\times$  25-cm; 10- $\mu$ m packing L1

**Flow rate:** 1.5 mL/min

**Injection size:** 10  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 2.5

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{16}H_{19}N_3O_5S$  in the portion of Capsules taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times P \times F \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Amoxicillin RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of amoxicillin in the *Sample solution* (mg/mL)

$P$  = potency of amoxicillin in USP Amoxicillin RS ( $\mu$ g/mg)

$F$  = conversion factor, 0.001 mg/ $\mu$ g

**Acceptance criteria:** 90.0%–120.0%

### PERFORMANCE TESTS

#### • DISSOLUTION (711)

##### Test 1

**Medium:** Water; 900 mL

**Apparatus 1:** 100 rpm, for Capsules containing 250 mg

**Apparatus 2:** 75 rpm, for Capsules containing 500 mg

**Time:** 60 min

**Analytical wavelength:** UV 272 nm

**Standard solution:** USP Amoxicillin RS in *Medium*

**Sample solution:** Pass a portion of the solution under test through a suitable filter. Dilute with *Medium*, if necessary, to a concentration that is similar to that of the *Standard solution*.

**Tolerances:** NLT 80% (Q) of the labeled amount of  $C_{16}H_{19}N_3O_5S$  is dissolved.

**Test 2:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

**Medium:** Water; 900 mL

**Apparatus 1:** 100 rpm

**Time:** 90 min

**Analytical wavelength:** UV 272 nm

**Standard solution:** USP Amoxicillin RS in *Medium*

**Sample solution:** Pass a portion of the solution under test through a suitable filter. Dilute with *Medium*, if necessary, to a concentration that is similar to that of the *Standard solution*.

**Tolerances:** NLT 80% (Q) of the labeled amount of  $C_{16}H_{19}N_3O_5S$  is dissolved.

- UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

### SPECIFIC TESTS

- MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** The total aerobic microbial count does not exceed  $10^3$  cfu/g, and the total combined molds and yeasts count does not exceed  $10^2$  cfu/g.

### ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- USP REFERENCE STANDARDS (11)**  
USP Amoxicillin RS

## Amoxicillin and Clavulanate Potassium for Oral Suspension

### DEFINITION

Amoxicillin and Clavulanate Potassium for Oral Suspension contains the equivalent of NLT 90.0% and NMT 120.0% of the labeled amount of amoxicillin ( $C_{16}H_{19}N_3O_5S$ ) and the equivalent of NLT 90.0% and NMT 125.0% of the labeled amount of clavulanic acid ( $C_8H_9NO_5$ ). It contains one or more suitable buffers, colors, flavors, preservatives, stabilizers, sweeteners, and suspending agents.

### IDENTIFICATION

- A.** The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the Assay.

**ASSAY****• PROCEDURE**

**Buffer:** 7.8 g of monobasic sodium phosphate in 900 mL of water. Adjust with phosphoric acid or 10 N sodium hydroxide to a pH of  $4.4 \pm 0.1$ , and dilute with water to 1000 mL.

**Mobile phase:** Methanol and *Buffer* (1:19). Pass through a suitable filter.

**Standard solution:** 0.5 mg/mL of USP Amoxicillin RS and 0.2 mg/mL of USP Clavulanate Lithium RS in water

**Sample solution:** Nominally 0.5 mg/mL of amoxicillin in water, prepared as follows. Constitute Amoxicillin and Clavulanate Potassium for Oral Suspension with water using the volume specified in the labeling. Stir by mechanical means for 10 min, and filter. Use within 1 h.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 220 nm

**Column:** 4-mm  $\times$  30-cm; 3- to 10- $\mu$ m packing L1

**Flow rate:** 2 mL/min

**Injection volume:** 20  $\mu$ L

**System suitability**

**Sample:** *Standard solution*

[NOTE—The relative retention times for clavulanic acid and amoxicillin are about 0.5 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 3.5 between the amoxicillin and clavulanic acid peaks

**Tailing factor:** NMT 1.5 for each analyte peak

**Relative standard deviation:** NMT 2.0% for each analyte peak

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of amoxicillin ( $C_{16}H_{19}N_3O_5S$ ) in the Amoxicillin and Clavulanate Potassium for Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

$r_U$  = peak response of amoxicillin from the *Sample solution*

$r_S$  = peak response of amoxicillin from the *Standard solution*

$C_S$  = concentration of USP Amoxicillin RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of amoxicillin in the *Sample solution* (mg/mL)

$P$  = potency of amoxicillin in USP Amoxicillin RS ( $\mu$ g/mg)

$F$  = conversion factor, 0.001 mg/ $\mu$ g

Calculate the percentage of the labeled amount of clavulanic acid ( $C_8H_9NO_5$ ) in the Amoxicillin and Clavulanate Potassium for Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times 100$$

$r_U$  = peak response of clavulanic acid from the *Sample solution*

$r_S$  = peak response of clavulanic acid from the *Standard solution*

$C_S$  = concentration of USP Clavulanate Lithium RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of clavulanic acid in the *Sample solution* (mg/mL)

$P$  = potency of clavulanic acid in USP Clavulanate Lithium RS (mg/mg)

**Acceptance criteria:** 90.0%–120.0% of the labeled amount of amoxicillin ( $C_{16}H_{19}N_3O_5S$ ) and 90.0%–125.0% of the labeled amount of clavulanic acid ( $C_8H_9NO_5$ )

**PERFORMANCE TESTS****• DELIVERABLE VOLUME <698>**

For powder packaged in multiple-unit containers: Meets the requirements

**• UNIFORMITY OF DOSAGE UNITS <905>**

For powder packaged in single-unit containers: Meets the requirements

**SPECIFIC TESTS****• pH <791>**

**Sample solution:** Constitute as directed in the labeling, and perform the test immediately after constitution.

**Acceptance criteria:** 3.8–6.6

**• MICROBIAL ENUMERATION TESTS <61> and TESTS FOR SPECIFIED MICROORGANISMS <62>**

The total aerobic microbial count does not exceed  $10^3$  cfu/g, and the total combined molds and yeasts count does not exceed  $10^2$  cfu/g.

**ADDITIONAL REQUIREMENTS****• PACKAGING AND STORAGE:**

Preserve in tight containers, at controlled room temperature.

**• USP REFERENCE STANDARDS <11>**

USP Amoxicillin RS

USP Clavulanate Lithium RS

## Amoxicillin and Clavulanate Potassium Tablets

**DEFINITION**

Amoxicillin and Clavulanate Potassium Tablets contain the equivalent of NLT 90.0% and NMT 120.0% of the labeled amounts of amoxicillin ( $C_{16}H_{19}N_3O_5S$ ) and clavulanic acid ( $C_8H_9NO_5$ ).

**IDENTIFICATION**

The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

**ASSAY****• PROCEDURE**

**Buffer:** 7.8 g of monobasic sodium phosphate in 900 mL of water. Adjust with phosphoric acid or 10 N sodium hydroxide to a pH of  $4.4 \pm 0.1$ , and dilute with water to 1000 mL.

**Mobile phase:** Methanol and *Buffer* (1:19). Pass through a suitable filter.

**Standard solution:** 0.5 mg/mL of USP Amoxicillin RS and 0.2 mg/mL of USP Clavulanate Lithium RS in water

**Sample stock solution:** Dissolve NLT 10 Tablets in water with the aid of mechanical stirring. Transfer to a suitable volumetric flask, and dilute with water to volume.

**Sample solution:** Dilute a suitable volume of the *Sample stock solution* with water to obtain a solution containing 0.5 mg/mL of amoxicillin. [NOTE—Use the *Sample solution* within 1 h.]

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 220 nm

**Column:** 4-mm  $\times$  30-cm; 3- to 10- $\mu$ m packing L1

**Flow rate:** 2 mL/min

**Injection size:** 20  $\mu$ L

**System suitability**

**Sample:** *Standard solution*

[NOTE—The relative retention times for clavulanic acid and amoxicillin are 0.5 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 3.5 between the amoxicillin and clavulanic acid peaks

**Tailing factor:** NMT 1.5 for each analyte peak  
**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
 Calculate the percentage of  $C_{16}H_{19}N_3O_5S$  in each Tablet taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

$r_U$  = peak response of amoxicillin from the *Sample solution*

$r_S$  = peak response of amoxicillin from the *Standard solution*

$C_S$  = concentration of USP Amoxicillin RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of amoxicillin in the *Sample solution* (mg/mL)

$P$  = potency of USP Amoxicillin RS ( $\mu\text{g}/\text{mg}$ )

$F$  = conversion factor, 0.001 mg/ $\mu\text{g}$

Calculate the percentage of  $C_8H_9NO_5$  in each Tablet taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times 100$$

$r_U$  = peak response of clavulanic acid from the *Sample solution*

$r_S$  = peak response of clavulanic acid from the *Standard solution*

$C_S$  = concentration of USP Clavulanate Lithium RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of clavulanic acid in the *Sample solution* (mg/mL)

$P$  = potency of clavulanic acid in USP Clavulanate Lithium RS (mg/mg)

**Acceptance criteria:** 90.0%–120.0%

#### PERFORMANCE TESTS

- **DISINTEGRATION** (701): Tablets labeled for veterinary use only; 30 min, simulated gastric fluid TS being substituted for water in the test

- **DISSOLUTION** (711)

[NOTE—Tablets labeled for veterinary use only are exempt from this requirement.]

##### Test 1

**Medium:** Water; 900 mL

**Apparatus 2:** 75 rpm

**Time:** 30 min; or 45 min where the Tablets are labeled as chewable

**Analysis:** Determine the amount of  $C_{16}H_{19}N_3O_5S$  and  $C_8H_9NO_5$  dissolved, using the *Analysis* set forth in the *Assay*, making any necessary volumetric adjustments.

**Tolerances:** NLT 85% (Q) of the labeled amount of  $C_{16}H_{19}N_3O_5S$  and NLT 80% (Q) of the labeled amount of  $C_8H_9NO_5$  are dissolved.

**For Tablets labeled as chewable:** NLT 80% (Q) of the labeled amounts of  $C_{16}H_{19}N_3O_5S$  and  $C_8H_9NO_5$  is dissolved in 45 min.

**Test 2:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

**Medium, Apparatus 2, and Analysis:** Proceed as directed for *Test 1*.

**Times:** 45 min for amoxicillin, and 30 min for clavulanic acid

**Tolerances:** NLT 85% (Q) of the labeled amount of  $C_{16}H_{19}N_3O_5S$  and NLT 80% (Q) of the labeled amount of  $C_8H_9NO_5$  are dissolved.

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

#### SPECIFIC TESTS

- **WATER DETERMINATION**, *Method I* (921):

Tablet Label Claim Amoxicillin (mg/Tablet)	Acceptance Criteria, NMT (%)
≤250	7.5
>250 and ≤500	10.0
>500	11.0

For products labeled as chewable Tablets:

Tablet Label Claim Amoxicillin (mg/Tablet)	Acceptance Criteria, NMT (%)
≤125	6.0
>125	8.0

For Tablets labeled for veterinary use only: NMT 10.0%

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total aerobic microbial count does not exceed  $10^3$  cfu/g, and the total combined molds and yeasts count does not exceed  $10^2$  cfu/g.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Label chewable Tablets to include the word “chewable” in juxtaposition to the official name. The labeling indicates that chewable Tablets may be chewed before being swallowed or may be swallowed whole. Tablets intended for veterinary use only are so labeled. When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS** (11)  
 USP Amoxicillin RS  
 USP Clavulanate Lithium RS

### Amoxicillin Intramammary Infusion

» Amoxicillin Intramammary Infusion is a suspension of Amoxicillin in a suitable vegetable oil vehicle. It contains not less than 90.0 percent and not more than 120.0 percent of the labeled amount of amoxicillin ( $C_{16}H_{19}N_3O_5S$ ). It contains a suitable dispersing agent and preservative.

**Packaging and storage**—Preserve in well-closed disposable syringes.

**Labeling**—Label it to indicate that it is intended for veterinary use only.

**USP Reference standards** (11)—  
 USP Amoxicillin RS

**Identification**—Transfer a quantity of Intramammary Infusion, equivalent to about 60 mg of amoxicillin, to a 50-mL centrifuge tube, add 25 mL of toluene, mix, and centrifuge. Decant and discard the toluene. Wash the residue with four 25-mL portions of toluene, sonicating for about 30 seconds after each addition of toluene. Dry the residue in vacuum over silica gel. Add 15 mL of 0.1 N hydrochloric acid to the residue, and mix. The solution obtained responds to the *Identification* test under *Amoxicillin Capsules*.

**Water**, *Method I* (921): not more than 1.0%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

**Assay**—Proceed as directed for amoxicillin under *Antibiotics—Microbial Assays* (81). Expel the contents of 1 syringe of Intramammary Infusion into a high-speed glass blender jar containing 499.0 mL of Buffer No. 3 and 1.0 mL of polysorbate 80, and blend for 3 to 5 minutes. Allow to stand for about 10 minutes, and dilute an accurately measured volume of the aqueous phase quantitatively and stepwise with Buffer No. 3 to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

## Amoxicillin for Injectable Suspension

» Amoxicillin for Injectable Suspension is a sterile mixture of Amoxicillin and one or more suitable buffers, preservatives, stabilizers, and suspending agents. It contains not less than 90.0 percent and not more than 120.0 percent of the labeled amount of amoxicillin ( $C_{16}H_{19}N_3O_5S$ ).

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* (1).

**Labeling**—Label it to indicate that it is for veterinary use only.

**USP Reference standards** (11)—

USP Amoxicillin RS

USP Endotoxin RS

**Identification**—Prepare a test solution containing the equivalent of 4 mg of amoxicillin per mL by adding 0.1 N hydrochloric acid to Amoxicillin for Injectable Suspension. Allow the solution to stand for 5 minutes before use: the solution responds to the *Identification* test under *Amoxicillin Capsules*.

**Bacterial endotoxins** (85)—It contains not more than 0.25 Endotoxin Unit per mg of amoxicillin.

**Sterility** (71)—It meets the requirements when tested as directed in the section *Direct Inoculation of the Culture Medium* under *Test for Sterility of the Product to be Examined*, except to use Fluid Thioglycollate Medium containing polysorbate 80 solution (1 in 200) and an amount of sterile penicillinase sufficient to inactivate the amoxicillin in each tube, to use Soybean–Casein Digest Medium containing polysorbate 80 solution (1 in 200) and an amount of sterile penicillinase sufficient to inactivate the amoxicillin in each tube, and to shake the tubes once daily.

**pH** (791): between 5.0 and 7.0, in the suspension constituted as directed in the labeling.

**Water, Method I** (921): between 11.0% and 14.0%.

**Assay**—

*Diluent, Mobile phase, Standard preparation, and Chromatographic system*—Prepare as directed in the *Assay* under *Amoxicillin*.

*Assay preparation 1* (where it is represented as being in a single-dose container)—Constitute Amoxicillin for Injectable Suspension as directed in the labeling. Withdraw all of the withdrawable contents, using a hypodermic needle and syringe, and quantitatively dilute with *Diluent* to obtain a solution containing about 1 mg of anhydrous amoxicillin per mL. Pass a portion of this solution through a suitable filter of 1- $\mu$ m or finer porosity, and use the filtrate as *Assay preparation 1*. Use this solution within 6 hours.

*Assay preparation 2* (where the label states the quantity of amoxicillin in a given volume of constituted suspension)—Constitute Amoxicillin for Injectable Suspension as directed in the labeling. Quantitatively dilute an accurately measured volume of the constituted suspension with *Diluent* to obtain a solution containing about 1 mg of anhydrous

amoxicillin per mL. Pass a portion of this solution through a suitable filter of 1- $\mu$ m or finer porosity, and use the filtrate as *Assay preparation 2*. Use this solution within 6 hours.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Amoxicillin*. Calculate the quantity, in mg, of amoxicillin ( $C_{16}H_{19}N_3O_5S$ ) in the container, or in the portion of constituted Suspension taken by the formula:

$$(L / D)(CP / 1000)(r_U / r_S)$$

in which *L* is the labeled quantity, in mg, of anhydrous amoxicillin in the container, or in the volume of constituted suspension taken; *D* is the concentration, in mg of anhydrous amoxicillin per mL, of *Assay preparation 1* or of *Assay preparation 2* on the basis of the labeled quantity in the container or in the portion of constituted suspension taken, respectively, and the extent of dilution; and the other terms are as defined therein.

## Amoxicillin Oral Suspension

» Amoxicillin Oral Suspension is a suspension of Amoxicillin in Soybean Oil. It contains not less than 90.0 percent and not more than 120.0 percent of the labeled amount of amoxicillin ( $C_{16}H_{19}N_3O_5S$ ).

**Packaging and storage**—Preserve in multiple-dose containers equipped with a suitable dosing pump.

**Labeling**—Label it to indicate that it is for veterinary use only.

**USP Reference standards** (11)—

USP Amoxicillin RS

**Identification**—Shake a portion of Oral Suspension with a mixture of acetone and 0.1 N hydrochloric acid (4:1) to obtain a solution containing about 1 mg of amoxicillin per mL. The solution responds to the *Identification* test under *Amoxicillin Capsules*.

**Water, Method I** (921): not more than 2.0%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

**Assay**—

*Standard preparation*—Prepare as directed for *Standard Preparation* under *Iodometric Assay—Antibiotics* (425), using USP Amoxicillin RS.

*Assay preparation*—Using the dosing pump, deliver a number of doses of Oral Suspension, equivalent to about 250 mg of amoxicillin, to a separator containing 100 mL of hexanes, and shake vigorously. Add 140 mL of water, and shake for 5 minutes. Allow the layers to separate, and drain the lower, aqueous layer into a 250-mL volumetric flask. Repeat the extraction with two 50-mL portions of water. Combine the aqueous extracts in the volumetric flask, dilute with water to volume, and mix.

*Procedure*—Proceed with Oral Suspension as directed for *Procedure* under *Iodometric Assay—Antibiotics* (425), using USP Amoxicillin RS. Calculate the quantity, in mg, of amoxicillin ( $C_{16}H_{19}N_3O_5S$ ) in each dose of Oral Suspension taken by the formula:

$$(250 / N)(F / 2000)(B - I)$$

in which *N* is the number of doses taken, and the other terms are as defined therein.

## Amoxicillin for Oral Suspension

### DEFINITION

Amoxicillin for Oral Suspension contains the equivalent of NLT 90.0% and NMT 120.0% of the labeled amount of amoxicillin ( $C_{16}H_{19}N_3O_5S$ ). It contains one or more suitable buffers, colors, flavors, preservatives, stabilizers, sweeteners, and suspending agents.

### IDENTIFICATION

- The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

**Buffer:** Dissolve 6.8 g/L of monobasic potassium phosphate in water. Adjust with a 45% (w/w) solution of potassium hydroxide to a pH of  $5.0 \pm 0.1$ .

**Mobile phase:** Acetonitrile and *Buffer* (1:24)

**Standard solution:** 1.2 mg/mL of USP Amoxicillin RS in *Buffer*. [NOTE—Use this solution within 6 h.]

**Sample solution:** Dilute a measured volume of Amoxicillin for Oral Suspension, constituted as directed in the labeling, freshly mixed and free from air bubbles, quantitatively and stepwise in *Buffer* to obtain a solution containing nominally 1 mg/mL of anhydrous amoxicillin. Pass a portion of this solution through a suitable filter. [NOTE—Use this solution within 6 h.]

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 230 nm

**Column:** 4-mm  $\times$  25-cm; 10- $\mu$ m packing L1

**Flow rate:** 1.5 mL/min

**Injection size:** 10  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 2.5

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{16}H_{19}N_3O_5S$  in the Amoxicillin for Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Amoxicillin RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of anhydrous amoxicillin in the *Sample solution* (mg/mL)

$P$  = potency of amoxicillin in USP Amoxicillin RS ( $\mu$ g/mg)

$F$  = conversion factor, 0.001 mg/ $\mu$ g

**Acceptance criteria:** 90.0%–120.0%

### PERFORMANCE TESTS

#### UNIFORMITY OF DOSAGE UNITS (905)

- For solids packaged in single-unit containers: Meets the requirements

- DELIVERABLE VOLUME** (698): Meets the requirements

### SPECIFIC TESTS

- PH** (791): 5.0–7.5, in the suspension constituted as directed in the labeling

- MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total aerobic microbial count does not exceed  $10^3$  cfu/g, and the total combined molds and yeasts count does not exceed  $10^2$  cfu/g.

### ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- USP REFERENCE STANDARDS** (11)  
USP Amoxicillin RS

## Amoxicillin Tablets

### DEFINITION

Amoxicillin Tablets contain NLT 90.0% and NMT 120.0% of the labeled amount of amoxicillin ( $C_{16}H_{19}N_3O_5S$ ).

### IDENTIFICATION

- A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

**Buffer:** 6.8 g/L of monobasic potassium phosphate in water. Adjust with a 45% (w/w) solution of potassium hydroxide to a pH of  $5.0 \pm 0.1$ .

**Mobile phase:** Acetonitrile and *Buffer* (1:24)

**Standard solution:** 1.2 mg/mL of USP Amoxicillin RS in *Buffer*. [NOTE—Use this solution within 6 h.]

**Sample solution:** Place NLT 5 Tablets in a high-speed glass blender jar containing *Buffer* sufficient to yield a concentration of 1 mg/mL of anhydrous amoxicillin. Blend for  $4 \pm 1$  min, allow to stand for 5 min, and centrifuge a portion of the mixture. [NOTE—Where the volume of *Buffer* required would exceed 500 mL, place 5 Tablets in a volumetric flask of such capacity that when finally diluted to volume, a concentration of 1 mg of anhydrous amoxicillin per mL would be obtained. Add a volume of *Buffer* equivalent to three-fourths of the capacity of the volumetric flask, and sonicate for 5 min. Dilute with *Buffer* to volume, add a magnetic stirring bar, and stir for 30 min. Centrifuge a portion of this solution.]

Pass a portion of the clear supernatant through a suitable filter. [NOTE—Use this solution within 6 h.]

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 230 nm

**Column:** 4-mm  $\times$  25-cm; 10- $\mu$ m packing L1

**Flow rate:** 1.5 mL/min

**Injection size:** 10  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 2.5

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{16}H_{19}N_3O_5S$  in each Tablet taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

$r_U$  = peak response of amoxicillin from the *Sample solution*

$r_S$  = peak response of amoxicillin from the *Standard solution*

$C_S$  = concentration of USP Amoxicillin RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of amoxicillin in the *Sample solution* (mg/mL)

$P$  = potency of amoxicillin in USP Amoxicillin RS ( $\mu$ g/mg)

$F$  = conversion factor, 0.001 mg/ $\mu$ g

**Acceptance criteria:** 90.0%–120.0%

**PERFORMANCE TESTS**• **DISSOLUTION** <711>**Medium:** Water; 900 mL**Apparatus 2:** 75 rpm**Time:** 30 minDetermine the amount of  $C_{16}H_{19}N_3O_5S$  dissolved by using the following method.**Buffer:** 27.2 g of monobasic potassium phosphate in 3 L of water. Adjust with a 45% (w/w) solution of potassium hydroxide to a pH of  $5.0 \pm 0.1$ . Dilute with water to obtain 4 L of solution.**Mobile phase:** Acetonitrile and *Buffer* (1:39)**Standard solution:** 0.05 mg/mL of USP Amoxicillin RS in *Buffer*. [NOTE—Use this solution within 6 h.]**Sample solution:** Pass a portion of the sample through a suitable filter of 0.5- $\mu$ m pore size. Quantitatively dilute a volume of the filtrate with water to obtain an estimated concentration of 0.045 mg/mL of amoxicillin. Use this solution within 6 h.**Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** UV 230 nm**Column****Analytical:** 3.9-mm  $\times$  30-cm; packing L1**Guard:** 2-mm  $\times$  2-cm; packing L2**Column temperature:** The analytical column is maintained at a constant temperature of  $40 \pm 1^\circ$ .**Flow rate:** 0.7 mL/min**Injection size:** 10  $\mu$ L**System suitability****Sample:** *Standard solution***Suitability requirements****Capacity factor:** 1.1–2.8**Column efficiency:** NLT 1700 theoretical plates**Tailing factor:** NMT 2.5**Relative standard deviation:** NMT 1.5%**Analysis****Samples:** *Standard solution* and *Sample solution*Calculate the percentage of  $C_{16}H_{19}N_3O_5S$  dissolved:

**Amphetamine Sulfate**

---

(C<sub>9</sub>H<sub>13</sub>N)<sub>2</sub> · H<sub>2</sub>SO<sub>4</sub> 368.49  
 Benzeneethanamine, α-methyl-, sulfate (2:1), (±)-;  
 (±)-α-Methylphenethylamine sulfate (2:1) [60-13-9].

**DEFINITION**

Amphetamine Sulfate contains NLT 98.0% and NMT 102.0% of (C<sub>9</sub>H<sub>13</sub>N)<sub>2</sub> · H<sub>2</sub>SO<sub>4</sub> on the dried basis.

**IDENTIFICATION**

- **A. INFRARED ABSORPTION** <197M>
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **C. IDENTIFICATION TESTS—GENERAL, Sulfate** <191>: Meets the requirements  
 Sample solution: 100 mg/mL

**ASSAY****PROCEDURE**

**Solution A:** Add 5.0 mL of trifluoroacetic acid to 900 mL of water, adjust with ammonium hydroxide to a pH of 2.2 ± 0.1, and add 100 mL of acetonitrile.

**Solution B:** Use degassed acetonitrile.  
**Mobile phase:** See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	100	0
15	65	35
20	0	100
22	0	100
23	100	0
30	100	0

**Standard solution:** 2.0 mg/mL of USP Dextroamphetamine Sulfate RS in *Solution A*

**System suitability solution:** Transfer 40 mL of the *Standard solution* to a 50-mL volumetric flask. Using a microliter syringe, add 1 µL each of USP Dextroamphetamine Related Compound A RS and USP Dextroamphetamine Related Compound B RS. Dilute with *Standard solution* to volume, and mix.

**Sample solution:** 2.0 mg/mL of Amphetamine Sulfate in *Solution A*

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 257 nm

**Column:** 4.6-mm × 15-cm; 5-µm packing L1

**Column temperature:** 40°

**Flow rate:** 1.5 mL/min

**Injection size:** 20 µL

#### System suitability

**Samples:** *Standard solution* and *System suitability solution*

[NOTE—Identify the peaks by the relative retention times in *Impurity Table 1* under *Organic Impurities*. Amphetamine and dextroamphetamine have exactly the same retention time.]

#### Suitability requirements

**Resolution:** NLT 3.0 between dextroamphetamine related compound A and dextroamphetamine related compound B, *System suitability solution*

**Tailing factor:** NMT 3.0, *Standard solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of (C<sub>9</sub>H<sub>13</sub>N)<sub>2</sub> · H<sub>2</sub>SO<sub>4</sub> in the portion of Amphetamine Sulfate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response for amphetamine sulfate from the *Sample solution*

$r_S$  = peak response for dextroamphetamine sulfate from the *Standard solution*

$C_S$  = concentration of USP Dextroamphetamine Sulfate RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Amphetamine Sulfate in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the dried basis

#### IMPURITIES

##### Inorganic Impurities

• **RESIDUE ON IGNITION** <281>: NMT 0.2%

##### Organic Impurities

##### • PROCEDURE

*Solution A*, *Solution B*, *Mobile phase*, *System suitability solution*, *Standard solution*, *Sample solution*,

**Chromatographic system, and System suitability:** Proceed as directed in the *Assay*.

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

[NOTE—Identify the impurities by the relative retention times in *Impurity Table 1*.]

Calculate the percentage of each impurity in the portion of Amphetamine Sulfate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response for each impurity from the *Sample solution*

$r_S$  = peak response for dextroamphetamine from the *Standard solution*

$C_S$  = concentration of USP Dextroamphetamine Sulfate RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Amphetamine Sulfate in the *Sample solution* (mg/mL)

$F$  = relative response factor (see *Impurity Table 1*)

#### Acceptance criteria

**Individual impurities:** See *Impurity Table 1*.

**Total impurities:** NMT 1.0%

**Impurity Table 1**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Cathinone	0.81	55.6	0.25
Amphetamine	1.0	1.0	—
Benzaldehyde	1.73	105.3	0.25
Dextroamphetamine related compound A	1.88	1.5	0.25
Dextroamphetamine related compound B	2.05	1.8	0.25
Individual unspecified impurity	—	1.0	0.1

#### SPECIFIC TESTS

- **LOSS ON DRYING** <731>: Dry a sample at 105° for 2 h: it loses NMT 1.0% of its weight.
- **DEXTROAMPHETAMINE:** A solution (20 mg/mL) is optically inactive.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** <11>
  - USP Dextroamphetamine Sulfate RS
  - USP Dextroamphetamine Related Compound A RS
  - 1-Phenyl-2-propanol.
  - C<sub>9</sub>H<sub>12</sub>O 136.20 [CAS-14898-87-4]
  - USP Dextroamphetamine Related Compound B RS
  - Phenyl acetone.
  - C<sub>9</sub>H<sub>10</sub>O 134.18 [CAS-103-79-7]

## Amphetamine Sulfate Tablets

### DEFINITION

Amphetamine Sulfate Tablets contain NLT 93.0% and NMT 107.0% of the labeled amount of amphetamine sulfate  $[(C_9H_{13}N)_2 \cdot H_2SO_4]$ .

### IDENTIFICATION

#### • A. MELTING RANGE OR TEMPERATURE, Class I (741)

**Sample:** Macerate a quantity of powdered Tablets, equivalent to 50 mg of amphetamine sulfate, with 10 mL of water for 30 min, and filter into a small flask. To the filtrate add 3 mL of 1 N sodium hydroxide. Cool to 10°–15°, add 1 mL of a mixture of absolute ether and benzoyl chloride (2:1), insert the stopper, and shake well for 3 min. Filter the precipitate, wash with 15 mL of cold water, and recrystallize twice from diluted alcohol. Dry the residue at 80° for 2 h.

**Acceptance criteria:** The crystals of the benzoyl derivative of amphetamine melt between 131° and 135°.

#### • B. The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### • PROCEDURE

**Diluted acetic acid:** 14 mL of glacial acetic acid in 100 mL of water

**Mobile phase:** Dissolve 1.1 g of sodium 1-heptanesulfonate in 525 mL of water. Add 25 mL of diluted acetic acid and 450 mL of methanol. Adjust with glacial acetic acid to a pH of  $3.3 \pm 0.1$ . Pass through a 0.5- $\mu$ m membrane filter.

**Standard solution:** 0.3 mg/mL of USP Dextroamphetamine Sulfate RS in 0.12 N phosphoric acid

**Sample solution:** Nominally 0.3 mg/mL of amphetamine sulfate from NLT 20 finely powdered Tablets prepared as follows. Transfer a suitable amount of the powdered tablets to a suitable volumetric flask. Add 80% of the flask volume of 0.12 N phosphoric acid, and sonicate for 15 min. Dilute with 0.12 N phosphoric acid to volume. Pass through a 0.5- $\mu$ m membrane filter, discarding the first 20 mL of the filtrate.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 3.9-mm  $\times$  30-cm; 10- $\mu$ m packing L1

**Flow rate:** 2 mL/min. [NOTE—A 4.6-mm  $\times$  25-cm column; 5- $\mu$ m packing L1 may be used with a flow rate of 1 mL/min.]

**Injection size:** 50  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 3

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of amphetamine sulfate  $[(C_9H_{13}N)_2 \cdot H_2SO_4]$  in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Dextroamphetamine Sulfate RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of amphetamine sulfate in the *Sample solution* (mg/mL)

**Acceptance criteria:** 93.0%–107.0%

### PERFORMANCE TESTS

#### • DISSOLUTION, Procedure for a Pooled Sample (711)

**Medium:** Water; 500 mL

**Apparatus 1:** 100 rpm

**Time:** 45 min

**Standard solution:** USP Dextroamphetamine Sulfate RS in *Medium* having a known concentration of USP Dextroamphetamine Sulfate RS similar to the concentration expected in the sample.

**Sample solution:** Pass a portion of the solution under test through a suitable filter.

**Diluted acetic acid:** 14 mL of glacial acetic acid in 100 mL of water

**Mobile phase:** 1.1 g of sodium 1-heptanesulfonate in 575 mL of water. Add 25 mL of *Diluted acetic acid* and 400 mL of methanol. Adjust with glacial acetic acid to a pH of  $3.3 \pm 0.1$ .

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 3.9-mm  $\times$  30-cm; packing L1

**Flow rate:** 1 mL/min

**Injection size:** 500  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

**Suitability requirements**

**Relative standard deviation:** NMT 2.0%

#### Analysis

Calculate the percentage of the labeled amount of amphetamine sulfate  $[(C_9H_{13}N)_2 \cdot H_2SO_4]$  dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$L$  = label claim (mg/Tablet)

$V$  = volume of *Medium*, 500 mL

**Tolerances:** NLT 75% (Q) of amphetamine sulfate  $[(C_9H_{13}N)_2 \cdot H_2SO_4]$  is dissolved.

#### • UNIFORMITY OF DOSAGE UNITS (905): Meet the requirements

### ADDITIONAL REQUIREMENTS

#### • PACKAGING AND STORAGE: Preserve in well-closed containers.

#### • USP REFERENCE STANDARDS (11)

USP Dextroamphetamine Sulfate RS

## Amphotericin B

$C_{47}H_{73}NO_{17}$  924.08

Amphotericin B.

Amphotericin B.

[1R-(1R\*,3S\*,5R\*,6R\*,9R\*,11R\*,15S\*,16R\*,17R\*,18S\*,19E,21E,23E,25E,27E,29E,31E,33R\*,35S\*,36R\*,37S\*)]-33-[(3-Amino-3,6-dideoxy- $\beta$ -D-mannopyranosyl)oxy]-1,3,5,6,

9,11,17,37-octahydroxy-15,16,18-trimethyl-13-oxo-14,-39-dioxabicyclo[33.3.1]nonatriaconta-19,21,23,25,27,29,31-heptaene-36-carboxylic acid [1397-89-3].

» Amphotericin B has a potency of not less than 750 µg of C<sub>47</sub>H<sub>73</sub>NO<sub>17</sub> per mg, calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers, and store in a cold place.

**Labeling**—Label it to state whether it is intended for use in preparing dermatological and oral dosage forms or parenteral dosage forms.

**USP Reference standards** (11)—

USP Amphotericin B RS

USP Nystatin RS

**Identification**, *Ultraviolet Absorption* (197U)—

*Spectral range 1:* 240 to 320 nm.

*Solution 1:* prepared as directed for *Test preparation* in the *Limit of amphotericin A*, and compare its absorbance to that of the *Amphotericin B standard preparation*. An extra peak may occur at 304 nm in the spectrum of this solution.

*Spectral range 2:* 320 to 400 nm.

*Solution 2:* prepared as directed for *Test preparation* in the *Limit of amphotericin A* and then diluted with 9 volumes of methanol. Compare its absorbance to that of a similar dilution of the *Amphotericin B standard preparation*.

**Loss on drying** (731)—Dry about 100 mg, accurately weighed, in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours; it loses not more than 5.0% of its weight.

**Residue on ignition** (281): not more than 0.5%, the charred residue being moistened with 2 mL of nitric acid and 5 drops of sulfuric acid. [NOTE—Amphotericin B intended for use in preparing dermatological creams, lotions, and ointments, and oral suspensions and capsules, yields not more than 3.0%.]

**Limit of amphotericin A**—

*Test preparation*—Dissolve about 50 mg of Amphotericin B, accurately weighed, in 10.0 mL of dimethyl sulfoxide in a 50-mL volumetric flask, dilute with methanol to volume, and mix. Transfer 4.0 mL of this solution to a 50-mL volumetric flask, dilute with methanol to volume, and mix.

*Nystatin standard preparation*—Dissolve about 20 mg of USP Nystatin RS, accurately weighed, in 40.0 mL of dimethyl sulfoxide in a 200-mL volumetric flask, dilute with methanol to volume, and mix. Transfer 4.0 mL of this solution to a 50-mL volumetric flask, dilute with methanol to volume, and mix.

*Amphotericin B standard preparation*—Dissolve about 50 mg of USP Amphotericin B RS, accurately weighed, in 10.0 mL of dimethyl sulfoxide in a 50-mL volumetric flask, dilute with methanol to volume, and mix. Transfer 4.0 mL of this solution to a 50-mL volumetric flask, dilute with methanol to volume, and mix. Prepare this solution fresh daily.

*Procedure*—Concomitantly determine the absorbances of the *Nystatin* and *Amphotericin B standard preparations* and the *Test preparation* in 1-cm cells at 304 nm and at 282 nm, with a suitable spectrophotometer, using a 1 in 62.5 solution of dimethyl sulfoxide in methanol as the blank. Calculate the percentage of amphotericin A taken by the formula:

$$25W_N[(A_{B_{282}} \times A_{U_{304}}) - (A_{B_{304}} \times A_{U_{282}})] / [(A_{B_{282}} \times A_{N_{304}}) - (A_{B_{304}} \times A_{N_{282}})]W_U$$

in which  $W_N$  is the weight, in mg, of USP Nystatin RS taken,  $A_{B_{282}}$  and  $A_{B_{304}}$  are the absorbances of the *Amphotericin B standard preparation* at 282 nm and 304 nm, respectively,  $A_{N_{282}}$  and  $A_{N_{304}}$  are the absorbances of the *Nystatin standard*

*preparation* at 282 nm and 304 nm, respectively,  $A_{U_{282}}$  and  $A_{U_{304}}$  are the absorbances of the *Test preparation* at 282 nm and 304 nm, respectively, and  $W_U$  is the weight, in mg, of the Amphotericin B taken: not more than 5%, calculated on the dried basis, is found. [NOTE—Amphotericin B intended for use in preparing dermatological creams, lotions, and ointments, and oral suspensions and capsules, contains not more than 15% of amphotericin A, calculated on the dried basis.]

**Assay**—Proceed with amphotericin B as directed under *Antibiotics—Microbial Assays* (81).

## Amphotericin B Cream

» Amphotericin B Cream contains not less than 90.0 percent and not more than 125.0 percent of the labeled amount of Amphotericin B.

**Packaging and storage**—Preserve in collapsible tubes, or other well-closed containers.

**USP Reference standards** (11)—

USP Amphotericin B RS

**Minimum fill** (755): meets the requirements.

**Assay**—Proceed as directed for amphotericin B under *Antibiotics—Microbial Assays* (81), blending a suitable accurately weighed portion of Cream in a high-speed blender with a sufficient accurately measured volume of dimethyl sulfoxide to give a convenient concentration. Quantitatively dilute an accurately measured volume of this solution with dimethyl sulfoxide to obtain a stock solution having a concentration of about 20 µg of amphotericin B per mL. Quantitatively dilute an accurately measured volume of this stock solution with *Buffer No. 10* to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

## Amphotericin B for Injection

» Amphotericin B for Injection is a sterile complex of Amphotericin B and deoxycholate sodium and one or more suitable buffers. It contains not less than 90.0 percent and not more than 120.0 percent of the labeled amount of C<sub>47</sub>H<sub>73</sub>NO<sub>17</sub>.

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* (1), in a refrigerator and protected from light.

**Labeling**—Label it to indicate that it is intended for use by intravenous infusion to hospitalized patients only, and that the solution should be protected from light during administration.

**USP Reference standards** (11)—

USP Amphotericin B RS

USP Endotoxin RS

**Bacterial endotoxins** (85)—It contains not more than 5.0 USP Endotoxin Units per mg of amphotericin B. For products used or labeled for intrathecal injection, it contains not more than 0.9 USP Endotoxin Unit per mg of amphotericin B.

**Sterility** (71)—It meets the requirements when tested as directed in the section *Membrane Filtration* under *Test for Sterility of the Product to be Examined*, 50 mg from each container being tested.

**pH** (791): between 7.2 and 8.0, in an aqueous solution containing 10 mg of amphotericin B per mL.

**Loss on drying** (731)—Dry about 100 mg in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 8.0% of its weight.

**Other requirements**—It meets the requirements for *Uniformity of Dosage Units* (905) and for *Labeling under Injections* (1).

**Assay—**

*Assay preparation 1* (where it is packaged as a single-dose container)—Constitute Amphotericin B for Injection as directed in the labeling. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and dilute quantitatively and stepwise with dimethyl sulfoxide to obtain a solution containing about 20 µg of amphotericin B per mL.

*Assay preparation 2* (where the labeling states the quantity of amphotericin B in a given volume of constituted solution)—Constitute Amphotericin B for Injection as directed in the labeling. Withdraw an accurately measured volume of the resultant solution, using a suitable hypodermic needle and syringe, and dilute quantitatively and stepwise with dimethyl sulfoxide to obtain a solution containing about 20 µg of amphotericin B per mL.

*Procedure*—Proceed as directed for amphotericin B under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of *Assay preparation* diluted quantitatively and stepwise with *Buffer No. 10* to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

## Amphotericin B Lotion

» Amphotericin B Lotion contains not less than 90.0 percent and not more than 125.0 percent of the labeled amount of amphotericin B.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—  
USP Amphotericin B RS

**Minimum fill** (755): meets the requirements.

**pH** (791): between 5.0 and 7.0.

**Assay**—Proceed as directed for amphotericin B under *Antibiotics—Microbial Assays* (81), quantitatively dissolving a suitable accurately measured volume of Lotion in sufficient dimethyl sulfoxide to give a convenient concentration. Quantitatively dilute an accurately measured volume of this solution with dimethyl sulfoxide to obtain a stock solution having a concentration of about 20 µg of amphotericin B per mL. Quantitatively dilute an accurately measured volume of this stock solution with *Buffer No. 10* to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

## Amphotericin B Ointment

» Amphotericin B Ointment is Amphotericin B in a suitable ointment base. It contains not less than 90.0 percent and not more than 125.0 percent of the labeled amount of amphotericin B.

**Packaging and storage**—Preserve in collapsible tubes, or other well-closed containers.

**USP Reference standards** (11)—  
USP Amphotericin B RS

**Minimum fill** (755): meets the requirements.

**Water, Method I** (921): not more than 1.0%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

**Assay**—Proceed as directed for amphotericin B under *Antibiotics—Microbial Assays* (81), using an accurately weighed portion of Ointment, equivalent to about 30 mg of amphotericin B, mixed with 10.0 mL of ether in a suitable glass-stoppered conical flask and allowed to stand, with intermittent shaking, for 1 hour. Add 20.0 mL of dimethyl sulfoxide and shake by mechanical means for 10 minutes. Dilute quantitatively and stepwise with dimethyl sulfoxide to a concentration of approximately 20 µg per mL. Quantitatively dilute an accurately measured volume of this stock solution with *Buffer No. 10* to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

## Ampicillin

C<sub>16</sub>H<sub>19</sub>N<sub>3</sub>O<sub>4</sub>S (anhydrous) 349.40  
4-Thia-1-azabicyclo[3.2.0]heptane-2 carboxylic acid, [6-(aminophenylacetyl)amino]-3,3-dimethyl-7-oxo-,  
[2S-[2α,5α,6β(S\*)]]-;  
(2S,5R,6R)-6-[(R)-2-Amino-2-phenylacetamido]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid  
[69-53-4].  
Trihydrate 403.46  
[7177-48-2].

### DEFINITION

Ampicillin is anhydrous or contains three molecules of water of hydration. It contains NLT 900 µg and NMT 1050 µg of C<sub>16</sub>H<sub>19</sub>N<sub>3</sub>O<sub>4</sub>S per mg, calculated on the anhydrous basis.

### IDENTIFICATION

- **INFRARED ABSORPTION** (197K): Except that where the specimen under test is the trihydrate, both it and the USP Ampicillin Trihydrate RS are undried.

### ASSAY

#### • PROCEDURE

[NOTE—The *Standard solution* and the *Sample solution* should be analyzed immediately after preparation.]

**Solution A:** 6.54 mg/mL of monobasic potassium phosphate and 0.34 mg/mL of dibasic potassium phosphate, adjusted with 1 N sodium hydroxide or 1 N phosphoric acid to a pH of 5.5 before final dilution

**Solution B:** Acetonitrile and *Solution A* (2:23)

**Solution C:** Acetonitrile and *Solution A* (3:7)

**Mobile phase:** See gradient table below.

Time (min)	Solution B (%)	Solution C (%)
0	100	0
6	100	0
15	0	100
16	0	100
18	100	0
20	100	0

**Solution D:** 46.3 mg/mL of monobasic potassium phosphate and 27.8 mg/mL of dibasic potassium phosphate, adjusted with 1 N sodium hydroxide or 1 N phosphoric acid to a pH of 6.5 before final dilution

**System suitability solution:** 0.5 mg/mL of USP Ampicillin RS and 0.1 mg/mL of USP Amoxicillin RS in acetonitrile, water, and *Solution D* (4:91:5). [NOTE—Dissolve first in a mixture of acetonitrile, water, and *Solution D* (4:30:5), sonicating if necessary, and dilute with water to volume.]

**Standard solution:** 0.5 mg/mL of USP Ampicillin RS in acetonitrile, water, and *Solution D* (4:91:5). [NOTE—Dissolve first in a mixture of acetonitrile, water, and *Solution D* (4:30:5), sonicating if necessary, and dilute with water to volume.]

**Sample solution:** 0.5 mg/mL of Ampicillin in acetonitrile, water, and *Solution D* (4:91:5). [NOTE—Dissolve first in a mixture of acetonitrile, water, and *Solution D* (4:30:5), sonicating if necessary, and dilute with water to volume.]

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 230 nm

**Column:** 4.6-mm × 15-cm; 5-μm packing L1

**Flow rate:** 1.5 mL/min

**Injection size:** 20 μL

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

#### Suitability requirements

**Resolution:** NLT 10 between the ampicillin and amoxicillin peaks, *System suitability solution*

**Tailing factor:** NMT 1.4, *System suitability solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the quantity, in μg, of C<sub>16</sub>H<sub>19</sub>N<sub>3</sub>O<sub>4</sub>S in each mg of Ampicillin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Ampicillin RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of Ampicillin in the *Sample solution* (mg/mL)

$P$  = potency of USP Ampicillin RS (μg/mg)

**Acceptance criteria:** 900 μg–1050 μg on the anhydrous basis

5% of the final volume, and dilute with water to volume.]

#### System suitability

**Samples:** *Sensitivity solution*, *System suitability solution*, and *Standard solution*

#### Suitability requirements

**Signal-to-noise ratio:** NLT 3, *Sensitivity solution*

**Resolution:** NLT 10 between ampicillin and amoxicillin, *System suitability solution*

**Tailing factor:** NMT 1.4, *System suitability solution*

**Relative standard deviation:** NMT 10.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Ampicillin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_S$  = peak response of ampicillin from the *Standard solution*

$C_S$  = concentration of USP Ampicillin RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of Ampicillin in the *Sample solution* (mg/mL)

$P$  = potency of USP Ampicillin RS (μg/mg)

$F$  = conversion factor, 0.001 mg/μg

#### Acceptance criteria

**Individual impurities:** See *Impurity Table 1*.

**Total impurities:** NMT 3.0%

**Impurity Table 1**

## IMPURITIES

### Organic Impurities

#### • PROCEDURE 1

[NOTE— The *Standard solution* and the *Sample solution* should be analyzed immediately after preparation.]

**Solution A, Solution B, Solution C, Mobile phase, Solution D, System suitability solution, Sample solution, and Chromatographic system:** Prepare as directed in the *Assay*.

**Standard stock solution:** Prepare as directed for *Standard solution* in the *Assay*.

**Standard solution:** 0.005 mg/mL of ampicillin in *Solution D* and water (1:19) from *Standard stock solution*.

[NOTE—Transfer an aliquot of the *Standard stock solution* to a suitable volumetric flask, add *Solution D*, using about 5% of the final volume, dilute with water to volume.]

**Sensitivity solution:** 0.0005 mg/mL of ampicillin in *Solution D* and water (1:19) from *Standard solution*.

[NOTE—Transfer an aliquot of the *Standard solution* to a suitable volumetric flask, add *Solution D*, using about

**Impurity Table 1** (Continued)

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Ampicillin oligomer 1 (trimer) <sup>i</sup>	2.9	0.4
Any individual unspecified impurity	—	0.25

<sup>a</sup> (R)-2-Amino-2-phenylacetic acid.<sup>b</sup> (2S,5R,6R)-6-Amino-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid.<sup>c</sup> (4S)-2-[(R)-2-Amino-2-phenylacetamido](carboxy)methyl)-5,5-dimethylthiazolidine-4-carboxylic acid.<sup>d</sup> (S)-6-[(R)-2-Amino-2-phenylacetamido]-2,2-dimethyl-7-oxo-2,3,4,7-tetrahydro-1,4-thiazepine-3-carboxylic acid.<sup>e</sup> (4S)-2-(3,6-Dioxo-5-phenylpiperazin-2-yl)-5,5-dimethylthiazolidine-4-carboxylic acid.<sup>f</sup> (4S)-2-{1-[(R)-2-Amino-2-phenylacetamido]-2-[(1R)-2-(carboxy[(4S)-4-carboxy-5,5-dimethylthiazolidin-2-yl]methylamino)-2-oxo-1-phenylethylamino]-2-oxoethyl}-5,5-dimethylthiazolidine-4-carboxylic acid.<sup>g</sup> (2S,5R,6R)-6-[(R)-2-[(R)-2-Amino-2-phenylacetamido]-2-phenylacetamido]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid.<sup>h</sup> (2S,5R,6R)-6-[(2R)-2-[2-[(R)-2-Amino-2-phenylacetamido]-2-[(4S)-4-carboxy-5,5-dimethylthiazolidin-2-yl]acetamido]-2-phenylacetamido]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid.<sup>i</sup> (4S,4'S)-2,2'-[(1R,7R,13R)-1-Amino-14-[(2S,5R,6R)-2-carboxy-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptan-6-ylamino]-2,5,8,11,14-penta-oxo-1,7,13-triphenyl-3,6,9,12-tetraazatetradecane-4,10-diyl]bis(5,5-dimethylthiazolidine-4-carboxylic acid).

- **PROCEDURE 2: DIMETHYLANILINE** <223>: Meets the requirements

**SPECIFIC TESTS**

- **STERILITY TESTS** <71>: Where the label states that Ampicillin is sterile, it meets the requirements when tested as directed for *Test for Sterility of the Product to be Examined, Membrane Filtration*, except to dissolve 6 g in 800 mL of *Fluid D* containing sufficient sterile penicillinase to inactivate the ampicillin and to swirl the vessel until solution is complete before filtering.
- **CRYSTALLINITY** <695>: Meets the requirements
- **PH** <791>: 3.5–6.0  
Sample solution: 10 mg/mL
- **WATER DETERMINATION, Method I** <921>: NMT 2.0% where it is labeled as Ampicillin (anhydrous); between 12.0% and 15.0% where it is labeled as Ampicillin (tri-hydrate)
- **BACTERIAL ENDOTOXINS TEST** <85>: Where the label states that Ampicillin is sterile or must be subjected to further processing during the preparation of injectable dosage forms, it contains NMT 0.15 USP Endotoxin Unit/mg of ampicillin.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE**: Preserve in tight containers.
- **LABELING**: Label to indicate whether it is anhydrous or is the trihydrate. Where the quantity of ampicillin is indicated in the labeling of any preparation containing Ampicillin, this shall be understood to be in terms of anhydrous ampicillin (C<sub>16</sub>H<sub>19</sub>N<sub>3</sub>O<sub>4</sub>S). Where it is intended for use in preparing injectable dosage forms, the label states that it is the trihydrate and that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.
- **USP REFERENCE STANDARDS** <11>  
USP Amoxicillin RS  
USP Ampicillin RS  
USP Ampicillin Trihydrate RS  
USP Endotoxin RS

**Ampicillin Boluses**

» Ampicillin Boluses contain an amount of ampicillin (as the trihydrate) equivalent to not less than 90.0 percent and not more than 120.0 percent of the labeled amount of ampicillin (C<sub>16</sub>H<sub>19</sub>N<sub>3</sub>O<sub>4</sub>S).

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Label the Boluses to indicate that they are for veterinary use only.

**USP Reference standards** <11>—  
USP Ampicillin RS

**Identification**—Powder 1 or more Boluses, and prepare a solution containing the equivalent of 10 mg of ampicillin per mL in a mixture of acetone and 0.1 N hydrochloric acid (4:1); the resulting solution responds to the *Identification* test under *Ampicillin Capsules*.

**Uniformity of dosage units** <905>: meet the requirements.

**Loss on drying** <731>: not more than 5.0%.

**Assay—**

*Standard preparation*—Prepare as directed for *Standard Preparation* under *Iodometric Assay—Antibiotics* <425>, using USP Ampicillin RS.

*Assay preparation*—Place not fewer than 5 Boluses in a high-speed glass blender jar containing an accurately measured volume of water, and blend for 4 ± 1 minutes. Dilute an accurately measured volume of this stock solution quantitatively and stepwise with water to obtain an *Assay preparation* containing about 1.25 mg of ampicillin per mL.

*Procedure*—Proceed as directed for *Procedure* under *Iodometric Assay—Antibiotics* <425>. Calculate the quantity, in mg, of ampicillin (C<sub>16</sub>H<sub>19</sub>N<sub>3</sub>O<sub>4</sub>S) in each Bolus taken by the formula:

$$(T / D)(F / 2000)(B - I)$$

in which *T* is the labeled quantity, in mg, of ampicillin in each Bolus; and *D* is the concentration, in mg per mL, of ampicillin in the *Assay preparation* on the basis of the labeled quantity in each Bolus and the extent of dilution.

**Ampicillin Capsules**

» Ampicillin Capsules contain an amount of ampicillin (anhydrous or as the trihydrate) equivalent to not less than 90.0 percent and not more than 120.0 percent of the labeled amount of ampicillin (C<sub>16</sub>H<sub>19</sub>N<sub>3</sub>O<sub>4</sub>S).

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Label the Capsules to indicate whether the ampicillin therein is in the anhydrous form or is the trihydrate.

**USP Reference standards** <11>—  
USP Ampicillin RS

**Identification**—Prepare a solution containing about 5 mg of ampicillin per mL, using powder from Ampicillin Capsules, in a mixture of acetone and 0.1 N hydrochloric acid (4:1). Prepare a Standard solution of USP Ampicillin RS to contain 5 mg per mL in the same solvent mixture. Apply separately 2 µL of each solution on a thin-layer chromatographic plate (see *Chromatography* <621>) coated with a 0.25-mm layer of chromatographic silica gel mixture. Place

the plate in a suitable chromatographic chamber, and develop the chromatogram in a solvent system consisting of a mixture of acetone, water, toluene, and glacial acetic acid (650:100:25). When the solvent front has moved about three-fourths of the length of the plate, remove the plate from the chamber, mark the solvent front, and allow to air-dry. Locate the spots on the plate by spraying lightly with a solution of ninhydrin in alcohol containing 3 mg per mL, and dry at 90° for 15 minutes: the  $R_f$  value of the principal spot obtained from the solution under test corresponds to that obtained from the Standard solution.

**Dissolution, Procedure for a Pooled Sample** (711)—

**Medium:** water; 900 mL.

**Apparatus 1:** 100 rpm.

**Time:** 45 minutes.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Ampicillin RS in water to obtain a solution having a known concentration of about L/900 mg per mL,  $L$  being the labeled amount, in mg, of ampicillin per Capsule.

**Procedure**—Proceed as directed for *Procedure* in the section *Antibiotics—Hydroxylamine Assay under Automated Methods of Analysis* (16), using a filtered portion of the solution under test as the *Assay preparation*. Calculate the quantity, in mg, of  $C_{16}H_{19}N_3O_4S$  dissolved by the formula:

$$0.9CP(A_U / A_S).$$

**Tolerances**—Not less than 75% ( $Q$ ) of the labeled amount of  $C_{16}H_{19}N_3O_4S$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Water, Method I** (921): not more than 4.0% where the Capsules contain anhydrous Ampicillin, or between 10.0% and 15.0% where the Capsules contain Ampicillin trihydrate.

**Assay—**

**Standard preparation**—Prepare as directed for *Standard Preparation under Iodometric Assay—Antibiotics* (425), using USP Ampicillin RS.

**Assay preparation**—Place not fewer than 5 Capsules in a high-speed glass blender jar containing an accurately measured volume of water, and blend for  $4 \pm 1$  minutes. Dilute an accurately measured volume of this stock solution quantitatively and stepwise with water to obtain an *Assay preparation* containing about 1.25 mg of ampicillin per mL.

**Procedure**—Proceed as directed for *Procedure under Iodometric Assay—Antibiotics* (425). Calculate the quantity, in mg, of ampicillin ( $C_{16}H_{19}N_3O_4S$ ) in each Capsule taken by the formula:

$$(T / D)(F / 2000)(B - I)$$

in which  $T$  is the labeled quantity, in mg, of ampicillin in each Capsule; and  $D$  is the concentration, in mg per mL, of ampicillin in the *Assay preparation* on the basis of the labeled quantity in each Capsule and the extent of dilution.

## Ampicillin for Injection

### DEFINITION

Ampicillin for Injection contains an amount of Ampicillin Sodium equivalent to NLT 90.0% and NMT 115.0% of the labeled amount of ampicillin ( $C_{16}H_{19}N_3O_4S$ ).

### ASSAY

#### • PROCEDURE

**Mobile phase:** Acetonitrile, water, 1 M monobasic potassium phosphate, and 1 N acetic acid (80:909:10:1)

**Diluent:** Water, 1 M monobasic potassium phosphate, and 1 N acetic acid (989:10:1)

**Standard solution:** 1 mg/mL of USP Ampicillin RS in *Diluent*. Shake and sonicate, if necessary, to dissolve. Use this solution promptly after preparation.

**System suitability solution:** 0.12 mg/mL of caffeine in the *Standard solution*

**Sample solution 1** (where it is represented as being in a single-dose container): 1 mg/mL of ampicillin in *Diluent*. Constitute Ampicillin for Injection in a volume of *Diluent*, corresponding to the volume of solvent specified in the labeling. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and dilute with *Diluent*. Use this solution promptly after preparation.

**Sample solution 2** (where the label states the quantity of ampicillin in a given volume of constituted solution): 1 mg/mL of ampicillin in *Diluent*. Constitute 1 container of Ampicillin for Injection in a volume of *Diluent*, corresponding to the volume of solvent specified in the labeling. Dilute a suitable aliquot of the constituted solution with *Diluent*. Use this solution promptly after preparation.

### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Columns**

**Precolumn:** 4-mm  $\times$  5-cm; 5- to 10- $\mu$ m packing L1

**Analytical:** 4-mm  $\times$  30-cm; 5- to 10- $\mu$ m packing L1

**Flow rate:** 2 mL/min

**Injection volume:** 20  $\mu$ L

### System suitability

**Samples:** *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for ampicillin and caffeine are 0.5 and 1.0, respectively, *System suitability solution*.]

### Suitability requirements

**Resolution:** NLT 2.0 between caffeine and ampicillin, *System suitability solution*

**Tailing factor:** NMT 1.4, *Standard solution*

**Capacity factor:** NMT 2.5, *Standard solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

### Analysis

**Samples:** *Standard solution* and *Sample solution 1* or *Sample solution 2*

Calculate the percentage of the labeled amount of ampicillin ( $C_{16}H_{19}N_3O_4S$ ) in the container or in the volume of constituted solution taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times P \times (1 / F) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Ampicillin RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of *Sample solution 1* or *Sample solution 2* (mg/mL)

$P$  = potency of ampicillin in USP Ampicillin RS ( $\mu$ g/mg)

$F$  = conversion factor, 0.001 mg/ $\mu$ g

Where the test for *Uniformity of Dosage Units* has been performed using the *Procedure for content uniformity*, use the average of these determinations as the *Assay* value.

**Acceptance criteria:** 90.0%–115.0%

### PERFORMANCE TESTS

#### • UNIFORMITY OF DOSAGE UNITS (905)

**Procedure for content uniformity**

**Analysis:** Perform the *Assay* on individual containers using *Sample solution 1* or *Sample solution 2*, or both, as appropriate.

Acceptance criteria: Meets the requirements

#### SPECIFIC TESTS

- **CRYSTALLINITY** (695): Meets the requirements. Freeze-dried products are exempt from this requirement.
- **pH** (791)  
Sample solution: 10.0 mg/mL of ampicillin  
Acceptance criteria: 8.0–10.0
- **WATER DETERMINATION, Method I** (921): NMT 2.0%
- **PARTICULATE MATTER IN INJECTIONS** (788): Meets the requirements for small-volume injections
- **STERILITY TESTS** (71): Meets the requirements
- **BACTERIAL ENDOTOXINS TEST** (85): NMT 0.15 USP Endotoxin Units/mg of ampicillin
- **CONSTITUTED SOLUTION:** At the time of use, it meets the requirements for *Injections* (1), *Constituted Solutions*.
- **OTHER REQUIREMENTS:** It meets the requirements of the tests for *Identification* in *Ampicillin Sodium*. It also meets the requirements in *Injections* (1), *Labeling*.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve as described in *Injections* (1), *Containers for Sterile Solids*. Protect the constituted solution from freezing.
- **USP REFERENCE STANDARDS** (11)  
USP Ampicillin RS  
USP Ampicillin Sodium RS  
USP Endotoxin RS

### Ampicillin Soluble Powder

» Ampicillin Soluble Powder is a dry mixture of Ampicillin (as the trihydrate) and one or more suitable diluents and stabilizing agents. It contains not less than 90.0 percent and not more than 120.0 percent of the labeled amount of ampicillin ( $C_{16}H_{19}N_3O_4S$ ).

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Label it to indicate that it is for veterinary use only.

**USP Reference standards** (11)—  
USP Ampicillin RS

**Identification**—Dissolve a quantity of it in a mixture of acetone and 0.1 N hydrochloric acid (4:1) to obtain a solution containing 10 mg of ampicillin per mL: the resulting solution responds to the *Identification* test under *Ampicillin Capsules*.

**pH** (791): between 3.5 and 6.0, in an aqueous solution containing the equivalent of 20 mg of ampicillin per mL.

**Water, Method I** (921): not more than 5.0%.

#### Assay—

**Standard preparation**—Prepare as directed for *Standard Preparation under Iodometric Assay—Antibiotics* (425), using USP Ampicillin RS.

**Assay preparation**—Transfer an accurately weighed quantity of Soluble Powder, equivalent to about 125 mg of ampicillin, to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

**Procedure**—Proceed as directed for *Procedure under Iodometric Assay—Antibiotics* (425). Calculate the quantity, in mg, of ampicillin ( $C_{16}H_{19}N_3O_4S$ ) in the portion of Soluble Powder taken by the formula:

$$(F/20)(B - I).$$

### Ampicillin for Injectable Suspension

» Ampicillin for Injectable Suspension is a dry mixture of ampicillin trihydrate and one or more suitable buffers, preservatives, stabilizers, and suspending agents. It contains the equivalent of not less than 90.0 percent and not more than 120.0 percent of the labeled amount of ampicillin ( $C_{16}H_{19}N_3O_4S$ ).

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* (1).

**USP Reference standards** (11)—

USP Ampicillin RS  
USP Endotoxin RS

**Identification**—Dissolve a quantity in a mixture of acetone and 0.1 N hydrochloric acid (4:1) to obtain a solution containing 5 mg of ampicillin per mL: the resulting solution responds to the *Identification* test under *Ampicillin Capsules*.

**Bacterial endotoxins** (85)—It contains not more than 0.15 Endotoxin Unit per mg of ampicillin.

**pH** (791): between 5.0 and 7.0, in the suspension constituted as directed in the labeling.

**Water, Method I** (921): between 11.4% and 14.0%.

**Sterility** (71)—It meets the requirements when tested as directed for *Antibiotic Solids, Bulks, and Blends* in the section *Membrane Filtration under Test for Sterility of the Product to be Examined*, except to use *Fluid D*, to which has been added sufficient sterile penicillinase to inactivate the ampicillin and to swirl the vessel until solution is complete before filtering. If it does not dissolve completely, proceed as directed for *Solids* in the section *Direct Inoculation of the Culture Medium under Test for Sterility of the Product to be Examined*, except to use *Fluid Thioglycollate Medium* and *Soybean-Casein Digest Medium* containing sufficient penicillinase to inactivate the ampicillin in each vessel.

**Other requirements**—It meets the requirements for *Uniformity of Dosage Units* (905), and for *Labeling* under *Injections* (1).

#### Assay—

**Phosphate buffer solution**—Accurately weigh 68 g of monobasic potassium phosphate, and transfer to a 500-mL volumetric flask. Dissolve in and dilute with water to volume.

**Mobile phase**—Prepare a suitable mixture of water, acetonitrile, *Phosphate buffer solution*, and glacial acetic acid (3600:360:40:4). Pass through a 0.45- $\mu$ m nylon filter, and degas.

**Standard preparation**—Dissolve, with sonication, an accurately weighed quantity of USP Ampicillin RS in water to prepare a solution having 0.5 mg per mL. Pass through a 0.45- $\mu$ m PTFE filter, discarding the first 3 mL of the filtrate.

**Caffeine solution**—Transfer about 30 mg of caffeine, accurately weighed, to a 50-mL volumetric flask. Add 25 mL of water, sonicate to dissolve, and dilute with water to volume. Pass through a 0.45- $\mu$ m PTFE filter, discarding the first 3 mL of the filtrate.

**System suitability solution**—Prepare a solution of 1.0 mL of *Caffeine solution* and 9.0 mL of *Standard preparation*, and mix.

**Assay preparation**—Quantitatively dilute an accurately measured volume of Ampicillin for Injectable Suspension, constituted as directed in the labeling, with water to obtain a solution containing about 0.5 mg per mL. Pass through a 0.45- $\mu$ m PTFE filter, discarding the first 3 mL of the filtrate.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  30-cm analytical column that contains 10- $\mu$ m packing L1. The flow rate is about 2.0 mL per min-

ute. The column temperature is maintained at 40°. Chromatograph the *System suitability solution* and the *Standard preparation*, and record the peak responses as directed for *Procedure*: the order of elution is ampicillin followed by caffeine; the resolution,  $R$ , between ampicillin and caffeine is greater than 2; the column efficiency is not less than 2000 theoretical plates for the ampicillin peak; the tailing factor is not greater than 1.4; and the relative standard deviation for replicate injections of the *Standard preparation* is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas of the major peaks. Calculate the quantity, in mg, of ampicillin ( $C_{16}H_{19}N_3O_4S$ ) in each mL of the constituted solution of Ampicillin for Injectable Suspension taken by the formula:

$$CD(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Ampicillin RS in the *Standard preparation*;  $D$  is the dilution factor used in preparing the *Assay preparation*; and  $r_U$  and  $r_S$  are the average peak responses of the ampicillin peaks obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Ampicillin for Oral Suspension

» Ampicillin for Oral Suspension contains an amount of Ampicillin (anhydrous or as the trihydrate) equivalent to not less than 90.0 percent and not more than 120.0 percent of the labeled amount of  $C_{16}H_{19}N_3O_4S$ , when constituted as directed. It contains one or more suitable buffers, colors, flavors, preservatives, and sweetening ingredients.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Label it to indicate whether the ampicillin therein is in the anhydrous form or is the trihydrate.

**USP Reference standards** (11)—  
USP Ampicillin RS

**Identification**—Dissolve a quantity in a mixture of acetone and 0.1 N hydrochloric acid (4:1) to obtain a solution containing 5 mg of ampicillin per mL: the resulting solution responds to the *Identification* test under *Ampicillin Capsules*.

**Uniformity of dosage units** (905)—

FOR SOLID PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** (698): meets the requirements.

**pH** (791): between 5.0 and 7.5, in the suspension constituted as directed in the labeling.

**Water, Method I** (921): not more than 2.5%, or not more than 5.0% if it contains ampicillin trihydrate and contains the equivalent of 100 mg of ampicillin per mL when constituted as directed in the labeling.

**Assay**—

**Standard preparation**—Prepare as directed for *Standard Preparation* under *Iodometric Assay—Antibiotics* (425), using USP Ampicillin RS.

**Assay preparation**—Dilute an accurately measured volume of Ampicillin for Oral Suspension, constituted as directed in the labeling, freshly mixed and free from air bubbles, quantitatively and stepwise with water to obtain a solution containing about 1.25 mg of ampicillin per mL.

**Procedure**—Proceed as directed for *Procedure* under *Iodometric Assay—Antibiotics* (425). Calculate the quantity, in mg, of  $C_{16}H_{19}N_3O_4S$  in each mL of the constituted suspension prepared from Ampicillin for Oral Suspension taken by the formula:

$$(T / D)(F / 2000)(B - I)$$

in which  $T$  is the labeled quantity, in mg per mL, of ampicillin in the constituted suspension; and  $D$  is the concentration, in mg per mL, of ampicillin in the *Assay preparation* on the basis of the labeled quantity in the constituted suspension and the extent of dilution.

## Ampicillin Tablets

» Ampicillin Tablets contain an amount of Ampicillin (anhydrous form or trihydrate form) equivalent to not less than 90.0 percent and not more than 120.0 percent of the labeled amount of ampicillin ( $C_{16}H_{19}N_3O_4S$ ).

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

**Labeling**—Label the Tablets to indicate whether the ampicillin therein is in the anhydrous form or is the trihydrate. Label chewable Tablets to indicate that they are to be chewed before swallowing. Tablets intended for veterinary use only are so labeled.

**USP Reference standards** (11)—  
USP Ampicillin RS

**Identification**—Powder 1 or more Tablets, and prepare a solution containing 5 mg of ampicillin per mL in a mixture of acetone and 0.1 N hydrochloric acid (4:1): the resulting solution meets the requirements for the *Identification* test under *Ampicillin Capsules*.

**Dissolution, Procedure for a Pooled Sample** (711)—

**Medium:** water; 900 mL.

**Apparatus 1:** 100 rpm.

**Time:** 45 minutes.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Ampicillin RS in water to obtain a solution having a known concentration of about  $L/900$  mg per mL,  $L$  being the labeled amount, in mg, of ampicillin per Tablet.

**Procedure**—Proceed as directed for *Procedure* in the section *Antibiotics—Hydroxylamine Assay* under *Automated Methods of Analysis* (16), using a filtered portion of the solution under test as the *Assay preparation*. Calculate the quantity, in mg, of  $C_{16}H_{19}N_3O_4S$  dissolved by the formula:

$$0.9CP(A_U / A_S).$$

**Tolerances**—Not less than 75% ( $Q$ ) of the labeled amount of  $C_{16}H_{19}N_3O_4S$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Water, Method I** (921): not more than 4.0% where nonchewable Tablets contain anhydrous Ampicillin; between 9.5% and 12.0% where nonchewable Tablets contain Ampicillin trihydrate; not more than 3.0% where chewable Tablets contain anhydrous Ampicillin; not more than 5.0% where chewable Tablets contain Ampicillin trihydrate; and not more than 13.0% where Tablets are labeled for veterinary use only and contain Ampicillin trihydrate.

**Assay—**

*Standard preparation*—Prepare as directed for *Standard Preparation* under *Iodometric Assay—Antibiotics* (425), using USP Ampicillin RS.

*Assay preparation*—Place not fewer than 5 Tablets in a high-speed glass blender jar containing an accurately measured volume of water, and blend for  $4 \pm 1$  minutes. Dilute an accurately measured volume of this stock solution with water to obtain an *Assay preparation* containing about 1.25 mg of ampicillin per mL.

*Procedure*—Proceed as directed for *Procedure* under *Iodometric Assay—Antibiotics* (425). Calculate the quantity, in mg, of ampicillin ( $C_{16}H_{19}N_3O_4S$ ) in each Tablet taken by the formula:

$$(T/D)(F/2000)(B - I)$$

in which  $T$  is the labeled quantity, in mg, of ampicillin in each Tablet; and  $D$  is the concentration, in mg per mL, of ampicillin in the *Assay preparation* on the basis of the labeled quantity in each Tablet and the extent of dilution.

## Ampicillin and Probenecid for Oral Suspension

» Ampicillin and Probenecid for Oral Suspension contains an amount of Ampicillin (as the trihydrate) equivalent to not less than 90.0 percent and not more than 120.0 percent of the labeled amount of ampicillin ( $C_{16}H_{19}N_3O_4S$ ) and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of probenecid ( $C_{13}H_{19}NO_4S$ ). It contains one or more suitable colors, flavors, and suspending agents.

**Packaging and storage**—Preserve in tight, unit-dose containers.

**USP Reference standards** (11)—

USP Ampicillin RS  
USP Probenecid RS

**Uniformity of dosage units** (905)—

FOR SOLID PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements for *Content Uniformity* with respect to ampicillin and probenecid.

**Deliverable volume** (698): meets the requirements.

**pH** (791): between 5.0 and 7.5, in the suspension constituted as directed in the labeling.

**Water, Method I** (921): not more than 5.0%.

**Assay for ampicillin—**

*Standard preparation*—Prepare as directed for *Standard Preparation* under *Iodometric Assay—Antibiotics* (425), using USP Ampicillin RS.

*Assay preparation*—Constitute Ampicillin and Probenecid for Oral Suspension as directed in the labeling, and mix. Transfer the resulting suspension to a high-speed glass blender jar containing sufficient water to make 500.0 mL, and blend for about 10 minutes. Quantitatively dilute an accurately measured volume of this stock solution with water to obtain an *Assay preparation* containing about 1.25 mg of ampicillin per mL.

*Procedure*—Proceed as directed for *Procedure* under *Iodometric Assay—Antibiotics* (425). Calculate the quantity, in

mg, of ampicillin ( $C_{16}H_{19}N_3O_4S$ ) in the Ampicillin and Probenecid for Oral Suspension taken by the formula:

$$(L/D)(F/2000)(B - I)$$

in which  $L$  is the labeled quantity, in mg, of ampicillin in the Ampicillin and Probenecid for Oral Suspension; and  $D$  is the concentration, in mg per mL, of ampicillin in the *Assay preparation* on the basis of the labeled quantity in the Ampicillin and Probenecid for Oral Suspension and the extent of dilution.

**Assay for probenecid—**

*Standard preparation*—Dissolve an accurately weighed portion of USP Probenecid RS in sodium carbonate solution (1 in 100) to obtain a solution having a known concentration of about 1 mg per mL.

*Assay preparation*—Constitute Ampicillin and Probenecid for Oral Suspension as directed in the labeling, and mix. Quantitatively dilute the resulting suspension with sodium carbonate solution (1 in 100) to obtain a solution containing about 1 mg of probenecid per mL, mix, and filter.

*Procedure*—Transfer 2.0 mL of the clear *Assay preparation* to a 125-mL separator, and add 8.0 mL of 1.0 N hydrochloric acid. Extract this solution with four 20-mL portions of chloroform, filtering each extract through a glass wool pledget and 6 g of chloroform-washed anhydrous sodium sulfate into a 100-mL volumetric flask. Wash the pledget and the sodium sulfate with chloroform, collecting the washings in the 100-mL volumetric flask, dilute with chloroform to volume, and mix. Treat 2.0 mL of the *Standard preparation* in the same manner. Concomitantly determine the absorbances of the solutions from the *Assay preparation* and the *Standard preparation* at the wavelength of maximum absorbance at about 257 nm, with a suitable spectrophotometer, using chloroform washed with sodium carbonate solution (1 in 100) as the blank. Calculate the quantity, in mg, of probenecid ( $C_{13}H_{19}NO_4S$ ) in the Ampicillin and Probenecid for Oral Suspension taken by the formula:

$$C(L/D)(A_U/A_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Probenecid RS in the *Standard preparation*;  $L$  is the labeled quantity, in mg, of probenecid in the Ampicillin and Probenecid for Oral Suspension;  $D$  is the concentration, in mg per mL, of probenecid in the *Assay preparation* on the basis of the labeled quantity in the Ampicillin and Probenecid for Oral Suspension and the extent of dilution; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

## Ampicillin Sodium

$C_{16}H_{18}N_3NaO_4S$  371.39  
4-Thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid, [6-(aminophenylacetyl)amino]-3,3-dimethyl-7-oxo-, monosodium salt, [2S-[2 $\alpha$ ,5 $\alpha$ ,6 $\beta$ (S\*)]]-;  
Monosodium *D*-(-)-6-(2-amino-2-phenylacetamido)-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate [69-52-3].

**DEFINITION**

Ampicillin Sodium has a potency equivalent to NLT 845  $\mu$ g and NMT 988  $\mu$ g of ampicillin ( $C_{16}H_{19}N_3O_4S$ ) per mg, calculated on the anhydrous basis.

**IDENTIFICATION**

- **A. INFRARED ABSORPTION** <197M>
- **B. IDENTIFICATION TESTS—GENERAL**, Sodium <191>

**ASSAY**• **PROCEDURE**

**Diluent:** Water, 1 M monobasic potassium phosphate, and 1 N acetic acid (989:10:1)

**Mobile phase:** Acetonitrile, water, 1 M monobasic potassium phosphate, and 1 N acetic acid (80:909:10:1)

**Standard solution:** 1 mg/mL of USP Ampicillin RS in *Diluent* using shaking and sonication, if necessary, to dissolve. Use this solution promptly after preparation.

**System suitability solution:** 0.12 mg/mL of caffeine in *Standard solution*

**Sample solution:** [NOTE—Ampicillin Sodium is hygroscopic. Minimize exposure to the atmosphere, and weigh promptly.] Equivalent to 1 mg/mL of anhydrous ampicillin in *Diluent*. [NOTE—Use this solution promptly after preparation.]

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column**

**Pre-column:** 4-mm × 5-cm; 5- to 10-μm packing L1

**Analytical column:** 4-mm × 30-cm; 5- to 10-μm packing L1

**Flow rate:** 2 mL/min

**Injection size:** 20 μL

**System suitability**

**Samples:** *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for ampicillin and caffeine are 0.5 and 1.0, respectively, *System suitability solution*.]

**Suitability requirements**

**Resolution:** NLT 2.0 between the caffeine and the ampicillin peaks, *System suitability solution*

**Tailing factor:** NMT 1.4, *Standard solution*

**Capacity factor:** NMT 2.5, *Standard solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
Calculate the quantity, in μg, of C<sub>16</sub>H<sub>19</sub>N<sub>3</sub>O<sub>4</sub>S in each mg of Ampicillin Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Ampicillin RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of Ampicillin Sodium in the *Sample solution* (mg/mL)

$P$  = potency of USP Ampicillin RS (μg/mg)

**Acceptance criteria:** 845–988 μg/mg on the anhydrous basis

**IMPURITIES****Organic Impurities**• **PROCEDURE 1: LIMIT OF METHYLENE CHLORIDE**

**Internal standard solution:** 2.1 mg/mL of dioxane in dimethyl sulfoxide

**Standard solution:** 0.33 mg/mL of methylene chloride in *Internal standard solution*

**Sample solution:** 166.7 mg/mL of Ampicillin Sodium in *Internal standard solution*

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 1.8-m × 4-mm glass column packed with a 10% phase G39 on unsilanized support S1A

**Temperature**

**Column:** 65°

**Injector:** 100°

**Detector block:** 260°

**Carrier gas:** Nitrogen

**Flow rate:** 60 mL/min

**Injection size:** 1 μL

**System suitability**

**Sample:** *Standard solution*

[NOTE— The relative retention times for methylene chloride and dioxane are 0.5 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 4 between methylene chloride and dioxane

**Relative standard deviation:** NMT 5%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of methylene chloride in the portion of Ampicillin Sodium taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratio of methylene chloride to dioxane from the *Sample solution*

$R_S$  = peak response ratio of methylene chloride to dioxane from the *Standard solution*

$C_S$  = concentration of methylene chloride in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of Ampicillin Sodium in the *Sample solution* (mg/mL)

**Acceptance criteria:** NMT 0.2%.

- **PROCEDURE 2: DIMETHYLANILINE** <223>: Meets the requirement

**SPECIFIC TESTS**

- **CRYSTALLINITY** <695>: Meets the requirements. [NOTE— Ampicillin Sodium in the freeze-dried form is exempt from this requirement.]
- **PH** <791>: 8.0–10.0  
**Sample solution:** 10.0 mg/mL
- **WATER DETERMINATION, Method I** <921>: NMT 2.0%
- **STERILITY TESTS** <71>: Where the label states that Ampicillin Sodium is sterile, it meets the requirements.
- **BACTERIAL ENDOTOXINS TEST** <85>: Where the label states that Ampicillin Sodium is sterile or the label states that Ampicillin Sodium must be subjected to further processing during the processing of injectable dosage forms, it contains NMT 0.15 USP Endotoxin Unit/mg of ampicillin.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.
- **USP REFERENCE STANDARDS** <11>  
USP Ampicillin RS  
USP Ampicillin Sodium RS  
USP Endotoxin RS

**Ampicillin and Sulbactam for Injection**

» Ampicillin and Sulbactam for Injection is a sterile, dry mixture of Ampicillin Sodium and Sulbactam Sodium. It contains the equivalent of not less than 90.0 percent and not more than 115.0 percent of the labeled amounts of ampicillin (C<sub>16</sub>H<sub>19</sub>N<sub>3</sub>O<sub>4</sub>S) and sulbactam (C<sub>8</sub>H<sub>11</sub>NO<sub>5</sub>S), the labeled amounts representing proportions of ampicillin to sulbactam of 2:1. It contains not

less than 563 µg of ampicillin and 280 µg of sulbactam per mg, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* (1).

**USP Reference standards** (11)—

USP Ampicillin RS

USP Endotoxin RS

USP Sulbactam RS

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* (1).

**Identification**—The retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Bacterial endotoxins** (85)—It contains not more than 0.17 USP Endotoxin Unit in a portion equivalent to 1 mg of a mixture of ampicillin and sulbactam (0.67 and 0.33 mg, respectively).

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** (791): between 8.0 and 10.0, in a solution containing 10 mg of ampicillin and 5 mg of sulbactam per mL.

**Water, Method I** (921): not more than 2.0%.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Other requirements**—It meets the requirements for *Uniformity of Dosage Units* (905) and for *Labeling* under *Injections* (1).

**Assay**—

*0.005 M Tetrabutylammonium hydroxide*—Dilute 6.6 mL of a 40% solution of tetrabutylammonium hydroxide with water to obtain 1800 mL of solution. Adjust with 1 M phosphoric acid to a pH of  $5.0 \pm 0.1$ , dilute with water to 2000 mL, and mix.

*Mobile phase*—Prepare a filtered and degassed mixture of 0.005 M Tetrabutylammonium hydroxide and acetonitrile (1650:350). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Quantitatively dissolve accurately weighed quantities of USP Ampicillin RS and USP Sulbactam RS in *Mobile phase* to obtain a solution having known concentrations of about 0.6 mg of ampicillin per mL and 0.3 mg of sulbactam per mL. [NOTE—Inject this solution promptly.]

*Resolution solution*—Prepare a solution of USP Sulbactam RS in 0.01 N sodium hydroxide containing 0.3 mg per mL, and allow to stand for 30 minutes. Adjust with phosphoric acid to a pH of  $5.0 \pm 0.1$ . Transfer 5 mL of the solution to a 25-mL volumetric flask, add 4.25 mL of acetonitrile, dilute with 0.005 M Tetrabutylammonium hydroxide to volume, and mix. Transfer 1 mL of this solution to a second 25-mL volumetric flask, add 15 mg of USP Ampicillin RS, dilute with *Mobile phase* to volume, and mix. [NOTE—Inject this solution promptly.]

*Assay preparation 1*—Mix the contents of a container of Ampicillin and Sulbactam for Injection. Quantitatively dissolve an accurately weighed portion of the powder in *Mobile phase* to obtain a solution having a concentration of about 1 mg of the powder per mL. [NOTE—Inject this solution promptly.]

*Assay preparation 2* (where it is represented as being in a single-dose container)—Constitute a container of Ampicillin and Sulbactam for Injection with a volume of water, accurately measured, corresponding to the volume of solvent

specified in the labeling. Withdraw the total withdrawable contents from the container, using a suitable hypodermic needle and syringe, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution containing about 0.6 mg of ampicillin per mL and 0.3 mg of sulbactam per mL. [NOTE—Inject this solution promptly.]

*Assay preparation 3* (where the label states the quantities of ampicillin and sulbactam in a given volume of constituted solution)—Constitute a container of Ampicillin and Sulbactam for Injection with a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Dilute an accurately measured volume of the constituted solution quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution containing about 0.6 mg of ampicillin per mL and 0.3 mg of sulbactam per mL. [NOTE—Inject this solution promptly.]

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 230-nm detector and a 4-mm  $\times$  30-cm column containing packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Resolution solution*, and record the responses as directed for *Procedure*: the relative retention times are about 0.7 for ampicillin and 1.0 for sulbactam alkaline degradation product; and the resolution,  $R$ , between ampicillin and sulbactam alkaline degradation product is not less than 4.0. Chromatograph the *Standard preparation*, and record the responses as directed for *Procedure*: the relative retention times are about 0.35 for ampicillin and 1.0 for sulbactam; the column efficiency determined from the sulbactam peak is not less than 3500 theoretical plates; the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the appropriate *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantities, in µg, of ampicillin ( $C_{16}H_{19}N_3O_4S$ ) and of sulbactam ( $C_8H_{11}NO_5S$ ) in the portion of Ampicillin and Sulbactam for Injection taken by the same formula:

$$(C_S P / C_U)(r_U / r_S)$$

in which  $C_S$  is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard preparation*;  $P$  is the assigned content, in µg per mg, of the appropriate USP Reference Standard;  $C_U$  is the concentration, in mg per mL, of Ampicillin and Sulbactam for Injection in *Assay preparation 1*, based on the weight, in mg, of powder removed from the container and the extent of dilution; and  $r_U$  and  $r_S$  are the peak areas for the appropriate analyte obtained from *Assay preparation 1* and the *Standard preparation*, respectively. Calculate the quantities of ampicillin ( $C_{16}H_{19}N_3O_4S$ ) and of sulbactam ( $C_8H_{11}NO_5S$ ) withdrawn from the container, or in the volume of constituted solution taken by the same formula:

$$(L / D)(C_S P)(r_U / r_S)$$

in which  $L$  is the labeled quantity, in mg, of ampicillin or sulbactam, as appropriate, in the container or in the volume of constituted solution taken;  $D$  is the concentration, in mg per mL, of ampicillin or sulbactam in *Assay preparation 2* or *Assay preparation 3*, on the basis of the labeled quantity, in mg, of ampicillin or sulbactam, as appropriate, in the container and the extent of dilution;  $r_U$  and  $r_S$  are the peak areas for the appropriate analyte obtained from *Assay preparation 2* or *Assay preparation 3* and the *Standard preparation*, respectively; and the other terms are as defined above.

## Amprolium

$C_{14}H_{19}ClN_4 \cdot HCl$  315.24

1-[(4-Amino-2-propyl-5-pyrimidinyl)methyl]-2-methylpyridinium chloride monohydrochloride.

1-[(4-Amino-2-propyl-5-pyrimidinyl)methyl]-2-picolinium chloride monohydrochloride [137-88-2].

» Amprolium contains not less than 97.0 percent and not more than 101.0 percent of amprolium ( $C_{14}H_{19}ClN_4 \cdot HCl$ ), calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—Label it to indicate that it is for veterinary use only.

**USP Reference standards** (11)—

USP Amprolium RS

**Identification**—

**A:** *Infrared Absorption* (197K): previously dried.

**B:** *Ultraviolet Absorption* (197U)—

*Solution:* 10 µg per mL.

*Medium:* 0.1 N hydrochloric acid.

Absorptivities at 246 nm, calculated on the dried basis, do not differ by more than 3.0%.

**Loss on drying** (731)—Dry it at a pressure not exceeding 5 mm of mercury at 100° for 3 hours: it loses not more than 1.0% of its weight.

**Assay**—

*Diluent*—Prepare a mixture of 500 mL of water, 450 mL of methanol, and 50 mL of acetonitrile.

*Mobile phase*—Dissolve 6 g of sodium 1-heptanesulfonate in 500 mL of water, add 12 mL of glacial acetic acid, 2.0 mL of triethylamine, 450 mL of methanol, and 50 mL of acetonitrile, and mix. Pass through a suitable filter of 0.5 µm or finer porosity. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Amprolium RS in *Diluent* to obtain a solution having a known concentration of about 0.5 mg per mL.

*Assay preparation*—Transfer about 50 mg of Amprolium, accurately weighed, to a 100-mL volumetric flask, add *Diluent* to volume, and mix.

*Resolution solution*—Prepare a solution in *Diluent* containing about 0.5 mg of USP Amprolium RS and 0.2 mg of 2-picoline per mL.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column containing packing L13. The flow rate is about 0.6 mL per minute. Chromatograph the *Resolution solution*, and record the responses as directed for *Procedure*: the resolution,  $R$ , between amprolium and 2-picoline is not less than 7; the column efficiency determined from the amprolium peak is not less than 6500 theoretical plates; the tailing factor for the analyte peak is not more than 2.3; and the relative standard deviation of the amprolium responses for replicate injections is not more than 1.0%.

*Procedure*—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and meas-

ure the areas for the major peaks. Calculate the quantity, in mg, of amprolium ( $C_{14}H_{19}ClN_4 \cdot HCl$ ) in the portion of Amprolium taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Amprolium RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the amprolium peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Amprolium Soluble Powder

» Amprolium Soluble Powder contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of amprolium ( $C_{14}H_{19}ClN_4 \cdot HCl$ ).

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Label it to indicate that it is for veterinary use only.

**USP Reference standards** (11)—

USP Amprolium RS

**Identification, Ultraviolet Absorption** (197U)—

*Solution:* 10 µg per mL, filtered.

*Medium:* 0.1 N hydrochloric acid.

**Assay**—

*Diluent, Mobile phase, Standard preparation, Resolution solution, and Chromatographic system*—Proceed as directed in the *Assay* under *Amprolium*.

*Assay preparation*—Transfer an accurately weighed portion of Soluble Powder, equivalent to about 50 mg of amprolium, to a 100-mL volumetric flask, add about 75 mL of *Diluent*, and sonicate for about 10 minutes. Allow to cool to room temperature, dilute with *Diluent* to volume, and mix. Pass through a suitable filter of 0.5-µm or finer porosity, and use the clear filtrate as the *Assay preparation*.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Amprolium*. Calculate the quantity, in mg, of amprolium ( $C_{14}H_{19}ClN_4 \cdot HCl$ ) in the portion of Soluble Powder taken by the formula:

$$100C(r_U / r_S)$$

in which the terms are as defined therein.

## Amprolium Oral Solution

» Amprolium Oral Solution contains not less than 93.0 percent and not more than 107.0 percent of the labeled amount of amprolium ( $C_{14}H_{19}ClN_4 \cdot HCl$ ).

**Packaging and storage**—Preserve in tight containers, protected from light. Store at a temperature between 5° and 30°, in a dry place.

**Labeling**—Label it to indicate that it is for veterinary use only.

**USP Reference standards** (11)—

USP Amprolium RS

**Identification, Ultraviolet Absorption** (197U)—

*Solution:* 10 µg per mL, filtered.

*Medium:* 0.1 N hydrochloric acid.

**pH** (791): between 2.5 and 3.0.

**Assay—**

*Mobile phase*—To 4.5 g of sodium 1-hexanesulfonate add 1500 mL of water, 400 mL of methanol, and 100 mL of acetonitrile, mix, and allow to cool to room temperature. Adjust with phosphoric acid to a pH of 5.1, and pass through a filter having a 0.5-µm or finer porosity. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Quantitatively dissolve an accurately weighed quantity of USP Amprolium RS in water to obtain a solution having a known concentration of about 0.5 mg per mL.

*Assay preparation*—Transfer an accurately measured volume of Oral Solution, equivalent to about 960 mg of amprolium, to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 5.0 mL of this stock solution to a second 100-mL volumetric flask, dilute with water to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 268-nm detector and a 3.9-mm × 30-cm column that contains packing L11. The column is maintained at a constant temperature of about 45°. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak areas for amprolium. Calculate the quantity, in mg, of amprolium (C<sub>14</sub>H<sub>19</sub>ClN<sub>4</sub> · HCl) in each mL of the Oral Solution taken by the formula:

$$(2000C/V)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Amprolium RS in the *Standard preparation*; V is the volume, in mL, of Oral Solution taken to prepare the *Assay preparation*; and  $r_U$  and  $r_S$  are the amprolium peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Amyl Nitrite**

C<sub>5</sub>H<sub>11</sub>NO<sub>2</sub> 117.15

Mixture of nitrous acid, 2-methylbutyl ester, and nitrous acid, 3-methylbutyl ester [8017-89-8; 110-46-3].

» Amyl Nitrite is a mixture of the nitrite esters of 3-methyl-1-butanol and 2-methyl-1-butanol. It contains not less than 85.0 percent and not more than 103.0 percent of C<sub>5</sub>H<sub>11</sub>NO<sub>2</sub>.

**Caution**—Amyl Nitrite is very flammable. Do not use where it may be ignited.

**Packaging and storage**—Preserve in tight containers, and store in a cool place, protected from light.

**USP Reference standards** (11)—

USP Benzyl Benzoate RS

**Identification—**

A: The NMR spectrum recorded as directed in the *Assay* exhibits, among other peaks, a doublet with a band centered

at about 1 ppm and a multiplet with a band centered at about 4.8 ppm representing methyl protons and methylene protons alpha to the nitrite group, respectively, both relative to the tetramethylsilane singlet at 0 ppm.

B: To a few drops of it add a mixture of 1 mL of ferrous sulfate TS and 5 mL of 3 N hydrochloric acid: a greenish brown color is produced.

**Specific gravity** (841): between 0.870 and 0.876.

**Acidity**—To 0.30 mL in a glass-stoppered cylinder add a mixture of 0.60 mL of 0.1 N sodium hydroxide, 10 mL of water, and 1 drop of phenolphthalein TS, and invert the cylinder three times: the red tint of the water layer is still perceptible.

**Limit of nonvolatile residue**—Allow 10 mL to evaporate at room temperature in a tared evaporating dish, in a well-ventilated hood, and dry the residue at 105° for 1 hour: the weight of the residue does not exceed 2 mg (0.02%).

**Content of total nitrites**—Inject a portion of Amyl Nitrite of suitable volume, but not more than 2 µL, into a suitable gas chromatograph (see *Chromatography* (621)) equipped with a thermal conductivity detector. Under typical conditions, the instrument contains a 3-mm × 2-m column packed with a methyl polysiloxane oil, 25% by weight on suitable calcined diatomite, the column is maintained at about 80°, the injection port and detector block are maintained about 10° above the temperature of the column, and helium is used as a carrier gas at a flow rate of about 60 mL per minute. From the area under the curve, calculate the percentage (a/a) of total nitrites, represented by the area under the main peak of the chromatogram, in the Amyl Nitrite taken: not less than 97.0% is found.

**Assay—**

*Solvent:* carbon tetrachloride.

*Internal standard*—USP Benzyl Benzoate RS.

*Procedure*—Transfer 4 to 5 mEq of *Internal standard*, accurately weighed, to a semimicro sampling tube, add 2 to 3 mL of carbon tetrachloride, apply a sampling valve and septum,\* thereby sealing the tube, and determine the weight of the sealed assembly. Open the valve, introduce about 500 µL of Amyl Nitrite with a syringe, close the valve, and determine the weight of the sealed assembly when it has attained constant weight. Shake the sampling tube and valve assembly, and transfer about 500 µL of the solution to a precision NMR tube as directed for *Absolute Method of Quantitation* under *Nuclear Magnetic Resonance* (761). With no spinning, or with the spinning adjusted so that the spinning side bands of neither the substance under assay nor the *Internal standard* interfere with the regions to be integrated, record as  $A_S$  the average area of the *Internal standard* singlet appearing at about 5.3 ppm, representing the methylene protons of benzyl benzoate, and record as  $A_U$  the average area of the multiplet with a band center at about 4.8 ppm, representing the alpha methylene protons of amyl nitrite, with reference to the tetramethylsilane singlet at 0 ppm. Calculate the quantity of C<sub>5</sub>H<sub>11</sub>NO<sub>2</sub> in the Amyl Nitrite taken, using 58.57 as the equivalent weight of amyl nitrite ( $EW_U$ ) and 106.12 as that of benzyl benzoate ( $EW_S$ ).

**Amyl Nitrite Inhalant**

» Amyl Nitrite Inhalant contains a mixture of the nitrite esters of 3-methyl-1-butanol and 2-methyl-1-butanol. It contains not less than 80.0 percent

\* Suitable sampling tubes, sampling valves, and septums are available, respectively, as catalog Nos. K-749000, K-749100, and K-749102 (50 septums) or K-749101 (100 septums), from Kontes Glass Company, Vineland, NJ 08360.

and not more than 105.0 percent of  $C_5H_{11}NO_2$ . It contains a suitable stabilizer.

**Caution**—Amyl Nitrite Inhalant is very flammable. Do not use where it may be ignited.

**Packaging and storage**—Preserve in tight, unit-dose glass containers, wrapped loosely in gauze or other suitable material, and store in a cool place, protected from light.

**USP Reference standards** (11)—

USP Benzyl Benzoate RS

**Specific gravity** (841): between 0.870 and 0.880.

**Content of total nitrites**—Remove the gauze or other covering, place the glass container of Inhalant upright in a dry ice-acetone slurry, and cool for 10 minutes. Dry the container of Inhalant, place it in a pointed glass tube, and break the container with a glass rod. Proceed as directed for *Total nitrites* under *Amyl Nitrite*: not less than 95.0% is found.

**Other requirements**—It responds to the *Identification* tests and meets the requirements of the test for *Acidity* under *Amyl Nitrite*.

**Assay**—

**Solvent:** carbon tetrachloride.

**Internal standard**—USP Benzyl Benzoate RS.

**Procedure**—Remove the gauze or other covering from 1 or more Inhalant ampuls containing a total of 300 to 400  $\mu$ L of amyl nitrite. Weigh accurately the clean and dry intact glass ampul(s), and place the weighed specimen in a freezer for not less than 15 minutes. Transfer the chilled specimen to a glass-stoppered, 25-mL conical flask containing a solution of 4 to 5 mEq of *Internal standard*, accurately weighed, in 1 to 2 mL of carbon tetrachloride. Break the ampul(s) with a glass rod, and rinse any sample or glass fragments adhering to the glass rod with 1 mL of carbon tetrachloride into the main assay solution. Insert the stopper in the flask immediately, mix, and proceed as directed for *Absolute Method of Quantitation under Nuclear Magnetic Resonance* (761), beginning with "When dissolution has been completed." With no spinning, or with the spinning adjusted so that the spinning side bands of neither the substance under assay nor the *Internal standard* interfere with the regions to be integrated, record as  $A_s$  the average area of the *Internal standard* singlet appearing at about 5.3 ppm, representing the methylene protons of benzyl benzoate, and record as  $A_U$  the average area of the multiplet with a band center at about 4.8 ppm, representing the alpha methylene protons of amyl nitrite, with reference to the tetramethylsilane singlet at 0 ppm. Calculate the quantity of  $C_5H_{11}NO_2$  in the Inhalant taken, using 58.57 as the equivalent weight of amyl nitrite ( $EW_U$ ) and 106.12 as that of benzyl benzoate ( $EW_s$ ). Rinse the flask containing the assay preparation with three 5-mL portions of ether, decanting each rinsing carefully to avoid loss of glass fragments, and evaporate any remaining ether with the aid of a current of dry air. Transfer the dry glass fragments to a tared watch glass, weigh, and subtract the weight of the glass fragments from that of the intact ampul(s) to obtain the weight of the Inhalant taken.

## Anagrelide Hydrochloride

$C_{10}H_7Cl_2N_3O \cdot HCl \cdot H_2O$   
Anhydrous

310.56  
292.55

[58579-51-4].

Imidazo[2,1-*b*]quinazolin-2(3*H*)-one, 6,7-dichloro-1,5-dihydro-, monohydrochloride, monohydrate;  
6,7-Dichloro-1,5-dihydroimidazo[2,1-*b*]quinazolin-2(3*H*)-one monohydrochloride, monohydrate [823178-43-4].

**DEFINITION**

Anagrelide Hydrochloride contains NLT 98.0% and NMT 102.0% of  $C_{10}H_7Cl_2N_3O \cdot HCl$ , calculated on the anhydrous basis.

**IDENTIFICATION**

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention time of the major peak in the chromatogram of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **C. IDENTIFICATION TESTS—GENERAL, Chloride** (191): Meets the requirements

**ASSAY**

• **PROCEDURE**

[NOTE—Use freshly prepared standard and sample solutions and inject within 2 h.]

**Solution A:** 6.8 g/L of monobasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 2.5.

**Mobile phase:** Acetonitrile and *Solution A* (1:3)

**Diluent:** Acetonitrile and water (1:1)

**Standard stock solution:** 0.5 mg/mL of anagrelide hydrochloride in acetonitrile. Transfer USP Anagrelide Hydrochloride RS into a suitable volumetric flask, add a small amount of 2 N hydrochloric acid (3 drops per every 50 mL of the final volume) and acetonitrile equivalent to 80% of the final volume. Sonicate to dissolve and dilute with acetonitrile to volume.

**Standard solution:** 0.05 mg/mL of anagrelide hydrochloride in *Diluent*, from *Standard stock solution*

**Sample stock solution:** Weigh Anagrelide Hydrochloride, equivalent to 25 mg of anhydrous salt, into a 50-mL volumetric flask, add 3 drops of 2 N hydrochloric acid and 40 mL of acetonitrile. Sonicate to dissolve and dilute with acetonitrile to volume.

**Sample solution:** Transfer 5 mL of *Sample stock solution* to a 50-mL volumetric flask and dilute with *Diluent* to volume.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm  $\times$  15-cm; 4- $\mu$ m packing L11

**Flow rate:** 1.2 mL/min

**Injection size:** 20  $\mu$ L

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Column efficiency:** NMT 3000 theoretical plates

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{10}H_7Cl_2N_3O \cdot HCl$  in the portion of Anagrelide Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Anagrelide Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Anagrelide Hydrochloride in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the anhydrous basis

**IMPURITIES****Inorganic Impurities**

- **RESIDUE ON IGNITION** (281): NMT 0.1%
- **HEAVY METALS, Method II** (231): NMT 20 ppm

**Organic Impurities**

[NOTE—Use freshly prepared standard and sample solutions and inject within 2 h.]

• **PROCEDURE**

**Mobile phase:** Proceed as directed in the Assay.

**Diluent A:** Use the *Diluent* as described in the Assay.

**Diluent B:** Acetonitrile and water (1:3)

**Standard stock solution A:** 0.05 mg/mL of USP Anagrelide Related Compound A RS in *Diluent A*

**Standard stock solution B:** 0.05 mg/mL of anagrelide related compound B in acetonitrile. Transfer USP Anagrelide Related Compound B RS into a suitable volumetric flask, add acetonitrile equivalent to 50% of the final volume and a small amount of 2 N hydrochloric acid (3 drops per 200 mL of the final volume). Sonicate to dissolve, heat in the hot water bath if necessary, and dilute with acetonitrile to volume.

**System suitability solution:** 0.25 µg/mL of each of anagrelide related compound A and anagrelide related compound B in *Mobile phase*, from *Standard stock solution A* and *Standard stock solution B*

**Standard stock solution C:** 0.1 mg/mL of anagrelide hydrochloride in acetonitrile. Transfer USP Anagrelide Hydrochloride RS into a suitable volumetric flask, add acetonitrile equivalent to 80% of the final volume and a small amount of 0.12 N hydrochloric acid (1 mL per 100 mL of the final volume). Sonicate to dissolve and dilute with acetonitrile to volume.

**Standard solution:** 0.05 µg/mL of anagrelide hydrochloride in *Mobile phase*, from *Standard stock solution C*

**Sample stock solution:** Weigh Anagrelide Hydrochloride, equivalent to 25 mg of anhydrous salt, into a 50-mL volumetric flask. Add 45 mL of acetonitrile, sonicate, and swirl the flask until the preparation turns into a cloudy liquid. Add 1 drop of 0.12 N hydrochloric acid, swirl the flask until the liquid turns to clear, and dilute with acetonitrile to volume.

**Sample solution:** Transfer 5 mL of *Sample stock solution* into a 50-mL volumetric flask and dilute with *Diluent B* to volume.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 15-cm; 4-µm packing L11

**Refrigerated autosampler temperature:** 5°

**Flow rate:** 1.2 mL/min

**Injection size:** 50 µL

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

**Suitability requirements**

**Column efficiency:** NLT 3000 theoretical plates, *Standard solution*

**Tailing factor:** NMT 2.0, *Standard solution*

**Resolution:** NLT 2.0 between anagrelide related compound B and anagrelide related compound A, *System suitability solution*

**Relative standard deviation:** NMT 10.0%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Anagrelide Hydrochloride, on the anhydrous basis, taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_S$  = peak response of anagrelide from the *Standard solution*

$C_S$  = concentration of USP Anagrelide Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Anagrelide Hydrochloride (anhydrous) in the *Sample solution* (mg/mL)

$F$  = relative response factor for each individual impurity (see *Impurity Table 1*)

**Acceptance criteria**

**Individual impurities:** See *Impurity Table 1*. [NOTE—Disregard any impurity peak less than 0.05%.]

**Total impurities:** NMT 1.0%

**Impurity Table 1**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Anagrelide related compound B <sup>a</sup>	0.40	0.43	0.3
Anagrelide related compound A <sup>b</sup>	0.55	0.37	0.15
Anagrelide	1.00	1.0	—
Anagrelide related compound C <sup>c</sup>	1.41	0.32	0.15
Anagrelide trichloro derivative <sup>d</sup>	2.44	1.0	0.15
Any unspecified impurity	—	1.0	0.1

<sup>a</sup> (2-Amino-5,6-dichloroquinazolin-3(4*H*)-yl)acetic acid.

<sup>b</sup> Ethyl 2-(6-amino-2,3-dichlorobenzylamino)acetate.

<sup>c</sup> Ethyl 2-(5,6-dichloro-2-imino-1,2-dihydroquinazolin-3(4*H*)-yl)acetate hydrobromide.

<sup>d</sup> 6,7,8-Trichloro-3,5-dihydroimidazo[2,1-*b*]quinazolin-2(1*H*)-one.

**SPECIFIC TESTS**

- **WATER DETERMINATION, Method I** (921): Between 4.5% and 7.5%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store in a cold place.
- **USP REFERENCE STANDARDS** (11)
  - USP Anagrelide Hydrochloride RS
  - USP Anagrelide Related Compound A RS
  - Ethyl 2-(6-amino-2,3-dichlorobenzylamino)acetate.  $C_{11}H_{14}Cl_2N_2O_2$  277.15
  - USP Anagrelide Related Compound B RS
  - (2-Amino-5,6-dichloroquinazolin-3(4*H*)-yl)acetic acid.  $C_{10}H_9Cl_2N_3O_2$  274.10

**Anagrelide Capsules****DEFINITION**

Anagrelide Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of  $C_{10}H_7Cl_2N_3O$ .

**IDENTIFICATION**

- The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

**ASSAY**• **PROCEDURE**

**Solution A:** 1.0 g/L of sodium hexanesulfonate. Add 1.0 mL of phosphoric acid and filter.

**Mobile phase:** Acetonitrile and *Solution A* (7:13)

**Diluent:** Acetonitrile and water (1:1)

**Standard stock solution:** 0.25 mg/mL of USP Anagrelide Hydrochloride RS in acetonitrile. Initially add acetonitrile (about 80% of the volume of the flask) and a small quantity of 2 N hydrochloric acid (about 0.2 mL for every 100 mL of the final volume). Sonicate to dissolve, and dilute with acetonitrile to volume.

**Standard solution:** 0.01 mg/mL of anagrelide free base in *Diluent* from *Standard stock solution*

**Sample solution:** 0.01 mg/mL of anagrelide free base prepared from the contents of NLT 20 Capsules. Add *Diluent* (80% of the volume of the flask), sonicate for 10 min, and stir for 15 min. Further dilute with *Diluent* to volume, centrifuge for 15 min at 4000 rpm, and use the supernatant for analysis.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 15-cm; 4-μm packing L11

**Column temperature:** 60°

**Flow rate:** 1.0 mL/min

**Injection size:** 20 μL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Column efficiency:** NLT 3000 theoretical plates

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of C<sub>14</sub>H<sub>13</sub>N<sub>5</sub>O<sub>5</sub>S<sub>2</sub>, based on the label claim, in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of anagrelide from the *Sample solution*

$r_S$  = peak response of anagrelide from the *Standard solution*

$C_S$  = concentration of anagrelide in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of anagrelide in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

#### PERFORMANCE TESTS

##### • DISSOLUTION <711>

**Medium:** 0.1 N hydrochloric acid; 900 mL

**Apparatus 1:** 100 rpm

**Time:** 15 min

**Mobile phase:** Proceed as directed in the *Assay*.

**Standard solution:** Transfer about 30.32 mg of USP Anagrelide Hydrochloride RS, equivalent to 25.00 mg of anagrelide, to a 100-mL volumetric flask. Add about 80 mL of acetonitrile and 3 drops of 2 N hydrochloric acid. Sonicate until dissolved. Dilute with acetonitrile to volume. Dilute this solution with *Medium* to obtain a final concentration of about (L/1000) mg/mL, where L is the Capsule label claim in mg.

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45-μm pore size.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 274 nm

**Column:** 4.6-mm × 15-cm; 5-μm packing L7

**Sample cooler temperature:** 5°

**Flow rate:** 1.0 mL/min

**Injection size:** 20 μL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Column efficiency:** NLT 3000 theoretical plates

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

Calculate the percentage of anagrelide dissolved:

$$\text{Result} = (r_U/r_S) \times W_S(100 - W_C)/(25 \times 100) \times M_{r1}/M_{r2} \times V/L \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$W_S$  = weight of the USP Anagrelide Hydrochloride RS taken (mg)

$W_C$  = water content of the USP Anagrelide Hydrochloride RS (%)

$M_{r1}$  = molecular weight of anagrelide, 256.10

$M_{r2}$  = molecular weight of anagrelide hydrochloride, 292.56

$V$  = volume of *Medium*, 900 mL

$L$  = label claim (mg/Capsule)

**Tolerances:** NLT 80% (Q) of the labeled amount of anagrelide is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

#### IMPURITIES

##### Organic Impurities

##### • PROCEDURE

**Buffer solution:** 6.8 g/L of monobasic potassium phosphate. Adjust with diluted phosphoric acid to a pH of 3.50 ± 0.05. Mix well and filter.

**Mobile phase:** Acetonitrile and *Buffer solution* (27:73)

**Diluent:** Acetonitrile:water (7:13)

**Related compound A stock solution:** 10 μg/mL of USP Anagrelide Related Compound A RS in *Diluent*

**Related compound C stock solution:** 10 μg/mL of USP Anagrelide Related Compound C RS in *Diluent*

**System suitability solution:** 0.2 μg/mL of each USP Anagrelide Related Compound A RS and USP Anagrelide Related Compound C RS and 0.02 mg/mL of USP Anagrelide Hydrochloride RS. Initially dissolve USP Anagrelide Hydrochloride RS in *Diluent* (about 80% of the volume of the flask), sonicate for 10 min, and stir for 15 min. Add appropriate amounts of *Related compound A stock solution* and *Related compound C stock solution*, and dilute with *Diluent* to volume.

**Standard stock solution:** 0.1 mg/mL of anagrelide free base by dissolving USP Anagrelide Hydrochloride RS in acetonitrile (about 80% of the volume of the flask). Add a small quantity of 2 N hydrochloric acid (about 0.2 mL for every 100 mL of the final volume), sonicate to dissolve, and dilute with acetonitrile to volume.

**Standard solution:** 0.10 μg/mL of anagrelide free base in *Diluent* from *Standard stock solution*

**Sample solution:** 0.02 mg/mL of anagrelide free base from NLT 20 Capsules. Initially add *Diluent* to about 80% of the volume of the flask, sonicate for 10 min, stir for about 15 min, and dilute with *Diluent* to volume. Centrifuge (about 4000 rpm) the solution for 15 min, and use the supernatant for analysis.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 15-cm; 4-μm packing L11

**Column temperature:** 45°

**Flow rate:** 1.0 mL/min

**Injection size:** 30 μL

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

#### Suitability requirements

**Resolution:** NLT 2.0 between anagrelide hydrochloride and anagrelide related compound C, and be-

tween anagrelide hydrochloride and anagrelide related compound A, *System suitability solution*  
**Column efficiency:** NLT 3000 theoretical plates, *Standard solution*  
**Tailing factor:** NMT 2.0, *Standard solution*

**Relative standard deviation:** NMT 2.0% for the anagrelide peak, *Standard solution*

Calculate the percentage of each impurity in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response of each individual impurity from the *Sample solution*

$r_S$  = peak response of anagrelide from the *Standard solution*

$C_U$  = nominal concentration of anagrelide in the *Sample solution* (mg/mL)

$C_S$  = concentration of anagrelide in the *Standard solution* (mg/mL)

$F$  = relative response factor (see *Impurity Table 1*)

**Acceptance criteria:** The individual and total impurities meet the limits in *Impurity Table 1*. [NOTE—Anagrelide related compound A (RRT = 0.86) and anagrelide related compound C (RRT = 1.15) are process related and controlled in the drug substance.]

**Impurity Table 1**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Anagrelide hydrochloride	1.0	—	—
Anagrelide related compound B <sup>a</sup>	0.3	0.34	1.0
Anagrelide trichloro derivative <sup>b</sup>	1.8–2.3	1.0	0.15
Any other individual impurity	—	—	0.2
Total Impurities	—	—	1.5

<sup>a</sup> [2-Amino-5,6-dichloroquinazoline-3(4*H*)-yl]acetic acid.

<sup>b</sup> 6,7,8-Trichloro-3,5-dihydroimidazo[2,1-*b*]quinazolin-2(1*H*)-one.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, protected from light. Store at controlled room temperature.
- **USP REFERENCE STANDARDS** <11>
  - USP Anagrelide Hydrochloride RS
  - USP Anagrelide Related Compound A RS
  - Ethyl 2-(6-amino-2,3-dichlorobenzylamino)acetate.  
C<sub>11</sub>H<sub>14</sub>Cl<sub>2</sub>N<sub>2</sub>O<sub>2</sub> 277.15
  - USP Anagrelide Related Compound C RS
  - Ethyl 2-(5,6-dichloro-2-imino-1,2-dihydroquinazolin-3(4*H*)-yl)acetate hydrobromide.

## Anastrozole

C<sub>17</sub>H<sub>19</sub>N<sub>5</sub> 293.37

1,3-Benzenediacetonitrile,  $\alpha,\alpha,\alpha',\alpha'$ -tetramethyl-5-(1*H*-1,2,4-triazol-1-ylmethyl)-.

$\alpha,\alpha,\alpha',\alpha'$ -Tetramethyl-5-(1*H*-1,2,4-triazol-1-ylmethyl)-*m*-benzenediacetonitrile [120511-73-1].

» Anastrozole contains not less than 98.0 percent and not more than 102.0 percent of C<sub>17</sub>H<sub>19</sub>N<sub>5</sub>, calculated on the anhydrous and solvent-free basis.

**Packaging and storage**—Preserve in well-closed containers. Store at room temperature.

#### USP Reference standards <11>—

USP Anastrozole RS

USP Anastrozole Related Compound A RS

2,2'-(5-methyl-1,3-phenylene)bis(2-methylpropanenitrile).

C<sub>15</sub>H<sub>18</sub>N<sub>2</sub> 226.32

#### Identification—

**A: Infrared Absorption** <197K>—

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Water**, *Method Ic* <921>: not more than 0.3%.

**Residue on ignition** <281>: not more than 0.1%.

**Heavy metals**, *Method II* <231>: not more than 0.001%.

#### Related compounds—

*Solution A* and *Solution B*—Prepare as directed in the *Assay*.

**Peak identification solution**—Transfer accurately weighed quantities of USP Anastrozole RS and USP Anastrozole Related Compound A RS to a suitable volumetric flask, add a quantity of acetonitrile equivalent to about 40% of the volume of the flask to dissolve, and dilute with *Solution A* to volume to obtain a solution having known concentrations of about 0.5 mg of each per mL. Transfer 1 mL of this solution to a 50-mL volumetric flask, and dilute with *Solution A* to volume.

**Standard solution**—Dissolve an accurately weighed quantity of USP Anastrozole RS in acetonitrile, and dilute quantitatively, and stepwise if necessary, with *Solution A* to obtain a solution having a known concentration of about 0.02 mg per mL.

**Test solution**—Transfer about 50 mg of Anastrozole to a 25-mL volumetric flask, and add about 10 mL of acetonitrile. Dissolve in and dilute with *Solution A* to volume.

**Blank solution**—Transfer 10 mL of acetonitrile to a 25-mL volumetric flask, and dilute with *Solution A* to volume.

**Chromatographic system** (see *Chromatography* <621>)—Prepare as directed in the *Assay*. Chromatograph the *Peak identification solution*, and record the peak responses as directed for *Procedure*: the relative retention times for anastrozole and anastrozole related compound A are listed in *Table 1*. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the tailing factor of the anastrozole peak is between 0.9 and 1.4; and the relative standard deviation for replicate injections of the anastrozole peak is not more than 5%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Blank solution*, the *Standard solution*, and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak areas. Adjust the peak areas for any interference from the *Blank solution*. Calculate the percentage of each anastrozole related compound in the portion of Anastrozole taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which  $C_S$  is the concentration, in mg per mL, of anastrozole in the *Standard solution*;  $C_U$  is the concentration, in mg per mL, of the *Test solution*; and  $r_U$  and  $r_S$  are the peak areas of anastrozole related compound obtained from the

Test solution and the Standard solution, respectively. The limits are given in Table 1. [NOTE—Any impurity of less than 0.05% is disregarded.]

Table 1

Name	Relative Retention	
	Time	Limit (%)
Anastrozole related compound B <sup>1</sup>	0.6	0.2
Anastrozole	1.0	—
Anastrozole related compound C <sup>2</sup>	2.0	0.2
Anastrozole related compound A <sup>3</sup>	4.0	—
Anastrozole related compound D <sup>4</sup>	4.3	0.1
Anastrozole related compound E <sup>5</sup>	5.4	0.1
Individual unspecified impurity	—	0.1
Total unspecified impurities	—	0.2
Total impurities	—	0.5

<sup>1</sup>2-(3-(1-Cyanoethyl)-5-(1H-1,2,4-triazol-1-ylmethyl)phenyl)-2-methylpropanenitrile [C<sub>16</sub>H<sub>17</sub>N<sub>5</sub>, 279.34].

<sup>2</sup>2,3-Bis(3-(1-cyano-1-methylethyl)-5-(1H-1,2,4-triazol-1-ylmethyl)phenyl)-2-methylpropanenitrile [C<sub>30</sub>H<sub>31</sub>N<sub>9</sub>, 517.63].

<sup>3</sup>The relative retention time of anastrozole related compound A has been included for system suitability purposes only and is not intended for quantification.

<sup>4</sup>2,2'-(5-(Bromomethyl)-1,3-phenylene)bis(2-methylpropanenitrile) [C<sub>15</sub>H<sub>17</sub>BrN<sub>2</sub>, 305.21].

<sup>5</sup>2,2'-(5-(Dibromomethyl)-1,3-phenylene)bis(2-methylpropanenitrile) [C<sub>15</sub>H<sub>16</sub>Br<sub>2</sub>N<sub>2</sub>, 384.11].

### Assay—

**Solution A**—Prepare a mixture of water, methanol, acetonitrile, and trifluoroacetic acid (600:300:100:0.5). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Solution B**—Prepare a mixture of methanol, water, acetonitrile, and trifluoroacetic acid (450:400:150:0.5). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Transfer a suitable quantity of USP Anastrozole RS to a suitable volumetric flask, and add a quantity of acetonitrile equivalent to about 40% of the volume of the flask. Dissolve in and dilute with *Solution A* to volume to obtain a solution having a known concentration of about 0.5 mg per mL.

**Assay preparation**—Transfer about 25 mg of Anastrozole to a 50-mL volumetric flask, and add about 20 mL of acetonitrile. Dissolve in and dilute with *Solution A* to volume.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 215-nm detector and a 3.2-mm × 10-cm column that contains 5-μm packing L42. The flow rate is about 0.75 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–10	100	0	isocratic
10–40	100→0	0→100	linear gradient
40–41	0→100	100→0	linear gradient
41–56	100	0	equilibration

[NOTE—These gradient elution times are established on an HPLC system with a dwell time of approximately 0 minutes. The gradient elution times in the table can be adjusted by subtracting the dwell time to achieve the separation described.] Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor of the anastrozole peak is between 0.9 and 1.4; and the relative standard deviation for replicate injections of the anastrozole peak is not more than 1.5%.

**Procedure**—Inject equal volumes (about 10 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak areas. Calculate the percentage of C<sub>17</sub>H<sub>19</sub>N<sub>5</sub> in the portion of Anastrozole taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which  $C_S$  is the concentration, in mg per mL, of anastrozole in the *Standard preparation*;  $C_U$  is the concentration of anastrozole in the *Assay preparation*; and  $r_U$  and  $r_S$  are the peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Anileridine

C<sub>22</sub>H<sub>28</sub>N<sub>2</sub>O<sub>2</sub> 352.47

4-Piperidinecarboxylic acid, 1-[2-(4-aminophenyl)ethyl]-4-phenyl-, ethyl ester.

Ethyl 1-(*p*-aminophenethyl)-4-phenylisonipecotate [144-14-9].

» Anileridine contains not less than 98.5 percent and not more than 101.0 percent of C<sub>22</sub>H<sub>28</sub>N<sub>2</sub>O<sub>2</sub>, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight, light-resistant containers. Store at room temperature.

### Identification—

**A:** Dissolve 40 mg in 2.3 mL of 0.1 N hydrochloric acid in a 100-mL volumetric flask, dilute with water to volume, and mix (*Stock solution*). Transfer 4.0 mL of this solution to a 100-mL volumetric flask, and add 25 mL of pH 7.0 *Buffer solution*. (Prepare the *Buffer solution* by dissolving 22.73 g of anhydrous dibasic sodium phosphate and 14.52 g of monobasic potassium phosphate in water to make 1000 mL. Dilute 25 mL of the buffer with water to 100 mL: the pH, determined potentiometrically, is 7.0 ± 0.05.) Dilute with water to volume, and mix (*Solution A*). Transfer 20.0 mL of the *Stock solution* to a 100-mL volumetric flask, add 25 mL of the pH 7.0 *Buffer solution*, dilute with water to volume, and mix (*Solution B*): the UV absorption spectrum of *Solution A* exhibits a maximum at 234 ± 1 nm; and the UV absorption spectrum of *Solution B* exhibits a maximum at 285 ± 2 nm. The ratio  $5A_{234} / A_{285}$  is about 8.8.

**B:** To 5 mL of a solution in 0.1 N hydrochloric acid (1 in 5000), add 2 mL of a solution of *p*-dimethylaminobenzaldehyde in alcohol (1 in 100): a yellow color develops immediately.

**Water, Method I** (921): not more than 1.0%.

**Residue on ignition** (281): not more than 0.1%.

**Chloride** (221)—Dissolve 180 mg in a mixture of 1 mL of nitric acid and 40 mL of water: the solution shows no more chloride than corresponds to 0.10 mL of 0.020 N hydrochloric acid (0.040%).

**Assay**—Dissolve about 350 mg of Anileridine, accurately weighed, in 50 mL of glacial acetic acid, add 1 drop of crystal violet TS, and titrate with 0.1 N perchloric acid VS to a blue-green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 17.62 mg of C<sub>22</sub>H<sub>28</sub>N<sub>2</sub>O<sub>2</sub>.

## Anileridine Injection

» Anileridine Injection is a sterile solution of Anileridine in Water for Injection, prepared with the aid of Phosphoric Acid. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of anileridine ( $C_{22}H_{28}N_2O_2$ ), as the phosphate.

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I glass, protected from light.

### USP Reference standards (11)—

USP Anileridine Hydrochloride RS

USP Endotoxin RS

### Identification—

**A:** Dilute a volume of Injection, equivalent to about 1.25 mg of anileridine, with water to 5 mL, and add 2 mL of a 1 in 100 solution of *p*-dimethylaminobenzaldehyde in alcohol: a yellow color develops immediately.

**B:** A volume of Injection, diluted with water to a concentration of about 25 mg of anileridine in 1000 mL, exhibits absorbance maxima at  $234 \pm 1$  and  $285 \pm 2$  nm.

**Bacterial endotoxins** (85)—It contains not more than 7.2 USP Endotoxin Units per mg of anileridine.

**pH** (791): between 4.5 and 5.0.

**Other requirements**—It meets the requirements under *Injections* (1).

### Assay—

**Standard preparation**—[NOTE—Prepare on the day of the assay.] Dissolve an accurately weighed quantity of USP Anileridine Hydrochloride RS in 0.1 N hydrochloric acid, and quantitatively dilute with the same solvent to obtain a solution having a known concentration of about 250 µg per mL. (Each mg of anileridine hydrochloride is equivalent to 0.8286 mg of anileridine.)

**Assay preparation**—Transfer to a 500-mL volumetric flask an accurately measured volume of Injection, equivalent to about 100 mg of anileridine, dilute with 0.1 N hydrochloric acid to volume, and mix.

**Procedure**—Transfer 5.0 mL each of the *Standard preparation*, the *Assay preparation*, and 0.1 N hydrochloric acid to provide the blank to separate 200-mL volumetric flasks. To each flask add 25 mL of water, 5 mL of 1 N hydrochloric acid, and 5 mL of sodium nitrite solution (1 in 1000), and mix. Allow to stand for 2 minutes, then add to each flask 5 mL of ammonium sulfamate solution (1 in 200), and mix. Allow to stand for 3 minutes, then add 5 mL of N-(1-naphthyl)ethylenediamine dihydrochloride solution (1 in 1000), and mix. Allow to stand for 1 hour, dilute with water to volume, and mix. Determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 560 nm, with a suitable spectrophotometer, using the reagent blank to set the instrument. Calculate the quantity, in mg, of anileridine ( $C_{22}H_{28}N_2O_2$ ) in each mL of the Injection taken by the formula:

$$(352.48 / 425.40)(0.5C / V)(A_U / A_S)$$

in which 352.48 and 425.40 are the molecular weights of anileridine and anileridine hydrochloride, respectively; C is the concentration, in µg per mL, of USP Anileridine Hydrochloride RS in the *Standard preparation*; V is the volume, in mL, of Injection taken; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

## Anileridine Hydrochloride

$C_{22}H_{28}N_2O_2 \cdot 2HCl$  425.39

4-Piperidinecarboxylic acid, 1-[2-(4-aminophenyl)ethyl]-4-phenyl-, ethyl ester, dihydrochloride.

Ethyl 1-(*p*-aminophenethyl)-4-phenylisonipicotate dihydrochloride [126-12-5].

» Anileridine Hydrochloride contains not less than 96.0 percent and not more than 102.0 percent of  $C_{22}H_{28}N_2O_2 \cdot 2HCl$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

### USP Reference standards (11)—

USP Anileridine Hydrochloride RS

### Identification—

**A:** *Infrared Absorption* (197K).

**B:** Dissolve 50 mg in water in a 100-mL volumetric flask, dilute with water to volume, and mix (*Stock solution*). Transfer 4.0 mL of this solution to a 100-mL volumetric flask, and add 25 mL of *pH 7.0 Buffer solution*. (Prepare the *pH 7.0 Buffer solution* by dissolving 22.73 g of anhydrous dibasic sodium phosphate and 14.52 g of monobasic potassium phosphate in water to make 1000.0 mL. Dilute 25 mL of the buffer with water to 100 mL: the pH, determined potentiometrically, is  $7.0 \pm 0.05$ .) Dilute with water to volume, and mix (*Solution A*). Transfer 20.0 mL of the *Stock solution* to a 100-mL volumetric flask, add 25 mL of the *pH 7.0 Buffer solution*, dilute with water to volume, and mix (*Solution B*): the UV absorption spectrum of *Solution A* exhibits a maximum at  $234 \pm 1$  nm, and the UV absorption spectrum of *Solution B* exhibits a maximum at  $285 \pm 2$  nm.

**C:** To 5 mL of a solution (1 in 5000) add 2 mL of a 1 in 100 solution of *p*-dimethylaminobenzaldehyde in alcohol: a yellow color develops immediately.

**D:** A solution (1 in 100) responds to the tests for *Chloride* (191).

**pH** (791): between 2.5 and 3.0, in a solution (1 in 20).

**Loss on drying** (731)—Dry it at a pressure below 5 mm of mercury at  $100^\circ$  for 2 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Chloride content**—Dissolve about 200 mg, accurately weighed, in 50 mL of water in a glass-stoppered flask. Add 25.0 mL of 0.1 N silver nitrate VS, then add 5 mL of 2 N nitric acid and 5 mL of nitrobenzene, shake vigorously, add 2 mL of ferric ammonium sulfate TS, and titrate the excess silver nitrate with 0.1 N ammonium thiocyanate VS. Each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of Cl: the content of Cl is between 16.0% and 17.2%.

**Assay**—Dissolve about 200 mg of Anileridine Hydrochloride, accurately weighed, in 10 mL of glacial acetic acid by heating on a steam bath. Cool immediately in a cold water bath, add 5 mL of mercuric acetate TS, 20 mL of acetone, and 0.5 mL of indicator solution (70 mg of  $\alpha$ -naphtholbenzein, 10 mg of crystal violet, and 40 mg of quinaldine red in 100 mL of glacial acetic acid), and titrate with 0.1 N perchloric acid VS to a gray-green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 21.27 mg of  $C_{22}H_{28}N_2O_2 \cdot 2HCl$ .

## Anileridine Hydrochloride Tablets

» Anileridine Hydrochloride Tablets contain an amount of anileridine hydrochloride ( $C_{22}H_{28}N_2O_2 \cdot 2HCl$ ) equivalent to not less than 95.0 percent and not more than 105.0 percent of the labeled amount of anileridine ( $C_{22}H_{28}N_2O_2$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—  
USP Anileridine Hydrochloride RS

### Identification—

**A:** Place a quantity of finely powdered Tablets, equivalent to about 50 mg of anileridine, in a 250-mL volumetric flask, add 100 mL of water, and heat on a steam bath. Cool, dilute with water to volume, mix, and filter: five mL of the filtrate responds to *Identification* test C under *Anileridine Hydrochloride*.

**B:** Transfer to a 100-mL volumetric flask a quantity of finely powdered Tablets, equivalent to about 50 mg of anileridine. Add about 30 mL of water, and heat on a steam bath. Cool, dilute with water to volume, mix, and filter (*Stock solution*): the filtrate responds to *Identification* test B under *Anileridine Hydrochloride*, beginning with "Transfer 4.0 mL of this solution."

### Dissolution (711)—

**Medium:** 0.01 N hydrochloric acid; 900 mL.

**Apparatus 1:** 100 rpm.

**Time:** 45 minutes.

**Procedure**—Determine the amount of anileridine ( $C_{22}H_{28}N_2O_2$ ) dissolved, employing the procedure set forth in the *Assay*, using a filtered portion of the solution under test as the *Assay preparation* in comparison with a Standard solution having a known concentration of USP Anileridine Hydrochloride RS in the same *Medium*.

**Tolerances**—Not less than 65% (Q) of the labeled amount of  $C_{22}H_{28}N_2O_2$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

### Assay—

**Standard preparation**—Prepare as directed in the *Assay* under *Anileridine Injection*.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 50 mg of anileridine, to a 250-mL volumetric flask. Add 25 mL of 1 N hydrochloric acid and 100 mL of water, and heat on a water bath. Cool, dilute with water to volume, and mix. Filter the solution, discarding the first 25 mL of the filtrate.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Anileridine Injection*. Calculate the quantity, in mg, of  $C_{22}H_{28}N_2O_2$  in the portion of Tablets taken by the formula:

$$(352.48/425.40)(0.25C)(A_U / A_S)$$

in which 352.48 and 425.40 are the molecular weights of anileridine and anileridine hydrochloride, respectively; C is the concentration, in  $\mu\text{g}$  per mL, of USP Anileridine Hydrochloride RS in the *Standard preparation*; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

## Antazoline Phosphate

$C_{17}H_{19}N_3 \cdot H_3PO_4$  363.35

1-*H*-imidazole-2-methanamine, 4,5-dihydro-*N*-phenyl-*N*-(phenylmethyl)-, phosphate (1:1).

2-[(*N*-Benzylanilino)methyl]-2-imidazoline phosphate (1:1) [154-68-7].

» Antazoline Phosphate contains not less than 98.0 percent and not more than 101.0 percent of  $C_{17}H_{19}N_3 \cdot H_3PO_4$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Antazoline Phosphate RS

### Identification—

**A:** *Infrared Absorption* (197M).

**B:** The  $R_f$  value of the principal spot in the chromatogram of the *Identification* corresponds to that of *Standard preparation A* as obtained in the test for *Chromatographic purity*.

**Melting range, Class Ia** (741): between 194° and 198°, with decomposition.

**pH** (791): between 4.0 and 5.0, in a solution (1 in 50).

**Loss on drying** (731)—Dry it at 105° for 4 hours: it loses not more than 0.5% of its weight.

### Chromatographic purity—

**Standard solutions**—Dissolve USP Antazoline Phosphate RS in methanol, and mix to obtain a solution having a known concentration of 0.10 mg per mL. Quantitatively dilute with methanol to obtain 5 *Standard solutions* having the following compositions:

Standard preparation	Dilution	Concentration ( $\mu\text{g}$ RS per mL)	Percentage (% for comparison with test specimen)
A	(1 in 2)	50	0.5
B	(2 in 5)	40	0.4
C	(3 in 10)	30	0.3
D	(1 in 5)	20	0.2
E	(1 in 10)	10	0.1

**Test solution**—Dissolve an accurately weighed quantity of Antazoline Phosphate in methanol to obtain a solution containing 10 mg per mL.

**Identification solution**—Dilute a portion of the *Test solution* quantitatively with methanol to obtain a solution containing 50  $\mu\text{g}$  per mL.

**Procedure**—Apply separately 10  $\mu\text{L}$  of the *Test solution*, 10  $\mu\text{L}$  of the *Identification solution*, and 10  $\mu\text{L}$  of each *Standard solution* to a suitable thin-layer chromatographic plate (see *Chromatography* (621)), coated with a 0.25-mm layer of chromatographic silica gel mixture. Position the plate in a chromatographic chamber, and develop the chromatograms in a solvent system consisting of a mixture of ethyl acetate, methanol, and diethylamine (17:2:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Examine the plate under short-wavelength UV light, and compare the intensities of any secondary spots observed in the chromato-

gram of the *Test solution* with those of the principal spots in the chromatograms of the *Standard solutions*. [NOTE—Disregard any spots observed at the origins of the chromatograms.] No secondary spot from the chromatogram of the *Test solution* is larger or more intense than the principal spot obtained from *Standard solution A* (0.5%), and the sum of the intensities of all secondary spots obtained from the *Test solution* corresponds to not more than 1.0%.

**Assay**—Dissolve about 750 mg of Antazoline Phosphate, accurately weighed, in 50 mL of glacial acetic acid, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically, using a glass electrode and a calomel electrode containing a saturated solution of lithium chloride in glacial acetic acid (see *Titrimetry* <541>). Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 36.34 mg of  $C_{17}H_{19}N_3 \cdot H_3PO_4$ .

## Anthralin

$C_{14}H_{10}O_3$

9(10*H*)-Anthracenone, 1,8-dihydroxy-;  
1,8-Dihydroxy-9-anthrone [1143-38-0].

226.23

### DEFINITION

Anthralin contains NLT 97.0% and NMT 102.0% of anthralin ( $C_{14}H_{10}O_3$ ), calculated on the dried basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION** <197K>
- **B. ULTRAVIOLET ABSORPTION** <197U>  
Sample solution: 10 µg/mL in chloroform  
Acceptance criteria: Meets the requirements

### ASSAY

#### PROCEDURE

[NOTE—Use low-actinic glassware.]

**Mobile phase:** *n*-Hexane, dichloromethane, and glacial acetic acid (82:12:6)

**Internal standard solution:** 0.5 mg/mL of *o*-nitroaniline in *n*-hexane prepared as follows. First dissolve *o*-nitroaniline in a small quantity of dichloromethane, and then dilute with *n*-hexane.

**System suitability stock solution:** 0.1 mg/mL of USP Anthralin RS and 0.2 mg/mL of danthron in dichloromethane

**System suitability solution:** Transfer 5 mL of the *System suitability stock solution* into a 25-mL volumetric flask, add 5 mL of *n*-hexane, and dilute with *Mobile phase* to volume.

**Solvent blank solution:** *Mobile phase*, *n*-hexane, and dichloromethane (3:1:1)

**Standard stock solution:** 0.25 mg/mL of USP Anthralin RS in dichloromethane

**Standard solution:** Transfer 5 mL each of *Standard stock solution* and *Internal standard solution* into a 25-mL volumetric flask, and dilute with *Mobile phase* to volume.

**Sample stock solution:** 0.25 mg/mL of Anthralin in dichloromethane

**Sample solution:** Transfer 5 mL each of *Sample stock solution* and *Internal standard solution* into a 25-mL volumetric flask, dilute with *Mobile phase* to volume.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 354 nm

**Column:** 4.6-mm × 25-cm; packing L3

**Flow rate:** 2 mL/min

**Injection volume:** 10 µL

#### System suitability

**Samples:** *System suitability solution*, *Solvent blank solution*, and *Standard solution*

[NOTE—The relative retention times for anthralin, danthron, dianthrone, and *o*-nitroaniline are 1.0, 1.2, 1.7, and 2.3, respectively.]

#### Suitability requirements

**Resolution:** NLT 1.3 between anthralin and danthron, *System suitability solution*

**Tailing factor:** NMT 1.5, *System suitability solution*

**Relative standard deviation:** NMT 2.0% of the ratio of the peak responses, *Standard solution*

**Interference:** No discernible signal is observed at the retention time of anthralin, *Solvent blank solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of anthralin ( $C_{14}H_{10}O_3$ ) in the portion of Anthralin taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratio of anthralin to *o*-nitroaniline from the *Sample solution*

$R_S$  = peak response ratio of anthralin to *o*-nitroaniline from the *Standard solution*

$C_S$  = concentration of USP Anthralin RS in the *Standard solution* (µg/mL)

$C_U$  = concentration of Anthralin in the *Sample solution* (µg/mL)

**Acceptance criteria:** 97.0%–102.0% on the dried basis

### IMPURITIES

- **RESIDUE ON IGNITION** <281>: NMT 0.1%

- **CHLORIDE AND SULFATE**, *Chloride* <221>

Sample: 1 g

**Analysis:** To 15 mL of water add the *Sample*, mix, and filter. Acidify 5 mL of the filtrate with nitric acid, and add a few drops of silver nitrate TS.

**Acceptance criteria:** No more opalescence is produced immediately than is present in a 5-mL portion of the filtrate to which nothing has been added.

- **CHLORIDE AND SULFATE**, *Sulfate* <221>

Sample: 5 mL of the untreated filtrate obtained in the test for *Chloride*

**Analysis:** To the *Sample* add 3 drops of 3 N hydrochloric acid and 5 drops of barium chloride TS.

**Acceptance criteria:** No more turbidity is produced than is present in a 5-mL portion of the filtrate to which nothing has been added.

### SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE**, *Class I* <741>: 178°–181°

- **LOSS ON DRYING** <731>

**Analysis:** Dry a sample over silica gel for 4 h.

**Acceptance criteria:** NMT 0.5%

- **ACIDITY OR ALKALINITY**

**Analysis:** Suspend a sample in water, and filter.

**Acceptance criteria:** The filtrate is neutral to litmus.

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers in a cool place. Protect from light.

- **USP REFERENCE STANDARDS** <11>  
USP Anthralin RS

## Anthralin Cream

### DEFINITION

Anthralin Cream is Anthralin in an aqueous (oil-in-water) or oily (water-in-oil) cream vehicle. Cream labeled to contain more than 0.1% of anthralin contains NLT 90.0% and NMT 115.0% of the labeled amount of anthralin ( $C_{14}H_{10}O_3$ ), and Cream labeled to contain 0.1% or less of anthralin contains NLT 90.0% and NMT 130.0% of the labeled amount of anthralin ( $C_{14}H_{10}O_3$ ).

### ASSAY

#### • PROCEDURE

[NOTE—Use low-actinic glassware.]

**Mobile phase:** *n*-Hexane, dichloromethane, and glacial acetic acid (82:12:6)

**Internal standard solution:** 0.5 mg/mL of *o*-nitroaniline in *n*-hexane prepared as follows. First dissolve *o*-nitroaniline in a small quantity of dichloromethane, and then dilute with *n*-hexane.

**System suitability stock solution:** 0.1 mg/mL of USP Anthralin RS and 0.2 mg/mL of danthron in dichloromethane

**System suitability solution:** Transfer 5 mL of the *System suitability stock solution* into a 25-mL volumetric flask, add 5 mL of *n*-hexane, and dilute with *Mobile phase* to volume.

**Solvent blank solution:** *Mobile phase*, *n*-hexane, and dichloromethane (3:1:1)

**Standard stock solution:** 0.25 mg/mL of USP Anthralin RS in dichloromethane

**Standard solution:** Transfer 2 mL each of *Standard stock solution* and *Internal standard solution* into a 25-mL volumetric flask, and dilute with *Mobile phase* to volume.

**Sample stock solution:** Weigh 5 g of Cream into a 100-mL beaker. Add 20 mL of dichloromethane and 10 mL of glacial acetic acid, and stir to disperse the Cream. Transfer the contents of the beaker to a filter paper (Whatman No. 4, or equivalent) with the aid of dichloromethane, and filter into a 100-mL volumetric flask. Thoroughly wash the precipitate with dichloromethane, and allow the washings to drain into the flask. Dilute with dichloromethane to volume.

**Sample solution:** Transfer a volume of *Sample stock solution* equivalent to 0.5 mg of anthralin and 2 mL of *Internal standard solution* into a 25-mL volumetric flask, and dilute with *Mobile phase* to volume.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 354 nm

**Column:** 4.6-mm  $\times$  25-cm; packing L3

**Flow rate:** 2 mL/min

**Injection volume:** 10  $\mu$ L

#### System suitability

**Samples:** *System suitability solution*, *Solvent blank solution*, and *Standard solution*

[NOTE—The relative retention times for anthralin, danthron, dianthrone, and *o*-nitroaniline are 1.0, 1.2, 1.7, and 2.3, respectively.]

#### Suitability requirements

**Resolution:** NLT 1.3 between anthralin and danthron, *System suitability solution*

**Tailing factor:** NMT 1.5, *System suitability solution*

**Relative standard deviation:** NMT 2.0% of the ratio of the peak responses, *Standard solution*

**Interference:** No discernible signal is observed at the retention time of anthralin, *Solvent blank solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of anthralin ( $C_{14}H_{10}O_3$ ) in the portion of Cream taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratio of anthralin to *o*-nitroaniline from the *Sample solution*

$R_S$  = peak response ratio of anthralin to *o*-nitroaniline peak from the *Standard solution*

$C_S$  = concentration of USP Anthralin RS in the *Standard solution* ( $\mu$ g/mL)

$C_U$  = nominal concentration of anthralin in the *Sample solution* ( $\mu$ g/mL)

**Acceptance criteria:** 90.0%–115.0% for Cream labeled to contain more than 0.1% of anthralin; 90.0%–130.0% for Cream labeled to contain 0.1% or less of anthralin

### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers, in a cool place. Protect from light.

• **LABELING:** Label it to indicate whether the cream vehicle is aqueous or oily.

• **USP REFERENCE STANDARDS** <11>  
USP Anthralin RS

## Anthralin Ointment

### DEFINITION

Anthralin Ointment is Anthralin in a petrolatum or other oleaginous vehicle. Ointment labeled to contain more than 0.1% of anthralin contains NLT 90.0% and NMT 115.0% of the labeled amount of anthralin ( $C_{14}H_{10}O_3$ ), and Ointment labeled to contain 0.1% or less of anthralin contains NLT 90.0% and NMT 130.0% of the labeled amount of anthralin ( $C_{14}H_{10}O_3$ ).

### ASSAY

#### • PROCEDURE

[NOTE—Use low-actinic glassware.]

**Mobile phase:** *n*-Hexane, dichloromethane, and glacial acetic acid (82:12:6)

**Internal standard solution:** 0.5 mg/mL of *o*-nitroaniline in *n*-hexane prepared as follows. First dissolve *o*-nitroaniline in a small quantity of dichloromethane, and then dilute with *n*-hexane.

**System suitability stock solution:** 0.1 mg/mL of USP Anthralin RS and 0.2 mg/mL of danthron in dichloromethane

**System suitability solution:** Transfer 5 mL of the *System suitability stock solution* into a 25-mL volumetric flask, add 5 mL of *n*-hexane, and dilute with *Mobile phase* to volume.

**Solvent blank solution:** *Mobile phase*, *n*-hexane, and dichloromethane (3:1:1)

**Standard stock solution:** 0.25 mg/mL of USP Anthralin RS in dichloromethane

**Standard solution:** Transfer 2 mL each of *Standard stock solution* and *Internal standard solution* into a 25-mL volumetric flask, and dilute with *Mobile phase* to volume.

**Sample stock solution:** Weigh 5 g of Ointment into a 100-mL beaker. Add 20 mL of dichloromethane and 10 mL of glacial acetic acid, and stir to disperse the Ointment. Transfer the contents of the beaker to a filter paper (Whatman No. 4, or equivalent) with the aid of dichloromethane, and filter into a 100-mL volumetric flask. Thoroughly wash the precipitate with dichloromethane, and allow the washings to drain into the flask. Dilute with dichloromethane to volume.

**Sample solution:** Transfer a volume of *Sample stock solution* equivalent to 0.5 mg of anthralin and 2 mL of *Internal standard solution* into a 25-mL volumetric flask, and dilute with *Mobile phase* to volume.

- **PACKAGING AND STORAGE:** Preserve in tight containers, in a cool place. Protect from light.
- **USP REFERENCE STANDARDS (11)**  
USP Anthralin RS

**Anthrax Vaccine Adsorbed**

» Anthrax Vaccine Adsorbed is a sterile, milky-white suspension made from cell-free filtrates of microaerophilic cultures of an avirulent, nonencapsulated strain of *Bacillus anthracis*. The final product contains no dead or live bacteria. The production cultures are grown in a chemically defined protein-free medium containing amino acids, vitamins, inorganic salts, and sugars. The sterile filtrate is adsorbed on sterile aluminum hydroxide, concentrated 10-fold, and resuspended in sterile physiological saline containing formaldehyde with benzethonium chloride as a preservative. Sublots may be combined to produce final lots. The product meets potency requirements when tested against the U.S. Reference Standard Anthrax Vaccine, in accordance with approved procedures (guinea pig intracutaneous challenge models).

**Packaging and storage**—Preserve in multiple-dose tight Type I glass containers, and store at a temperature between 2° and 8°. Do not freeze.

**Expiration date**—The expiration date is 18 months from the date of manufacture.

**Labeling**—Label it to state that it is to be well shaken before use and that it is not to be frozen.

**FILTRATE—****Identification—**

**Trichloroacetic acid solution**—Prepare a solution of trichloroacetic acid (see *Reagent Specifications* in the section *Reagents, Indicators, and Solutions*) in water containing 100 g trichloroacetic acid per 100 mL of the solution.

**Sample buffer**—Prepare a solution containing 141 mM tris(hydroxymethyl)aminomethane, 106 mM tris(hydroxymethyl)aminomethane hydrochloride, 0.51 mM edetate disodium, 2% (w/v) dodecyl lithium sulfate, 10% (v/v) glycerol, 0.22 mM Coomassie blue G-250, and 0.175 mM phenolsulfonphthalein. If necessary, adjust with hydrochloric acid or sodium hydroxide to a pH of 8.5.

**Running buffer**—Prepare a solution containing 25 mM tris(hydroxymethyl)aminomethane, 192 mM glycine, and 0.1% (w/v) dodecyl sodium sulfate (see *Reagent Specifications* in the section *Reagents, Indicators, and Solutions*) in water. If necessary, adjust with hydrochloric acid or sodium hydroxide to a pH of 8.5.

**Transblotting buffer**—Prepare a solution containing 12.5 mM tris(hydroxymethyl)aminomethane, 96 mM glycine, and 10% (v/v) methanol. If necessary, adjust with hydrochloric acid or sodium hydroxide to a pH of 8.0.

**Blocking buffer**—Prepare a solution containing 10 mM monobasic sodium phosphate, 150 mM sodium chloride, 5% (w/v) nonfat dry milk, and 0.05% (w/v) Polysorbate 20. Adjust with sodium hydroxide to a pH of 7.4.

**Primary antibody solutions**—Prepare suitable monoclonal antibodies raised against the Protective Antigen (PA), the Lethal Factor (LF), and the Edema Factor (EF), respectively, of *Bacillus anthracis* in murine ascites cells, harvested, and used without further purification. Immediately before use, dilute each of the murine ascites fluids containing the monoclonal antibodies 1:1000 (v/v) with the *Blocking buffer*.

**Secondary antibody solution**—Immediately before use, dissolve according to the manufacturer's instructions, if necessary, and dilute the stock horseradish peroxidase conjugated to goat anti-mouse IgG solution 1:1000 with *Blocking buffer*.

**Chromogenic visualization solution**—Prepare a 150 mg per mL solution of 4-chloro-1-naphthol in water.

**Test solution**—Use Anthrax Vaccine Filtrate as is.

**Procedure**—In a suitable centrifuge tube transfer 30/c mL of the *Test solution*, where c is the total protein concentration, in µg per mL, of the solution as determined in the test for *Total protein*. Add 16.5/c mL of *Trichloroacetic acid solution*, and incubate for at least 10 minutes. Centrifuge at 9000g for about 10 minutes, decant off the supernatant, and hold the tube inverted to drain on a filter paper. Dissolve the pellet in about 60 µL of *Sample buffer*, and transfer the solution to a polypropylene microfuge tube that has a lid. Close the lid tightly, secure with a lid-lock, and heat at 100° for 5 minutes. Allow the solution to cool to room temperature, and centrifuge at 10,000g for 15 seconds to collect the liquids. In a suitable device for polyacrylamide-gel electrophoresis (see *Electrophoresis* (726) and the section *Polyacrylamide Gel Electrophoresis* under *Biotechnology-Derived Articles—Tests* (1047)) add appropriate volumes of the *Running buffer* in the upper and the lower buffer chambers. Attach a 4%–20% gradient tris-glycine polyacrylamide slab gel sandwiched between two glass plates, such that the wells for sample application are exposed to the *Running buffer* in the upper buffer chamber. Apply about 20-µL aliquots of the treated *Test solution* in three alternate lanes. [NOTE—Do not apply any solution in the outside lanes.] Connect the lower buffer chamber electrode to the positive ter-

minal and the upper buffer chamber electrode to the negative terminal of a suitable power supply unit, and carry out the electrophoresis at a constant current of about 40 mA. When the dye-front is about 1 cm from the bottom of the gel (about 40 minutes), stop the current, and remove the gel from the gel assembly. [NOTE—Do not touch the gel with bare hand. Use gloves.]

Place 3–4 filter papers, cut to the size of the gel and soaked in the *Transblotting buffer*, on the anode plate of a suitable semidry electroblotter. Cut a nitrocellulose membrane to the same size as the gel plus 1–2 mm on each side, and “wet” the membrane by immersing it into the *Transblotting buffer* for about 15 seconds, such that there is no air-bubble between the buffer and the membrane. Place the “wet” membrane immediately on the stack of filter papers, and remove all air bubbles between the membrane and filter paper by rolling a pipet, or equivalent, gently over the surface of the membrane. Place a few drops of the *Transblotting buffer* on the membrane, and then carefully place the gel on it. Gently roll a pipet, or equivalent, over the surface of the gel to ensure intimate contact between the gel and the membrane, making sure that there are no air bubbles in between. Place a filter paper cut to the size of the gel and soaked in the *Transblotting buffer*, such that there is no air-bubble between the filter paper and the gel. Place 2–3 additional filter papers, prepared in a similar manner, on the top, and complete the transfer stack by placing the cathode plate on the top. Apply a current of about 250 mA, and continue transfer for 90 minutes.

Remove the membrane, and wash it quickly by immersing into water for 15 seconds. [NOTE—Do not touch the membrane with bare hand. Use gloves.] Cut the membrane into three strips such that each strip contains a lane containing the *Test solution*, and mark the strips as PA, LF, and EF at the top. Place each strip in a heat-sealable bag, add 5 mL of *Blocking buffer*, and seal the bag. Incubate for 30 minutes with constant agitation. Open each bag, and pour out the *Blocking buffer*. Add 9 mL of the diluted *Primary antibody solution* against PA to the bag containing the strip marked PA. Similarly, add 9 mL of the diluted *Primary antibody solution* against LF and EF to the bags containing strips labeled LF and EF, respectively. Seal the bags, and incubate under agitation for 2 hours at room temperature or overnight at 2° to 8°. Remove the strips from the plastic bags, and place in separate plastic boxes. Add sufficient *Blocking buffer* so that each strip is completely immersed. Agitate for at least 30 minutes at room temperature with two changes of *Blocking buffer*. Remove the strips, and place each strip in a new heat-sealable plastic bag. Add 9 mL of the *Secondary antibody solution* to each plastic bag. Seal the bags, and incubate for 1 hour at room temperature under agitation. Remove the strips from the plastic bags, and place in separate plastic boxes. Add sufficient *Blocking buffer* so that each strip is completely immersed. Agitate for at least 30 minutes at room temperature with two changes of the *Blocking buffer*. Transfer each strip into a new heat-sealable plastic bag, add 9 mL *Chromogenic visualization solution*, 10  $\mu$ L of 30% (v/v) hydrogen peroxide, and seal the bags. Incubate for about 30 minutes under agitation. Transfer the strips into separate plastic boxes, and remove the excess 4-chloro-1-naphthol by incubating with water under agitation for 10 minutes. Visual observation indicates a strong positive band on the strip labeled PA (Protective Antigen), a faintly detectable band on the strip labeled LF (Lethal Factor), and no detectable band on the strip labeled EF (Edema Factor).

### 83 kDa protein—

*Trichloroacetic acid solution*, *Sample buffer*, *Running buffer*, and *Test solution*—Prepare as directed under *Identification*.

*Staining solution*—Prepare a solution of Coomassie blue G-250 having a concentration of 1.25 g per L in a mixture of water, methanol, and acetic acid (5:4:1, v/v).

*Protein molecular weight standard solution*—Reconstitute a vial of protein molecular weight standard mixture contain-

ing proteins of molecular weights at least in the range of 14 to 200 kDa, according to manufacturer's instruction. Dilute the solution with *Sample buffer* such that the concentration of each protein in the solution is about 0.5  $\mu$ g per  $\mu$ L.

*Procedure*—In a suitable centrifuge tube transfer 10/*c* mL of the *Test solution*, where *c* is the total protein concentration, in  $\mu$ g per mL, of the solution as determined by the test for *Total protein* (see below). Add 5.5/*c* mL of *Trichloroacetic acid solution*, and incubate for at least 10 minutes. Centrifuge at 9000*g* for about 10 minutes, decant off the supernatant, and hold the tube inverted to drain on a filter paper. Dissolve the pellet in 20  $\mu$ L of *Sample buffer*, and transfer the solution to a polypropylene microfuge tube with a lid. Transfer 20  $\mu$ L of *Protein molecular weight standard solution* to another polypropylene microfuge tube with a lid. Close the lids tightly, secure with lid-locks, and heat both solutions at 100° for 5 minutes. Allow the solutions to cool to room temperature, and centrifuge at 10,000*g* for 15 seconds to collect the liquids. Apply the solutions to two consecutive lanes of a 4%–20% gradient tris-glycine polyacrylamide slab gel [NOTE—Do not apply any solution in the outside lanes.], and electrophorese as directed under *Identification* (see *Electrophoresis* (726) and the section *Polyacrylamide Gel Electrophoresis* under *Biotechnology-Derived Articles*—*Tests* (1047)). When the dye-front is about 1 cm from the bottom of the gel (about 40 minutes), stop the current, and remove the gel from the gel assembly. Soak the gel in a suitable volume of the *Staining solution* for at least 1 hour, such that the gel is completely immersed in the *Staining solution* during staining. [NOTE—Do not touch the gel with bare hand. Use disposable gloves.] Destain the gel with a large volume of water under constant agitation with repeated changes of water until the background of the gel is completely color free. Using the molecular weights of the proteins in *Protein molecular weight standard solution*, identify the band corresponding to the Protective Antigen (MW about 83 kDa) in the *Test solution* lane. [NOTE—This band is also the single most predominant band in the lane of the *Test solution*.] Scan the gel, and determine the relative amount (by peak area) of the 83-kDa band by densitometry in the lane of the *Test solution*. The content of 83 kDa band is not less than 35% of the total peak area.

### Total protein—

*Standard solution A*—Prepare a solution of albumin bovine serum (see *Reagent Specifications* in the section *Reagents, Indicators, and Solutions*) in water to obtain a known concentration of about 2.0 mg per mL.

*Standard solutions B, C, D, and E*—Dilute *Standard solution A* with water to obtain solutions having protein concentrations of 4, 8, 16, and 24  $\mu$ g per mL, respectively.

*Test solution*—Use Anthrax Vaccine Filtrate as is.

*Procedure* (See *Biotechnology-Derived Articles*—*Tests* (1047), *Total Protein Assay, Method 3*)—To a series of test tubes transfer 800  $\mu$ L each of *Standard solutions B, C, D, and E* and the *Test solution*. Also transfer 800  $\mu$ L of water to be used as the blank. Add 200  $\mu$ L of Coomassie blue G-250 dye solution (see *Reagent Specifications* in the section *Reagents, Indicators, and Solutions*) to each tube, and mix without foaming. Determine absorbances of the solutions at 595 nm using a suitable spectrophotometer (see *Spectrophotometry and Light-Scattering* (851)), using the blank to set the instrument to zero. [NOTE—Do not use quartz (silica) spectrophotometer cells; the dye binds to silica.] Construct a standard curve by plotting the absorbances versus protein concentrations, in  $\mu$ g per mL, of *Standard solutions B, C, D, and E* and by drawing a best-fit straight line using the linear regression method. From the standard curve, determine the total protein concentration of the *Test solution* using the absorbance value. The protein concentration is between 5 and 20  $\mu$ g per mL.

**FINAL PRODUCT—****Aluminum—**

**Standard solutions**—Prepare as directed for *Standard Preparations* under *Aluminum* (206), except to prepare solutions containing 10, 20, 30, 40, and 50 µg per mL of aluminum.

**Test solution**—Mix Anthrax Vaccine Adsorbed, Final Product well, and transfer 0.2 mL to a 10-mL volumetric flask. Add 0.5 mL of concentrated sulfuric acid and 0.5 mL of concentrated nitric acid, and mix gently. Incubate at room temperature for 30 minutes or until the solution becomes essentially clear. Dilute with water to volume.

**Procedure**—Proceed as directed for *Procedure* under *Aluminum* (206). Plot the absorbances versus the content of aluminum, in µg per mL, for the *Standard solutions*, and draw a best-fit straight line through the points using a linear regression model. Calculate the amount of aluminum in Anthrax Vaccine Adsorbed, in mg per mL. The aluminum concentration is between 0.8 and 1.5 mg per mL.

**Safety**—It meets the requirements when tested as directed in the section *Safety Tests—Biologicals* under *Biological Reactivity Tests, In Vivo* (88).

**Sterility** (71)—It meets the requirements when tested as directed for *Direct Inoculation of the Culture Medium* method under *Test for Sterility of the Product to be Examined*.

**pH** (791): between 7.5 and 8.5.

**Sodium chloride—**

**Standard solutions A and B**—Prepare two solutions of sodium chloride in water having concentrations of 0.2 mM and 2.0 mM, respectively.

**Test solution**—Transfer 0.5 mL of Anthrax Vaccine Adsorbed, Final Product to a 50-mL volumetric flask. Dilute with water to volume.

**Procedure**—Determine the voltage readings of *Standard solutions A* and *B* and the *Test solution* using an ion-specific electrode specific for the chloride ion electrically coupled with a standard silver-silver chloride reference electrode. Plot the voltage readings versus concentration of chloride, in mg per mL, for *Standard solutions A* and *B*, and draw a straight line joining the points. Calculate the concentration of chloride ion in the *Test solution* from the voltage reading. Assuming that the chloride ion comes entirely from sodium chloride, calculate the concentrations of sodium chloride in the *Test solution*. The concentration of sodium chloride in Anthrax Vaccine Adsorbed is between 0.75% and 0.95% (w/v).

**Formaldehyde—**

**Potassium ferricyanide solution**—Dissolve 2.5 g of potassium ferricyanide in about 100 mL of water, and mix.

**Phenylhydrazine hydrochloride solution**—Dissolve 4 g of phenylhydrazine hydrochloride in 100 mL of absolute alcohol, add 2 mL of water, and mix.

**Standard stock solution**—To prepare a stock solution, proceed as directed in the *Assay* under *Formaldehyde Solution* to determine the concentration of formaldehyde in percent (w/v).

**Standard solutions**—Dilute the *Standard stock solution* in water to obtain solutions having concentrations of 0.005%, 0.01%, and 0.02% (w/v).

**Test solution**—Use Anthrax Vaccine Adsorbed, Final Product as is.

**Procedure**—To suitable glass centrifuge tubes transfer 1.0 mL each of water, the *Standard solutions*, and the *Test solution*. To each tube add 1.0 mL of *Potassium ferricyanide solution*, 4.0 mL of 18% (w/v) hydrochloric acid and 2.0 mL of *Phenylhydrazine hydrochloride solution*. Mix after each addition. Incubate for 50 to 60 minutes at room temperature. Centrifuge the solutions at 10,000g for at least 10 minutes, and measure absorbances of the supernatants at 540 nm using a suitable spectrophotometer (see *Spectrophotometry and Light-Scattering* (851)). Plot the absorbances versus concentrations of formaldehyde, in mg per mL, in the *Standard*

*solutions*, and draw the best-fit straight line through the points. Calculate the amount of formaldehyde in the sample in percent (w/v). The concentration of formaldehyde in Anthrax Vaccine Adsorbed is less than 0.02% (w/v).

**Benzethonium chloride—**

**Citrate buffer**—Dissolve 25 g of citric acid monohydrate in about 60 mL of water, and adjust with a solution of sodium hydroxide to a pH of 4.5. Transfer the solution to a 100-mL volumetric flask. Dilute with water to volume, and mix.

**Dye solution**—Dissolve 50 mg of 2',4',5',7'-tetrabromofluorescein in about 100 mL water, and mix. Dilute 1 mL of this solution to 100 mL with water.

**Docusate sodium solution**—Dissolve 50 mg of docusate sodium in 1 L of water.

**Standard solution A**—Transfer about 0.5 g, accurately weighed, of benzethonium chloride to a 100-mL volumetric flask, dissolve in about 60 mL water, dilute with water to volume, and mix.

**Standard solutions B, C, D, and E**—Dilute *Standard solution A* with water to obtain solutions having concentrations of 0.001%, 0.002%, 0.003%, and 0.004% (w/v), respectively.

**Test solution**—Use Anthrax Vaccine Adsorbed, Final Product as is.

**Procedure**—Transfer 4.0 mL each of *Standard solutions B, C, D, and E* and the *Test solution* to suitable glass centrifuge tubes. Add 1.0 mL *Citrate buffer* and 0.4 mL of the *Dye solution* to each tube, and mix. Add 4.0 mL of 1,1,2,2-tetrachloroethane to each tube, and vigorously mix on a vortex mixer for 1 minute. Centrifuge at about 1000g for at least 15 minutes to separate the organic layer from the aqueous layer. Transfer 2.0 mL of the organic layer from the tubes to another set of glass tubes. Add 4.0 mL of water and 0.5 mL of *Citrate buffer* to each tube, and mix on a vortex mixer for approximately 1 minute. Titrate the benzethonium chloride-dye complex in each tube with the *Docusate sodium solution* (see *Titrimetry* (541)) to the colorimetric endpoint indicated by the disappearance of the pink color of the organic layer. [NOTE—Vigorously mix the solution on a vortex mixer after each addition of the *Docusate sodium solution*.] Plot the volumes of *Docusate sodium solution* required versus the concentrations of benzethonium chloride in *Standard solutions B, C, D, and E*, and draw a best-fit straight line through the points. Determine the concentration of benzethonium chloride in the *Test solution* from the volume of *Docusate sodium solution* required to titrate the *Test solution*. The concentration of benzethonium chloride in Anthrax Vaccine Adsorbed is between 0.0015% and 0.0030% (w/v).

**Relative potency—**

**Standard solutions**—Dilute approved U.S. Reference Standard Anthrax Vaccine 1:1.6, 1:4, 1:10, and 1:25 aseptically with a sterile 0.9% sodium chloride solution.

**Test solutions**—Dilute Anthrax Vaccine Adsorbed, Final Product 1:1.6, 1:4, 1:10, and 1:25 aseptically with a sterile 0.9% sodium chloride solution.

**Procedure**—Assign each dilution to a set of 12 randomly selected guinea pigs, strain Mdh:S(RA), 6 males and 6 females, each weighing 315 to 385 g on the day of vaccination. Inject the animals subcutaneously in the ventral abdomen with 0.5 mL of the assigned dilutions. On the 14th day post-vaccination, challenge the animals with approximately 1000 spores of *Bacillus anthracis* Vollum 1B, and record the deaths daily for a 10-day observation period. Record the numbers of surviving animals for each of the *Standard solutions* and the *Test solutions* at the end of the test. Perform calculations by estimating best-fit lines for the *Standard solutions* and the *Test solutions* using a logistic regression model that utilizes the number of animals that survived at the end of the test and the time to death for the animals that died. Evaluate statistically the lines corresponding to the *Standard solutions* and the *Test solutions* for parallelism. Determine the common slope, and draw the parallel lines using the common slope. The relative potency of Anthrax Vaccine Ad-

sorbed with respect to the corresponding Approved U.S. Reference Standard Anthrax Vaccine is the antilog of the horizontal distance between the two parallel lines. The relative potency of Anthrax Vaccine Adsorbed is acceptable if it is between 0.53 and 1.79, both values inclusive.

### Anticoagulant Citrate Dextrose Solution

» Anticoagulant Citrate Dextrose Solution is a sterile solution of Citric Acid, Sodium Citrate, and Dextrose in Water for Injection. It contains in each 1000 mL:

	Solution A	Solution B
Total Citrate, expressed as citric acid, anhydrous ( $C_6H_8O_7$ )		
not less than . . . . .	20.59 g	12.37 g
not more than . . . . .	22.75 g	13.67 g
Dextrose ( $C_6H_{12}O_6 \cdot H_2O$ )		
not less than . . . . .	23.28 g	13.96 g
not more than . . . . .	25.73 g	15.44 g
Sodium (Na)		
not less than . . . . .	4.90 g	2.94 g
not more than . . . . .	5.42 g	3.25 g

It contains no antimicrobial agents.  
Prepare Anticoagulant Citrate Dextrose Solution as follows:

	Solution A	Solution B
Citric Acid (anhydrous) . .	7.3 g	4.4 g
Sodium Citrate (dihydrate)	22.0 g	13.2 g
Dextrose (monohydrate)	24.5 g	14.7 g
Water for Injection, a sufficient quantity to make	1000mL	1000mL

Dissolve the ingredients, and mix. Filter the solution until clear, place immediately in suitable containers, and sterilize.

If desired, 8 g and 4.8 g of monohydrated citric acid may be used instead of the indicated, respective amounts of anhydrous citric acid; 19.3 g and 11.6 g of anhydrous sodium citrate may be used instead of the indicated, respective amounts of dihydrated sodium citrate; and 22.3 g and 13.4 g of anhydrous dextrose may be used instead of the indicated, respective amounts of monohydrated dextrose.

**Packaging and storage**—Preserve in single-dose containers, of colorless, transparent, Type I or Type II glass, or of a suitable plastic material (see *Transfusion and Infusion Assemblies and Similar Medical Devices* <161>).

**Labeling**—Label it to indicate the number of mL of Solution required per 100 mL of whole blood or the number of mL of Solution required per volume of whole blood to be collected.

**USP Reference standards** <11>—

USP Citric Acid RS

USP Endotoxin RS

**Identification**—It responds to the *Identification* test under *Dextrose*, and, when concentrated to one-half its volume, responds to the tests for *Citrate* <191> and for *Sodium* <191>.

**Bacterial endotoxins** <85>—It contains not more than 5.56 USP Endotoxin Units per mL.

**pH** <791>: between 4.5 and 5.5.

**Chloride** <221>—A 10-mL portion shows no more chloride than corresponds to 0.50 mL of 0.020 N hydrochloric acid (0.0035%).

**Other requirements**—It meets the requirements under *Injections* <1>.

**Assay for total citrate**—

*Mobile Phase, Standard Preparation 1, and Chromatographic System*—Proceed as directed under *Assay for Citric Acid/Citrate and Phosphate* <345>.

*Assay preparation*—Pipet 5 mL of Solution into a suitable volumetric flask, and proceed as directed for *Assay Preparation for Citric Acid/Citrate Assay* under general chapter <345>.

*Procedure*—Proceed as directed for *Procedure* under general chapter <345>, and calculate the quantity, in mg, of anhydrous citric acid ( $C_6H_8O_7$ ) in the volume of Solution taken by the formula:

$$0.001(192.12/189.10)C_5 D(r_U / r_S)$$

in which 192.12 is the molecular weight of anhydrous citric acid; 189.10 is the molecular weight of citrate ( $C_6H_5O_7$ );  $C_5$  is the concentration, in  $\mu\text{g}$  per mL, of citrate in *Standard Preparation 1*;  $D$  is the dilution factor; and  $r_U$  and  $r_S$  are the citrate peak areas obtained from the *Assay preparation* and *Standard Preparation 1*, respectively.

**Assay for sodium**—Proceed as directed in the *Assay for sodium under Anticoagulant Citrate Phosphate Dextrose Adenine Solution*.

**Assay for dextrose**—Determine the angular rotation of Solution in a suitable polarimeter tube (see *Optical Rotation* <781>). Where the Solution is labeled to contain anhydrous dextrose, calculate the percentage (g per 100 mL) of  $C_6H_{12}O_6$  in the portion of Solution taken by the formula:

$$(100/52.9)AR$$

in which 100 is the percentage; 52.9 is the midpoint of the specific rotation range for anhydrous dextrose, in degrees;  $A$  is 100 mm divided by the length of the polarimeter tube, in mm; and  $R$  is the observed rotation, in degrees. Where the Solution is labeled to contain dextrose monohydrate, calculate the percentage (g per 100 mL)  $C_6H_{12}O_6 \cdot H_2O$  in the portion of Solution taken by the formula:

$$(100/52.9)(198.17/180.16)AR$$

in which 100 is the percentage; 52.9 is the midpoint of the specific rotation range for anhydrous dextrose, in degrees; 198.17 and 180.16 are the molecular weights for dextrose monohydrate and anhydrous dextrose, respectively;  $A$  is 100 mm divided by the length of the polarimeter tube, in mm; and  $R$  is the observed rotation, in degrees.

## Anticoagulant Citrate Phosphate Dextrose Solution

» Anticoagulant Citrate Phosphate Dextrose Solution is a sterile solution of Citric Acid, Sodium Citrate, Monobasic Sodium Phosphate, and Dextrose in Water for Injection. It contains, in each 1000 mL, not less than 2.11 g and not more than 2.33 g of monobasic sodium phosphate ( $\text{NaH}_2\text{PO}_4 \cdot \text{H}_2\text{O}$ ); not less than 24.22 g and not more than 26.78 g of dextrose ( $\text{C}_6\text{H}_{12}\text{O}_6 \cdot \text{H}_2\text{O}$ ); not less than 19.16 g and not more than 21.18 g of total citrate, expressed as citric acid, anhydrous ( $\text{C}_6\text{H}_8\text{O}_7$ ); and not less than 6.21 g and not more than 6.86 g of Sodium (Na). It contains no antimicrobial agents.

Prepare Anticoagulant Citrate Phosphate Dextrose Solution as follows:

Citric Acid (anhydrous) . . . . .	2.99 g
Sodium Citrate (dihydrate) . . . . .	26.3 g
Monobasic Sodium Phosphate (monohydrate; $\text{NaH}_2\text{PO}_4 \cdot \text{H}_2\text{O}$ ) . . . . .	2.22 g
Dextrose (monohydrate) . . . . .	25.5 g
Water for Injection, a sufficient quantity, to make . . . . .	1000 mL

Dissolve the ingredients, and mix. Filter the solution until clear, place immediately in suitable containers, and sterilize.

If desired, 3.27 g of monohydrated citric acid may be used instead of the indicated amount of anhydrous citric acid; 23.06 g of anhydrous sodium citrate may be used instead of the indicated amount of dihydrated sodium citrate; 1.93 g of anhydrous monobasic sodium phosphate may be used instead of the indicated amount of monohydrated monobasic sodium phosphate; and 23.2 g of anhydrous dextrose may be used instead of the indicated amount of monohydrated dextrose.

**Packaging and storage**—Preserve in single-dose containers, of colorless, transparent, Type I or Type II glass, or of a suitable plastic material (see *Transfusion and Infusion Assemblies and Similar Medical Devices* <161>).

**Labeling**—Label it to indicate the number of mL of Solution required per 100 mL of whole blood or the number of mL of Solution required per volume of whole blood to be collected.

**USP Reference standards** <11>—

USP Citric Acid RS

USP Endotoxin RS

**Identification**—It responds to the *Identification* test under *Dextrose*, and to the tests for *Phosphate* <191>, and, when concentrated to one-half its volume, responds to the tests for *Citrate* <191> and for *Sodium* <191>.

**Bacterial endotoxins** <85>—It contains not more than 5.56 USP Endotoxin Units per mL.

**pH** <791>: between 5.0 and 6.0.

**Chloride** <221>—A 10-mL portion shows no more chloride than corresponds to 0.50 mL of 0.020 N hydrochloric acid (0.0035%).

**Other requirements**—It meets the requirements under *Injections* <1>.

**Assay for total citrate and total phosphate**—

*Mobile Phase, Standard Preparation 2, and Chromatographic System*—Proceed as directed under *Assay for Citric Acid/Citrate and Phosphate* <345>.

*Assay preparation for total citrate assay*—Pipet 10 mL of Solution into a suitable volumetric flask, and proceed as directed for *Assay Preparation for Citric Acid/Citrate Assay* under general chapter <345>.

*Assay preparation for total phosphate assay*—Pipet 5 mL of Solution into a suitable volumetric flask, and proceed as directed for *Assay Preparation for Phosphate Assay* under general chapter <345>.

*Procedure*—Proceed as directed for *Procedure* under general chapter <345>, and calculate the quantity, in mg, of anhydrous citric acid ( $\text{C}_6\text{H}_8\text{O}_7$ ) in the volume of Solution taken by the formula:

$$0.001(192.12/189.10)C_S D(r_U / r_S)$$

in which 192.12 is the molecular weight of anhydrous citric acid; 189.10 is the molecular weight of citrate ( $\text{C}_6\text{H}_5\text{O}_7$ );  $C_S$  is the concentration, in  $\mu\text{g}$  per mL, of citrate in *Standard Preparation 2*;  $D$  is the dilution factor; and  $r_U$  and  $r_S$  are the citrate peak areas obtained from the *Assay preparation for total citrate assay* and *Standard Preparation 2*, respectively.

Calculate the quantity, in mg, of phosphate, expressed as monobasic sodium phosphate monohydrate ( $\text{NaH}_2\text{PO}_4 \cdot \text{H}_2\text{O}$ ), in the volume of Solution taken by the formula:

$$0.001(137.99/94.97)C_S D(r_U / r_S)$$

in which 137.99 is the molecular weight of monobasic sodium phosphate monohydrate; 94.97 is the molecular weight of phosphate ( $\text{PO}_4$ );  $C_S$  is the concentration, in  $\mu\text{g}$  per mL, of phosphate in *Standard Preparation 2*;  $D$  is the dilution factor; and  $r_U$  and  $r_S$  are the phosphate peak areas obtained from the *Assay preparation for total phosphate assay* and *Standard Preparation 2*, respectively.

**Assay for dextrose**—Tare a clean, medium-porosity filtering crucible containing several carborundum boiling chips or glass beads. Pipet 50 mL of freshly mixed alkaline cupric tartrate TS into a 400-mL beaker. Add the boiling chips or glass beads from the tared crucible, 45 mL of water, and 5.0 mL of Solution to the beaker. Heat the beaker and contents over a burner that has been adjusted to cause boiling of the solution to start in 3.5 to 4 minutes. Boil the solution for 2 minutes, accurately timed, and filter immediately through the tared crucible, taking care to transfer all of the boiling chips or glass beads to the crucible. Wash the precipitate with hot water and 10 mL of alcohol. Dry the crucible and contents at  $110^\circ$  to constant weight. Perform a blank determination, and correct the weight of the precipitate from the sample for any precipitate obtained in the blank. Each mg of cuprous oxide precipitate obtained from the substance under assay is equivalent to 0.496 mg of  $\text{C}_6\text{H}_{12}\text{O}_6 \cdot \text{H}_2\text{O}$ .

**Assay for sodium**—Proceed as directed in the *Assay for sodium* under *Anticoagulant Citrate Phosphate Dextrose Adenine Solution*.

## Anticoagulant Citrate Phosphate Dextrose Adenine Solution

» Anticoagulant Citrate Phosphate Dextrose Adenine Solution is a sterile solution of Citric Acid, Sodium Citrate, Monobasic Sodium Phosphate, Dextrose, and Adenine in Water for Injection. It contains, in each 1000 mL, not less than 2.11 g and not more than 2.33 g of monobasic sodium phosphate ( $\text{NaH}_2\text{PO}_4 \cdot \text{H}_2\text{O}$ ); not less than 30.30 g and not more than 33.50 g of dextrose ( $\text{C}_6\text{H}_{12}\text{O}_6 \cdot \text{H}_2\text{O}$ ); not less than 19.16 g and not more than 21.18 g of total citrate, expressed as citric acid, anhydrous ( $\text{C}_6\text{H}_8\text{O}_7$ ); not less than 6.21 g and not more than 6.86 g of sodium (Na); and not less than 0.247 g and not more than 0.303 g of adenine ( $\text{C}_5\text{H}_5\text{N}_5$ ). It contains no antimicrobial agents.

Prepare Anticoagulant Citrate Phosphate Dextrose Adenine Solution as follows:

Citric Acid (anhydrous) . . . . .	2.99 g
Sodium Citrate (dihydrate) . . . . .	26.3 g
Monobasic Sodium Phosphate (monohydrate; $\text{NaH}_2\text{PO}_4 \cdot \text{H}_2\text{O}$ ) . . . . .	2.22 g
Dextrose (monohydrate) . . . . .	31.9 g
Adenine ( $\text{C}_5\text{H}_5\text{N}_5$ ) . . . . .	0.275 g
Water for Injection, a sufficient quantity, to make . . . . .	1000 mL

Dissolve the ingredients, and mix. Filter the solution until clear, place immediately in suitable containers, and sterilize.

If desired, 3.27 g of monohydrated citric acid may be used instead of the indicated amount of anhydrous citric acid; 23.06 g of anhydrous sodium citrate may be used instead of the indicated amount of dihydrated sodium citrate; 1.93 g of anhydrous monobasic sodium phosphate may be used instead of the indicated amount of monohydrated monobasic sodium phosphate; and 29.0 g of anhydrous dextrose may be used instead of the indicated amount of monohydrated dextrose.

**Packaging and storage**—Preserve in single-dose containers, of colorless, transparent, Type I or Type II glass, or of a suitable plastic material (see *Transfusion and Infusion Assemblies and Similar Medical Devices* (161)).

**Labeling**—Label it to indicate the number of mL of solution required per 100 mL of whole blood or the number of mL of solution required per volume of whole blood to be collected.

**USP Reference standards** (11)—

USP Adenine RS  
USP Citric Acid RS  
USP Endotoxin RS

**Bacterial endotoxins** (85)—It contains not more than 5.56 USP Endotoxin Units per mL.

**pH** (791): between 5.0 and 6.0.

**Chloride** (221)—A 10-mL portion shows no more chloride than corresponds to 0.50 mL of 0.020 N hydrochloric acid (0.0035%).

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay for total citrate and total phosphate**—

*Mobile Phase, Standard Preparation 2, and Chromatographic System*—Proceed as directed under *Assay for Citric Acid/Citrate and Phosphate* (345).

*Assay preparation for total citrate assay*—Pipet 10 mL of Solution into a suitable volumetric flask, and proceed as directed for *Assay Preparation for Citric Acid/Citrate Assay* under general chapter (345).

*Assay preparation for total phosphate assay*—Pipet 5 mL of Solution into a suitable volumetric flask, and proceed as directed for *Assay Preparation for Phosphate Assay* under general chapter (345).

*Procedure*—Proceed as directed for *Procedure* under general chapter (345), and calculate the quantity, in mg, of anhydrous citric acid ( $\text{C}_6\text{H}_8\text{O}_7$ ) in the volume of Solution taken by the formula:

$$0.001(192.12/189.10)C_5 D(r_U / r_S)$$

in which 192.12 is the molecular weight of anhydrous citric acid; 189.10 is the molecular weight of citrate ( $\text{C}_6\text{H}_5\text{O}_7$ );  $C_5$  is the concentration, in  $\mu\text{g}$  per mL, of citrate in *Standard Preparation 2*;  $D$  is the dilution factor; and  $r_U$  and  $r_S$  are the citrate peak areas obtained from the *Assay preparation for total citrate assay* and *Standard Preparation 2*, respectively.

Calculate the quantity, in mg, of phosphate, expressed as monobasic sodium phosphate monohydrate ( $\text{NaH}_2\text{PO}_4 \cdot \text{H}_2\text{O}$ ), in the volume of Solution taken by the formula:

$$0.001(137.99/94.97)C_5 D(r_U / r_S)$$

in which 137.99 is the molecular weight of monobasic sodium phosphate monohydrate; 94.97 is the molecular weight of phosphate ( $\text{PO}_4$ );  $C_5$  is the concentration, in  $\mu\text{g}$  per mL, of phosphate in *Standard Preparation 2*;  $D$  is the dilution factor; and  $r_U$  and  $r_S$  are the phosphate peak areas obtained from the *Assay preparation for total phosphate assay* and *Standard Preparation 2*, respectively.

**Assay for sodium**—

*Lithium diluent solution*—Transfer 1.04 g of lithium nitrate to a 1000-mL volumetric flask, add a suitable nonionic surfactant, then add water to volume, and mix. This solution contains 15 mEq of lithium per L.

*Standard preparation*—Transfer 8.18 g of sodium chloride, previously dried at 105° for 2 hours and accurately weighed, to a 1000-mL volumetric flask, dilute with water to volume, and mix. This solution contains 140 mEq of sodium per L. Transfer 50  $\mu\text{L}$  of this solution to a 10-mL volumetric flask, dilute with *Lithium diluent solution* to volume, and mix.

*Assay preparation*—Pipet 25 mL of Solution into a 50-mL volumetric flask, dilute with water to volume, and mix. Transfer 50  $\mu\text{L}$  of this solution to a 10-mL volumetric flask, dilute with *Lithium diluent solution* to volume, and mix.

*Procedure*—Using a suitable flame photometer, adjusted to read zero with *Lithium diluent solution*, concomitantly determine the sodium flame emission readings for the *Standard preparation* and the *Assay preparation* at the wavelength of maximum emission at about 589 nm. Calculate the quantity, in g, of Na in 1000 mL of Anticoagulant Citrate Phosphate Dextrose Adenine Solution taken by the formula:

$$2(8.18)(22.99/58.44)(R_U/R_S)$$

in which 8.18 is the weight, in g, of sodium chloride taken to make the *Standard preparation*; 22.99 is the atomic

weight of sodium; 58.44 is the molecular weight of sodium chloride; and  $R_U$  and  $R_S$  are the sodium emission readings obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for dextrose**—Tare a clean, medium-porosity filtering crucible containing several carborundum boiling chips or glass beads. Pipet 50 mL of freshly mixed alkaline cupric tartrate TS into a 400-mL beaker. Add the boiling chips or glass beads from the tared crucible, 45 mL of water, and 5.0 mL of Solution to the beaker. Heat the beaker and contents over a burner that has been adjusted to cause boiling of the solution to start in 3.5 to 4 minutes. Boil the solution for 2 minutes, accurately timed, and filter immediately through the tared crucible, taking care to transfer all of the boiling chips or glass beads to the crucible. Wash the precipitate with hot water and 10 mL of alcohol. Dry the crucible and contents at 110° to constant weight. Perform a blank determination, and make any necessary correction. Each mg of cuprous oxide precipitate obtained is equivalent to 0.496 mg of  $C_6H_{12}O_6 \cdot H_2O$ .

#### Assay for adenine—

**Mobile phase**—Dissolve 3.45 g of ammonium dihydrogen phosphate in 950 mL of water in a 1000-mL volumetric flask, add 10 mL of glacial acetic acid, dilute with water to volume, mix, pass through a membrane filter having a 1- $\mu$ m or finer porosity, and degas.

**Standard preparations**—Dissolve accurately weighed quantities of USP Adenine RS in dilute hydrochloric acid (1 in 120) in three separate volumetric flasks, dilute with the dilute hydrochloric acid solution to volume, and mix to obtain Standard preparations having known concentrations of about 0.25, 0.275, and 0.30 mg of adenine per mL, respectively. Protect from light.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm  $\times$  30-cm stainless steel column that contains packing L9. The flow rate is about 2.0 mL per minute. Prepare a solution containing USP Adenine RS and purine, each at about 0.275 mg per mL, in dilute hydrochloric acid (1 in 120), and chromatograph not less than four injections (about 20  $\mu$ L) of this solution: the relative standard deviation of the peak response of adenine is not more than 2.5%, the relative standard deviation of the retention time of adenine is not more than 2.0%, and the resolution of adenine and purine is not less than 3.0.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the Solution and the *Standard preparations*, record the chromatograms, and measure the responses for the major peaks. Plot the responses against the concentrations, in mg of USP Adenine RS per mL of the *Standard preparations*. Calculate the quantity, in mg, of  $C_5H_5N_5$  in each mL of the Solution taken as the value read directly from the Standard curve corresponding to the response obtained from the portion of the Anticoagulant Citrate Phosphate Dextrose Adenine Solution chromatographed.

### Anticoagulant Sodium Citrate Solution

» Anticoagulant Sodium Citrate Solution is a sterile solution of Sodium Citrate in Water for Injection. It contains, in each 100 mL, not less than 3.80 g and not more than 4.20 g of  $C_6H_5Na_3O_7 \cdot 2H_2O$ . It contains no antimicrobial agents.

Sodium Citrate (dihydrate) . . . . .	40 g
Water for Injection, a sufficient quantity to make . . . . .	1000 mL

NOTE—Anhydrous sodium citrate (35.1 g) may be used instead of the dihydrate.

Dissolve the Sodium Citrate in sufficient Water for Injection to make 1000 mL, and filter until clear. Place the solution in suitable containers, and sterilize.

**Packaging and storage**—Preserve in single-dose containers, preferably of Type I or Type II glass.

#### USP Reference standards <11>—

USP Citric Acid RS

USP Endotoxin RS

**Identification**—When evaporated to a concentration of 1 in 20, it responds to the tests for *Sodium* <191> and for *Citrate* <191>.

**Bacterial endotoxins** <85>—It contains not more than 5.56 USP Endotoxin Units per mL.

**pH** <791>: between 6.4 and 7.5.

**Other requirements**—It meets the requirements under *Injections* <1>.

#### Assay—

**Mobile Phase, Standard Preparation 1, and Chromatographic System**—Proceed as directed under *Assay for Citric Acid/Citrate and Phosphate* <345>.

**Assay preparation**—Pipet 10 mL of Solution into a suitable volumetric flask, and proceed as directed for *Assay Preparation for Citric Acid/Citrate Assay* under general chapter <345>.

**Procedure**—Proceed as directed for *Procedure* under general chapter <345>, and calculate the quantity, in mg, of sodium citrate dihydrate ( $C_6H_5Na_3O_7 \cdot 2H_2O$ ) in the volume of Solution taken by the formula:

$$0.001(294.10/189.10)C_S D(r_U / r_S)$$

in which 294.10 is the molecular weight of sodium citrate dihydrate; 189.10 is the molecular weight of citrate ( $C_6H_5O_7$ );  $C_S$  is the concentration, in  $\mu$ g per mL, of citrate in *Standard Preparation 1*;  $D$  is the dilution factor; and  $r_U$  and  $r_S$  are the citrate peak areas obtained from the *Assay preparation* and *Standard Preparation 1*, respectively.

### Antimony Potassium Tartrate

$C_8H_4K_2O_{12}Sb_2 \cdot 3H_2O$  667.87

Antimonate(2-), bis[ $\mu$ -[2,3-dihydroxybutanedioato(4-)- $O^1$ ,  $O^2$ : $O^3$ ,  $O^4$ ]]-di-, dipotassium, trihydrate, stereoisomer.

Dipotassium bis[ $\mu$ -[L-(+)-tartrato(4-)]diantimonate(2-) trihydrate [28300-74-5].

Anhydrous 613.82 [11071-15-1].

» Antimony Potassium Tartrate contains not less than 99.0 percent and not more than 103.0 percent of  $C_8H_4K_2O_{12}Sb_2 \cdot 3H_2O$ .

**Packaging and storage**—Preserve in well-closed containers.

**Completeness of solution** <641>: meets the requirements, using a 750-mg specimen and water as the solvent.

**Identification**—

**A:** When heated to redness, it chars, emits an odor resembling that of burning sugar, and leaves a blackened residue. This residue has an alkaline reaction, and when a small fragment of it is held in a nonluminous flame, the flame is tinted violet.

**B:** In a solution (1 in 20), acidified with hydrochloric acid, hydrogen sulfide TS produces an orange-red precipitate, which is soluble in ammonium sulfide TS and in 1 N sodium hydroxide.

**C:** It responds to the test for *Tartrate* <191>.

**Acidity or alkalinity**—Dissolve 1.0 g in 50 mL of carbon dioxide-free water, and titrate with 0.010 N hydrochloric acid or 0.010 N sodium hydroxide to a pH of 4.5: not more than 2.0 mL is required.

**Loss on drying** <731>—Dry it at 105° to constant weight: it loses not more than 2.7% of its weight.

**Arsenic**—Dissolve 100 mg in 5 mL of hydrochloric acid. Add 10 mL of a recently prepared solution of 20 g of stannous chloride in 30 mL of hydrochloric acid. Mix, transfer to a color-comparison tube, and allow to stand for 30 minutes. Viewed downward over a white surface, the color of the solution appears no deeper than that of a blank to which has been added 15 µg of arsenic (0.015%).

**Lead** <251>: not more than 0.002%.

**Assay**—Dissolve about 500 mg of Antimony Potassium Tartrate, accurately weighed, in 50 mL of water, add 5 g of potassium sodium tartrate, 2 g of sodium borate, and 3 mL of starch TS, and immediately titrate with 0.1 N iodine VS to the production of a persistent blue color. Each mL of 0.1 N iodine is equivalent to 16.70 mg of  $C_8H_4K_2O_{12}Sb_2 \cdot 3H_2O$ .

## Antimony Sodium Tartrate

$C_8H_4Na_2O_{12}Sb_2$  581.61  
Antimonate(2-), bis[ $\mu$ -[2,3-dihydroxybutanedioato(4-)-O<sup>1</sup>, O<sup>2</sup>:O<sup>3</sup>, O<sup>4</sup>]]di-, disodium, stereoisomer.  
Disodium bis[ $\mu$ -[L-(+)-tartrato(4-)]diantimonate(2-)  
[34521-09-0].

» Antimony Sodium Tartrate contains not less than 98.0 percent and not more than 101.0 percent of  $C_8H_4Na_2O_{12}Sb_2$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

**Identification**—It responds to the tests for *Antimony* <191>, for *Sodium* <191>, and for *Tartrate* <191>.

**Acidity or alkalinity**—Dissolve 1.0 g in 50 mL of carbon dioxide-free water, and titrate with 0.010 N hydrochloric acid or 0.010 N sodium hydroxide to a pH of 4.5: not more than 2.0 mL is required.

**Loss on drying** <731>—Dry it at 105° to constant weight: it loses not more than 6.0% of its weight.

**Arsenic, Method II** <211>: 8 ppm.

**Lead** <251>: not more than 0.002%.

**Assay**—Dissolve about 500 mg of Antimony Sodium Tartrate, accurately weighed, in 50 mL of water, add 5 g of potassium sodium tartrate, 2 g of sodium borate, and 3 mL of starch TS, and immediately titrate with 0.1 N iodine VS to the production of a persistent blue color. Each mL of 0.1 N iodine is equivalent to 14.54 mg of  $C_8H_4Na_2O_{12}Sb_2$ .

## Antipyrine

$C_{11}H_{12}N_2O$  188.23

1,2-Dihydro-1,5-dimethyl-2-phenyl-3H-pyrazol-3-one.  
2,3-Dimethyl-1-phenyl-3-pyrazolin-5-one [60-80-0].

» Antipyrine contains not less than 99.0 percent and not more than 100.5 percent of  $C_{11}H_{12}N_2O$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** <11>—

USP Antipyrine RS

**Completeness and color of solution**—It is completely soluble in its own weight of cold water, the solution being colorless or not more than slightly yellow when viewed transversely in a tube having a diameter of about 20 mm.

**Identification**—

**A:** *Infrared Absorption* <197K>.

**B:** *Ultraviolet Absorption* <197U>—

*Solution:* 20 µg per mL.

*Medium:* methanol.

Absorptivities at 266 nm, calculated on the dried basis, do not differ by more than 3.0%.

**C:** Add tannic acid TS to a solution of it: a white precipitate is formed.

**Melting range** <741>: between 110° and 112.5°.

**Loss on drying** <731>—Dry it at 60° for 2 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** <281>: not more than 0.15%.

**Heavy metals** <231>—Dissolve 1 g in 2 mL of 1 N acetic acid, and add water to make 25 mL: the limit is 0.002%.

**Ordinary impurities** <466>—

*Test solution:* chloroform.

*Standard solution:* chloroform.

*Eluant:* a mixture of chloroform, acetone, butyl alcohol, and formic acid (60:15:15:15).

*Visualization:* 1.

**Assay**—Transfer about 150 mg of Antipyrine, accurately weighed, to a 250-mL iodine flask, and dissolve in 25 mL of water. Add 2 g of sodium acetate, 1 mL of diluted acetic acid, and 20.0 mL of 0.1 N iodine VS, mix, and allow to stand in a cool, dark place for 20 minutes. Add 25 mL of alcohol to dissolve the precipitate, and titrate the excess iodine with 0.1 N sodium thiosulfate VS, using starch TS as the indicator. Each mL of 0.1 N iodine is equivalent to 9.412 mg of  $C_{11}H_{12}N_2O$ .

## Antipyrine and Benzocaine Otic Solution

» Antipyrine and Benzocaine Otic Solution is a solution of Antipyrine and Benzocaine in Glycerin. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of antipyrine ( $C_{11}H_{12}N_2O$ ) and benzocaine ( $C_9H_{11}NO_2$ ). [NOTE—In the preparation of this Otic Solution, use Glycerin that has a low water content, in order that the Otic Solution may comply with the *Water* limit. This may be ensured by using Glycerin having a specific gravity of not less than 1.2607, corresponding to a concentration of 99.5 percent.]

**Packaging and storage**—Preserve in tight, light-resistant containers.

### USP Reference standards (11)—

USP Antipyrine RS  
USP Benzocaine RS

### Identification—

**A:** Transfer 5 mL to a separator containing 25 mL of water, and extract the solution with two 25-mL portions of a mixture of equal volumes of ether and solvent hexane. Combine the extracts, and retain the water solution for *Identification* test **B**. Extract the ether-hexane solution with 50 mL of water, and discard the water layer. Evaporate the ether-hexane solution to dryness, dry the residue in vacuum at 40° to 50° for 1 hour, and dissolve the residue in 1 mL of chloroform: the IR absorption spectrum of this solution exhibits maxima at the same wavelengths as that of a similar solution of USP Benzocaine RS, concomitantly measured.

**B:** Add 5 mL of 1 N sodium hydroxide solution to the water solution retained from *Identification* test **A**, and extract with two 25-mL portions of chloroform. Evaporate the combined extracts to dryness, dry the residue in vacuum at 40° to 50° for 1 hour, and dissolve the residue in 3 mL of chloroform: the IR absorption spectrum of this solution exhibits maxima at the same wavelengths as that of a similar solution of USP Antipyrine RS, concomitantly measured.

**C:** The retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Water, Method I** (921): not more than 1.0% is found.

### Assay—

**Ammonium acetate solution**—Dissolve 7.7 g of ammonium acetate in water, dilute with water to 1000 mL, and mix.

**Mobile phase**—Prepare a filtered and degassed mixture of *Ammonium acetate solution* and acetonitrile (3:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Transfer about 15 mg of USP Benzocaine RS, accurately weighed, to a 100-mL volumetric flask, add 15J mg of USP Antipyrine RS, accurately weighed, J being the ratio of the labeled amount, in mg, of antipyrine to the labeled amount, in mg, of benzocaine per mL of Otic Solution. Add 50 mL of methanol, dissolve in methanol, dilute with methanol to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Assay preparation**—Transfer an accurately measured volume of Otic Solution, equivalent to about 15 mg of benzocaine, to a 100-mL volumetric flask. Dissolve in 50 mL of methanol, dilute with methanol to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4-mm × 15-cm column that contains 5-μm packing L15. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor for the benzocaine peak is not more than 2.5, the column efficiency for the benzocaine peaks is not less than 1500 theoretical plates, and the relative standard deviation for replicate injections is not more than 2%.

**Procedure**—Separately inject equal volumes (about 10 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.35 for antipyrine, and 1.0 for benzocaine. Calculate the quantity, in mg, of benzocaine ( $C_9H_{11}NO_2$ ) in each mL of the Otic Solution taken by the formula:

$$1000(C/V)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Benzocaine RS in the *Standard preparation*; V is the volume, in mL, of Otic Solution taken; and  $r_U$  and  $r_S$  are the peak responses due to benzocaine in the *Assay preparation* and the *Standard preparation*, respectively. Calculate the quantity, in mg, of antipyrine ( $C_{11}H_{12}N_2O$ ) in each mL of the Otic Solution taken by the same formula, changing the terms to refer to antipyrine instead of benzocaine.

## Antipyrine, Benzocaine, and Phenylephrine Hydrochloride Otic Solution

» Antipyrine, Benzocaine, and Phenylephrine Hydrochloride Otic Solution is a solution of Antipyrine, Benzocaine, and Phenylephrine Hydrochloride in a suitable nonaqueous solvent. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of antipyrine ( $C_{11}H_{12}N_2O$ ), benzocaine ( $C_9H_{11}NO_2$ ), and phenylephrine hydrochloride ( $C_9H_{13}NO_2 \cdot HCl$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

### USP Reference standards (11)—

USP Antipyrine RS  
USP Benzocaine RS  
USP Phenylephrine Hydrochloride RS

**Identification**—The retention times of the major peaks in the chromatograms of the *Assay preparations* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

### Assay—

**Mobile phase**—Mix 480 mL of acetonitrile, 3520 mL of a 0.005 M solution of sodium 1-heptanesulfonate in water, and 4 mL of phosphoric acid.

**Standard preparation**—Accurately weigh about 25 mg of USP Antipyrine RS, about 25 mg of USP Benzocaine RS, and about 25 mg of USP Phenylephrine Hydrochloride RS into a 250-mL volumetric flask. Add 5 mL of a 0.5 mg per mL solution of p-aminobenzoic acid in *Mobile phase*. Add 150 mL of *Mobile phase*, and mix to effect solution, sonicating if necessary. Dilute with *Mobile phase* to volume, and mix.

**Assay preparation A**—Transfer an accurately measured volume of Otic Solution, equivalent to about 100 mg of antipyrine, to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Pipet 5 mL of this solution into a 100-mL

volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Assay preparation B**—Transfer an accurately measured volume of Otic Solution, equivalent to about 100 mg of benzocaine, to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Pipet 5 mL of this solution into a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Assay preparation P**—Transfer an accurately measured volume of Otic Solution, equivalent to about 5 mg of phenylephrine hydrochloride, to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 272-nm detector and a 4.6-mm × 30-cm column that contains packing L11. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.19 for *p*-aminobenzoic acid, 0.26 for phenylephrine, 0.64 for antipyrine, and 1.0 for benzocaine; the resolution, *R*, between phenylephrine and aminobenzoic acid is not less than 1.5, and the relative standard deviation for replicate injections is not more than 3.0%.

**Procedure**—Separately inject equal volumes (about 20 or 25 µL) of the *Standard preparation* and each of the *Assay preparations* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of antipyrine (C<sub>11</sub>H<sub>12</sub>N<sub>2</sub>O) in each mL of the Otic Solution taken by the formula:

$$(C/V)(r_U/r_S)$$

in which *C* is the concentration, in µg per mL of USP Antipyrine RS in the *Standard preparation*; *V* is the volume, in mL, of Otic Solution taken; and *r<sub>U</sub>* and *r<sub>S</sub>* are the antipyrine peak responses obtained from *Assay preparation A* and the *Standard preparation*, respectively. Calculate the quantity, in mg, of benzocaine (C<sub>9</sub>H<sub>11</sub>NO<sub>2</sub>) in each mL of the Otic Solution taken by the formula:

$$(C/V)(r_U/r_S)$$

in which *C* is the concentration, in µg per mL, of USP Benzocaine RS in the *Standard preparation*; *V* is the volume, in mL, of Otic Solution taken; and *r<sub>U</sub>* and *r<sub>S</sub>* are the benzocaine peak responses obtained from *Assay preparation B* and the *Standard preparation*, respectively. Calculate the quantity, in µg of phenylephrine hydrochloride (C<sub>9</sub>H<sub>13</sub>NO<sub>2</sub> · HCl) in each mL of the Otic Solution taken by the formula:

$$50(C/V)(r_U/r_S)$$

in which *C* is the concentration, in µg per mL, of USP Phenylephrine Hydrochloride RS in the *Standard preparation*; *V* is the volume, in mL, of Otic Solution taken; and *r<sub>U</sub>* and *r<sub>S</sub>* are the phenylephrine peak responses obtained from *Assay preparation P* and the *Standard preparation*, respectively.

## Antithrombin III Human

### DEFINITION

Antithrombin III Human is a glycoprotein, which is the major inhibitor of thrombin and other activated clotting factors, including factors IX, X, XI, and XII, and the cofactor through which heparin exerts its effect. It is obtained from human plasma of healthy donors who must, as far as can be ascertained, be free from detectable agents of infection transmissible by transfusion of blood or blood derivatives. The method of manufacturing includes steps that have been shown to remove or inactivate known agents of infection. If substances are used for inactivation

of viruses during production, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to an acceptable level and that any residues are such as not to compromise the safety of the preparation for patients. The antithrombin III concentrate is passed through a bacteria-retentive filter, filled aseptically into its final, sterile containers, and immediately frozen. It is then freeze-dried, and the containers are closed under vacuum. No antimicrobial preservative is added at any stage of production. Antithrombin III Human complies with the requirements for *Biologics* <1041>. When reconstituted in the recommended volume of diluent, the potency is NLT 25 USP Antithrombin III Units/mL. [NOTE—One USP Antithrombin III Unit is the amount of antithrombin III that forms a complex with one unit of thrombin at 25° in the presence of heparin at a pH of 8.4.]

### IDENTIFICATION

- Meets the requirements of the *Assay*

### ASSAY

#### PROCEDURE

**Solution A:** Dissolve Tris(hydroxymethyl)aminomethane, edetic acid, and sodium chloride in water containing 0.1% polyethylene glycol 6000 to obtain a solution having concentrations of 0.050 M, 0.0075 M, and 0.175 M, respectively. Adjust with hydrochloric acid or sodium hydroxide solution to a pH of 8.4.

**Solution B:** 0.05% (w/v) of albumin human in *Solution A*

**Solution C:** 10 mg/mL of polybrene in *Solution B*

**Solution D:** 15 USP Heparin Units/mL of USP Heparin Sodium for Assays RS in *Solution B*

**Solution E:** Reconstitute thrombin bovine, and dilute with *Solution B* to obtain a solution having a concentration of 2.0 Thrombin Units/mL.

**Solution F:** Prepare a solution of chromogenic substrate for amidolytic test (see *Reagents, Indicators, and Solutions—Reagent Specifications*) for factor II<sub>a</sub> in water to obtain a solution having a concentration of about 5.0 mM, and dilute the solution further with *Solution C* to 1.0 mM.

**Stopping solution:** 20% (v/v) of acetic acid in water

**Standard solution A:** USP Antithrombin III Human RS in *Solution D* to obtain a solution containing 1.0 USP Antithrombin III Unit

**Standard solutions B, C, D, and E:** Dilute *Standard solution A* with *Solution D* 60-, 120-, 180-, and 300-fold.

**Sample solution A:** Dissolve a quantity of Antithrombin III Human in *Solution D* to obtain a solution having the same concentration as *Standard solution A*.

**Sample solutions B, C, D, and E:** Dilute *Sample solution A* with *Solution D* 60-, 120-, 180-, and 300-fold.

**Analysis:** Pipet 400 µL each of *Standard solutions B, C, D, and E* and *Sample solutions B, C, D, and E* into suitable tubes placed in a water bath set at 37°. Add 200 µL of *Solution E*, prewarmed at 37° to each tube, mix, and incubate for 1 min. Add 200 µL of *Solution F*, prewarmed at 37° to each tube, mix, and incubate for 60 s. Stop the reaction by adding 200 µL *Stopping solution*. To prepare a blank, add the reagents in reverse order, starting with 200 µL of *Stopping solution*, followed by the addition of 200 µL of *Solution F*, then adding 200 µL of *Solution E*, and ending with 400 µL of *Solution D*. Record the absorbance at 405 nm against the blank.

For *Standard solutions* and *Sample solutions*, calculate the regression of the absorbance against log concentrations, and calculate the activity of Antithrombin III Human in USP Antithrombin III Units, using a suitable statistical method for parallel-line assays. The four independent relative activity estimates are then combined to obtain the final mean, and the confidence limits are calculated.

**Acceptance criteria:** 80%–120% of the potency stated on the label. The specific activity is NLT 6.0 USP Anti-thrombin III Units/mg of total protein. The confidence interval ( $P = 0.95$ ) is between 90% and 110% of the estimated potency.

## IMPURITIES

### Organic Impurities

#### • PROCEDURE: HEPARIN CONTENT

**Solution A:** Dissolve Tris(hydroxymethyl)aminomethane, edetic acid, and sodium chloride in water containing 0.1% polyethylene glycol 6000 to obtain a solution having concentrations of 0.050 M, 0.0075 M, and 0.175 M, respectively. Adjust with hydrochloric acid or sodium hydroxide solution to a pH of 8.4.

**Solution B:** Solution of chromogenic substrate for amidolytic test for factor  $X_a$  in water to obtain a solution of concentration of 2.5 mM

**Solution C:** Dissolve Factor  $X_a$  in *Solution A* to obtain a solution containing 20 nanokatalytic units (nkats).

**Solution D:** 20% (v/v) of acetic acid in water

**Standard solution:** Dissolve USP Antithrombin III Human RS in *Solution A* to obtain a solution containing 1.0 USP Antithrombin III Unit.

**Sample solution:** Dissolve Antithrombin III Human in *Solution A* to obtain a solution containing 1.0 USP Antithrombin III Unit.

**Analysis:** Pipet 250  $\mu$ L each of *Solution A*, the *Standard solution*, and the *Sample solution* to suitable tubes placed in a water bath set at 37°. Add 250  $\mu$ L of *Solution C* prewarmed at 37° to each tube, and incubate for 2 min. Add 250  $\mu$ L of *Solution B* prewarmed at 37° to each tube, mix, and incubate for 120 s. Stop the reaction by adding 250  $\mu$ L of *Solution D*. Record the absorbance at 405 nm, using *Solution A* as the blank. Calculate the USP Heparin Unit per USP Antithrombin III Unit:

$$\text{Result} = P_R (A_F - A_U) / (A_F - A_S)$$

$P_R$  = heparin content of USP Antithrombin III Human RS in USP Heparin Unit per USP Antithrombin III Unit

$A_F$  = absorbance value from *Solution A*

$A_U$  = absorbance value from the *Sample solution*

$A_S$  = absorbance value from the *Standard solution*

**Acceptance criteria:** NMT 0.1 USP Heparin Unit per USP Antithrombin III Unit

## SPECIFIC TESTS

- **STERILITY TESTS** <71>: Meets the requirements when tested as directed for *Test for Sterility of the Product to Be Examined, Direct Inoculation of the Culture Medium*
- **WATER DETERMINATION, Method I** <921>: NMT 3.0%
- **PYROGEN TEST** <151>: Inject 50 USP Antithrombin III Units per kg of the rabbit's weight, calculated from the activity stated on the label: meets the requirements.
- **GENERAL SAFETY:** Meets the requirements for biologics as set forth under *Biological Reactivity Tests, In Vivo* <88>, *Safety Tests—Biologicals*
- **OSMOLALITY AND OSMOLARITY, Osmolality** <785>: Reconstitute with the diluent according to the manufacturer's instruction: NLT 240 mOsmol/kg for the solution.
- **pH** <791>: Reconstitute with the diluent according to the manufacturer's instruction: 6.0–7.5.
- **MOLECULAR WEIGHT DISTRIBUTION**

**Mobile phase:** Solution containing 0.1 M sodium phosphate, 0.15 M sodium chloride, and 0.05% sodium azide, having a pH of 6.5. Degas and filter.

**Solution A:** 4–5 mg/mL of thyroglobulin in *Mobile phase*

**Sample solution:** 8–10 mg/mL of Antithrombin III Human

**System suitability solution:** Dilute USP Albumin Human RS, if necessary, with water to obtain a solution containing 5%.

## Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 280 nm

**Column:** 7.5-  $\times$  75-mm guard column and a 7.5-  $\times$  300-mm analytical column, both containing packing L59

**Temperature:** Ambient

**Flow rate:** 0.5 mL/min maintained constant to  $\pm 1\%$

**Injection size:** 10  $\mu$ L

## System suitability

**Sample:** *System suitability solution*

## Suitability requirements

**Column efficiency:** Greater than 1500 theoretical plates

**Tailing factor:** 0.5–2.5

## Analysis

**Samples:** *Solution A* and *Sample solution*

**Acceptance criteria:** Note the retention times of the major peak in the *Solution A* chromatogram. The relative peak area of the high-molecular weight peak eluting at about the same retention time as the major peak in the *Solution A* chromatogram, or earlier, is NMT 13%.

## • TOTAL PROTEIN CONTENT

**Solution A:** 1000 mg/mL of trichloroacetic acid in water

**Sample solution:** 7.5 mg/mL of Antithrombin III Human in 0.15 M sodium chloride solution

**Blank:** 0.15 M solution of sodium chloride

**Analysis:** To each of 2.0 mL of the *Sample solution* and the *Blank* in suitable centrifuge tubes, add 1.5 mL of *Solution A*. Mix, allow to stand for at least 10 min, centrifuge for 5 min, and decant the supernatant. Resuspend the precipitates in 1.5 mL of *Solution A*, centrifuge for 5 min, decant the supernatant, and hold the tubes inverted on a filter paper to drain. Quantitatively transfer the residues with a minimum quantity of water to a micro-Kjeldahl flask, and determine the nitrogen content using *Method II* (see *Nitrogen Determination* <461>). Multiply the result, corrected for the *Blank*, by 6.25 to calculate the quantity of protein.

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Use a Type I glass container with an appropriate stopper and seal. Store protected from light between 2° and 8°, excursions permitted up to 25°.
- **LABELING:** The labeling should state the content of antithrombin III in USP Antithrombin III Units. The diluent and the volume to be used to reconstitute the preparation are indicated.
- **USP REFERENCE STANDARDS** <11>
  - USP Albumin Human RS
  - USP Antithrombin III Human RS
  - USP Heparin Sodium for Assays RS

## Apomorphine Hydrochloride

$C_{17}H_{17}NO_2 \cdot HCl \cdot \frac{1}{2}H_2O$  312.79

4*H*-Dibenzo[*de,g*]quinoline-10,11-diol, 5,6,6a,7-tetrahydro-6-methyl-, hydrochloride, hemihydrate, (*R*)-.

6aβ-Aporphine-10,11-diol hydrochloride hemihydrate [41372-20-7].

Anhydrous 303.79 [314-19-2].

» Apomorphine Hydrochloride contains not less than 98.5 percent and not more than 100.5 percent of  $C_{17}H_{17}NO_2 \cdot HCl$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—  
USP Apomorphine Hydrochloride RS

**Color of solution**—Place 100 mg in a suitable test tube, add 10 mL of cold, oxygen-free water, and agitate gently until dissolved: the color of the resulting solution, observed promptly after the Apomorphine Hydrochloride has dissolved, is not more intense than that of a color standard prepared as follows. Dissolve 5 mg of Apomorphine Hydrochloride in 100.0 mL of water. Transfer 1.0 mL of this solution to a test tube of the same size as that used for the test solution, dilute with 6 mL of water, add 1 mL of sodium bicarbonate solution (1 in 20), and then add 0.50 mL of iodine TS. Allow to stand for 30 seconds, add 0.60 mL of sodium thiosulfate solution (1 in 40), and dilute with water to 10 mL.

**Identification**—

**A: Infrared Absorption** (197K).

**B:** To 5 mL of a solution (1 in 100) add a slight excess of sodium bicarbonate solution (1 in 20): a white or greenish-white precipitate is formed. Add 3 drops of iodine TS, and shake vigorously: an emerald-green color is produced. Add 5 mL of ether and, after vigorous shaking, allow the layers to separate: the ether is colored deep ruby-red while the water layer retains its green color.

**C:** Dissolve it in nitric acid: a dark purple solution is produced.

**D:** To a solution of it add silver nitrate TS: a white precipitate, which is insoluble in nitric acid, is formed. This precipitate soon darkens by reduction to metallic silver, the reduction being accelerated by the addition of 6 N ammonium hydroxide.

**Specific rotation** (781S): between  $-60.5^\circ$  and  $-63.0^\circ$ .

*Test solution:* 15 mg per mL, in dimethylsulfoxide.

**Loss on drying** (731)—Dry it at  $105^\circ$  for 2 hours: it loses between 2.0% and 3.5% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Decomposition products**—Shake 100 mg with 5 mL of ether: the latter acquires not more than a pale reddish color.

**Ordinary impurities** (466)—

*Solvent for Test Solution:* methanol.

*Solvent for Standard Solution:* methanol.

*Eluant:* a mixture of 1-butanol, water, and formic acid (7:2:1).

*Visualization:* a freshly prepared mixture of 10% ferric chloride solution and 5% potassium ferricyanide solution (2:1). Allow the chromatograms to develop until the solvent front has moved about 8 cm. [NOTE—The development time is 1.5 to 2 hours.] Allow the plates to dry at room temperature for 1 hour prior to spraying.

**Assay**—Dissolve about 300 mg of Apomorphine Hydrochloride, accurately weighed, in 100 mL of glacial acetic acid with the aid of heat provided by a steam bath. Add 0.1 mL of acetic anhydride to the hot solution, and stir for 5 minutes. Cool to room temperature, add 5 mL of mercuric acetate TS and 0.25 mL of crystal violet TS, and titrate with 0.1 N perchloric acid VS to a blue endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 30.38 mg of  $C_{17}H_{17}NO_2 \cdot HCl$ .

## Apomorphine Hydrochloride Tablets

» Apomorphine Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{17}H_{17}NO_2 \cdot HCl \cdot \frac{1}{2}H_2O$ .

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—  
USP Apomorphine Hydrochloride RS

**Color of solution**—Dissolve a quantity of powdered Tablets, equivalent to 5 mg of apomorphine hydrochloride, in water to make 100.0 mL. Transfer 1.0 mL of the solution to a test tube, dilute with 6 mL of water, and, if necessary, filter through a small pledget of cotton. Add 1 mL of sodium bicarbonate solution (1 in 20), then add 0.50 mL of iodine TS. Allow to stand for 30 seconds, then add 0.60 mL of sodium thiosulfate solution (1 in 40), and dilute with water to 10 mL. This solution represents the color standard.

Place a quantity of powdered Tablets, equivalent to about 50 mg of apomorphine hydrochloride, in a test tube of suitably small size, add 10.0 mL of cold, oxygen-free water, insert the stopper in the test tube, and agitate gently until no more dissolves; if necessary, filter immediately through a small pledget of cotton. The color of the solution, observed promptly after preparation, is not more intense than that of the color standard. Use closely matched test tubes for the comparison.

**Identification**—To 5 mL of a filtered solution of Tablets, containing about 10 mg of apomorphine hydrochloride, add a slight excess of sodium bicarbonate solution (1 in 20): a white or greenish-white precipitate is formed. Add 3 drops of iodine TS, and shake vigorously: an emerald-green color is produced. Add 5 mL of ether, and, after vigorous shaking, allow the layers to separate: the ether is colored deep ruby-red while the water layer retains its green color.

**Disintegration** (701): 15 minutes.

**Uniformity of dosage units** (905): meet the requirements.

*Procedure for content uniformity*—Place 1 Tablet in a 500-mL volumetric flask containing 100 mL of 0.1 N hydrochloric acid, and shake for 15 minutes. Dilute with 0.1 N hydrochloric acid to volume, mix, and filter, discarding the first 20 mL of filtrate. Dilute a portion of the subsequent filtrate quantitatively and stepwise, if necessary, with 0.1 N hydrochloric acid to provide a solution containing approximately 12  $\mu$ g of apomorphine hydrochloride per mL. Concurrently determine the absorbances of this solution and of a solution of USP Apomorphine Hydrochloride RS in the same medium having a known concentration of about 12  $\mu$ g of anhydrous apomorphine hydrochloride per mL, in 1-cm cells at the wavelength of maximum absorbance at about 273 nm, with a suitable spectrophotometer, using 0.1 N hydrochloric acid as the blank. Calculate the quantity, in mg, of  $C_{17}H_{17}NO_2 \cdot HCl \cdot \frac{1}{2}H_2O$  in the Tablet taken by the formula:

$$(312.80 / 303.79)(TC / D)(A_U / A_S)$$

in which 312.80 and 303.79 are the molecular weights of apomorphine hydrochloride hemihydrate and anhydrous apomorphine hydrochloride, respectively;  $T$  is the labeled quantity, in mg, of apomorphine hydrochloride in the Tablet;  $C$  is the concentration, in  $\mu$ g per mL, of anhydrous apomorphine hydrochloride in the Standard solution;  $D$  is the concentration, in  $\mu$ g per mL, of apomorphine hydrochloride in the solution from the Tablet, based upon the labeled quantity per Tablet and the extent of dilution; and  $A_U$  and  $A_S$  are the absorbances of the solution from the Tablet and the Standard solution, respectively.

**Assay**—Weigh and finely powder not fewer than 20 Tablets. Dissolve an accurately weighed portion of the powder, equivalent to about 50 mg of apomorphine hydrochloride, in 25 mL of water in a separator, add 500 mg of sodium bicarbonate, and completely extract with successive small portions of ether. Combine the ether extracts in a separator, and wash them with three 5-mL portions of water. Shake the combined water washings with 10 mL of ether, and add this ether to the combined ether extracts. Extract the ether solutions with 20.0 mL of 0.02 N sulfuric acid VS, and wash with three 5-mL portions of water. Combine the acid extract and washings in a beaker, and warm on a steam bath to expel any residual ether. Cool, add methyl red TS, and titrate the excess acid with 0.02 N sodium hydroxide VS (see *Residual Titrations* under *Titrimetry* (541)). Each mL of 0.02 N sulfuric acid is equivalent to 6.256 mg of  $C_{17}H_{17}NO_2 \cdot HCl \cdot \frac{1}{2}H_2O$ .

## Apraclonidine Hydrochloride

$C_9H_{10}Cl_2N_4 \cdot HCl$  281.57

1,4-Benzenediamine, 2,6-dichloro-N<sup>1</sup>-2-imidazolidinylidene-, monohydrochloride.

2-[(4-Amino-2,6-dichlorophenyl)imino]imidazolidine monohydrochloride [73218-79-8].

» Apraclonidine Hydrochloride contains not less than 98.0 percent and not more than 102.0 percent of  $C_9H_{10}Cl_2N_4 \cdot HCl$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—  
USP Apraclonidine Hydrochloride RS

### Identification—

**A:** *Infrared Absorption* (197K).

**B:** It responds to the tests for *Chloride* (191).

**pH** (791): between 5.0 and 6.6 in a solution (1 in 100).

**Loss on drying** (731)—Dry it in vacuum at 105° for 3 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals, Method II** (231): 0.002%.

### Chromatographic purity—

**Phosphate buffer**—Transfer 6.8 mL of phosphoric acid to a 2000-mL volumetric flask, add about 1900 mL of water, and mix. Adjust with sodium hydroxide solution (1 in 2) to a pH of 3.0, dilute with water to volume, and mix.

**Mobile phase**—Prepare a filtered and degassed mixture of acetonitrile, *Phosphate buffer*, and methanol (56:40:4). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**System suitability solution**—Prepare a solution in *Mobile phase* containing about 0.8 mg of USP Apraclonidine Hydrochloride RS per mL.

**Test solution**—Transfer about 20 mg of Apraclonidine Hydrochloride, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 220-nm detector and an 8-mm × 100-mm column that contains packing L7. The flow rate is about 3 mL per minute. Chromatograph the

*System suitability solution*, and record the peak responses as directed for *Procedure*: the tailing factor for the apraclonidine peak is not more than 2.2, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Inject about 20 µL of the *Test solution* into the chromatograph, record the chromatogram, and measure the areas for the major peaks. [NOTE—Allow about five times the elution time of apraclonidine before making the next injection.] Calculate the percentage of each peak, other than the solvent peak and the apraclonidine peak, in the specimen of Apraclonidine Hydrochloride taken by the same formula:

$$100r_i / r_t$$

in which  $r_i$  is the response of each peak other than the principal peak, and  $r_t$  is the sum of the responses of all of the peaks, excluding that of the solvent peak: not more than 1.0% for any individual impurity and not more than 2.0% total impurities are found.

**Assay**—Dissolve about 125 mg of Apraclonidine Hydrochloride, accurately weighed, in 40 mL of glacial acetic acid. Add 10 mL of mercuric acetate TS, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically from the second inflection point, using a calomel-glass electrode system (see *Titrimetry* (541)). Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 14.08 mg of  $C_9H_{10}Cl_2N_4 \cdot HCl$ .

## Apraclonidine Ophthalmic Solution

» Apraclonidine Ophthalmic Solution is a sterile, aqueous solution of Apraclonidine Hydrochloride. It contains an amount of apraclonidine hydrochloride ( $C_9H_{10}Cl_2N_4 \cdot HCl$ ) equivalent to not less than 90.0 percent and not more than 115.0 percent of the labeled amount of apraclonidine ( $C_9H_{10}Cl_2N_4$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—  
USP Apraclonidine Hydrochloride RS

### Identification—

**A:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the major peak in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**B:** Apply 2 µL of Apraclonidine Ophthalmic Solution and 2 µL of a Standard solution of USP Apraclonidine Hydrochloride RS in methanol containing about 11.5 mg per mL to a suitable high performance thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.2-mm layer of chromatographic silica gel mixture, or equivalent. Allow the applications to dry, and develop the chromatogram in a solvent system consisting of a mixture of chloroform, methanol, and ammonium hydroxide (74:22:4) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by viewing under short-wavelength UV light. [NOTE—The apraclonidine spot should appear as a blue spot.] Spray the plate with fluorecamine solution, prepared by dissolving about 25 mg of fluorecamine in 25 mL of acetone. [NOTE—Avoid prolonged or repeated breathing of the aerosol from the fluorecamine spray. Also avoid prolonged or repeated contact with skin. Fluorecamine solu-

tion should be sprayed only in a hood.] Examine the plate under normal light and long-wavelength UV light. [NOTE—The apraclonidine spot should appear as a yellow spot under normal light and as a white spot under long-wavelength UV light.] The  $R_f$  value and appearance of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration under Test for Sterility of the Product to be Examined*.

**pH** (791): between 4.4 and 7.8.

#### Assay—

**Phosphate buffer**—Prepare as directed in the test for *Chromatographic purity under Apraclonidine Hydrochloride*.

**Mobile phase**—Prepare a filtered and degassed mixture of *Phosphate buffer*, acetonitrile, and methanol (68:30:2). Make adjustments if necessary (see *System Suitability under Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Apraclonidine Hydrochloride RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a *Stock standard solution* having a known concentration of about 0.23 mg per mL. Transfer 2.5 mL of this solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix to obtain a *Standard preparation* having a known concentration of about 11.5 µg of USP Apraclonidine Hydrochloride RS per mL (equivalent to about 10 µg of apraclonidine per mL).

**Resolution solution**—Transfer about 1 mL of propiophenone to a 100-mL volumetric flask, dilute with methanol to volume, and mix. Transfer 3.0 mL of this solution to a 50-mL volumetric flask, dilute with methanol to volume, and mix. Transfer 1.0 mL of this solution and 5.0 mL of the *Stock standard solution* to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Assay preparation**—Transfer an accurately measured volume of Ophthalmic Solution, equivalent to about 20 mg of apraclonidine, to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 2.5 mL of this solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and an 8-mm × 100-mm column that contains packing L7. The flow rate is about 3 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.6 for apraclonidine and 1.0 for propiophenone; the column efficiency determined from the analyte peak is not less than 1000 theoretical plates; the tailing factor for the analyte peak is not more than 2.2; the resolution,  $R$ , between the analyte and propiophenone peaks is not less than 3.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of apraclonidine ( $C_9H_{10}Cl_2N_4$ ) in each mL of the Ophthalmic Solution taken by the formula:

$$(245.11 / 281.57)(2C / V)(r_U / r_S)$$

in which 245.11 and 281.57 are the molecular weights of apraclonidine and apraclonidine hydrochloride, respectively;  $C$  is the concentration, in µg per mL, of USP Apraclonidine Hydrochloride RS in the *Standard preparation*;  $V$  is the volume, in mL, of Ophthalmic Solution taken; and  $r_U$  and  $r_S$  are the apraclonidine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Aprotinin

RPDFCLEPPY TGPCKARIIR YFYNAKAGLC QTFFVYGGRA KRNNFKSAED  
CMRTCGGA

$C_{284}H_{432}N_{84}O_{79}S_7$  6511.44

Trypsin inhibitor, pancreatic basic.

L-Arginyl-L-prolyl-L-aspartyl-L-phenylalanyl-L-cysteinyl-L-leucyl-L-glutamyl-L-prolyl-L-prolyl-L-tyrosyl-L-threonylglycyl-L-prolyl-L-cysteinyl-L-lysyl-L-alanyl-L-arginyl-L-isoleucyl-L-isoleucyl-L-arginyl-L-tyrosyl-L-phenylalanyl-L-tyrosyl-L-asparaginyl-L-alanyl-L-lysyl-L-alanylglycyl-L-leucyl-L-cysteinyl-L-glutamyl-L-threonyl-L-phenylalanyl-L-valyl-L-tyrosylglycylglycyl-L-cysteinyl-L-arginyl-L-alanyl-L-lysyl-L-arginyl-L-asparaginyl-L-asparaginyl-L-phenylalanyl-L-lysyl-L-seryl-L-alanyl-L-glutamyl-L-aspartyl-L-cysteinyl-L-methionyl-L-arginyl-L-threonyl-L-cysteinylglycylglycyl-L-alanine cyclic (5→55), (14→38), (30→51) tris(disulfide) [9087-70-1].

» Aprotinin is a polypeptide consisting of a chain of 58 amino acid residues, which inhibits stoichiometrically the activity of several proteolytic enzymes such as chymotrypsin, kallikrein, plasmin, and trypsin. Aprotinin is obtained from bovine tissues and purified by a suitable process, and is stored as a bulk solution or lyophilized powder. Its potency calculated on the dried basis is not less than 3 USP Aprotinin Units per mg. In addition, the method of manufacture is validated to result in not more than 0.2 µg of histamine per 3 USP Aprotinin Units using validated methods. The origin and sourcing of bovine material must be specified in compliance with FDA requirements. The manufacturing process is validated to demonstrate the clearance of potential infectious agents (i.e., viruses, TSE agents). One USP Aprotinin Unit is equivalent to 1800 Kallikrein Inhibition Units (K.I.U.).

**Packaging and storage**—For lyophilized powder, preserve in tight containers, and store in a cold place. Protect from light. For bulk solution, preserve in tight containers at a temperature not exceeding 25°. Avoid freezing.

**Labeling**—The labeling states the source of material and the number of Kallikrein Inhibition Units per mg or the number of Kallikrein Inhibition Units per mL.

#### USP Reference standards (11)—

USP Aprotinin RS

USP Aprotinin System Suitability RS

USP Endotoxin RS

USP Trypsin Crystallized RS

#### Identification—

**A: Thin-Layer Chromatographic Identification Test** (201)—

**Test solution**—Prepare a solution of Aprotinin in water having a concentration of about 15 USP Aprotinin Units per mL.

**Developing solvent system:** a mixture of glacial acetic acid and water (100 : 80) containing 100 g per L of sodium acetate.

**Cupric chloride solution**—Dissolve 1 g of cupric chloride in 100 mL of water.

**Spray reagent**—Dissolve 0.1 g of ninhydrin in a mixture containing 6 mL of *Cupric chloride solution*, 21 mL of glacial acetic acid, and 70 mL of alcohol.

**Procedure**—Proceed as directed in the chapter, except to spray the plate with the *Spray reagent*, and heat at 60° to visualize the spots.

**B:** The retention time of the major peak in the chromatogram of the *Test solution* corresponds to that in the chromatogram of the *Resolution solution*, as obtained in the test for *Limit of N-pyroglutamyl-aprotinin and related compounds*.

**Absorbance** (851)—Prepare a solution containing 3.0 USP Aprotinin Units per mL. The solution shows an absorption maximum at 277 nm. The absorbance at the maximum is not greater than 0.80.

**Safety**—Prepare a solution of Aprotinin that contains 4 USP Aprotinin Units per mL using a sufficient quantity of Water for Injection. It meets the requirements when tested as directed in the section *Safety Tests—Biologicals* under *Biological Reactivity Tests, In Vivo* (88).

**Bacterial endotoxins** (85)—It contains not more than 0.14 USP Endotoxin Unit per USP Aprotinin Unit. Use a solution that contains 6 USP Aprotinin Units per mL.

**Loss on drying** (731)—[NOTE—This test should only be performed on the lyophilized powder.] Dry about 100 mg, accurately weighed, in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 6.0% of its weight.

**Specific activity of the dry residue**—[NOTE—This test should only be performed when product is a concentrated solution.] Evaporate 25.0 mL of Aprotinin concentrated solution to dryness in a water bath, dry the residue at 110° for 15 hours, and weigh. From the weight of the residue and the activity determined in the *Assay*, calculate the number of USP Aprotinin Units per mg of dry residue. Not less than 3.0 USP Aprotinin Units per mg of dried residue is found.

**Limit of des-Ala-aprotinin and des-Ala-des-Gly-aprotinin—**

*Test solution*—Dilute a concentrated solution of Aprotinin with water, or weigh out Aprotinin and dissolve in water, to obtain a solution containing about 4 to 7 USP Aprotinin Units per mL.

*Standard solution*—Dilute USP Aprotinin RS with water to obtain a solution having a concentration similar to that of the *Test solution*.

*Capillary zone electrophoresis buffer*—Dissolve 8.21 g of monobasic potassium phosphate in 400 mL of water, adjust with phosphoric acid to a pH of 3.0, and dilute with water to 500 mL.

*Capillary zone electrophoresis system* (see *Capillary Electrophoresis* under *Biotechnology-Derived Articles—Test* (1047))—The capillary electropherograph is equipped with a 214-nm detector and a 45- to 60-cm uncoated fused silica capillary with an internal diameter of 75 µm with the temperature controlled at 25°. Apply a field strength of 0.2 kV/cm for 30 minutes, using *Capillary zone electrophoresis buffer* as the electrolyte in both buffer reservoirs. Electropherograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative migration times are about 0.98 for des-Ala-des-Gly-aprotinin, 0.99 for des-Ala-aprotinin, and 1 for aprotinin. The resolution,  $R_s$ , between the des-Ala-des-Gly-aprotinin and des-Ala-aprotinin peaks is not less than 0.8, and the resolution between the des-Ala-aprotinin and aprotinin peaks is not less than 0.5. The migration time for the aprotinin peak is between 19 and 25 minutes. The tailing factor,  $T$ , of the aprotinin peak is not more than 3 (see *Chromatography* (621) for calculation). The baseline is stable and shows little drift. Rinse the capillary for at least 1 minute with at least 10 total capillary volumes of 0.1 N sodium hydroxide, followed by at least 10 total capillary volumes of water, and by at least 20 capillary volumes of *Capillary zone electrophoresis buffer* between injections.

*Procedure*—Transfer a volume of the *Test solution*, approximately 15 nL, into the anodic end of the capillary (apply differential pressure of 3.5 kPa for 3 seconds either by vacuum or pressure), record an electropherogram, and measure

the peak areas. Calculate the percentage contents of des-Ala-des-Gly-aprotinin and des-Ala-aprotinin by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the peak response corresponding to des-Ala-des-Gly-aprotinin or des-Ala-aprotinin; and  $r_s$  is the sum of the responses of des-Ala-des-Gly-aprotinin, des-Ala-aprotinin, and aprotinin peaks: not more than 8.0% des-Ala-des-Gly-aprotinin and not more than 7.5% des-Ala-aprotinin is found.

**Limit of N-pyroglutamyl-aprotinin and related compounds—**

*Solution A*—Prepare a filtered and degassed solution containing 3.52 g of monobasic potassium phosphate and 7.26 g of dibasic sodium phosphate dissolved in 1000 mL of water.

*Solution B*—Prepare a filtered and degassed solution containing 3.52 g of monobasic potassium phosphate, 7.26 g of dibasic sodium phosphate, and 66.07 g of ammonium sulfate dissolved in 1000 mL of water.

*Resolution solution*—Prepare a solution of USP Aprotinin System Suitability RS containing about 5 USP Aprotinin Units per mL in *Solution A*.

*Test solution*—Prepare a solution of Aprotinin having a concentration of about 5 USP Aprotinin Units per mL. Dilute with *Solution A*.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 210-nm detector and a 7.5-mm × 7.5-cm column that contains packing L52 and is maintained at a constant temperature of 40°. The flow rate is 1 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–21	92→64	8→36	linear gradient
21–30	64→0	36→100	linear gradient
30–31	0→92	100→8	linear gradient
31–40	92	8	re-equilibration

Chromatograph the *Resolution solution* as directed for *Procedure*: the retention time for aprotinin is between 17 and 20 minutes; the relative retention times are about 0.9 for *N*-pyroglutamyl-aprotinin, and 1.0 for aprotinin; the resolution,  $R$ , between *N*-pyroglutamyl-aprotinin and aprotinin is not less than 1.0; and the tailing factor for the aprotinin peak is not greater than 2.0.

*Procedure*—Inject 40 µL of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak areas. Calculate the percentage of each impurity peak in the chromatogram by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the response of each impurity peak; and  $r_s$  is the sum of the responses of all peaks in the chromatogram of the *Test solution*: not more than 1.0% *N*-pyroglutamyl-aprotinin is found; not more than 0.5% of any other impurity is found; and the sum of all unknown impurities is not more than 1.0%.

**Limit of high molecular weight proteins—**

*Mobile phase*—Prepare a filtered and degassed mixture of water, glacial acetic acid, and acetonitrile (6:2:2).

*Resolution solution*—Prepare an aprotinin solution that contains about 5 USP Aprotinin Units per mL with about 2% aprotinin oligomers. [NOTE—This solution can be obtained by heating lyophilized aprotinin at 112° for about 2 hours and dissolving the solid at the specified concentration in water.]

*Test solution*—Prepare a solution of Aprotinin in water that contains about 5 USP Aprotinin Units per mL.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 280-nm detector and a series of three 7.8-mm × 30-cm columns containing packing L33. The flow rate is about 1.0 mL per minute. Chromatograph the *Resolution solution* as directed for *Procedure*: the retention time for aprotinin is between 24.5 and 25.5 minutes; the relative retention times are about 0.9 for the dimer and 1.0 for aprotinin; the resolution,  $R$ , between the dimer peak and the aprotinin peak is not less than 1.3; and the tailing factor for the aprotinin peak is not greater than 2.5.

**Procedure**—Inject about 100  $\mu$ L of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak areas. Calculate the percentage of each oligomer peak in the chromatogram by the formula:

$$100r_i / r_s$$

in which  $r_i$  is the response of each peak having a retention time less than that of aprotinin monomer; and  $r_s$  is the sum of the responses of all peaks: the sum of all oligomers is not more than 1.0%.

#### Assay—

**0.0015 M Borate buffer**—Transfer about 0.93 g of boric acid into a 1000-mL volumetric flask, dissolve in 900 mL of water, adjust with 5 N sodium hydroxide to a pH of 8.0, dilute with water to volume, and mix. Transfer 100 mL of this solution into a 1000-mL volumetric flask, dilute with water to volume, and mix.

**Assay preparation**—Prepare a solution of Aprotinin with 0.0015 M Borate buffer to obtain a solution having about 1.67 USP Aprotinin Units per mL (about 0.6 mg per mL).

**Trypsin solution**—Prepare a solution of USP Trypsin Crystallized RS containing about 4300 USP Trypsin Units per mL, using 0.001 N hydrochloric acid as the solvent. Use a freshly prepared solution, and keep in ice water.

**Trypsin and aprotinin solution**—To 4.0 mL of the *Trypsin solution*, add 1.0 mL of the *Assay preparation*. Dilute immediately with 0.0015 M Borate buffer to 40.0 mL. Allow to stand at room temperature for 10 minutes, and then keep in ice water. [NOTE—Use within 6 hours of preparation.]

**Dilute trypsin solution**—Dilute 0.5 mL of the *Trypsin solution* with 0.0015 M Borate buffer to 10.0 mL. Allow to stand at room temperature for 10 minutes, and then keep in ice water.

**Substrate solution**—Dissolve 69 mg of *N*-benzoyl-L-arginine ethyl ester hydrochloride in 10 mL of water. [NOTE—Use within 2 hours.]

**Procedure**—Mix 9.0 mL of 0.0015 M Borate buffer and 1.0 mL of *Substrate solution* in a jacketed glass vessel with a capacity of about 30 mL and that contains a stirring device. The lid of the reaction vessel should contain five holes to accommodate the electrodes, the tip of a buret, a tube for the admission of nitrogen, and the introduction of reactants. An automated or manual titration apparatus may be used. Adjust to a pH of 8.0 by the addition of 0.1 N sodium hydroxide VS. Maintain an atmosphere of nitrogen within the vessel, and stir continuously. When the temperature has reached equilibrium at  $25 \pm 0.1^\circ$ , add 1.0 mL of *Trypsin and aprotinin solution*, and start a timer. Maintain at a pH of 8.0 by the addition of 0.1 N sodium hydroxide VS, and note the volume added every 30 seconds. Continue the reaction for 6 minutes. Determine the volume of 0.1 N sodium hydroxide added per second, in mL ( $n_1$ ). Carry out a similar titration using 1.0 mL of the *Dilute trypsin solution*. Determine the volume of 0.1 N sodium hydroxide added per second, in mL ( $n_2$ ). For the lyophilized powder, calculate the

aprotinin activity in USP Aprotinin Units per mg using the formula:

$$4000(2n_2 - n_1)/m$$

in which  $m$  is the quantity, in mg, of Aprotinin used to prepare 1 mL of the *Assay preparation*. For the concentrated solution, calculate the USP Aprotinin Units per mL using the following formula:

$$4000(2n_2 - n_1)D$$

in which  $D$  is the dilution factor of the concentrated solution used to prepare the *Assay preparation*.

## Aprotinin Injection

» Aprotinin Injection is a sterile solution of Aprotinin in Water for Injection that also contains sodium chloride. One USP Aprotinin Unit is equivalent to 1800 Kallikrein Inhibition Units (K.I.U.). It contains not less than 90.0 percent and not more than 110.0 percent of the potency stated on the label, expressed in Kallikrein Inhibition Units per mL.

**Packaging and storage**—Preserve in single-dose containers, store up to  $25^\circ$ , and avoid freezing.

#### USP Reference standards (11)—

USP Aprotinin RS  
USP Aprotinin System Suitability RS  
USP Endotoxin RS  
USP Trypsin Crystallized RS

#### Identification—

**A:** The retention time of the major peak in the chromatogram of the *Test solution* corresponds to that in the chromatogram of the *Standard solution*, as obtained in the test for *Limit of N-pyroglyutamyl-aprotinin and related compounds under Aprotinin*.

**B:** The determination of activity by the Assay is based on the specific inhibition of trypsin.

**Bacterial endotoxins** (85)—It contains not more than 0.14 USP Endotoxin Units per USP Aprotinin Unit.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration under Test for Sterility of the Product to be Examined*.

**pH** (791): between 4.5 and 6.5.

**Particulate matter** (788): meets the requirements.

**Sodium chloride content**—Pipet 5.0 mL of Injection into 50 mL of water in a beaker. Add 10 mL of 25% nitric acid. Titrate with 0.1 N silver nitrate VS to a potentiometric endpoint, using a silver combination electrode. Perform a blank determination (see *Titrimetry* (541)), and make any necessary correction. Each mL of 0.1 N silver nitrate is equivalent to 5.844 mg of sodium chloride: between 42.5 mg and 47.5 mg of sodium chloride is found.

**Other requirements**—It meets the requirements under *Injections* (1) and for *Limit of N-pyroglyutamyl-aprotinin and related compounds under Aprotinin*.

**Limit of high molecular weight proteins**—Proceed as directed in the test for *Limit of high molecular weight proteins under Aprotinin*. The sum of all oligomers is not more than 1.5%.

**Assay**—Proceed as directed in the Assay under *Aprotinin*.

## Arginine

$C_6H_{14}N_4O_2$   
L-Arginine [74-79-3].

174.20

### DEFINITION

Arginine contains NLT 98.5% and NMT 101.5% of  $C_6H_{14}N_4O_2$ , as L-arginine, calculated on the dried basis.

### IDENTIFICATION

- **INFRARED ABSORPTION** (197K)

### ASSAY

#### • PROCEDURE

**Sample:** 80 mg of Arginine

**Titrimetric system**

(See *Titrimetry* (541).)

**Mode:** Direct titration

**Titrant:** 0.1 N perchloric acid VS

**Endpoint detection:** Potentiometric

**Blank:** 3 mL of formic acid and 50 mL of glacial acetic acid

**Analysis:** Dissolve the *Sample* in a mixture of 3 mL of formic acid and 50 mL of glacial acetic acid, and titrate with *Titrant*. Calculate the percentage of  $C_6H_{14}N_4O_2$  in the portion taken:

$$\text{Result} = [(V - B) \times N \times F \times 100]/W$$

$V$  = *Sample* titrant volume (mL)

$B$  = *Blank* titrant volume (mL)

$N$  = titrant normality (mEq/mL)

$F$  = equivalency factor: 87.10 mg/mEq

$W$  = weight of *Sample* (mg)

**Acceptance criteria:** 98.5%–101.5% on the dried basis

### IMPURITIES

#### Inorganic Impurities

- **RESIDUE ON IGNITION** (281): NMT 0.3%
- **CHLORIDE AND SULFATE, Chloride** (221): A 1.0-g portion shows no more chloride than corresponds to 0.70 mL of 0.020 N hydrochloric acid (0.05%).
- **CHLORIDE AND SULFATE, Sulfate** (221): A 1.0-g portion shows no more sulfate than corresponds to 0.30 mL of 0.020 N sulfuric acid (0.03%).
- **IRON** (241): NMT 30 ppm
- **HEAVY METALS, Method I** (231): NMT 15 ppm

#### Organic Impurities

#### • PROCEDURE

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture

**Standard solution:** 0.05 mg/mL of USP L-Arginine RS in 0.1 N hydrochloric acid. [NOTE—This solution has a concentration equivalent to 0.5% of that of the *Sample solution*.]

**Sample solution:** 10 mg/mL of Arginine in 2 N hydrochloric acid

**System suitability solution:** 0.4 mg/mL each of USP L-Arginine RS and USP L-Lysine Hydrochloride RS in 0.1 N hydrochloric acid

**Spray reagent:** 2 mg/mL of ninhydrin in a mixture of butyl alcohol and 2 N acetic acid (95:5)

**Application volume:** 5  $\mu$ L

**Developing solvent system:** Isopropyl alcohol and ammonium hydroxide (7:3)

#### Analysis

**Samples:** *Standard solution*, *Sample solution*, and *System suitability solution*

Proceed as directed under *Chromatography* (621), *Thin-Layer Chromatography*. Dry the plate between 100° and 105° until the ammonia disappears completely. Spray with *Spray reagent*, and heat between 100° and 105° for about 15 min. Examine the plate under white light. The chromatogram obtained from the *System suitability solution* exhibits two clearly separated spots.

#### Acceptance criteria

**Individual impurities:** Any secondary spot from the *Sample solution* is not larger or more intense than the principal spot from the *Standard solution*, NMT 0.5%

**Total impurities:** NMT 2.0%

### SPECIFIC TESTS

- **OPTICAL ROTATION, Specific Rotation** (781S): +26.3° to +27.7°

**Sample solution:** 80 mg/mL in 6 N hydrochloric acid

- **LOSS ON DRYING** (731): Dry a sample at 105° for 3 h: it loses NMT 0.5% of its weight.

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

- **USP REFERENCE STANDARDS** (11)

USP L-Arginine RS

USP L-Lysine Hydrochloride RS

## Arginine Hydrochloride

$C_6H_{14}N_4O_2 \cdot HCl$

210.66

L-Arginine monohydrochloride;

L-(+)-Arginine monohydrochloride [1119-34-2].

### DEFINITION

Arginine Hydrochloride contains NLT 98.5% and NMT 101.5% of arginine hydrochloride ( $C_6H_{14}N_4O_2 \cdot HCl$ ), calculated on the dried basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)

### ASSAY

#### • PROCEDURE

**Sample:** 100 mg of Arginine Hydrochloride

**Titrimetric system**

(See *Titrimetry* (541).)

**Mode:** Direct titration

**Titrant:** 0.1 N perchloric acid VS

**Endpoint detection:** Potentiometric

**Blank:** 50 mL of glacial acetic acid and 3 mL of 98% formic acid. Add 6 mL of mercuric acetate TS.

**Analysis:** Dissolve the *Sample* in 3 mL of 98% formic acid and 50 mL of glacial acetic acid. Add 6 mL of mercuric acetate TS and titrate with the *Titrant*. Calculate the percentage of arginine hydrochloride ( $C_6H_{14}N_4O_2 \cdot HCl$ ) in the *Sample* taken:

$$\text{Result} = [(V - B) \times N \times F \times 100]/W$$

$V$  = *Sample* titrant volume (mL)

$B$  = *Blank* titrant volume (mL)

$N$  = titrant normality (mEq/mL)

$F$  = equivalency factor, 105.3 mg/mEq

$W$  = weight of *Sample* (mg)

Acceptance criteria: 98.5%–101.5% on the dried basis

### IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%
  - **CHLORIDE AND SULFATE**, Sulfate (221): A 1.6-g portion shows no more sulfate than corresponds to 0.50 mL of 0.020 N sulfuric acid (0.03%).
  - **HEAVY METALS**, Method I (231)  
**Test preparation:** Proceed as directed in the chapter, except to dissolve 1.0 g in 20 mL of water, add 2 mL of 1 N acetic acid, and dilute with water to 25 mL.  
**Acceptance criteria:** NMT 20 ppm
  - **CHROMATOGRAPHIC PURITY**  
**System suitability solution:** 0.4 mg/mL each of USP Arginine Hydrochloride RS and USP L-Lysine Hydrochloride RS in water  
**Standard solution:** 0.05 mg/mL of USP Arginine Hydrochloride RS in water. [NOTE—This solution has a concentration equivalent to about 0.5% of that of the *Sample solution*.]  
**Sample solution:** 10 mg/mL of Arginine Hydrochloride in water  
**Chromatographic system**  
 (See *Chromatography* (621), *Thin-Layer Chromatography*).  
**Mode:** TLC  
**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture  
**Application volume:** 5  $\mu$ L  
**Developing solvent system:** Isopropyl alcohol and ammonium hydroxide (70:30)  
**Spray reagent:** 2 mg/mL of ninhydrin in a mixture of butyl alcohol and 2 N acetic acid (95:5)
- Analysis**  
**Samples:** *System suitability solution*, *Standard solution*, and *Sample solution*  
 Proceed as directed in the chapter. Dry the plate between 100° and 105° until the ammonia disappears completely. Spray with *Spray reagent*, and heat between 100° and 105° for about 15 min. Examine the plate under white light. The *System suitability solution* exhibits two clearly separated spots.  
**Acceptance criteria:** Any secondary spot from the *Sample solution* is not larger or more intense than the principal spot from the *Standard solution*.  
**Individual impurities:** NMT 0.5%  
**Total impurities:** NMT 2.0%

### SPECIFIC TESTS

- **OPTICAL ROTATION**, Specific Rotation (781S): +21.4° to +23.6° ( $t = 20^\circ$ )  
**Sample solution:** 80 mg/mL in 6 N hydrochloric acid
- **LOSS ON DRYING** (731): Dry a sample at 105° for 2 h: it loses NMT 0.2% of its weight.
- **CHLORIDE CONTENT**  
**Sample:** 350 mg of Arginine Hydrochloride  
**Titrimetric system**  
 (See *Titrimetry* (541).)  
**Mode:** Direct titration  
**Titrant:** 0.1 N silver nitrate VS  
**Endpoint detection:** Colorimetric  
**Blank:** 140 mL of water and 1 mL of dichlorofluorescein TS  
**Analysis:** Transfer the *Sample* to a porcelain casserole, and add 140 mL of water and 1 mL of dichlorofluorescein TS. Mix and titrate with the *Titrant* until the silver chloride flocculates and the mixture acquires a faint pink color.  
 Calculate the percentage of chloride (Cl) in the *Sample* taken:

$$\text{Result} = [(V - B) \times N \times F \times 100] / W$$

- $V$  = *Sample* titrant volume (mL)  
 $B$  = *Blank* titrant volume (mL)  
 $N$  = titrant normality (mEq/mL)

$F$  = equivalency factor, 35.45 mg/mEq  
 $W$  = weight of *Sample* (mg)  
**Acceptance criteria:** 16.5%–17.1%

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** (11)  
 USP Arginine Hydrochloride RS  
 USP L-Lysine Hydrochloride RS

## Arginine Hydrochloride Injection

» Arginine Hydrochloride Injection is a sterile solution of Arginine Hydrochloride in Water for Injection. It contains not less than 9.5 percent and not more than 10.5 percent of  $\text{C}_6\text{H}_{14}\text{N}_4\text{O}_2 \cdot \text{HCl}$ . It contains no antimicrobial agents.

NOTE—The chloride ion content of Arginine Hydrochloride Injection is approximately 475 mEq per L.

**Packaging and storage**—Preserve in single-dose containers, preferably of Type II glass.

### USP Reference standards (11)—

USP Arginine Hydrochloride RS  
 USP Endotoxin RS

**Labeling**—The label states the total osmolar concentration in mOsmol per L. Where the contents are less than 100 mL, or where the label states that the Injection is not for direct injection but is to be diluted before use, the label alternatively may state the total osmolar concentration in mOsmol per mL.

### Identification—

**A:** Transfer 1 mL of the Injection to a 200-mL volumetric flask, and dilute with water to volume. To 1 mL of this dilution add 2 mL of a solution of 0.02% 8-hydroxyquinoline in 3 N sodium hydroxide, and add 1 mL of 0.1% *N*-bromosuccinimide solution: an orange color is produced.

**B:** It meets the requirements of the tests for *Chloride* (191).

**Bacterial endotoxins** (85)—It contains not more than 0.01 USP Endotoxin Unit per mg of arginine hydrochloride.

**pH** (791): between 5.0 and 6.5.

**Other requirements**—It meets the requirements under *Injections* (1).

### Assay—

**Color reagent**—Dissolve 28.0 g of potassium hydroxide and 2.0 g of potassium sodium tartrate in 100 mL of water. Cool, and add, in the order named, 100 mg of 2,4-dichloro-1-naphthol, 180 mL of alcohol, and 20.0 mL of 0.475% sodium hypochlorite solution. Mix by swirling, and allow to stand at room temperature for 1 hour before using. This *Color reagent* may be stored in a glass-stoppered bottle, in a refrigerator, for 2 months.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Arginine Hydrochloride RS in water, and dilute quantitatively and stepwise with water to obtain a solution having a known concentration of about 40  $\mu$ g per mL.

**Assay preparation**—Pipet into a 100-mL volumetric flask a volume of Injection, equivalent to 200 mg of arginine hydrochloride, add water to volume, and mix. Pipet 5 mL of this solution into a 250-mL volumetric flask, add water to volume, and mix.

**Procedure**—Transfer 2.0-mL portions of the *Assay preparation* and the *Standard preparation*, respectively, to separate

flasks, and treat each as follows. Add 2.0 mL of potassium iodide solution (3 in 1000), mix, and allow to stand for 15 minutes. Add 6.0 mL of *Color reagent*, mix, and allow to stand for 15 minutes. Add 2.0 mL of sodium hypochlorite solution (19 in 10,000), mix, and allow to stand for 15 minutes. Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 520 nm, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg, of  $C_6H_{14}N_4O_2 \cdot HCl$  in each mL of the Injection taken by the formula:

$$5(C/V)(A_U/A_S)$$

in which  $C$  is the concentration, in  $\mu g$  per mL, of USP Arginine Hydrochloride RS in the *Standard preparation*;  $V$  is the volume, in mL, of Injection taken; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

## Arsanilic Acid

$C_6H_8AsNO_3$  217.05  
p-Aminobenzenearsonic acid [98-50-0].

» Arsanilic Acid contains not less than 98.0 percent and not more than 102.0 percent of  $C_6H_8AsNO_3$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—Label it to indicate that it is for veterinary use only.

**USP Reference standards** (11)—  
USP Arsanilic Acid RS

**Identification, Infrared Absorption** (197K).

**Loss on drying** (731)—Dry it in vacuum at 80° for 4 hours; it loses not more than 0.5% of its weight.

**Limit of o-arsanilic acid**—

*Mobile phase*—Dissolve 4.04 g of monobasic potassium phosphate in 985 mL of water, add 2 mL of phosphoric acid, and mix. Add 10 mL of methanol, mix, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard solution*—Transfer about 67 mg of o-arsanilic acid, accurately weighed, to a 100-mL volumetric flask, add about 65 mL of warm (about 70° to 80°) water, and shake or sonicate to dissolve. Allow to cool, dilute with water to volume, and mix. Dilute a portion of this solution quantitatively and stepwise with water to obtain a solution having a known concentration of about 0.0012 mg of o-arsanilic acid per mL.

*Test solution*—Transfer about 50 mg of Arsanilic Acid, accurately weighed, to a 50-mL volumetric flask, add about 30 mL of warm water, and shake or sonicate to dissolve. Allow to cool, dilute with water to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 242-nm detector and a 4.6-mm  $\times$  15-cm column that contains 5- $\mu m$  base-deactivated packing L1 and is maintained at a constant temperature of about 30°. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the capacity factor,  $k'$ , for the o-arsanilic acid peak is between 2.8 and

3.8; and the relative standard deviation for replicate injections is not more than 2.5%.

*Procedure*—Separately inject equal volumes (about 20  $\mu L$ ) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas of the responses for the o-arsanilic acid peaks. Calculate the percentage of o-arsanilic acid in the portion of Arsanilic Acid taken by the formula:

$$5000(C/W)(r_U/r_S)$$

in which  $C$  is the concentration, in mg per mL, of o-arsanilic acid in the *Standard solution*;  $W$  is the weight, in mg, of Arsanilic Acid taken to prepare the *Test solution*; and  $r_U$  and  $r_S$  are the responses of the o-arsanilic acid peaks obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.12% is found.

**Limit of aniline**—

*Mobile phase*—Dissolve 7.76 g of monobasic potassium phosphate in 950 mL of water, add 50 mL of methanol, mix, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard solution*—Transfer about 176 mg of aniline, accurately weighed, to a 25-mL volumetric flask, add about 1 mL of methanol, swirl, then add about 15 mL of water, and shake to dissolve. Dilute with water to volume, and mix. Dilute a portion of this solution quantitatively and stepwise with water to obtain a solution having a known concentration of about 0.00045 mg of aniline per mL.

*Test solution*—Transfer about 50 mg of Arsanilic Acid, accurately weighed, to a 50-mL volumetric flask, add about 30 mL of warm (about 70° to 80°) water, and shake or sonicate to dissolve. Allow to cool, dilute with water to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 235-nm detector and a 4.6-mm  $\times$  15-cm column that contains 5- $\mu m$  base-deactivated packing L1 and is maintained at a constant temperature of about 30°. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the capacity factor,  $k'$ , for the aniline peak is between 2.3 and 3.3; and the relative standard deviation for replicate injections is not more than 3.0%.

*Procedure*—Separately inject equal volumes (about 50  $\mu L$ ) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas of the responses for the aniline peaks. Calculate the percentage of aniline in the portion of Arsanilic Acid taken by the formula:

$$5000(C/W)(r_U/r_S)$$

in which  $C$  is the concentration, in mg per mL, of aniline in the *Standard solution*;  $W$  is the weight, in mg, of Arsanilic Acid taken to prepare the *Test solution*; and  $r_U$  and  $r_S$  are the responses of the aniline peaks obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.045% is found.

**Assay**—Transfer about 125 mg of Arsanilic Acid, accurately weighed, to a 50-mL conical flask, and add 10.0 mL of a mixture of sulfuric acid, nitric acid, and perchloric acid (1000:50:50) and several glass beads. Digest on a hot plate for about 1 hour, increasing the temperature of the hot plate in steps until a ring of sulfuric acid rises into the neck of the flask. Allow to cool, to the colorless solution add about 400 mg of hydrazine sulfate, and heat the flask vigorously on a hot plate until a ring of sulfuric acid rises into the neck of the flask. Allow to cool, and wash down the rim, neck, and insides of the flask with about 1 mL of water. Heat the flask again until a ring of sulfuric acid rises into the neck of the flask. Allow to cool, and transfer the colorless solution, with the aid of about 80 mL of water, to a 125-mL

conical flask. Add 10 mL of hydrochloric acid and several drops of 0.002 M potassium iodide, cool to between 0° and 5°, and titrate with 0.1 N potassium permanganate VS to a pale pink endpoint, maintaining the temperature between 0° and 5° during the titration. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N potassium permanganate is equivalent to 10.852 mg of  $C_6H_8AsNO_3$ .

## Articaine Hydrochloride

$C_{13}H_{20}N_2O_3S \cdot HCl$  320.84  
2-Thiophenecarboxylic acid, 4-methyl-3-[[1-oxo-2-(propylamino)propyl]amino]-, methyl ester, monohydrochloride;  
Methyl 4-methyl-3-[2-(propylamino)propionamido]-2-thiophenecarboxylate, monohydrochloride [23964-57-0].

### DEFINITION

Articaine Hydrochloride contains NLT 98.5% and NMT 101.0% of  $C_{13}H_{20}N_2O_3S \cdot HCl$ , calculated on the dried basis.

### IDENTIFICATION

#### A. INFRARED ABSORPTION <197>

**Standard solution:** 12 mg/mL of USP Articaine RS in methylene chloride. Transfer 20  $\mu$ L of this solution onto a 300-mg disk.

**Sample solution:** Dissolve 100 mg of Articaine Hydrochloride in 5 mL of water. Add 3 mL of a saturated solution of sodium bicarbonate, and shake twice with 2 mL of methylene chloride. Combine the methylene chloride layers, dilute with methylene chloride to 5.0 mL, and dry over anhydrous sodium sulphate. Transfer 20  $\mu$ L of this solution onto a 300-mg disk.

#### B. IDENTIFICATION TESTS—GENERAL, Chloride <191>

### ASSAY

#### PROCEDURE

**Sample solution:** 250 mg of Articaine Hydrochloride to a 250-mL conical flask. Add 5.0 mL of 0.01 M hydrochloric acid and 50 mL of alcohol. Stir to dissolve.

**Analysis:** Titrate with 0.1 M sodium hydroxide VS, determining the endpoint potentiometrically, using a glass electrode. Calculate the volume of sodium hydroxide consumed by reading the volume added between the two points of inflection. Each mL of 0.1 M sodium hydroxide is equivalent to 32.08 mg of  $C_{13}H_{20}N_2O_3S \cdot HCl$ .

**Acceptance criteria:** 98.5%–101.0% on the dried basis.

### IMPURITIES

#### Inorganic Impurities

##### HEAVY METALS, Method I <231>

**Sample solution:** 200 mg/mL of Articaine Hydrochloride

**Acceptance criteria:** NMT 5 ppm

##### RESIDUE ON IGNITION <281>

**Sample:** 1 g

**Acceptance criteria:** NMT 0.1%

#### Organic Impurities

##### PROCEDURE

**Buffer solution:** 2.02 g of sodium 1-heptanesulfonate and 4.08 g of potassium dihydrogen phosphate in 1 L of water. Adjust with phosphoric acid to a pH of 2.0.

**Mobile phase:** Acetonitrile and Buffer solution (1:3)

**Standard solution:** 2  $\mu$ g/mL of USP Articaine Related Compound A, and 1  $\mu$ g/mL each of USP Articaine Related Compound E RS and USP Articaine Hydrochloride RS in Mobile phase. [NOTE—This solution is also used to determine the reporting threshold limit.]

**Sample solution:** 1.0 mg/mL of Articaine Hydrochloride in Mobile phase

#### Chromatographic system

(See Chromatography <621>, System Suitability.)

**Mode:** LC

**Detector:** UV 276 nm

**Column:** 4.6-mm  $\times$  25-cm; packing L1

**Temperature:** 45°

**Flow rate:** 1 mL/min

**Injection size:** 10  $\mu$ L

#### System suitability

**Sample:** Standard solution

#### Suitability requirements

**Resolution:** NLT 1.2 between articaine related compound A and articaine related compound E

#### Analysis

**Samples:** Standard solution and Sample solution.

[NOTE—Run time is 5 times the retention time of articaine.]

Calculate the percentage of any articaine related compound A in the portion of Articaine Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = response of articaine related compound A from the Sample solution

$r_S$  = response of articaine related compound A from the Standard solution

$C_S$  = concentration of USP Articaine Related Compound A RS in the Standard solution (mg/mL)

$C_U$  = concentration of Articaine Hydrochloride in the Sample solution (mg/mL)

Calculate the percentage of each individual impurity in the portion of Articaine Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = response of each individual impurity from the Sample solution

$r_S$  = response of articaine hydrochloride from the Standard solution

$C_S$  = concentration of USP Articaine Hydrochloride RS in the Standard solution (mg/mL)

$C_U$  = concentration of Articaine Hydrochloride in the Sample solution (mg/mL)

[NOTE—Disregard any peak below 0.05%.]

#### Acceptance criteria

**Individual impurities:** See Impurity Table 1.

**Total impurities:** NMT 0.5%. [NOTE—Excluding articaine related compound A.]

Impurity Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Articaine acid <sup>a</sup>	0.6	0.1
Ethylarticaine <sup>b</sup>	0.7	0.1
Articaine related compound A <sup>c</sup>	0.8	0.2
Articaine related compound E <sup>d</sup>	0.86	0.1
Articaine acid-propionamide <sup>e</sup>	0.9	0.1
Articaine	1.0	—
Butylarticaine <sup>f</sup>	1.7	0.1

<sup>e</sup> 4-Methyl-*N*-propyl-3-[[[(2*RS*)-2-(propylamino)propanoyl]amino]thiophene-2-carboxamide.

<sup>f</sup> Methyl 3-[[[(2*RS*)-2-(butylamino)propanoyl]amino]-4-methylthiophene-2-carboxylate.

<sup>g</sup> Methyl 3-[[[(2*RS*)-2-(dipropylamino)propanoyl]amino]-4-methylthiophene-2-carboxylate.

<sup>h</sup> Methyl 3-amino-4-methylthiophene-2-carboxylate.

<sup>i</sup> 1-Methylethyl 4-methyl-3-[[[(2*RS*)-2-(propylamino)propanoyl]amino]thiophene-2-carboxylate.

<sup>j</sup> Methyl 3-[[[(2*RS*)-2-bromopropanoyl]amino]-4-methylthiophene-2-carboxylate.

### SPECIFIC TESTS

- **LOSS ON DRYING** (731): Dry at 105° for 5 h: it loses NMT 0.5% of its weight.
- **PH** (791)  
Sample solution: 10 mg/mL  
Acceptance criteria: 4.2–5.2

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in light-resistant containers.
- **USP REFERENCE STANDARDS** (11)  
USP Articaine RS  
USP Articaine Hydrochloride RS  
USP Articaine Related Compound A RS  
Methyl 4-methyl-3-[2-(propylamino)acetamido]thiophene-2-carboxylate.  
 $C_{12}H_{18}N_2O_3S$  270.35  
USP Articaine Related Compound E RS  
Methyl 3-[2-(isopropylamino)propanamido]-4-methylthiophene-2-carboxylate.  
 $C_{13}H_{20}N_2O_3S$  284.37

## Articaine Hydrochloride and Epinephrine Injection

### DEFINITION

Articaine Hydrochloride and Epinephrine Injection is a sterile solution of Articaine Hydrochloride and Epinephrine, in Water for Injection, and contains NLT 95.0% and NMT

105.0% of the labeled amount of articaine hydrochloride ( $C_{13}H_{20}N_2O_3S \cdot HCl$ ) and NLT 90.0% and NMT 115.0% of the labeled amount of epinephrine ( $C_9H_{13}NO_3$ ).

### IDENTIFICATION

- **A.** The retention times of the articaine and epinephrine peaks from the *Sample solution* correspond to those of the *Standard solution*, as obtained in the Assays for *Articaine Hydrochloride* and *Epinephrine*, respectively.

### ASSAY

#### ARTICAINE HYDROCHLORIDE

**Buffer:** Glacial acetic acid and water (50:930). Adjust with 2 N sodium hydroxide to a pH of 3.4.

**Mobile phase:** Acetonitrile and *Buffer* (22:78)

**Standard stock solution:** 40 mg/mL of USP Articaine Hydrochloride RS in water

**Standard solution:** 0.8 mg/mL of USP Articaine Hydrochloride RS in *Mobile phase* from *Standard stock solution*

**Sample solution:** Equivalent to 0.8 mg/mL of articaine hydrochloride in *Mobile phase* from a portion of Injection

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 270 nm

**Column:** 4.6-mm × 25-cm; 5-μm packing L1

**Flow rate:** 1 mL/min

**Injection size:** 10 μL

**Run time:** 2.5 times the retention time of articaine

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** NMT 2.2

**Relative standard deviation:** NMT 1.0%, from six injections

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of articaine hydrochloride ( $C_{13}H_{20}N_2O_3S \cdot HCl$ ) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Articaine Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of articaine hydrochloride in the *Sample solution* (mg/mL)

**Acceptance criteria:** 95.0%–105.0%

#### • EPINEPHRINE

**Mobile phase:** Mix 50 mL of glacial acetic acid and 930 mL of water. Adjust with 2 N sodium hydroxide to a pH of 3.4. In this solution, dissolve 1.2 g of sodium 1-heptanesulfonate, and add 1.0 mL of 0.1 M edetate disodium and 0.298 g of potassium chloride. Add 150 mL of methanol.

**Diluent:** 0.5 mg/mL potassium metabisulfite in water

**System suitability solution:** 22 μg/mL of epinephrine from USP Epinephrine Bitartrate RS and 20 μg/mL of norepinephrine from USP Norepinephrine Bitartrate RS in *Diluent*

**Standard stock solution:** 0.55 mg/mL of epinephrine from USP Epinephrine Bitartrate RS in *Diluent*

**Standard solution:** Dilute a suitable volume of the *Standard stock solution* with *Diluent* to obtain a final concentration of *L* mg/mL of epinephrine, where *L* is the label claim of epinephrine in the Injection.

**Sample solution:** Use the Injection directly.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** Amperometric electrochemical

**Reference electrode:** Silver/silver chloride

**Working electrode:** Glassy carbon

**Potential:** +650 mV

**Detector temperature:**  $28 \pm 2^\circ$

**Column:** 4.0-mm  $\times$  25-cm; 5- $\mu$ m packing L7

**Flow rate:** 1 mL/min

**Injection size:** 2  $\mu$ L

**Run time:** 1.7 times the retention time of epinephrine

**System suitability**

**Sample:** *System suitability solution*

[NOTE—The relative retention times for norepinephrine and epinephrine are 0.90 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 1.5 between the norepinephrine and epinephrine peaks

**Tailing factor:** NMT 2.0 for the epinephrine peak

**Relative standard deviation:** NMT 1.0% for the epinephrine peak, from six injections

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of epinephrine ( $C_9H_{13}NO_3$ ) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of epinephrine in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of epinephrine in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–115.0%

## PERFORMANCE TESTS

### • DELIVERABLE VOLUME (698)

For Articaine Hydrochloride and Epinephrine Injection packaged in single-dose containers: Meets the requirements

## IMPURITIES

### • ORGANIC IMPURITIES, LIMIT OF ARTICAINES RELATED COMPOUNDS

**Mobile phase, Standard stock solution, Sample solution, and Chromatographic system:** Proceed as directed in the *Assay for Articaine Hydrochloride*.

**Standard solution:** 0.8 mg/mL of USP Articaine Hydrochloride RS from *Standard stock solution* and 40  $\mu$ g/mL of USP Articaine Related Compound B RS in *Mobile phase*

**System suitability**

**Sample:** *Standard solution*

[NOTE—See Table 1 for relative retention times.]

**Suitability requirements**

**Tailing factor:** NMT 2.2 for the articaine peak

**Resolution:** NLT 1.25 between the articaine related compound B and articaine peaks

**Relative standard deviation:** NMT 1.0% for the articaine peak

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

[NOTE—Articaine related compounds elute at relative retention times of NMT 2.0 with respect to the articaine peak.]

Calculate the percentage of articaine related compounds and any other individual impurity in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = response of each individual impurity from the *Sample solution*

$r_S$  = response of articaine from the *Standard solution*

$C_S$  = concentration of articaine in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of articaine in the *Sample solution* (mg/mL)

[NOTE—Disregard any peak below 0.05%.]

**Acceptance criteria:** See Table 1.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Articaine related compound B	0.6	0.5
Articaine	1.0	—
Any other individual impurity	—	0.2
Total impurities	—	0.5

### • ORGANIC IMPURITIES, LIMIT OF EPINEPHRINE RELATED COMPOUNDS

**Mobile phase, System suitability solution, Standard solution, Sample solution, Chromatographic system, and System suitability:** Proceed as directed in the *Assay for Epinephrine*.

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

[NOTE—Epinephrine related compounds elute between relative retention times of 0.35 and 1.0, with respect to the epinephrine peak.]

Calculate the percentage of epinephrine related compounds and any other individual impurity in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = response of each individual impurity from the *Sample solution*

$r_S$  = response of epinephrine from the *Standard solution*

$C_S$  = concentration of epinephrine in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of epinephrine in the *Sample solution* (mg/mL)

**Acceptance criteria:** See Table 2.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Epinephrine sulfonate <sup>a</sup>	0.46	7.5
Specified impurity	0.52	8
Epinephrine	1.0	—
Any other individual impurity	—	1
Total impurities	—	10

<sup>a</sup> 1-(3,4-Dihydroxyphenyl)-2-(methylamino)ethanesulfonic acid.

## SPECIFIC TESTS

### • PH (791): 2.7–5.2

### • BACTERIAL ENDOTOXINS TEST (85): NMT 0.7 USP Endotoxin Unit/mg of articaine hydrochloride

### • STERILITY (71): It meets the requirements when tested as directed for *Test for Sterility of the Product to Be Examined, Membrane Filtration*.

### • PARTICULATE MATTER IN INJECTIONS (788): Meets the requirements

### • OTHER REQUIREMENTS: It meets the requirements under *Injections* (1).

## ADDITIONAL REQUIREMENTS

### • PACKAGING AND STORAGE: Preserve in single-dose containers, preferably of Type I glass. Store at controlled room temperature.

- **USP REFERENCE STANDARDS** <11>  
USP Articaïne Hydrochloride RS  
USP Articaïne Related Compound B RS  
4-Methyl-3-[[2-(propylamino)propanoyl]amino}thiophene-2-carboxylic acid.  
 $C_{12}H_{18}N_2O_3S$  270.35  
USP Endotoxin RS  
USP Epinephrine Bitartrate RS  
USP Norepinephrine Bitartrate RS

## Ascorbic Acid

$C_6H_8O_6$  176.12  
L-Ascorbic acid [50-81-7].

### DEFINITION

Ascorbic Acid contains NLT 99.0% and NMT 100.5% of  $C_6H_8O_6$ .

### IDENTIFICATION

- **A. INFRARED ABSORPTION** <197K>
- **B.** A 20-mg/mL solution reduces alkaline cupric tartrate TS slowly at room temperature but more readily upon heating.

### ASSAY

#### • PROCEDURE

**Sample:** 400 mg of Ascorbic Acid

#### Titrimetric system

(See *Titrimetry* <541>.)

**Mode:** Direct titration

**Titrant:** 0.1 N iodine VS

**Endpoint detection:** Visual

**Blank:** 100 mL of water and 25 mL of 2 N sulfuric acid.  
Add 3 mL of starch TS.

**Analysis:** Dissolve the *Sample* in a mixture of 100 mL of water and 25 mL of 2 N sulfuric acid. Add 3 mL of starch TS, and titrate immediately with *Titrant* until a persistent violet-blue color is obtained.

Calculate the percentage of ascorbic acid ( $C_6H_8O_6$ ) in the portion of Ascorbic Acid taken:

$$\text{Result} = [(V - B) \times N \times F \times 100] / W$$

$V$  = sample titrant volume (mL)

$B$  = blank titrant volume (mL)

$N$  = titrant normality (mEq/mL)

$F$  = equivalency factor, 88.06 mg/mEq

$W$  = weight of *Sample* (mg)

**Acceptance criteria:** 99.0%–100.5%

### IMPURITIES

- **RESIDUE ON IGNITION** <281>: NMT 0.1%

- **HEAVY METALS** <231>

**Sample solution:** 1 g in 25 mL of water

**Acceptance criteria:** NMT 20 ppm

### SPECIFIC TESTS

- **OPTICAL ROTATION, Specific Rotation** <781S>

**Sample solution:** 100 mg/mL in carbon dioxide-free water. Perform the test immediately after preparation of the *Sample solution*.

**Acceptance criteria:** +20.5° to +21.5°

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

- **USP REFERENCE STANDARDS** <11>  
USP Ascorbic Acid RS

## Ascorbic Acid Injection

» Ascorbic Acid Injection is a sterile solution, in Water for Injection, of Ascorbic Acid prepared with the aid of Sodium Hydroxide, Sodium Carbonate, or Sodium Bicarbonate. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ascorbic acid ( $C_6H_8O_6$ ).

**Packaging and storage**—Preserve in light-resistant, single-dose containers, preferably of Type I or Type II glass.

**Labeling**—In addition to meeting the requirements for *Labeling* under *Injections* <1>, fused-seal containers of the Injection in concentrations of 250 mg per mL and greater are labeled to indicate that since pressure may develop on long storage, precautions should be taken to wrap the container in a protective covering while it is being opened.

### USP Reference standards <11>—

USP Ascorbic Acid RS

USP Endotoxin RS

### Identification—

**A:** To a volume of Injection, equivalent to 40 mg of ascorbic acid, add 4 mL of 0.1 N hydrochloric acid, then add 4 drops of methylene blue TS, and warm to 40°: the deep blue color becomes appreciably lighter or is completely discharged within 3 minutes.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation*, obtained as directed in the *Assay*.

**C:** It responds to the flame test for *Sodium* <191>.

**Bacterial endotoxins** <85>—It contains not more than 1.2 USP Endotoxin Units per mg of ascorbic acid.

**pH** <791>: between 5.5 and 7.0.

**Limit of oxalate**—Dilute a volume of Injection, equivalent to 50 mg of ascorbic acid, with water to 5 mL. Add 0.2 mL of acetic acid and 0.5 mL of calcium chloride TS: no turbidity is produced in 1 minute.

**Other requirements**—It meets the requirements under *Injections* <1>.

### Assay—

**Mobile phase**—Dissolve 15.6 g of dibasic sodium phosphate and 12.2 g of monobasic potassium phosphate in 2000 mL of water, adjust with phosphoric acid to a pH of  $2.5 \pm 0.05$ . Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Ascorbic Acid RS in *Mobile phase*, and mix to obtain a solution having a known concentration of about 0.5 mg per mL. [NOTE—Refrigerate and store protected from light until use. The solution is stable for at least 24 hours. Inject within 3 hours after removal from the refrigerator.]

**Assay preparation**—Dilute the Injection, quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a concentration of about 0.5 mg per mL. [NOTE—Refrigerate and store protected from light until use. The solution is stable for at least 24 hours. Inject within 3 hours after removal from the refrigerator.]

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 245-nm detector and a 6-mm  $\times$  150-mm column that contains packing L39. The flow rate is about 0.6 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as

directed for *Procedure*: the column efficiency is not less than 3500 theoretical plates, the tailing factor is not more than 1.6, and the relative standard deviation for replicate injections is not more than 1.5%.

*Procedure*—Separately inject equal volumes (about 4  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peak. Calculate the quantity, in mg, of ascorbic acid ( $C_6H_8O_6$ ) in each mL of the injection taken by the formula:

$$CD(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Ascorbic Acid RS in the *Standard preparation*; *D* is the dilution factor; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Ascorbic Acid Oral Solution

### DEFINITION

Ascorbic Acid Oral Solution is a solution of Ascorbic Acid in a hydroxylic organic solvent or an aqueous mixture thereof. It contains NLT 90.0% and NMT 110.0% of the labeled amount of ascorbic acid ( $C_6H_8O_6$ ).

### IDENTIFICATION

- **A.**  
**Sample solution:** A volume of Oral Solution equivalent to 40 mg of ascorbic acid  
**Analysis:** To the *Sample solution* add 4 mL of 0.1 N hydrochloric acid, then 4 drops of methylene blue TS, and warm to 40°.  
**Acceptance criteria:** The deep blue color becomes appreciably lighter or is completely discharged within 3 min.
- **B.**  
**Sample solution:** A volume of Oral Solution equivalent to 20 mg of ascorbic acid  
**Analysis:** To the *Sample solution* add 15 mL of trichloroacetic acid solution (1 in 20). Add 200 mg of activated charcoal, shake the mixture vigorously for 1 min, and pass through a small fluted filter, returning the filtrate, if necessary, until clear. To 5 mL of the filtrate add 1 drop of pyrrole, agitate gently until dissolved, then heat in a bath at 50°.  
**Acceptance criteria:** A blue color develops.

### ASSAY

#### • PROCEDURE

**Sample solution:** Transfer a volume of Oral Solution equivalent to 50 mg of ascorbic acid, previously diluted with water if necessary, to a 100-mL volumetric flask. Add 20 mL of metaphosphoric-acetic acid TS, dilute with water to volume, and mix.

**Blank:** A mixture of 5.5 mL of metaphosphoric-acetic acid TS and 15 mL of water

#### Titrimetric system

(See *Titrimetry* <541>.)

**Mode:** Direct titration

**Titrant:** Standard dichlorophenol-indophenol VS

**Analysis:** Transfer a volume of the *Sample solution*, equivalent to 2 mg of ascorbic acid, into a 50-mL conical flask. Add 5 mL of metaphosphoric-acetic acid TS, and titrate with *Titrant* until a rose-pink color persists for at least 5 s. Correct for the volume of the *Titrant* consumed by the *Blank*.

Calculate the percentage of ascorbic acid ( $C_6H_8O_6$ ) in the portion of Oral Solution taken:

$$\text{Result} = [(V_S - V_B) \times F/W] \times 100$$

- $V_S$  = *Titrant* volume consumed by the *Sample solution* (mL)
- $V_B$  = *Titrant* volume consumed by the *Blank* (mL)
- $F$  = concentration of *Titrant* in terms of its equivalent of ascorbic acid (mg/mL)
- $W$  = nominal amount of ascorbic acid taken for *Analysis* (mg)

**Acceptance criteria:** 90.0%–110.0%

### OTHER COMPONENTS

- **ALCOHOL DETERMINATION, Method I <611>** (if present): 90.0%–110.0% of the labeled content of alcohol ( $C_2H_5OH$ )

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **LABELING:** Label Oral Solution that contains alcohol to state the alcohol content.

## Ascorbic Acid Tablets

### DEFINITION

Ascorbic Acid Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of ascorbic acid ( $C_6H_8O_6$ ).

### IDENTIFICATION

- **A.**  
**Sample solution:** Triturate a quantity of finely powdered Tablets with diluted alcohol to make a solution of ascorbic acid with a concentration of 20 mg/mL, and filter.  
**Analysis:** Add alkaline cupric tartrate TS to a portion of the *Sample solution*.  
**Acceptance criteria:** The *Sample solution* reduces alkaline cupric tartrate TS slowly at room temperature but more readily upon heating.
- **B.**  
**Sample solution:** Use the *Sample solution* from Identification test A.  
**Analysis:** To 2 mL of the *Sample solution* add 4 drops of methylene blue TS, and warm to 40°.  
**Acceptance criteria:** The deep blue color of methylene blue becomes appreciably lighter or is completely discharged within 3 min.
- **C.**  
**Sample solution:** Use the *Sample solution* from Identification test A.  
**Analysis:** To 1 mL of the *Sample solution* add 15 mL of trichloroacetic acid solution (1 in 20) and 200 mg of activated charcoal, shake the mixture vigorously for 1 min, and pass through a small fluted filter, returning the filtrate if necessary, until clear. To 5 mL of the filtrate add 1 drop of pyrrole, agitate gently until dissolved, and then heat in a bath at 50°.  
**Acceptance criteria:** A blue color develops.

### ASSAY

#### • PROCEDURE

**Sample stock solution:** Transfer NLT 20 Tablets to a 1000-mL volumetric flask containing 250 mL of metaphosphoric-acetic acids TS. Insert the stopper in the flask, and shake by mechanical means for 30 min or until the tablets have disintegrated completely. Dilute with water to volume.

**Sample solution:** Transfer a portion of the *Sample stock solution* to a centrifuge tube, and centrifuge until a clear supernatant is obtained. Quantitatively dilute the clear supernatant with water, if necessary, to obtain a solution containing 0.5 mg/mL of ascorbic acid.

**Blank:** A mixture of 5.5 mL of metaphosphoric-acetic acids TS and 15 mL of water

**Titrimetric system**(See *Titrimetry* <541>.)**Mode:** Direct titration**Titrant:** Standard dichlorophenol-indophenol VS**Endpoint detection:** Visual, a rose-pink color that persists for at least 5 s**Analysis:** Transfer a volume of the *Sample solution*, equivalent to 2 mg of ascorbic acid, into 50-mL conical flask. Add 5 mL of metaphosphoric-acetic acids TS, and titrate with *Titrant*. Correct for the volume of the *Titrant* consumed by the *Blank*.Calculate the percentage of the labeled amount of ascorbic acid ( $C_6H_8O_6$ ) in the portion of the Tablets taken:

$$\text{Result} = [(V_S - V_B) \times F / W] \times 100$$

 $V_S$  = *Titrant* volume consumed by the *Sample solution* (mL) $V_B$  = *Titrant* volume consumed by the *Blank* (mL) $F$  = concentration of the *Titrant* in terms of the equivalent of ascorbic acid (mg/mL) $W$  = nominal weight of ascorbic acid taken for *Analysis* (mg)**Acceptance criteria:** 90.0%–110.0%**PERFORMANCE TESTS****• DISSOLUTION <711>****Medium:** Water; 900 mL**Apparatus 2:** 50 rpm**Time:** 45 min**Sample solution:** Withdraw a portion of the solution under test, pass through a suitable filter, and use the pooled sample as the test specimen.**Analysis:** Proceed as directed in the *Assay*, conducting the procedure without delay and making any necessary modifications.

Calculate the percentage of ascorbic acid dissolved:

$$\text{Result} = (V_S - V_B) \times F \times [(V_M/a)/L] \times 100$$

 $V_S$  = *Titrant* volume consumed by the *Sample solution* (mL) $V_B$  = *Titrant* volume consumed by the *Blank* (mL) $F$  = concentration of the *Titrant* in terms of the equivalent of ascorbic acid (mg/mL) $V_M$  = volume of *Medium*, 900 mL $a$  = volume of the aliquot taken for *Analysis* $L$  = labeled amount of ascorbic acid (mg/Tablet)**Tolerances:** NLT 75% (Q) of the labeled amount of ascorbic acid ( $C_6H_8O_6$ ) is dissolved.**• UNIFORMITY OF DOSAGE UNITS <905>** Meet the requirements**ADDITIONAL REQUIREMENTS****• PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

---

**Aspartic Acid**

---

 $C_4H_7NO_4$   
L-Aspartic acid [56-84-8].

133.10

**DEFINITION**Aspartic Acid contains NLT 98.5% and NMT 101.5% of aspartic acid ( $C_4H_7NO_4$ ), calculated on the dried basis.**IDENTIFICATION****• A. INFRARED ABSORPTION <197K>****ASSAY****• PROCEDURE****Sample:** 100 mg of Aspartic Acid**Titrimetric system**(See *Titrimetry* <541>.)**Mode:** Direct titration**Titrant:** 0.1 N sodium hydroxide VS**Endpoint detection:** Visual**Blank:** 50 mL of carbon dioxide-free water. Add 0.1 mL of bromothymol blue TS.**Analysis:** Transfer the *Sample* to a 125-mL flask, and dissolve in 50 mL of carbon dioxide-free water. Heat slightly if necessary. Cool, add 0.1 mL of bromothymol blue TS, and titrate with *Titrant* until the color changes from yellow to blue.Calculate the percentage of aspartic acid ( $C_4H_7NO_4$ ) in the portion of Aspartic Acid taken:

$$\text{Result} = [(V - B) \times N \times F \times 100] / W$$

 $V$  = sample titrant volume (mL) $B$  = blank titrant volume (mL) $N$  = titrant normality (mEq/mL) $F$  = equivalency factor, 133.1 mg/mEq $W$  = weight of *Sample* (mg)**Acceptance criteria:** 98.5%–101.5% on the dried basis**IMPURITIES****• RESIDUE ON IGNITION <281>** NMT 0.1%**• CHLORIDE AND SULFATE, Chloride <221>****Sample solution:** Dissolve 0.7 g of Aspartic Acid in 10 mL of diluted nitric acid, and dilute with water to 15 mL.**Acceptance criteria:** The *Sample solution* shows no more chloride than corresponds to 0.20 mL of 0.020 N hydrochloric acid (NMT 0.02%).**• CHLORIDE AND SULFATE, Sulfate <221>****Sample solution:** Dissolve 0.8 g of Aspartic Acid in 4 mL of hydrochloric acid, and dilute with water to 15 mL.**Acceptance criteria:** The *Sample solution* shows no more sulfate than corresponds to 0.25 mL of 0.020 N sulfuric acid (NMT 0.03%).**• IRON <241>** NMT 10 ppm**• HEAVY METALS, Method II <31>** NMT 10 ppm**• CHROMATOGRAPHIC PURITY****System suitability solution:** 10 mg each of USP Aspartic Acid RS and glutamic acid in 2 mL of ammonia TS. Dilute with water to 25.0 mL.**Standard solution:** Transfer 5 mg of USP Aspartic Acid RS to a 100-mL volumetric flask, dissolve in 2 mL of 17% ammonia solution (prepared by diluting ammonium hydroxide, 6 in 10), and dilute with water to volume.**Sample solution:** Transfer 0.1 g of Aspartic Acid to a 10-mL volumetric flask, dissolve in 2 mL of 17% ammonia solution (prepared by diluting ammonium hydroxide, 6 in 10), and dilute with water to volume.**Chromatographic system**(See *Chromatography* <621>, *Thin-Layer Chromatography*.)**Mode:** TLC**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture**Application volume:** 5  $\mu$ L**Developing solvent system:** Butyl alcohol, glacial acetic acid, and water (3:1:1)**Spray reagent:** 2 mg/mL of ninhydrin in a mixture of butyl alcohol and 2 N acetic acid (95:5)**System suitability****Sample:** *System suitability solution***Suitability requirement:** The chromatogram of the *System suitability solution* exhibits two clearly separated spots.

**Analysis**

**Samples:** *System suitability solution, Standard solution, and Sample solution*

Proceed as directed in the chapter, except dry the plate at 80° for 30 min, spray with *Spray reagent*, and heat at 80° for 30 min. Examine the plate under white light.

**Acceptance criteria:** No secondary spot from the *Sample solution* is larger or more intense than the principal spot from the *Standard solution*.

**Individual impurities:** NMT 0.5%

**Total impurities:** NMT 2.0%

**SPECIFIC TESTS**

- **OPTICAL ROTATION, Specific Rotation (781S)**

**Sample solution:** 80 mg/mL in 6 N hydrochloric acid

**Acceptance criteria:** +24.0° to +26.0°, at 20°

- **LOSS ON DRYING (731):** Dry a sample at 105° for 3 h: it loses NMT 0.5% of its weight.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store protected from light.

- **USP REFERENCE STANDARDS (11)**

USP Aspartic Acid RS

---

**Aspirin**

---

C<sub>9</sub>H<sub>8</sub>O<sub>4</sub> 180.16

Benzoic acid, 2-(acetyloxy)-.

Salicylic acid acetate [50-78-2].

» Aspirin contains not less than 99.5 percent and not more than 100.5 percent of C<sub>9</sub>H<sub>8</sub>O<sub>4</sub>, calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards (11)**—

USP Aspirin RS

**Identification**—

A: Heat it with water for several minutes, cool, and add 1 or 2 drops of ferric chloride TS: a violet-red color is produced.

B: *Infrared Absorption* (197K).

**Loss on drying (731)**—Dry it over silica gel for 5 hours: it loses not more than 0.5% of its weight.

**Readily carbonizable substances (271)**—Dissolve 500 mg in 5 mL of sulfuric acid: the solution has no more color than *Matching Fluid Q*.

**Residue on ignition (281):** not more than 0.05%.

**Substances insoluble in sodium carbonate TS**—A solution of 500 mg in 10 mL of warm sodium carbonate TS is clear.

**Chloride (221)**—Boil 1.5 g with 75 mL of water for 5 minutes, cool, add sufficient water to restore the original volume, and filter. A 25-mL portion of the filtrate shows no more chloride than corresponds to 0.10 mL of 0.020 N hydrochloric acid (0.014%).

**Sulfate**—Dissolve 6.0 g in 37 mL of acetone, and add 3 mL of water. Titrate potentiometrically with 0.02 M lead perchlorate, prepared by dissolving 9.20 g of lead perchlorate in water to make 1000 mL of solution, using a pH meter capable of a minimum reproducibility of ±0.1 mV (see pH (791)) and equipped with an electrode system con-

sisting of a lead-specific electrode and a silver-silver chloride reference glass-sleeved electrode containing a solution of tetraethylammonium perchlorate in glacial acetic acid (1 in 44) (see *Titrimetry* (541)): not more than 1.25 mL of 0.02 M lead perchlorate is consumed (0.04%). [NOTE—After use, rinse the lead-specific electrode with water, drain the reference electrode, flush with water, rinse with methanol, and allow to dry.]

**Heavy metals**—Dissolve 2 g in 25 mL of acetone, and add 1 mL of water. Add 1.2 mL of thioacetamide-glycerin base TS and 2 mL of pH 3.5 Acetate Buffer (see *Heavy Metals* (231)), and allow to stand for 5 minutes: any color produced is not darker than that of a control made with 25 mL of acetone and 2 mL of *Standard Lead Solution* (see *Heavy Metals* (231)), treated in the same manner. The limit is 10 µg per g.

**Limit of free salicylic acid**—Dissolve 2.5 g in sufficient alcohol to make 25.0 mL. To each of two matched color-comparison tubes add 48 mL of water and 1 mL of a freshly prepared, diluted ferric ammonium sulfate solution (prepared by adding 1 mL of 1 N hydrochloric acid to 2 mL of ferric ammonium sulfate TS and diluting with water to 100 mL). Into one tube pipet 1 mL of a standard solution of salicylic acid in water, containing 0.10 mg of salicylic acid per mL. Into the second tube pipet 1 mL of the 1 in 10 solution of Aspirin. Mix the contents of each tube: after 30 seconds, the color in the second tube is not more intense than that in the tube containing the salicylic acid (0.1%).

**Assay**—Place about 1.5 g of Aspirin, accurately weighed, in a flask, add 50.0 mL of 0.5 N sodium hydroxide VS, and boil the mixture gently for 10 minutes. Add phenolphthalein TS, and titrate the excess sodium hydroxide with 0.5 N sulfuric acid VS. Perform a blank determination (see *Residual Titrations* under *Titrimetry* (541)). Each mL of 0.5 N sodium hydroxide is equivalent to 45.04 mg of C<sub>9</sub>H<sub>8</sub>O<sub>4</sub>.

---

**Aspirin Boluses**

---

» Aspirin Boluses contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of aspirin (C<sub>9</sub>H<sub>8</sub>O<sub>4</sub>).

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Label Boluses to indicate that they are for veterinary use only.

**USP Reference standards (11)**—

USP Aspirin RS

USP Salicylic Acid RS

**Identification**—

A: Crush 1 Bolus, boil a portion of the powder, equivalent to about 300 mg of aspirin, with 50 mL of water, cool, and add a drop of ferric chloride TS: a violet-red color is produced.

B: The retention time of the aspirin peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Dissolution (711)**—

*Medium:* 0.5 M phosphate buffer, pH 7.4; 900 mL.

*Apparatus 2:* 75 rpm.

*Time:* 45 minutes.

*Diluting solution*—Prepare a mixture of acetonitrile and formic acid (99:1).

*Procedure*—Determine the amount of aspirin (C<sub>9</sub>H<sub>8</sub>O<sub>4</sub>) dissolved by employing UV absorption at the wavelength of the isosbestic point of aspirin and salicylic acid at 265 ± 2 nm on filtered portions of the solution under test, suitably

diluted with *Diluting solution*, if necessary, in comparison with a Standard solution having a known concentration of USP Aspirin RS in the same *Medium*. [NOTE—Prepare the Standard solution at the time of use.]

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_9H_8O_4$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Limit of salicylic acid**—Using the chromatograms of the *Standard preparation* and the *Assay preparation*, obtained as directed in the *Assay*, calculate the percentage of salicylic acid ( $C_7H_6O_3$ ) in the portion of Boluses taken by the formula:

$$100,000(C / W_A)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Salicylic Acid RS in the *Standard preparation*;  $W_A$  is the quantity, in mg, of aspirin ( $C_9H_8O_4$ ) in the portion of Boluses taken, as determined in the *Assay*; and  $r_U$  and  $r_S$  are the salicylic acid peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively: not more than 0.3% is found.

#### Assay—

**Mobile phase**—Dissolve 2 g of sodium 1-heptanesulfonate in a mixture of 850 mL of water and 150 mL of acetonitrile, and adjust with glacial acetic acid to a pH of 3.4. Make any necessary adjustments (see *System Suitability* under *Chromatography* (621)).

**Diluting solution**—Prepare a mixture of acetonitrile and formic acid (99:1).

**Standard preparation**—Prepare a solution in *Diluting solution* having known concentrations of about 0.4 mg of USP Aspirin RS and 0.01 mg of USP Salicylic Acid RS per mL.

**Assay preparation**—Weigh and finely powder not fewer than 10 Boluses. Transfer an accurately weighed portion of the powder, equivalent to about 400 mg of aspirin, to a 100-mL volumetric flask, dilute with *Diluting solution* to volume, and stir by mechanical means for about 15 minutes. Pass a portion of this solution through a filter having a 0.5- $\mu$ m or finer porosity, and use the filtrate as the *Assay preparation*.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  25-cm column that contains 5- $\mu$ m packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.6 for salicylic acid and 1.0 for aspirin, and the relative standard deviation of the aspirin peak response for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of aspirin ( $C_9H_8O_4$ ) in the portion of Boluses taken by the formula:

$$1000C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Aspirin RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the aspirin peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Aspirin Capsules

» Aspirin Capsules contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of aspirin ( $C_9H_8O_4$ ).

NOTE—Capsules that are enteric-coated or the contents of which are enteric-coated meet the requirements for *Aspirin Delayed-Release Capsules*.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Aspirin RS

#### Identification—

**A:** Heat about 100 mg of the Capsule contents with 10 mL of water for several minutes, cool, and add 1 drop of ferric chloride TS: a violet-red color is produced.

**B:** Shake a quantity of the contents of Capsules, equivalent to about 500 mg of aspirin, with 10 mL of alcohol for several minutes. Centrifuge the mixture. Pour off the clear supernatant and evaporate it to dryness. Dry the residue in vacuum at 60° for 1 hour: the residue responds to *Identification test B* under *Aspirin*.

#### Dissolution (711)—

**Medium:** 0.05 M acetate buffer, prepared by mixing 2.99 g of sodium acetate trihydrate and 1.66 mL of glacial acetic acid with water to obtain 1000 mL of solution having a pH of  $4.50 \pm 0.05$ ; 500 mL.

**Apparatus 1:** 100 rpm.

**Time:** 30 minutes.

**Procedure**—Determine the amount of  $C_9H_8O_4$  dissolved from UV absorbances at the wavelength of the isosbestic point of aspirin and salicylic acid at  $265 \pm 2$  nm of filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Aspirin RS in the same *Medium*. [NOTE—Prepare the Standard solution at the time of use. An amount of alcohol not to exceed 1% of the total volume of the Standard solution may be used to bring the Reference Standard into solution prior to dilution with *Medium*.]

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_9H_8O_4$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

#### Limit of free salicylic acid—

**Ferric chloride-urea reagent**—Dissolve by swirling, without the aid of heat, 60 g of urea in a mixture of 8 mL of ferric chloride solution (6 in 10) and 42 mL of 0.05 N hydrochloric acid. Adjust the resulting solution, if necessary, with 6 N hydrochloric acid to a pH of 3.2.

**Standard preparation**—Transfer 75.0 mg of salicylic acid, previously dried over silica gel for 3 hours and accurately weighed, to a 100-mL volumetric flask, add chloroform to volume, and mix. Transfer 10.0 mL of this solution to a second 100-mL volumetric flask, dilute with chloroform to volume, and mix. Transfer 10.0 mL of this last solution to a 50-mL volumetric flask containing 10 mL of methanol, 2 drops of hydrochloric acid, and 10 mL of a 1 in 10 solution of glacial acetic acid in ether, dilute with chloroform to volume, and mix.

**Chromatographic column** (see *Chromatography* (621))—Proceed as directed under *Column Partition Chromatography*, packing a chromatographic tube with two segments of packing material. The lower segment is a mixture of 1 g of *Solid Support* and 0.5 mL of 5 M phosphoric acid, and the upper segment is a mixture of 3 g of *Solid Support* and 2 mL of freshly prepared *Ferric chloride-urea reagent*.

**Test preparation**—Weigh accurately a portion of the contents of the Capsules, as determined by the Assay, equivalent to 100 mg of aspirin, mix with 10 mL of chloroform by stirring for 3 minutes, and then transfer to the chromatographic column with the aid of a few mL of chloroform. Pass 50 mL of chloroform through the column, rinse the tip of the chromatographic tube with chloroform, and discard the eluate. Prepare as a receiver a 50-mL volumetric flask containing 10 mL of methanol and 2 drops of hydrochloric acid, and elute any salicylic acid from the column by passing 10 mL of a 1 in 10 solution of glacial acetic acid in ether that has been recently saturated with water, followed by 30 mL of chloroform. Dilute the eluate with chloroform to volume, and mix.

**Procedure**—Concomitantly determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 306 nm, with a suitable spectrophotometer, using as the blank a solvent mixture of the same composition as that used for the *Standard preparation*: the absorbance of the *Test preparation* does not exceed that of the *Standard preparation* (0.75%, calculated on the labeled aspirin content).

**Assay**—[NOTE—In this assay use chloroform recently saturated with water.]

**Standard preparation**—Transfer about 50 mg of USP Aspirin RS, accurately weighed, to a 50-mL volumetric flask, add 0.5 mL of glacial acetic acid, add chloroform to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with a 1 in 100 solution of glacial acetic acid in chloroform to volume, and mix. The concentration of USP Aspirin RS is about 50 µg per mL.

**Chromatographic column**—Proceed as directed under *Column Partition Chromatography* (see *Chromatography* (621)), packing a chromatographic tube with a mixture of 3 g of *Solid Support* and 2 mL of freshly prepared sodium bicarbonate solution (1 in 12).

**Assay preparation**—Remove, as completely as possible, the contents of not fewer than 20 Capsules, and weigh accurately. Mix the combined contents, and transfer an accurately weighed quantity of the powder, equivalent to about 50 mg of aspirin, to a 50-mL volumetric flask containing 1 mL of a 1 in 50 solution of hydrochloric acid in methanol, add chloroform to volume, and mix. Transfer 5.0 mL of this solution to the column, wash with 5 mL and then with 25 mL of chloroform, and discard the washings. Elute into a 100-mL volumetric flask with about 10 mL of a 1 in 10 solution of glacial acetic acid in chloroform and then with about 85 mL of a 1 in 100 solution of glacial acetic acid in chloroform, dilute with the latter solvent to volume, and mix.

**Procedure**—Without delay, concomitantly determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 280 nm, with a suitable spectrophotometer, using chloroform as the blank. Calculate the quantity, in mg, of aspirin ( $C_9H_8O_4$ ) in the portion of Capsules taken by the formula:

$$C(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Aspirin RS in the *Standard preparation*; and  $A_U$  and  $A_S$  are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

## Aspirin Delayed-Release Capsules

» Aspirin Delayed-Release Capsules contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of aspirin ( $C_9H_8O_4$ ).

**Packaging and storage**—Preserve in tight containers.

**Labeling**—The label indicates that the Capsules or the contents thereof are enteric-coated.

**USP Reference standards** (11)—

USP Aspirin RS

USP Salicylic Acid RS

**Identification**—

**A:** Heat about 100 mg of the Capsule contents with 10 mL of water for several minutes, cool, and add 1 drop of ferric chloride TS: a violet-red color is produced.

**B:** *Infrared Absorption* (197K)—Prepare the test specimen as follows. Shake a quantity of the contents of Capsules, equivalent to about 500 mg of aspirin, with 10 mL of alcohol for several minutes. Centrifuge the mixture. Pour off the clear supernatant and evaporate it to dryness. Dry the residue in vacuum at 60° for 1 hour.

**Dissolution** (711)—Proceed as directed for *Procedure for Method A* under *Apparatus 1* and *Apparatus 2*, *Delayed-Release Dosage Forms*.

*Apparatus 1:* 100 rpm.

*Time:* 90 minutes, for *Buffer stage*.

**Diluent**—Prepare a mixture of 0.1 N hydrochloric acid and 0.20 M tribasic sodium phosphate (3:1), and adjust, if necessary, with 2 N hydrochloric acid or 2 N sodium hydroxide to a pH of  $6.8 \pm 0.05$ .

**Procedure**—Determine the amount of  $C_9H_8O_4$  dissolved by determining UV absorbances at the wavelength of the isosbestic point of aspirin and salicylic acid (about 280 nm in the *Acid stage*, and about 265 nm in the *Buffer stage*), using a filtered portion of the solution under test, diluted, if necessary, with 0.1 N hydrochloric acid (analyzing the *Acid stage*) and with *Diluent* (analyzing the *Buffer stage*), in comparison with a Standard solution having a known concentration of USP Aspirin RS in the same medium.

**Uniformity of dosage units** (905): meet the requirements.

**Limit of free salicylic acid**—

**Mobile phase and Diluting solution**—Prepare as directed in the Assay.

**Standard solution**—Dissolve an accurately weighed quantity of USP Salicylic Acid RS in the *Standard preparation*, prepared as directed in the Assay, to obtain a solution having a known concentration of about 0.015 mg of salicylic acid per mL.

**Test solution**—Use the *Stock solution* prepared as directed for *Assay preparation*.

**Chromatographic system**—Use the *Chromatographic system* described in the Assay. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure* in the Assay: the relative retention times are about 0.7 for salicylic acid and 1.0 for aspirin; the resolution,  $R$ , between salicylic acid and aspirin is not less than 2.0; and the relative standard deviation of the salicylic acid peak responses is not more than 4.0%.

**Procedure**—Proceed as directed for *Procedure* in the Assay. Calculate the percentage of salicylic acid ( $C_7H_6O_3$ ) in the portion of Capsules taken by the formula:

$$2000(C / Q_A)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Salicylic Acid RS in the *Standard solution*;  $Q_A$  is the quantity, in mg, of aspirin ( $C_9H_8O_4$ ) in the portion of Capsules taken, as determined in the Assay; and  $r_U$  and  $r_S$  are the peak responses of the salicylic acid peaks obtained from the *Test solution* and the *Standard solution*, respectively: not more than 3.0% is found.

**Assay—**

**Mobile phase**—Dissolve 2 g of sodium 1-heptanesulfonate in a mixture of 850 mL of water and 150 mL of acetonitrile, and adjust with glacial acetic acid to a pH of 3.4.

**Diluting solution**—Prepare a mixture of acetonitrile and formic acid (99:1).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Aspirin RS in *Diluting solution* to obtain a solution having a known concentration of about 0.5 mg per mL.

**Assay preparation**—Remove, as completely as possible, the contents of not fewer than 20 Capsules, and weigh accurately. Mix the combined contents, and transfer an accurately weighed quantity of the powder, equivalent to about 100 mg of aspirin, to a suitable container. Add 20.0 mL of *Diluting solution* and about 10 glass beads. Shake vigorously for about 10 minutes, and centrifuge (*Stock solution*). Quantitatively dilute an accurately measured volume of the *Stock solution* with 9 volumes of *Diluting solution* (*Assay preparation*). Retain the remaining portion of *Stock solution* for the test for *Limit of free salicylic acid*.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4.0-mm × 30-cm column containing packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not greater than 2.0; and the relative standard deviation is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of aspirin (C<sub>9</sub>H<sub>8</sub>O<sub>4</sub>) in the portion of Capsules taken by the formula:

$$200C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Aspirin RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses of the aspirin peaks obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Aspirin Suppositories

» Aspirin Suppositories contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of aspirin (C<sub>9</sub>H<sub>8</sub>O<sub>4</sub>).

**Packaging and storage**—Preserve in well-closed containers, in a cool place.

**USP Reference standards** (11)—  
USP Aspirin RS

**Identification**—Transfer a portion of the melted Suppositories obtained in the *Assay*, equivalent to about 1 g of aspirin, to a 125-mL conical flask. Add 20 mL of alcohol, and warm until completely disintegrated. Cool in an ice bath for 5 minutes, filter, and evaporate the filtrate to dryness: the residue responds to *Identification tests A and B* under *Aspirin*.

**Limit of free salicylic acid—**

**Ferric chloride-urea reagent**—To a mixture of 8 mL of ferric chloride solution (6 in 10) and 42 mL of 0.05 N hydrochloric acid add 60 g of urea. Dissolve the urea by swirling and without the aid of heat, and adjust the resulting solution, if necessary, by the addition of 6 N hydrochloric acid to a pH of 3.2. Prepare on the day of use.

**Procedure**—Insert a small pledget of glass wool above the stem constriction of a 20- × 2.5-cm chromatographic tube,

and uniformly pack with a mixture of about 1 g of chromatographic siliceous earth and 0.5 mL of 5 M phosphoric acid. Directly above this layer, pack a similar mixture of about 3 g of chromatographic siliceous earth and 2 mL of *Ferric chloride-urea reagent*. Transfer to a small beaker an accurately weighed portion of the cooled mass from the previously melted Suppositories obtained in the *Assay*, equivalent to 50 mg of aspirin, add 10 mL of chloroform, warm slightly, and stir until dissolved. With the aid of 5 mL of chloroform, transfer the mixture to the chromatographic adsorption column. Pass 50 mL of chloroform in several portions through the column, rinse the tip of the chromatographic tube with chloroform, and discard the eluate. If the purple zone reaches the bottom of the tube, discard the column, and repeat the test with a smaller quantity of melted Suppositories.

Elute the adsorbed salicylic acid into a 100-mL volumetric flask containing 20 mL of methanol and 0.2 mL of hydrochloric acid by passing two 10-mL portions of a 1 in 10 solution of glacial acetic acid in water-saturated ether, and then 30 mL of chloroform, through the column, and dilute the eluate with chloroform to volume. Dissolve a suitable, accurately weighed quantity of salicylic acid in chloroform to obtain a *Standard solution* containing 150 µg of salicylic acid per mL. Pipet 5 mL of this solution into a 50-mL volumetric flask containing 10 mL of methanol, 0.1 mL of hydrochloric acid, and 10 mL of a 1 in 10 solution of glacial acetic acid in ether. Add chloroform to volume, and mix. Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 306 nm, using as the blank a solvent mixture of the same composition as that of the *Standard solution*: the absorbance of the solution from the Suppositories does not exceed that of the *Standard solution* (3.0%).

**Assay**—[NOTE—In this assay, use chloroform that recently was saturated with water.]

**Chromatographic column**—Uniformly pack a chromatographic tube, as described in the test for *Limit of free salicylic acid* for *Procedure*, with a mixture of about 3 g of chromatographic siliceous earth and 2 mL of sodium bicarbonate solution (1 in 12) prepared on the day of use.

**Standard preparation**—Transfer about 50 mg of USP Aspirin RS, accurately weighed, to a 50-mL volumetric flask, add 0.5 mL of glacial acetic acid, and add chloroform to volume. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, add a 1 in 100 solution of glacial acetic acid in chloroform to volume, and mix.

**Assay preparation**—Tare a small dish and glass rod, place in the dish not fewer than 5 Suppositories, heat gently on a steam bath until melted, then stir, cool while stirring, and weigh. Transfer an accurately weighed portion of the mass, equivalent to about 50 mg of aspirin, to a 50-mL volumetric flask containing 1 mL of a 1 in 50 solution of hydrochloric acid in methanol, add 40 mL of chloroform, mix, and add chloroform to volume.

**Procedure**—Pipet 5 mL of the *Assay preparation* into the column, wash with 5 mL and then with 25 mL of chloroform, and discard the washings. Without delay, elute into a 100-mL volumetric flask with about 10 mL of a 1 in 10 solution of glacial acetic acid in chloroform, and then with about 85 mL of a 1 in 100 solution of glacial acetic acid in chloroform, dilute with the latter solvent to volume, and mix. Without delay, concomitantly determine the absorbances of the eluted *Assay preparation* and the *Standard preparation* in 1-cm cells at the wavelength of maximum absorbance at about 280 nm, with a suitable spectrophotometer, using chloroform as the blank. Calculate the quantity, in mg, of aspirin (C<sub>9</sub>H<sub>8</sub>O<sub>4</sub>) in the portion of Suppositories taken by the formula:

$$C(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Aspirin RS in the *Standard preparation*; and  $A_U$  and  $A_S$  are the

absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

## Aspirin Tablets

» Aspirin Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of aspirin ( $C_9H_8O_4$ ). Tablets of larger than 81-mg size contain no sweeteners or other flavors.

NOTE—Tablets that are enteric-coated meet the requirements for *Aspirin Delayed-Release Tablets*.

**Packaging and storage**—Preserve in tight containers. Preserve flavored or sweetened Tablets of 81-mg size or smaller in containers holding not more than 36 Tablets each.

**USP Reference standards** (11)—

USP Aspirin RS

USP Salicylic Acid RS

**Identification**—

**A:** Crush 1 Tablet, boil it with 50 mL of water for 5 minutes, cool, and add 1 or 2 drops of ferric chloride TS: a violet-red color is produced.

**B:** *Infrared Absorption* (197K)—Prepare the test specimen as follows. Shake a quantity of finely powdered Tablets, equivalent to about 500 mg of aspirin, with 10 mL of alcohol for several minutes. Centrifuge the mixture. Pour off the clear supernatant, and evaporate it to dryness. Dry the residue in vacuum at 60° for 1 hour.

**Dissolution** (711)—

**Medium:** 0.05 M acetate buffer, prepared by mixing 2.99 g of sodium acetate trihydrate and 1.66 mL of glacial acetic acid with water to obtain 1000 mL of solution having a pH of  $4.50 \pm 0.05$ ; 500 mL.

**Apparatus 1:** 50 rpm.

**Time:** 30 minutes.

**Procedure**—Determine the amount of  $C_9H_8O_4$  dissolved from UV absorbances at the wavelength of the isosbestic point of aspirin and salicylic acid at  $265 \pm 2$  nm of filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Aspirin RS in the same *Medium*. [NOTE—Prepare the Standard solution at the time of use. An amount of alcohol not to exceed 1% of the total volume of the Standard solution may be used to bring the Reference Standard into solution prior to dilution with *Medium*.]

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_9H_8O_4$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Limit of free salicylic acid**—

**Mobile phase and Diluting solution**—Prepare as directed in the *Assay*.

**Standard solution**—Dissolve an accurately weighed quantity of USP Salicylic Acid RS in the *Standard preparation* prepared as directed in the *Assay*, to obtain a solution having a known concentration of about 0.015 mg of salicylic acid per mL.

**Test solution**—Use the *Stock solution* prepared as directed for *Assay preparation* in the *Assay*.

**Chromatographic system**—Use the *Chromatographic system* described in the *Assay*. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.7 for salicylic acid and 1.0 for aspirin; the resolution,  $R$ , between salicylic

acid and aspirin is not less than 2.0; and the relative standard deviation of the salicylic acid peak responses is not more than 4.0%.

**Procedure**—Proceed as directed for *Procedure* in the *Assay*. Calculate the percentage of salicylic acid ( $C_7H_6O_3$ ) in the portion of Tablets taken by the formula:

$$2000(C / Q_A)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Salicylic Acid RS in the *Standard solution*;  $Q_A$  is the quantity, in mg, of aspirin ( $C_9H_8O_4$ ) in the portion of Tablets taken, as determined in the *Assay*, and  $r_U$  and  $r_S$  are the peak responses of the salicylic acid peaks obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.3% is found. In the case of Tablets that are coated, not more than 3.0% is found.

**Assay**—

**Mobile phase**—Dissolve 2 g of sodium 1-heptanesulfonate in a mixture of 850 mL of water and 150 mL of acetonitrile, and adjust with glacial acetic acid to a pH of 3.4.

**Diluting solution**—Prepare a mixture of acetonitrile and formic acid (99:1).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Aspirin RS in *Diluting solution* to obtain a solution having a known concentration of about 0.5 mg per mL.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed quantity of the powder, equivalent to about 100 mg of aspirin, to a suitable container. Add 20.0 mL of *Diluting solution* and about 10 beads. Shake vigorously for about 10 minutes, and centrifuge (*Stock solution*). Quantitatively dilute an accurately measured volume of the *Stock solution* with 9 volumes of *Diluting solution* (*Assay preparation*). Retain the remaining portion of *Stock solution* for the test for *Limit of free salicylic acid*.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4.0-mm  $\times$  30-cm column containing packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not greater than 2.0; and the relative standard deviation is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of aspirin ( $C_9H_8O_4$ ) in the portion of Tablets taken by the formula:

$$200C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Aspirin RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses of the aspirin peaks obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Buffered Aspirin Tablets

» Buffered Aspirin Tablets contain Aspirin and suitable buffering agents. Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of aspirin ( $C_9H_8O_4$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Aspirin RS

## USP Salicylic Acid RS

**Identification—**

**A:** Crush 1 Tablet, boil it with 50 mL of water for 5 minutes, cool, and add 1 or 2 drops of ferric chloride TS: a violet-red color is produced.

**B:** *Infrared Absorption* (197K)—

*Test specimen*—Shake a quantity of finely powdered Tablets, equivalent to about 500 mg of aspirin, with 10 mL of chloroform for several minutes. Centrifuge the mixture. Pour off the clear supernatant, and evaporate it to dryness.

**Dissolution** (711)—

*Medium:* 0.05 M acetate buffer, prepared by mixing 2.99 g of sodium acetate trihydrate and 1.66 mL of glacial acetic acid with water to obtain 1000 mL of solution having a pH of  $4.50 \pm 0.05$ ; 500 mL.

*Apparatus 2:* 75 rpm. [NOTE—Where the Tablet is composed of multiple layers, a stainless steel wire helix may be used, if needed, to hold the Tablet in proper orientation in the apparatus.]

*Time:* 30 minutes.

*Procedure*—Determine the amount of aspirin ( $C_9H_8O_4$ ) dissolved by employing UV absorption at the wavelength of the isosbestic point of aspirin and salicylic acid at  $265 \pm 2$  nm on filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Aspirin RS in the same *Medium*. [NOTE—Prepare the Standard solution at the time of use. An amount of methanol not to exceed 1% of the total volume of the Standard solution may be used to dissolve the Reference Standard prior to dilution with *Medium*.]

*Tolerances*—Not less than 80% (Q) of the labeled amount of  $C_9H_8O_4$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Acid-neutralizing capacity** (301): not less than 1.9 mEq of acid is consumed for each 325 mg of aspirin in the Tablets.

**Limit of free salicylic acid—**

*Mobile phase* and *Diluting solution*—Prepare as directed in the Assay.

*Standard solution*—Dissolve an accurately weighed quantity of USP Salicylic Acid RS in the *Standard preparation* prepared as directed in the Assay, to obtain a solution having a known concentration of about 0.015 mg of salicylic acid per mL.

*Test solution*—Use the *Stock solution*, prepared as directed for Assay preparation in the Assay.

*Chromatographic system*—Prepare as directed in the Assay. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.7 for salicylic acid and 1.0 for aspirin; the resolution,  $R$ , between salicylic acid and aspirin is not less than 2.0; and the relative standard deviation determined from salicylic acid is not more than 4.0%.

*Procedure*—Proceed as directed in the Assay. Calculate the percentage of salicylic acid ( $C_7H_6O_3$ ) in the portion of Tablets taken by the formula:

$$2000(C / Q_A)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Salicylic Acid RS in the *Standard solution*;  $Q_A$  is the quantity, in mg, of aspirin ( $C_9H_8O_4$ ) in the portion of Tablets taken, as determined in the Assay; and  $r_U$  and  $r_S$  are the peak responses of salicylic acid obtained from the *Test solution* and the *Standard solution*, respectively: not more than 3.0% is found.

**Assay—**

*Mobile phase*—Dissolve 2 g of sodium 1-heptanesulfonate in a mixture of 850 mL of water and 150 mL of acetonitrile, and adjust with glacial acetic acid to a pH of 3.4.

*Diluting solution*—Prepare a mixture of acetonitrile and formic acid (99:1).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Aspirin RS in *Diluting solution* to obtain a solution having a known concentration of about 0.5 mg per mL.

*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed quantity of the powder, equivalent to about 100 mg of aspirin, to a suitable container. Add 20.0 mL of *Diluting solution* and about 10 glass beads. Shake vigorously for about 10 minutes, and centrifuge (*Stock solution*). Quantitatively dilute an accurately measured volume of the *Stock solution* with 9 volumes of *Diluting solution* (*Assay preparation*). Retain the remaining portion of *Stock solution* for the test for Limit of free salicylic acid.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4.0-mm  $\times$  30-cm column containing packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 2.0; and the relative standard deviation is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of aspirin ( $C_9H_8O_4$ ) in the portion of Tablets taken by the formula:

$$200C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Aspirin RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses of aspirin obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Aspirin Delayed-Release Tablets**

» Aspirin Delayed-Release Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of aspirin ( $C_9H_8O_4$ ).

**Packaging and storage**—Preserve in tight containers.

**Labeling**—The label indicates that the Tablets are enteric-coated.

**USP Reference standards** (11)—

USP Aspirin RS

USP Salicylic Acid RS

**Identification—**

**A:** Crush 1 Tablet, boil it with 50 mL of water for 5 minutes, cool, and add 1 or 2 drops of ferric chloride TS: a violet-red color is produced.

**B:** *Infrared Absorption* (197K)—Prepare the test specimen as follows. Shake a quantity of finely powdered Tablets, equivalent to about 500 mg of aspirin, with 10 mL of alcohol for several minutes. Centrifuge the mixture. Pour off the clear supernatant, and evaporate it to dryness. Dry the residue in vacuum at 60° for 1 hour.

**Dissolution** (711)—Proceed as directed for *Procedure* for Method B under *Apparatus 1* and *Apparatus 2*, *Delayed-Release Dosage Forms*.

*Apparatus 1*: 100 rpm.

*Time*: 90 minutes, for *Buffer stage*.

**Diluent**—Prepare a mixture of 0.1 N hydrochloric acid and 0.20 M tribasic sodium phosphate (3:1), and adjust, if necessary, with 2 N hydrochloric acid or 2 N sodium hydroxide to a pH of  $6.8 \pm 0.05$ .

**Procedure**—Determine the amount of  $C_9H_8O_4$  dissolved by determining UV absorbances at the wavelength of the isobestic point of aspirin and salicylic acid (about 280 nm in the *Acid stage*, and about 265 nm in the *Buffer stage*), using a filtered portion of the solution under test, diluted, if necessary, with 0.1 N hydrochloric acid (analyzing the *Acid stage*) and with *Diluent* (analyzing the *Buffer stage*), in comparison with a Standard solution having a known concentration of USP Aspirin RS in the same *Medium*.

**Uniformity of dosage units** (905): meet the requirements.

#### Limit of free salicylic acid—

**Mobile phase and Diluting solution**—Prepare as directed in the *Assay*.

**Standard solution**—Dissolve an accurately weighed quantity of USP Salicylic Acid RS in the *Standard preparation* prepared as directed in the *Assay*, to obtain a solution having a known concentration of about 0.015 mg of salicylic acid per mL.

**Test solution**—Use the *Stock solution*, prepared as directed for *Assay preparation* in the *Assay*.

**Chromatographic system**—Use the *Chromatographic system* described in the *Assay*. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.7 for salicylic acid and 1.0 for aspirin; the resolution, *R*, between salicylic acid and aspirin is not less than 2.0; and the relative standard deviation of the salicylic acid peak responses is not more than 4.0%.

**Procedure**—Proceed as directed for *Procedure* in the *Assay*. Calculate the percentage of salicylic acid ( $C_7H_6O_3$ ) in the portion of Tablets taken by the formula:

$$2000(C/Q_A)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Salicylic Acid RS in the *Standard solution*; *Q<sub>A</sub>* is the quantity, in mg, of aspirin ( $C_9H_8O_4$ ) in the portion of Tablets taken, as determined in the *Assay*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses of the salicylic acid peaks obtained from the *Test solution* and the *Standard solution*, respectively: not more than 3.0% is found.

#### Assay—

**Mobile phase**—Dissolve 2 g of sodium 1-heptanesulfonate in a mixture of 850 mL of water and 150 mL of acetonitrile, and adjust with glacial acetic acid to a pH of 3.4.

**Diluting solution**—Prepare a mixture of acetonitrile and formic acid (99:1).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Aspirin RS in *Diluting solution* to obtain a solution having a known concentration of about 0.5 mg per mL.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed quantity of the powder, equivalent to about 100 mg of aspirin, to a suitable container. Add 20.0 mL of *Diluting solution* and about 10 glass beads. Shake vigorously for about 10 minutes, and centrifuge (*Stock solution*). Quantitatively dilute an accurately measured volume of the *Stock solution* with 9 volumes of *Diluting solution* (*Assay preparation*). Retain the remaining portion of *Stock solution* for the test for *Limit of free salicylic acid*.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector

and a 4.0-mm × 30-cm column containing packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not greater than 2.0; and the relative standard deviation is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of aspirin ( $C_9H_8O_4$ ) in the portion of Tablets taken by the formula:

$$200C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Aspirin RS in the *Standard preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses of the aspirin peaks obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Aspirin Effervescent Tablets for Oral Solution

» Aspirin Effervescent Tablets for Oral Solution contain Aspirin and an effervescent mixture of a suitable organic acid and an alkali metal bicarbonate and/or carbonate. Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of aspirin ( $C_9H_8O_4$ ).

**Packaging and storage**—Preserve in tight containers.

#### USP Reference standards (11)—

USP Aspirin RS

USP Salicylic Acid RS

#### Identification—

**A**: Dissolve 1 Tablet in about 50 mL of 1 N hydrochloric acid, boil for about 5 minutes, and allow to cool. To 2 mL of the resulting solution add 2 or 3 drops of ferric chloride TS: a violet-red color is produced.

**B**: Add about one-half a Tablet to 50 mL of water in a flask, and immediately stopper with a stopper fitted with tubing so that the evolved gas passes through calcium hydroxide TS: a white precipitate forms.

**Solution time**—Two Tablets dissolve completely in 180 mL of water at  $17.5 \pm 2.5^\circ$  within 5 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Acid-neutralizing capacity** (301): not less than 5.0 mEq of acid is consumed by 1 Tablet.

**Limit of free salicylate**—Proceed as directed for *Limit of free salicylic acid* under *Buffered Aspirin Tablets*: not more than 8.0% is found.

**Assay**—Proceed as directed in the *Assay* under *Buffered Aspirin Tablets*.

## Aspirin Extended-Release Tablets

» Aspirin Extended-Release Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of aspirin ( $C_9H_8O_4$ ).

**Packaging and storage**—Preserve in tight containers.

**Labeling**—The labeling indicates the *Dissolution Test* with which the product complies.

**USP Reference standards** (11)—

USP Aspirin RS

USP Salicylic Acid RS

**Identification**—

**A:** Crush 1 Tablet, boil it with 50 mL of water for 5 minutes, cool, and add 1 or 2 drops of ferric chloride TS: a violet-red color is produced.

**B:** *Infrared Absorption* (197K)—Prepare the test specimen as follows. Shake a quantity of finely powdered Tablets, equivalent to about 500 mg of aspirin, with 10 mL of alcohol for several minutes. Centrifuge the mixture. Pour off the clear supernatant, and evaporate it to dryness. Dry the residue in vacuum at 60° for 1 hour.

**Dissolution** (711)—

**TEST 1**—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 1*.

**Medium:** 0.1 N hydrochloric acid; 900 mL.

**Apparatus 2:** 60 rpm.

**Times:** 1 hour and 4 hours.

**Procedure**—Determine the amount of  $C_9H_8O_4$  dissolved from UV absorbances at the isosbestic point at about 280 nm, using filtered portions of the solution under test, suitably diluted with 0.1 N hydrochloric acid, if necessary, in comparison with a Standard solution having a known concentration of USP Aspirin RS in the same medium.

**Tolerances**—The percentages of the labeled amount of  $C_9H_8O_4$  dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
1	between 20% and 55%
4	not less than 80%

**TEST 2**—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

**Medium:** water; 1000 mL.

**Apparatus 2:** 30 rpm.

**Times:** 1, 2, 4, and 8 hours.

**Procedure**—Determine the amount of  $C_9H_8O_4$  dissolved from UV absorbances at the isosbestic point at about 265 nm, using filtered portions of the solution under test, suitably diluted with water, if necessary, in comparison with a Standard solution having a known concentration of USP Aspirin RS in the same *Medium*. [NOTE—Prepare the Standard solution at the time of use. An amount of alcohol not to exceed 5% of the total volume of the Standard solution may be used to bring the USP Reference Standard into solution prior to dilution with *Medium*.]

**Tolerances**—The percentages of the labeled amount of  $C_9H_8O_4$  dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
1	between 15% and 40%
2	between 25% and 60%
4	between 35% and 75%
8	not less than 70%

**Uniformity of dosage units** (905): meet the requirements.

**Limit of free salicylic acid**—

**Mobile phase** and **Diluting solution**—Prepare as directed in the Assay.

**Standard solution**—Dissolve an accurately weighed quantity of USP Salicylic Acid RS in the *Standard preparation* prepared as directed in the Assay, to obtain a solution having a known concentration of about 0.015 mg of salicylic acid per mL.

**Test solution**—Use the *Stock solution*, prepared as directed for Assay preparation in the Assay.

**Chromatographic system**—Use the *Chromatographic system* described in the Assay. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure* in the Assay: the resolution,  $R$ , between salicylic acid and aspirin is not less than 2.0; and the relative standard deviation of the salicylic acid peak responses is not more than 4.0%.

**Procedure**—Proceed as directed for *Procedure* in the Assay. The relative retention times are about 0.7 for salicylic acid and 1.0 for aspirin. Calculate the percentage of salicylic acid ( $C_7H_6O_3$ ) in the portion of Tablets taken by the formula:

$$2000(C / Q_A)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Salicylic Acid RS in the *Standard solution*;  $Q_A$  is the quantity, in mg, of aspirin ( $C_9H_8O_4$ ) in the portion of Tablets taken, as determined in the Assay; and  $r_U$  and  $r_S$  are the peak responses of the salicylic acid peaks obtained from the *Test solution* and the *Standard solution*, respectively: not more than 3.0% is found.

**Assay**—

**Mobile phase**—Dissolve 2 g of sodium 1-heptanesulfonate in a mixture of 850 mL of water and 150 mL of acetonitrile, and adjust with glacial acetic acid to a pH of 3.4.

**Diluting solution**—Prepare a mixture of acetonitrile and formic acid (99:1).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Aspirin RS in *Diluting solution* to obtain a solution having a known concentration of about 0.5 mg per mL.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed quantity of the powder, equivalent to about 100 mg of aspirin, to a suitable container. Add 20.0 mL of *Diluting solution* and about 10 glass beads. Shake vigorously for about 10 minutes, and centrifuge (*Stock solution*). Quantitatively dilute an accurately measured volume of the *Stock solution* with 9 volumes of *Diluting solution* (*Assay preparation*). Retain the remaining portion of *Stock solution* for the test for *Limit of free salicylic acid*.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4.0-mm  $\times$  30-cm column containing packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not greater than 2.0; and the relative standard deviation is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of aspirin ( $C_9H_8O_4$ ) in the portion of Tablets taken by the formula:

$$200C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Aspirin RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses of the aspirin peaks obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Aspirin, Alumina, and Magnesia Tablets

» Aspirin, Alumina, and Magnesia Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of aspirin ( $C_9H_8O_4$ ), the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled amount of aluminum hydroxide [ $Al(OH)_3$ ], and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of magnesium hydroxide [ $Mg(OH)_2$ ].

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Aspirin RS

USP Salicylic Acid RS

**Identification**—

**A:** The chromatogram of the *Assay preparation* obtained as directed in the *Assay for aspirin and limit of free salicylic acid* exhibits a major peak for aspirin, the retention time of which corresponds with that exhibited in the chromatogram of the *Standard preparation*, obtained as directed in the *Assay for aspirin and limit of free salicylic acid*.

**B:** To a 0.7-g portion of finely powdered Tablets add 20 mL of 3 N hydrochloric acid and 5 drops of methyl red TS, heat to boiling, and add 6 N ammonium hydroxide until the color of the solution changes to deep yellow. Continue boiling for 2 minutes, and filter: the filtrate so obtained responds to the tests for *Magnesium* (191).

**C:** Wash the precipitate obtained in *Identification test B* with a hot solution of ammonium chloride (1 in 50), and dissolve the precipitate in hydrochloric acid: the solution so obtained responds to the tests for *Aluminum* (191).

**Dissolution** (711)—

**Medium:** 0.05 M acetate buffer, prepared by mixing 2.99 g of sodium acetate (trihydrate) and 1.66 mL of glacial acetic acid with water to obtain 1000 mL of solution having a pH of  $4.50 \pm 0.05$ ; 900 mL.

**Apparatus 2:** 75 rpm.

**Time:** 45 minutes.

**Procedure**—Determine the amount of aspirin ( $C_9H_8O_4$ ) dissolved from UV absorbances at the wavelength of the isosbestic point of aspirin and salicylic acid at  $265 \pm 2$  nm of filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Aspirin RS in the same medium. [NOTE—Prepare the Standard solution at the time of use. An amount of methanol not to exceed 1% of the total volume of the Standard solution may be used to bring the Reference Standard into solution prior to dilution with *Medium*.]

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_9H_8O_4$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements for *Weight Variation* with respect to aluminum hydroxide and to magnesium hydroxide, and for *Content Uniformity* with respect to aspirin.

**Acid-neutralizing capacity** (301): not less than 1.9 mEq of acid is consumed for each 325 mg of aspirin in the Tablets.

**Assay for aspirin and limit of free salicylic acid**—

**Mobile phase**—Dissolve 225 mg of tetramethylammonium hydroxide pentahydrate and 200 mg of sodium 1-octanesulfonate in 700 mL of water. Add 150 mL of methanol, 150 mL of acetonitrile, and 1.0 mL of glacial acetic acid, and stir. [NOTE—The composition of the *Mobile phase* may be adjusted if necessary (see *System Suitability* under *Chromatography* (621)).]

**Solvent mixture**—To 2 g of anhydrous citric acid add 990 mL of acetonitrile, 990 mL of chloroform, and 20 mL of formic acid, and stir for about 30 minutes. Allow to settle, and decant the clear solution into a suitable container. Use the clear solution as the *Solvent mixture*.

**Internal standard solution**—Dissolve phenacetin in *Solvent mixture* to obtain a solution having a concentration of about 2 mg per mL.

**Salicylic acid stock standard solution**—Dissolve a suitable quantity of USP Salicylic Acid RS in *Solvent mixture* to obtain a solution having a known concentration of about 1 mg per mL.

**Standard preparation**—Transfer about 325 mg of USP Aspirin RS, accurately weighed, to a 50-mL volumetric flask. Add 10.0 mL of *Salicylic acid stock standard solution* and 5.0 mL of *Internal standard solution*, dilute with *Solvent mixture* to volume, and mix.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Immediately transfer an accurately weighed portion of the powder, equivalent to about 325 mg of aspirin, to a screw-capped, 120-mL bottle, add 5.0 mL of *Internal standard solution* and 45.0 mL of *Solvent mixture*, cap the bottle, mix, and sonicate for 2 to 5 minutes. Centrifuge, and use a portion of the resultant clear solution as the *Assay preparation*.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4-mm  $\times$  30-cm column that contains 10- $\mu$ m packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.3 for salicylic acid, 0.6 for aspirin, and 1.0 for phenacetin. [NOTE—Record each chromatogram until the chloroform peak appears at a relative retention time of about 1.8; the resolution,  $R$ , between the salicylic acid, aspirin, and internal standard peaks is not less than 2.0; the tailing factor for any of these peaks is not more than 2.0; and the relative standard deviation for replicate injections is not more than 3.0%.

**Procedure**—Separately inject equal volumes (about 5  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of aspirin ( $C_9H_8O_4$ ) in the portion of Tablets taken by the formula:

$$50C(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Aspirin RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the ratios of the peak responses of aspirin and phenacetin obtained from the *Assay preparation* and the *Standard preparation*, respectively. Calculate the percentage of free salicylic acid in the Tablets taken by the formula:

$$5000(C / a)(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Salicylic Acid RS in the *Standard preparation*;  $a$  is the quantity, in mg, of aspirin in the portion of Tablets taken, based on the labeled amount; and  $R_U$  and  $R_S$  are the ratios of the peak responses of salicylic acid and phenacetin obtained from the *Assay preparation* and the *Standard preparation*, respectively: not more than 3.0% is found.

**Assay for aluminum hydroxide**—

**Edetate disodium titrant**—Prepare and standardize as directed in the *Assay* under *Ammonium Alum*.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 250 mg of aluminum hydroxide, to a 150-mL beaker, add 20 mL of water, stir, and slowly add 30 mL of 3 N hydrochloric acid. Heat gently, if necessary, to aid solution, cool, and transfer to a 200-mL

volumetric flask. Wash the beaker with water, adding the washings to the flask, add water to volume, and mix.

**Procedure**—Pipet 50 mL of *Assay preparation* into a 250-mL beaker, then add, in the order named and with continuous stirring, 25.0 mL of 0.05 M *Edetate disodium titrant* and 20 mL of acetic acid-ammonium acetate buffer TS, and heat the solution near the boiling temperature for 5 minutes. Cool, add 50 mL of alcohol and 2 mL of dithizone TS, and mix. Titrate with 0.05 M zinc sulfate VS until the color changes from green-violet to rose-pink. Perform a blank determination, substituting 50 mL of water for the *Assay preparation*, and make any necessary corrections. Each mL of 0.05 M *Edetate disodium titrant* consumed is equivalent to 3.900 mg of  $\text{Al}(\text{OH})_3$ .

#### Assay for magnesium hydroxide—

**Assay preparation**—Prepare as directed in the *Assay for aluminum hydroxide*.

**Procedure**—Pipet a volume of *Assay preparation*, equivalent to about 80 mg of magnesium hydroxide, into a 400-mL beaker, add 200 mL of water and 20 mL of triethanolamine, and mix. Add 50 mL of ammonia-ammonium chloride buffer TS and 2 drops of eriochrome black indicator solution (prepared by dissolving 200 mg of eriochrome black T in a mixture of 15 mL of triethanolamine and 5 mL of dehydrated alcohol, and mixing). Cool the solution to between 3° and 4° by immersion of the beaker in an ice bath, then remove, and titrate with 0.05 M edetate disodium VS until the color changes to pure blue. Perform a blank determination, substituting for the *Assay preparation*, a volume of water equal to the volume of *Assay preparation* used, and make any necessary corrections. Each mL of 0.05 M edetate disodium is equivalent to 2.916 mg of  $\text{Mg}(\text{OH})_2$ .

## Aspirin, Alumina, and Magnesium Oxide Tablets

» Aspirin, Alumina, and Magnesium Oxide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of aspirin ( $\text{C}_9\text{H}_8\text{O}_4$ ), the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled amount of aluminum hydroxide [ $\text{Al}(\text{OH})_3$ ], and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of magnesium oxide ( $\text{MgO}$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Aspirin RS

USP Salicylic Acid RS

**Identification**—

**A:** Tablets respond to the *Identification* tests under *Aspirin, Alumina, and Magnesia Tablets*.

**B:** Where the Tablets are composed of two layers, scrape a small amount of each layer into separate test tubes. Add 2 mL of water and 2 drops of methyl red TS to each tube, and shake for about 15 seconds: the solution from the aspirin-containing layer is red, and the solution from the buffer-containing layer is yellow.

**Dissolution** (711)—

**Medium:** 0.05 M acetate buffer, prepared by mixing 2.99 g of sodium acetate (trihydrate) and 1.66 mL of glacial acetic acid with water to obtain 1000 mL of solution having a pH of  $4.50 \pm 0.05$ ; 900 mL.

**Apparatus 1** (10-mesh screen): 100 rpm.

**Time:** 45 minutes.

Determine the amount of aspirin ( $\text{C}_9\text{H}_8\text{O}_4$ ) dissolved employing the following method.

**Alkaline detergent solution**—Prepare a suitable mixture of 1 N sodium hydroxide and a 30% solution of polyoxyethylene (23) lauryl ether (1000:0.5).

**pH 4.3 Buffer detergent**—Dissolve 12.9 g of citric acid monohydrate and 20.6 g of dibasic sodium phosphate heptahydrate in water to make 1000 mL of solution. Add 0.5 mL of a 30% solution of polyoxyethylene (23) lauryl ether, and mix.

**Standard preparation**—Dissolve a suitable quantity of USP Aspirin RS, accurately weighed, in *Medium* to obtain a solution having a known concentration of about 0.45 mg per mL.

**Procedure**—Use an automatic analyzer consisting of (1) a liquid sampler; (2) a proportioning pump; (3) a suitable fluorometer equipped with a 0.4-cm flow cell and suitable recording devices; and (4) a manifold consisting of the components illustrated in the diagram in the chapter *Automated Methods of Analysis* (16). With the sample line pumping pH 4.3 Buffer detergent, the other lines pumping their respective reagents, the fluorometer set at an excitation wavelength of 298 nm and an emission wavelength of 425 nm, adjust the system until a steady fluorescence baseline has been achieved. Start the sampler, and conduct determinations at a rate of 40 per hour, using a ratio of about 5:1 for sample and wash time. Record the fluorescence values of the *Standard preparation* and the solution under test. Calculate the quantity, in mg, of aspirin ( $\text{C}_9\text{H}_8\text{O}_4$ ) dissolved by the formula:

$$900C(F_U / F_S)$$

in which C is the concentration, in mg per mL, of USP Aspirin RS in the *Standard preparation*; and  $F_U$  and  $F_S$  are the fluorescence values of the solution under test and the *Standard preparation*, respectively.

**Tolerances**—Not less than 75% (Q) of the labeled amount of aspirin ( $\text{C}_9\text{H}_8\text{O}_4$ ) is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements for *Weight Variation* with respect to aluminum hydroxide and to magnesium oxide, and for *Content Uniformity* with respect to aspirin.

**Acid-neutralizing capacity** (301): not less than 1.9 mEq of acid is consumed for each 325 mg of aspirin in the Tablets.

**Assay for aspirin and limit of free salicylic acid**—

**Mobile phase**—Prepare a suitable mixture of water, methanol, and phosphoric acid (700:300:30). Filter and degas before use. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Solvent mixture**—Mix 20 mL of hydrochloric acid and 2000 mL of dehydrated alcohol.

**Standard aspirin preparation**—Dissolve a suitable quantity of USP Aspirin RS, accurately weighed, by blending in a 120-mL blender jar at high speed for about 1.5 minutes with an accurately measured volume of *Solvent mixture* to obtain a stock solution having a known concentration of about 5 mg per mL. Immediately transfer 5.0 mL of this stock solution to a 100-mL volumetric flask, dilute with dehydrated alcohol to volume, and mix. This solution contains about 0.25 mg per mL. [NOTE—Use these solutions within 1 hour.]

**Standard salicylic acid preparation**—Dissolve a suitable quantity of USP Salicylic Acid RS in dehydrated alcohol to obtain a stock solution having a known concentration of about 5 mg per mL. Transfer 3.0 mL of this stock solution to a 100-mL volumetric flask, dilute with *Solvent mixture* to volume, and mix. Transfer 5.0 mL of this intermediate stock solution to a second 100-mL volumetric flask, dilute with

dehydrated alcohol to volume, and mix. This solution contains about 7.5 µg per mL.

**Resolution solution**—Transfer 5.0 mL of the stock solution used to prepare the *Standard aspirin preparation* to a 100-mL volumetric flask, add 5.0 mL of the intermediate stock solution used to prepare the *Standard salicylic acid preparation*, dilute with dehydrated alcohol to volume, and mix.

**Assay preparation**—Transfer an accurately counted number of Tablets, equivalent to about 2500 mg of aspirin, to a 120-mL blender jar containing 100.0 mL of *Solvent mixture*, and blend at high speed for about 1.5 minutes. Immediately filter a portion of the mixture thus obtained, and transfer 1.0 mL of the filtrate to a 100-mL volumetric flask. Immediately dilute with dehydrated alcohol to volume, and mix. [NOTE—Promptly inject this *Assay preparation* into the chromatograph as directed for *Procedure*.]

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 205-nm detector and a 4.6-mm × 3-cm column that contains 5-µm packing L7. The flow rate is about 3.5 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between the aspirin peak and the salicylic acid peak is not less than 2. Chromatograph the *Standard aspirin preparation*, and record the responses as directed for *Procedure*: the tailing factor is not more than 2, and the relative standard deviation for replicate injections is not more than 2.0%. Chromatograph the *Standard salicylic acid preparation*, and record the responses as directed for *Procedure*: the tailing factor is not more than 2, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard aspirin preparation*, the *Standard salicylic acid preparation*, and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.7 for aspirin and 1.0 for salicylic acid. Calculate the quantity, in mg, of aspirin ( $C_9H_8O_4$ ) in each Tablet taken by the formula:

$$(10,000C/N)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Aspirin RS in the *Standard aspirin preparation*;  $N$  is the number of Tablets taken to prepare the *Assay preparation*; and  $r_U$  and  $r_S$  are the aspirin peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively. Calculate the percentage of free salicylic acid in the Tablets taken by the formula:

$$1000(C/a)(r_U / r_S)$$

in which  $C$  is the concentration, in µg per mL, of USP Salicylic Acid RS in the *Standard salicylic acid preparation*;  $a$  is the quantity, in mg, of aspirin in the number of Tablets taken to prepare the *Assay preparation*, based on the labeled amount; and  $r_U$  and  $r_S$  are the salicylic acid peak responses obtained from the *Assay preparation* and the *Standard salicylic acid preparation*, respectively: not more than 3.0% is found.

#### Assay for aluminum hydroxide—

**Eдетate disodium titrant**—Prepare and standardize as directed in the *Assay under Ammonium Alum*.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 600 mg of aluminum hydroxide, to a 150-mL beaker, add 20 mL of water, stir, and slowly add 30 mL of 3 N hydrochloric acid. Heat gently, if necessary, to aid solution, cool, and transfer to a 200-mL volumetric flask. Wash the beaker with water, adding the washings to the flask, add water to volume, and mix.

**Procedure**—Pipet 20 mL of the *Assay preparation* into a 250-mL beaker, add 20 mL of water, then add, in the order named and with continuous stirring, 25.0 mL of 0.05 M *Eдетate disodium titrant* and 20 mL of acetic acid-ammonium acetate buffer TS, and heat the solution near the boiling temperature for 5 minutes. Cool, add 50 mL of alcohol and 2 mL of dithizone TS, and mix. Titrate with 0.05 M zinc sulfate VS until the color changes from green-violet to rose-pink. Perform a blank determination, substituting 10 mL of water for the *Assay preparation*, and make any necessary corrections. Each mL of 0.05 to 3.900 mg of  $Al(OH)_3$ .

#### Assay for magnesium oxide—

**Assay preparation**—Prepare as directed in the *Assay for aluminum hydroxide*.

**Procedure**—Pipet a volume of *Assay preparation*, equivalent to about 40 mg of magnesium oxide, into a 400-mL beaker, and add, with mixing, 20 mL of triethanolamine and 200 mL of water. Cool the solution for 10 minutes, while stirring, by immersion of the beaker in an ice bath. Remove the beaker from the ice bath, and add 15 mL of ammonia-ammonium chloride buffer TS and 2 drops of eriochrome black indicator solution (prepared by dissolving 200 mg of eriochrome black T in a mixture of 15 mL of triethanolamine and 5 mL of dehydrated alcohol, and mixing). Titrate with 0.05 M edetate disodium VS to a blue endpoint, allowing about 60 seconds between drops of titrant as the endpoint is approached (after first color change is observed). [NOTE—The titration should be completed within 10 minutes after the addition of the buffer and indicator. If any precipitate is observed prior to titration, the solution should be discarded and a new solution prepared.] Perform a blank determination, substituting for the *Assay preparation*, a volume of water equivalent to the volume of *Assay preparation* used, and make any necessary correction. Each mL of 0.05 M edetate disodium consumed is equivalent to 2.015 mg of MgO.

## Aspirin, Caffeine, and Dihydrocodeine Bitartrate Capsules

» Aspirin, Caffeine, and Dihydrocodeine Bitartrate Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of aspirin ( $C_9H_8O_4$ ), caffeine ( $C_8H_{10}N_4O_2$ ), and dihydrocodeine bitartrate ( $C_{18}H_{23}NO_3 \cdot C_4H_6O_6$ ).

**Packaging and storage**—Preserve in tight containers.

#### USP Reference standards <11>—

USP Aspirin RS  
USP Caffeine RS  
USP Dihydrocodeine Bitartrate RS  
USP Salicylic Acid RS

**Identification**—The retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation* obtained as directed in the *Assay*.

#### Dissolution, Procedure for a Pooled Sample <711>—

**Medium:** 0.05 M acetate buffer, prepared by mixing 2.99 g of sodium acetate trihydrate and 1.66 mL of glacial acetic acid with water to obtain 1000 mL of solution having a pH of  $4.50 \pm 0.05$ ; 500 mL.

**Apparatus 1:** 50 rpm.

**Time:** 45 minutes.

**Mobile phase and Chromatographic system**—Prepare as directed in the *Assay and limit of salicylic acid*.

**Standard preparation**—Prepare a solution in *Medium* containing known concentrations of about 0.002A mg of USP Aspirin RS, 0.002C mg of USP Caffeine RS, and 0.002D mg of USP Dihydrocodeine Bitartrate RS per mL, A, C, and D being the labeled amounts, in mg, of aspirin, caffeine, and dihydrocodeine bitartrate, respectively, in each Capsule.

**Test preparation**—Filter a portion of the solution under test.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Test preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantities, in mg, of aspirin ( $C_9H_8O_4$ ), caffeine ( $C_8H_{10}N_4O_2$ ), and dihydrocodeine bitartrate ( $C_{18}H_{23}NO_3 \cdot C_4H_6O_6$ ) dissolved by the same formula:

$$500C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses of the relevant analyte obtained from the *Test preparation* and the *Standard preparation*, respectively.

**Tolerances**—Not less than 75% (Q) of the labeled amounts of  $C_9H_8O_4$ ,  $C_8H_{10}N_4O_2$ , and  $C_{18}H_{23}NO_3 \cdot C_4H_6O_6$  are dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

#### Assay and limit of salicylic acid—

**Mobile phase**—Dissolve 1 g of sodium 1-pentanesulfonate and 2.3 g of monobasic ammonium phosphate in 850 mL of water. Add 150 mL of acetonitrile, mix, degas, and adjust with phosphoric acid to a pH of 2.5. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Diluent**—Prepare a mixture of water and acetonitrile (53:46), and adjust with phosphoric acid to a pH of 2.5.

**Standard preparation**—Prepare a solution in *Diluent* containing known concentrations of about 0.001A mg of USP Aspirin RS, 0.001C mg of USP Caffeine RS, and 0.001D mg of USP Dihydrocodeine Bitartrate RS per mL, A, C, and D being the labeled amounts, in mg, of aspirin, caffeine, and dihydrocodeine bitartrate, respectively, in each Capsule. [NOTE—Use this solution within 3 hours.]

**Standard salicylic acid preparation**—Dissolve an accurately weighed quantity of USP Salicylic Acid RS in *Diluent* to obtain a solution having a known concentration of about 0.005A  $\mu$ g per mL, A being the labeled amount, in mg, of aspirin per Capsule. [NOTE—Use this solution within 3 hours.]

**Resolution solution**—Prepare a solution in *Standard preparation* containing about 0.0001A mg of USP Salicylic Acid RS per mL, A being the labeled amount, in mg, of aspirin in each Capsule. [NOTE—Use this solution within 3 hours.]

**Assay preparation**—Transfer the contents of 10 Capsules to a 500-mL volumetric flask. Dilute with *Diluent* to volume, and mix. Transfer 5.0 mL of this mixture to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix. Centrifuge a portion of this mixture, and use the clear supernatant as the *Assay preparation*. [NOTE—Use this solution within 3 hours.]

**Chromatographic system**—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm  $\times$  15-cm column that contains packing L7. The flow rate is about 2 mL per minute. Chromatograph the *Resolution solution*, and record the responses as directed for *Procedure*: the relative retention times are about 0.2 for caffeine, 0.3 for dihydrocodeine, 0.7 for aspirin, and 1.0 for salicylic acid; and the resolution, R, between the caffeine and dihydrocodeine peaks is not less than 2.5, between the dihydrocodeine and aspirin peaks is not less than 1.0, and between the aspirin and salicylic acid peaks is not less than 1.5. Chromatograph the *Standard preparation*, and record

the responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0% for each analyte.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Assay preparation*, the *Standard preparation*, and the *Standard salicylic acid preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantities, in mg, of aspirin ( $C_9H_8O_4$ ), caffeine ( $C_8H_{10}N_4O_2$ ), and dihydrocodeine bitartrate ( $C_{18}H_{23}NO_3 \cdot C_4H_6O_6$ ) in each Capsule taken by the same formula:

$$1000C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard preparation*; and  $r_U$  and  $r_S$  are the responses of the corresponding analyte peaks of the *Assay preparation* and the *Standard preparation*, respectively. Calculate the percentage of salicylic acid in the Capsules taken by the formula:

$$100(C / A)(r_U / r_S)$$

in which C is the concentration, in  $\mu$ g per mL, of USP Salicylic Acid RS in the *Standard salicylic acid preparation*; A is the labeled amount, in mg, of aspirin in each Capsule taken; and  $r_U$  and  $r_S$  are the salicylic acid peak responses obtained from the *Assay preparation* and the *Standard salicylic acid preparation*, respectively: not more than 3.0% is found.

## Aspirin and Codeine Phosphate Tablets

» Aspirin and Codeine Phosphate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of aspirin ( $C_9H_8O_4$ ) and codeine phosphate hemihydrate ( $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ ).

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

#### USP Reference standards (11)—

USP Aspirin RS  
USP Codeine Phosphate RS  
USP Salicylic Acid RS

**Identification**—Dissolve a suitable quantity of USP Aspirin RS in the *Solvent mixture* prepared as directed under *Assay for aspirin and codeine phosphate and limit of free salicylic acid* to obtain a *Standard aspirin solution* containing about 3.3 mg per mL. Dissolve a suitable quantity of USP Codeine Phosphate RS in the *Solvent mixture* to obtain a *Standard codeine phosphate solution* containing about 1 mg per mL. Chromatograph these solutions as directed for *Procedure* in the *Assay for aspirin and codeine phosphate and limit of free salicylic acid*. The retention times of the major peaks in the chromatogram of the *Assay preparation*, obtained as directed in the *Assay for aspirin and codeine phosphate and limit of free salicylic acid*, correspond to those in the chromatograms of the *Standard aspirin solution* and the *Standard codeine phosphate solution*, respectively.

#### Dissolution (711)—

**Medium**: 0.05 M acetate buffer, prepared by mixing 2.99 g of sodium acetate trihydrate and 1.66 mL of glacial acetic acid with water to obtain 1000 mL of solution having a pH of  $4.50 \pm 0.05$ ; 900 mL.

**Apparatus 2**: 75 rpm.

**Time**: 30 minutes.

Determine the amounts of aspirin ( $C_9H_8O_4$ ) and codeine phosphate hemihydrate ( $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ ) dissolved by employing the following method.

*Mobile phase, Solvent mixture, and Aspirin and codeine phosphate standard preparation*—Prepare as directed in the *Assay for aspirin and codeine phosphate and limit of free salicylic acid*.

*Internal standard solution*—Dissolve phenacetin in methanol to obtain a solution having a concentration of about 0.07 mg per mL.

*Standard solution A*—Prepare a solution of USP Aspirin RS in *Solvent mixture* having an accurately known concentration of about 0.36 mg per mL.

*Standard solution B*—Transfer about 12 mg of USP Codeine Phosphate RS and 25 mg of USP Salicylic Acid RS, each accurately weighed, to a 50-mL volumetric flask, add 2.5 mL of methanol, and mix. Add *Medium* to volume, and mix. Pipet 10 mL of the resulting solution into a 100-mL volumetric flask, add *Medium* to volume, and mix.

*Standard preparations A and B*—Pipet 10 mL of *Standard solution A* and 10 mL of *Standard solution B* into separate containers, add 3.0 mL of the *Internal standard solution* to each container, and mix.

*Test preparation*—Withdraw a portion of the solution under test and filter, discarding the few mL of the filtrate. Pipet 10 mL of the filtrate and 3.0 mL of the *Internal standard solution* into a suitable container, and mix.

*Chromatographic system*—Proceed as directed for *Chromatographic system* in the *Assay for aspirin and codeine phosphate and limit of free salicylic acid*, except to use only the *Aspirin and codeine phosphate preparation* for evaluation of the suitability of the system.

*Procedure*—Proceed as directed in the *Assay for aspirin and codeine phosphate and limit of free salicylic acid*, except to inject about 50  $\mu$ L of the *Standard preparations* and the *Test preparation*. The relative retention times are 0.3 for salicylic acid, 0.6 for aspirin, 0.8 for codeine phosphate, and 1.0 for phenacetin. Calculate the amount of codeine phosphate dissolved by comparison of the relative peak response ratios for the codeine phosphate peaks, obtained from *Standard preparation B* and the *Test preparation*. Calculate the percentage of aspirin dissolved by the formula:

$$[0.9C(R_U / R_S) + 0.9C'(R'_U / R'_S)(180.16 / 138.12)] / 3.25$$

in which C is the concentration, in  $\mu$ g per mL, of USP Aspirin RS in *Standard solution A*;  $R_U$  and  $R_S$  are the peak response ratios for the aspirin component obtained from the *Test preparation* and *Standard preparation A*, respectively;  $C'$  is the concentration, in  $\mu$ g per mL, of USP Salicylic Acid RS in *Standard solution B*;  $R'_U$  and  $R'_S$  are the peak response ratios for the salicylic acid component obtained from the *Test preparation* and *Standard preparation B*, respectively; and 180.16 and 138.12 are the molecular weights of aspirin and salicylic acid, respectively.

*Tolerances*—Not less than 75% (Q) of the labeled amounts of aspirin ( $C_9H_8O_4$ ) and codeine phosphate hemihydrate ( $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ ) is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements for *Content Uniformity* with respect to aspirin and codeine phosphate.

#### **Assay for aspirin and codeine phosphate and limit of free salicylic acid—**

*Mobile phase*—Dissolve 225 mg of tetramethylammonium hydroxide pentahydrate and 200 mg of sodium 1-octanesulfonate in 700 mL of water. Add 150 mL of methanol, 150 mL of acetonitrile, and 1.0 mL of glacial acetic acid, and stir. Pass through a membrane filter, and degas. [NOTE—The amounts of sodium 1-octanesulfonate, methanol, and acetonitrile may be varied to obtain acceptable chromatography.]

*Solvent mixture*—To 15 g of anhydrous citric acid add 200 mL of methanol and 20 mL of glacial acetic acid, dilute with chloroform to 1000 mL, and mix until the citric acid is dissolved.

*Internal standard solution*—Dissolve phenacetin in *Solvent mixture* to obtain a solution having a concentration of about 2 mg per mL.

*Salicylic acid stock standard solution*—Dissolve an accurately weighed quantity of USP Salicylic Acid RS in *Solvent mixture*, and quantitatively dilute with *Solvent mixture* to obtain a solution having a known concentration of about 1 mg per mL.

*Salicylic acid standard preparation*—Transfer 5.0 mL of *Salicylic acid stock standard solution* to a 50-mL volumetric flask, add 5.0 mL of *Internal standard solution*, dilute with *Solvent mixture* to volume, and mix.

*Codeine phosphate stock standard solution*—Transfer about 325J mg of USP Codeine Phosphate RS, accurately weighed, to a 25-mL volumetric flask, J being the ratio of the labeled amount, in mg, of codeine phosphate to the labeled amount, in mg, of aspirin per Tablet. Dissolve in and dilute with *Solvent mixture* to volume, and mix.

*Aspirin and codeine phosphate standard preparation*—Transfer about 65 mg of USP Aspirin RS, accurately weighed, to a 10-mL volumetric flask. Add 5.0 mL of *Codeine phosphate stock standard solution*, 1.0 mL of *Salicylic acid stock standard solution*, and 1.0 mL of *Internal standard solution*, dilute with *Solvent mixture* to volume, and mix.

*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 325 mg of aspirin, to a screw-capped, 120-mL bottle, add 5.0 mL of *Internal standard solution* and 45.0 mL of *Solvent mixture*, mix, and sonicate for 2 to 5 minutes. Centrifuge, and use a portion of the resultant clear solution as the *Assay preparation*. Use on the day prepared.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 3.9-mm  $\times$  30-cm column that contains 10- $\mu$ m packing L1. The flow rate is about 2 mL per minute. Chromatograph replicate injections of the *Salicylic acid standard preparation* and the *Aspirin and codeine phosphate standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times for salicylic acid, aspirin, codeine, and phenacetin are about 0.3, 0.5, 0.8, and 1.0, respectively; the resolution, R, between salicylic acid and aspirin, between aspirin and codeine, and between codeine and phenacetin is not less than 2.0; the tailing factor for each analyte peak is not more than 2.0; and the relative standard deviation of the ratios of the peak responses of salicylic acid, aspirin, and codeine to the peak response of phenacetin is not more than 3.0%.

*Procedure*—Separately inject equal volumes (about 5  $\mu$ L) of the *Salicylic acid standard preparation*, *Aspirin and codeine phosphate standard preparation*, and *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of aspirin ( $C_9H_8O_4$ ) in the portion of Tablets taken by the formula:

$$50C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of USP Aspirin RS in the *Aspirin and codeine phosphate standard preparation*; and  $R_U$  and  $R_S$  are the ratios of the peak responses of aspirin and phenacetin obtained from the *Assay preparation* and the *Aspirin and codeine phosphate standard preparation*, respectively. Calculate the quantity, in mg, of codeine phosphate hemihydrate ( $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ ) in the portion of Tablets taken by the formula:

$$(406.37/397.37)(50C)(R_U / R_S)$$

in which 406.37 and 397.37 are the molecular weights of codeine phosphate hemihydrate and anhydrous codeine phosphate, respectively; C is the concentration, in mg per mL, of USP Codeine Phosphate RS in the *Aspirin and codeine*

phosphate standard preparation; and  $R_U$  and  $R_S$  are the ratios of the peak responses of codeine phosphate and phenacetin obtained from the Assay preparation and the Aspirin and codeine phosphate standard preparation, respectively. Calculate the percentage of free salicylic acid in the Tablets taken by the formula:

$$5000(C/a)(R_U/R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Salicylic Acid RS in the Salicylic acid standard preparation;  $a$  is the quantity, in mg, of aspirin in the portion of powdered Tablets taken, based on the labeled amount; and  $R_U$  and  $R_S$  are the ratios of the peak responses of salicylic acid and phenacetin obtained from the Assay preparation and the Salicylic acid standard preparation, respectively: not more than 3.0% is found.

### Aspirin, Codeine Phosphate, Alumina, and Magnesia Tablets

» Aspirin, Codeine Phosphate, Alumina, and Magnesia Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of aspirin ( $C_9H_8O_4$ ), codeine phosphate hemihydrate ( $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ ), aluminum hydroxide [ $Al(OH)_3$ ], and magnesium hydroxide [ $Mg(OH)_2$ ].

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

#### USP Reference standards (11)—

USP Aspirin RS  
USP Codeine Phosphate RS  
USP Salicylic Acid RS

#### Identification—

**A:** Tablets respond to the Identification test under Aspirin and Codeine Phosphate Tablets.

**B:** Tablets respond to the Identification tests under Alumina and Magnesia Tablets.

#### Dissolution (711)—

**Medium:** 0.05 M acetate buffer, prepared by mixing 2.99 g of sodium acetate trihydrate and 1.66 mL of glacial acetic acid with water to obtain 1000 mL of solution having a pH of  $4.50 \pm 0.05$ ; 900 mL.

**Apparatus 2:** 75 rpm.

**Time:** 30 minutes.

**Mobile phase, Internal standard solution, Solvent mixture, Aspirin and codeine phosphate standard preparation, Standard solution A, Standard solution B, Standard preparations A and B, Test preparation, Chromatographic system, and Procedure**—Proceed as directed in the test for Dissolution under Aspirin and Codeine Phosphate Tablets.

**Tolerances**—Not less than 75% (Q) of the labeled amounts of aspirin ( $C_9H_8O_4$ ) and codeine phosphate hemihydrate ( $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ ) are dissolved in 30 minutes.

**Uniformity of dosage units (905):** meet the requirements for Content Uniformity with respect to aspirin and codeine phosphate and for Weight Variation with respect to aluminum hydroxide and magnesium hydroxide.

**Acid-neutralizing capacity (301):** not less than 1.9 mEq per Tablet.

#### Assay for aspirin and codeine phosphate and limit of free salicylic acid—

**Mobile phase, Solvent mixture, Salicylic acid stock standard solution, Salicylic acid standard preparation, Aspirin and co-**

**deine phosphate standard preparation, and Chromatographic system**—Prepare as directed in the Assay for aspirin and codeine phosphate and limit of free salicylic acid under Aspirin and Codeine Phosphate Tablets.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 325 mg of aspirin, to a screw-capped, 120-mL bottle, add 5.0 mL of Internal standard solution and 45.0 mL of Solvent mixture, mix, and sonicate for 2 to 5 minutes. Centrifuge, and use a portion of the resultant clear solution as the Assay preparation.

**Procedure**—Separately inject equal volumes (about 5  $\mu$ L) of the Salicylic acid standard preparation, the Aspirin and codeine phosphate standard preparation, and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times for salicylic acid, aspirin, codeine, and phenacetin are about 0.3, 0.5, 0.8, and 1.0, respectively. Calculate the quantity, in mg, of aspirin ( $C_9H_8O_4$ ) in the portion of powdered Tablets taken by the formula:

$$50C(R_U/R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Aspirin RS in the Aspirin and codeine phosphate standard preparation; and  $R_U$  and  $R_S$  are the ratios of the peak responses of aspirin and phenacetin obtained from the Assay preparation and the Aspirin and codeine phosphate standard preparation, respectively. Calculate the quantity, in mg, of codeine phosphate hemihydrate ( $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ ), in the portion of powdered Tablets taken by the formula:

$$(406.37/397.37)(50C)(R_U/R_S)$$

in which 406.37 and 397.37 are the molecular weights of codeine phosphate hemihydrate and anhydrous codeine phosphate, respectively;  $C$  is the concentration, in mg per mL, of USP Codeine Phosphate RS in the Aspirin and codeine phosphate standard preparation; and  $R_U$  and  $R_S$  are the ratios of the peak responses of codeine phosphate and phenacetin obtained from the Assay preparation and the Aspirin and codeine phosphate Standard preparation, respectively. Calculate the percentage of free salicylic acid in the Tablets taken by the formula:

$$5000(C/a)(R_U/R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Salicylic Acid RS in the Salicylic acid standard preparation;  $a$  is the quantity, in mg, of aspirin in the portion of Tablets taken, determined as directed above; and  $R_U$  and  $R_S$  are the ratios of the peak responses of salicylic acid and phenacetin obtained from the Assay preparation and the Salicylic acid standard preparation, respectively: not more than 3.0% is found.

#### Assay for aluminum hydroxide—

**Edetate disodium titrant**—Prepare and standardize as directed in the Assay under Ammonium Alum.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 600 mg of aluminum hydroxide, to a 150-mL beaker, add 20 mL of water, stir, and slowly add 30 mL of 3 N hydrochloric acid. Heat gently, if necessary, to aid solution, cool, and filter into a 200-mL volumetric flask. Wash the filter with water into the flask, add water to volume, and mix.

**Procedure**—Pipet 10 mL of Assay preparation into a 250-mL beaker, add 20 mL of water, then add, in the order named and with continuous stirring, 25.0 mL of Edetate disodium titrant and 20 mL of acetic acid-ammonium acetate buffer TS. Add 50 mL of alcohol and 2 mL of dithizone TS, and mix. Titrate with 0.05 M zinc sulfate VS until the color changes from green-violet to rose-pink. Perform a blank determination, substituting 10 mL of water for the Assay prepa-

ration, and make any necessary correction. Each mL of 0.05 M Edetate disodium titrant is equivalent to 3.900 mg of  $\text{Al}(\text{OH})_3$ .

#### Assay for magnesium hydroxide—

**Assay preparation**—Prepare as directed in the Assay for aluminum oxide.

**Procedure**—Pipet a volume of Assay preparation, equivalent to about 40 mg of magnesium hydroxide, into a 400-mL beaker, add 200 mL of water and 20 mL of triethanolamine, and stir. Add 10 mL of ammonia-ammonium chloride buffer TS and 3 drops of an eriochrome black indicator solution prepared by dissolving 200 mg of eriochrome black T in a mixture of 15 mL of triethanolamine and 5 mL of dehydrated alcohol, and mix. Cool the solution to between 3° and 4° by immersion of the beaker in an ice bath, then remove, and titrate with 0.05 M edetate disodium VS to a blue endpoint. Perform a blank determination, substituting 10 mL of water for the Assay preparation, and make any necessary correction. Each mL of 0.05 M edetate disodium consumed is equivalent to 2.916 mg of  $\text{Mg}(\text{OH})_2$ .

## Astemizole

$\text{C}_{28}\text{H}_{31}\text{FN}_4\text{O}$  458.57

1*H*-Benzimidazol-2-amine, 1-[(4-fluorophenyl)methyl]-*N*-[1-[2-(4-methoxyphenyl)ethyl]-4-piperidinyl]-1-(*p*-Fluorobenzyl)-2-[[1-(*p*-methoxyphenethyl)-4-piperidyl]amino]benzimidazole [68844-77-9].

» Astemizole contains not less than 98.0 percent and not more than 102.0 percent of  $\text{C}_{28}\text{H}_{31}\text{FN}_4\text{O}$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

#### USP Reference standards (11)—

USP Astemizole RS

**Identification, Infrared Absorption** (197K).

**Melting range** (741): between 175° and 178°.

**Loss on drying** (731)—Dry it at 105° in vacuum for 4 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals, Method II** (231): 0.001%.

#### Chromatographic purity—

**Solution A**—Prepare a filtered and degassed solution in water containing 17 g of tetrabutylammonium hydrogen sulfate per L. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Solution B**—Use filtered and degassed acetonitrile. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Mobile phase**—Use variable mixtures of Solution A and Solution B as directed for *Chromatographic system*.

**Standard solution**—Dissolve an accurately weighed quantity of USP Astemizole RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 25 µg per mL.

**Resolution solution**—Dissolve an accurately weighed quantity of USP Astemizole RS and ketoconazole in methanol,

and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 25 µg and 250 µg per mL, respectively.

**Test solution**—Transfer about 100 mg of Astemizole, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 278-nm detector and a 4.6-mm × 10-cm column that contains base-deactivated 3-µm packing L1. The flow rate is about 1 mL per minute. Equilibrate the system with acetonitrile and then with 95% Solution A and 5% Solution B, and hold at that composition for 5 minutes prior to injection. After injection, linearly change the composition to 80% Solution A and 20% Solution B over a period of 15 minutes. Maintain this composition for an additional 3 minutes. Purge the column with 100% Solution B for 5 minutes, and then equilibrate the system to the initial composition for 5 minutes prior to the following injection. Chromatograph the Resolution solution, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between the astemizole and ketoconazole peaks is not less than 1.5.

**Procedure**—Separately inject equal volumes (about 10 µL) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Astemizole taken by the formula:

$$0.25(r_i / r_s)$$

in which  $r_i$  is the peak response for each impurity, and  $r_s$  is the peak response of the Standard solution: not more than 0.25% of any individual impurity is found, and not more than 0.5% of total impurities is found.

#### Assay—

**Mobile phase**—Prepare a filtered and degassed mixture of methanol, 0.13 M ammonium acetate, acetonitrile, and diethylamine (470:300:230:1.0), and adjust with glacial acetic acid to a pH of 7.5. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Astemizole RS in Mobile phase, and dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution having a known concentration of about 1.0 mg per mL.

**Assay preparation**—Transfer about 50 mg of Astemizole, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the Standard preparation, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 4000 theoretical plates; the tailing factor is not more than 1.8; and the relative standard deviation for replicate injections is not more than 1.5%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $\text{C}_{28}\text{H}_{31}\text{FN}_4\text{O}$  in the portion of Astemizole taken by the formula:

$$50C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Astemizole RS in the Standard preparation; and  $r_U$  and  $r_S$  are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.

## Astemizole Tablets

» Astemizole Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of astemizole ( $C_{28}H_{31}FN_4O$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Astemizole RS

**Identification**—Transfer an amount of finely ground Tablets, equivalent to 100 mg of Astemizole, to a 100-mL volumetric flask, add methanol to volume, mix, and filter. Prepare a Standard solution of USP Astemizole RS in methanol having a concentration of 1 mg per mL. Separately apply 10  $\mu$ L of each solution to a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Develop the chromatogram in a solvent system consisting of a mixture of toluene, dioxane, methanol, and ammonium hydroxide (60:30:10:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, air-dry, and examine under short-wavelength UV light: the  $R_f$  value of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution.

**Dissolution** (711)—

*Medium*: simulated gastric fluid TS (without the enzyme); 800 mL.

*Apparatus 2*: 100 rpm.

*Time*: 45 minutes.

*Procedure*—Determine the amount of astemizole ( $C_{28}H_{31}FN_4O$ ) dissolved from UV absorbances at the wavelength of maximum absorbance at about 285 nm of filtered portions of the solution under test, suitably diluted with *Medium*, in comparison with a Standard solution having a known concentration of USP Astemizole RS in the same *Medium*.

*Tolerances*—Not less than 80% (Q) of the labeled amount of astemizole ( $C_{28}H_{31}FN_4O$ ) is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Chromatographic purity**—

*Mobile phase, Standard preparation, and Chromatographic system*—Proceed as directed in the Assay under Astemizole.

*Test solution*—Use the Assay preparation.

*Procedure*—Inject a volume (about 10  $\mu$ L) of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the peak response for each impurity; and  $r_s$  is the sum of the responses of all of the peaks: not more than 0.25% of any individual impurity is found; and the sum of all impurities is not more than 1.0%.

**Assay**—

*Mobile phase, Standard preparation, and Chromatographic system*—Proceed as directed in the Assay under Astemizole.

*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed quantity of the powder, equivalent to about 50 mg of astemizole, to a 50-mL volumetric flask. Add 25 mL of *Mobile phase*, mix for 30 minutes, dilute with *Mobile phase* to volume, and centrifuge. Use the supernatant as the *Assay preparation*.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and meas-

ure the responses for the major peaks. Calculate the quantity, in mg, of astemizole ( $C_{28}H_{31}FN_4O$ ) in the portion of Tablets taken by the formula:

$$50C(r_U / r_s)$$

in which C is the concentration, in mg per mL, of USP Astemizole RS in the *Standard preparation*; and  $r_U$  and  $r_s$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Atenolol

$C_{14}H_{22}N_2O_3$  266.34  
Benzeneacetamide, 4-[2-hydroxy-3-[(1-methylethyl)amino]propoxy]-; 2-[p-[2-Hydroxy-3-(isopropylamino)propoxy]-phenyl]-acetamide [29122-68-7].

### DEFINITION

Atenolol contains NLT 98.0% and NMT 102.0% of  $C_{14}H_{22}N_2O_3$ , calculated on the dried basis.

### IDENTIFICATION

• **A. INFRARED ABSORPTION** (197K)

• **B. ULTRAVIOLET ABSORPTION** (197U)

*Sample solution*: 20  $\mu$ g/mL in methanol

### ASSAY

#### • PROCEDURE

**Mobile phase**: 1.1 g of sodium 1-heptanesulfonate and 0.71 g of anhydrous dibasic sodium phosphate in 700 mL of water. Add 2 mL of dibutylamine, and adjust with 0.8 M phosphoric acid to a pH of 3.0. Add 300 mL of methanol, mix, and pass through a filter having a 0.5- $\mu$ m or finer porosity. Degas this solution before use.

**Standard solution**: 0.01 mg/mL of USP Atenolol RS in *Mobile phase*

**Sample solution**: 0.01 mg/mL of Atenolol in *Mobile phase*. Sonicate for 5 min for complete dissolution.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode**: LC

**Detector**: UV 226 nm

**Column**: 3.9-mm  $\times$  30-cm; packing L1

**Flow rate**: 0.6 mL/min

**Injection size**: 10  $\mu$ L

#### System suitability

**Sample**: *Standard solution*

#### Suitability requirements

**Column efficiency**: NLT 5000 theoretical plates

**Tailing factor**: NMT 2.0

**Relative standard deviation**: NMT 2.0%

#### Analysis

**Samples**: *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{14}H_{22}N_2O_3$  in the portion of Atenolol taken:

$$\text{Result} = (r_U / r_s) \times (C_s / C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_s$  = peak response from the *Standard solution*

$C_s$  = concentration of USP Atenolol RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Atenolol in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

### IMPURITIES

#### Inorganic Impurities

- **RESIDUE ON IGNITION** (281): NMT 0.2%

- **CHLORIDE AND SULFATE**, *Chloride* (221)

Sample solution: Dissolve 1.0-g in 100 mL of 0.15 N nitric acid.

Acceptance criteria: Shows no more turbidity with 1 mL of silver nitrate TS than 1.4 mL of 0.020 N hydrochloric acid in 100 mL of 0.15 N nitric acid (0.1%)

#### Organic Impurities

##### • PROCEDURE

Mobile phase: Prepare as directed in the Assay.

Sample solution 1: 0.1 mg/mL of Atenolol in *Mobile phase*

Sample solution 2: 0.5 µg/mL of Atenolol, from *Sample solution 1* in *Mobile phase*

Chromatographic system: Proceed as directed in the Assay, except use the injection size listed below.

Injection size: 50 µL

#### Analysis

Samples: *Sample solution 1* and *Sample solution 2*

[NOTE—Chromatograph *Sample solution 1* for a period of time that is 6 times the retention time of the atenolol peak.]

Calculate the percentage of each impurity in *Sample solution 1*:

$$\text{Result} = 0.5(r_U/r_A)$$

$r_U$  = peak response of any individual impurity in *Sample solution 1*

$r_A$  = peak response of Atenolol in *Sample solution 2*

#### Acceptance criteria

Individual impurities: NMT 0.25%

Total impurities: NMT 0.5%

### SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE**, *Class I* (741):

152°–156.5°

- **LOSS ON DRYING** (731): Dry a sample at 105° to constant weight: it loses NMT 0.5% of its weight.

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE**: Preserve in well-closed containers. Store at room temperature.
- **USP REFERENCE STANDARDS** (11)  
USP Atenolol RS

chromatogram of the *Standard preparation*, obtained as directed in the Assay.

**B**: *Ultraviolet Absorption* (197U)—

*Solution*: 10 µg of atenolol per mL.

*Medium*: methanol.

**Bacterial endotoxins** (85)—It contains not more than 33.3 USP Endotoxin Units per mg of atenolol.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** (791): between 5.5 and 6.5.

**Particulate matter** (788): meets the requirements for small-volume injections.

#### Assay—

*Citric acid buffer*—Transfer 2.5 g of citric acid to a 500-mL volumetric flask, add 400 mL of water, and swirl to dissolve. Adjust the solution with 2 N sodium hydroxide to a pH of 6.0, dilute with water to volume, and mix.

*Mobile phase*—Dissolve 930 mg of sodium octyl sulfate in 740 mL of water, add 8 mL of 3.6 N sulfuric acid, mix, and pass through a 1-µm or finer porosity filter. To the filtrate add 250 mL of acetonitrile, mix, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Transfer about 50 mg of USP Atenolol RS to a 100-mL volumetric flask, add 80 mL of *Citric acid buffer*, and sonicate for about 30 seconds to achieve dissolution. Dilute with *Citric acid buffer* to volume, and mix. Transfer 4.0 mL of this solution to a 10-mL volumetric flask, dilute with *Citric acid buffer* to volume, and mix. This solution contains about 0.2 mg of USP Atenolol RS per mL.

*Assay preparation*—Transfer an accurately measured volume of Injection, equivalent to 2 mg of atenolol, to a 10-mL volumetric flask, dilute with *Citric acid buffer* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 275-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1.7 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 2, and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of  $C_{14}H_{22}N_2O_3$  in each mL of the Injection taken by the formula:

$$10(C/V)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Atenolol RS in the *Standard preparation*; V is the volume, in mL, of Injection taken; and  $r_U$  and  $r_S$  are the atenolol peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Atenolol Injection

» Atenolol Injection is a sterile solution of Atenolol in Water for Injection. It contains a suitable buffering agent. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of atenolol ( $C_{14}H_{22}N_2O_3$ ).

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass, in a cool place or at controlled room temperature, protected from light. Avoid freezing.

**USP Reference standards** (11)—

USP Atenolol RS

USP Endotoxin RS

#### Identification—

**A**: The retention time of the main peak in the chromatogram of the *Assay preparation* corresponds to that in the

## Atenolol Oral Solution

### DEFINITION

Atenolol Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of  $C_{14}H_{22}N_2O_3$ .

Prepare Atenolol Oral Solution at a 0.2% concentration, for example, as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Atenolol	200 mg
Glycerin	5 mL
Vehicle for Oral Suspension	45 mL
Vehicle for Oral Solution, Sugar Free, a sufficient quantity to make	100 mL

Calculate the quantity of each ingredient required for the total volume and atenolol strength to be prepared. Mix the *Atenolol*, previously pulverized, and *Glycerin* to form a smooth paste. Incorporate the *Vehicle for Oral Suspension* or an equal volume of *Vehicle for Oral Solution, Sugar Free*. [NOTE—The *Vehicle for Oral Suspension* may be omitted.] Incorporate sufficient *Vehicle for Oral Solution, Sugar Free* in increments to bring to volume, and mix well. [NOTE—Do not use a sucrose-containing vehicle for oral solution.] Package, and label.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in amber, tight containers, and store at controlled room temperature.
- **LABELING:** Label it to state that it is to be shaken well before use, and discarded after 60 days. Label it to state that it is to be kept out of reach of children. Label it to indicate the nominal atenolol concentration.
- **BEYOND-USE DATE:** NMT 60 days after the day on which it was compounded

## Atenolol Tablets

#### DEFINITION

Atenolol Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of atenolol ( $C_{14}H_{22}N_2O_3$ ).

#### IDENTIFICATION

- **A. INFRARED ABSORPTION** <197K>  
**Sample:** Mix a quantity of powdered Tablets, equivalent to 100 mg of atenolol, with 15 mL of methanol, heat the mixture to 50°, and shake for 5 min. Filter, and evaporate the filtrate on a water bath to dryness. Add 10 mL of 0.1 N hydrochloric acid to the residue, warm the solution, shake, and filter. To the filtrate add sufficient 1 N sodium hydroxide to make it alkaline, and extract the solution with 10 mL of chloroform, drying the chloroform extract over anhydrous sodium sulfate. Filter the dried chloroform solution, evaporate the filtrate on a water bath to dryness, and dry the residue at 105° for 1 h.
- **B.** The retention time of the atenolol peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

#### ASSAY

##### PROCEDURE

**Mobile phase:** 1.1 g of sodium 1-heptanesulfonate and 0.71 g of anhydrous dibasic sodium phosphate in 700 mL of water. Add 2 mL of dibutylamine, and adjust with 0.8 M phosphoric acid to a pH of 3.0. Add 300 mL of methanol, and pass through a filter having a 0.5-μm or finer porosity. Degas this solution before use.  
**Standard solution:** 0.01 mg/mL of USP Atenolol RS in *Mobile phase*

**Sample stock solution:** Transfer 10 Tablets to a 1000-mL volumetric flask. Add 500 mL of *Mobile phase*, and sonicate for 15 min to disintegrate the Tablets. Dilute with *Mobile phase* to volume.

**Sample solution:** Centrifuge a portion of the *Sample stock solution*, and dilute a volume of the supernatant with *Mobile phase* to obtain a solution nominally containing 0.01 mg/mL of atenolol.

##### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 226 nm

**Column:** 3.9-mm × 30-cm; packing L1

**Flow rate:** 0.6 mL/min

**Injection size:** 10 μL

##### System suitability

**Sample:** *Standard solution*

##### Suitability requirements

**Column efficiency:** NLT 5000 theoretical plates

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

##### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{14}H_{22}N_2O_3$  in each Tablet taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Atenolol RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of atenolol in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

#### PERFORMANCE TESTS

##### DISSOLUTION <711>

**Medium:** 0.1 N acetate buffer, pH 4.6 (prepared by mixing 44.9 parts (v/v) of 0.1 N sodium acetate with 55.1 parts (v/v) of 0.1 N acetic acid solution, and adjust with either diluted sodium hydroxide or diluted acetic acid to a pH of 4.6); 900 mL

**Apparatus 2:** 50 rpm

**Time:** 30 min

Determine the amount of  $C_{14}H_{22}N_2O_3$  dissolved by using the following method.

**Mobile phase, Chromatographic system, and System suitability:** Proceed as directed in the *Assay* under Atenolol.

**Standard solution:** 0.01 mg/mL of USP Atenolol RS in *Mobile phase*

**Sample solution:** Pass a portion of the solution under test through a suitable 0.45-μm filter. Quantitatively dilute a measured volume of the filtrate with *Mobile phase* to obtain a solution estimated to contain about 0.01 mg/mL of atenolol.

**Analysis:** Proceed as directed in the *Assay*.

Calculate the percentage of  $C_{14}H_{22}N_2O_3$  dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times D \times (100/L)$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Atenolol RS in the *Standard solution* (mg/mL)

$V$  = volume of *Medium*, 900 mL

$D$  = dilution factor for the *Sample solution*

$L$  = Tablet label claim (mg)

**Tolerances:** NLT 80% (Q) of the labeled amount of  $C_{14}H_{22}N_2O_3$  is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** <905>: Meet the requirements

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

- **USP REFERENCE STANDARDS** <11>

USP Atenolol RS

## Atenolol and Chlorthalidone Tablets

» Atenolol and Chlorthalidone Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of atenolol ( $C_{14}H_{22}N_2O_3$ ) and chlorthalidone ( $C_{14}H_{11}ClN_2O_4S$ ).

**Packaging and storage**—Preserve in well-closed containers.

### USP Reference standards (11)—

USP Atenolol RS

USP Chlorthalidone RS

### Identification—

**A:** Shake a quantity of powdered Tablets, equivalent to about 50 mg of chlorthalidone, with 5 mL of methanol for 15 minutes, and filter. Apply 10  $\mu$ L of this test solution, 10  $\mu$ L of a Standard solution of USP Chlorthalidone RS in methanol containing 10 mg per mL, and 10  $\mu$ L of a second Standard solution of USP Atenolol RS in methanol containing 10 mg per mL,  $J$  being the ratio of the labeled amount, in mg, of atenolol to the labeled amount, in mg, of chlorthalidone per Tablet to a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of *n*-butyl alcohol and 1 N ammonium hydroxide (5:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, and air-dry. Locate the spots on the plate by viewing under short-wavelength UV light: the principal spots obtained from the test solution correspond in  $R_f$  value, size, and intensity to those obtained from the respective Standard solutions.

**B:** The retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

### Dissolution (711)—

*Medium:* 0.01 N hydrochloric acid; 900 mL.

*Apparatus 2:* 50 rpm.

*Time:* 45 minutes.

Determine the amounts of atenolol ( $C_{14}H_{22}N_2O_3$ ) and chlorthalidone ( $C_{14}H_{11}ClN_2O_4S$ ) dissolved by employing the following method.

*Mobile phase and Chromatographic system*—Prepare as directed in the *Assay*.

*Diluent*—Prepare a mixture of 1000 mL of acetonitrile and 32 mL of 3.6 N sulfuric acid.

*Standard solvent*—Prepare a mixture of water and *Diluent* (750: 225).

*Standard solution*—Dissolve accurately weighed quantities of USP Atenolol RS and USP Chlorthalidone RS in *Standard solvent* to obtain a solution having known concentrations of about 0.00085L mg of USP Atenolol RS and 0.00085L' mg of USP Chlorthalidone RS per mL,  $L$  and  $L'$  being the labeled amounts, in mg, of atenolol and chlorthalidone, respectively, per Tablet.

*Test solution*—Mix 10.0 mL of the filtered solution under test and 3.0 mL of *Diluent*.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantities, in mg, of

atenolol ( $C_{14}H_{22}N_2O_3$ ) and chlorthalidone ( $C_{14}H_{11}ClN_2O_4S$ ) dissolved by the same formula:

$$1170C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of the appropriate Reference Standard in the *Standard solution*; and  $r_U$  and  $r_S$  are the responses of the corresponding analyte obtained from the *Test solution* and the *Standard solution*, respectively.

*Tolerances*—Not less than 80% ( $Q$ ) of the labeled amount of atenolol ( $C_{14}H_{22}N_2O_3$ ) is dissolved in 45 minutes, and not less than 70% ( $Q$ ) of the labeled amount of chlorthalidone ( $C_{14}H_{11}ClN_2O_4S$ ) is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

*Procedure for content uniformity*—Proceed as directed in the *Assay*, except to prepare the *Assay preparation* as follows. Transfer 1 Tablet to a volumetric flask of such capacity that when filled to volume, a concentration of about 0.25 mg of chlorthalidone per mL is obtained. Add a mixture of water and acetonitrile (1:1) to about half the capacity of the flask, and shake by mechanical means for not less than 15 minutes to disintegrate the Tablet. Dilute with water to volume, and mix. Pass a portion of this solution through a filter having a 0.5- $\mu$ m or finer porosity, and use the filtrate as the *Assay preparation*. Calculate the quantities, in mg, of atenolol ( $C_{14}H_{22}N_2O_3$ ) and chlorthalidone ( $C_{14}H_{11}ClN_2O_4S$ ) in the Tablet taken by the formula:

$$CV(r_U / r_S)$$

in which  $V$  is the volume, in mL, of the volumetric flask used to prepare the *Assay preparation*; and the other terms are as defined in the *Assay*.

### Assay—

*Mobile phase*—Prepare a mixture of 740 mL of water, 250 mL of acetonitrile, 8 mL of 3.6 N sulfuric acid, and 930 mg of sodium octyl sulfate. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Dissolve accurately weighed quantities of USP Atenolol RS and USP Chlorthalidone RS in a mixture of water and acetonitrile (3:1) to obtain a solution having known concentrations of about 0.25 mg of USP Chlorthalidone RS and 0.25J mg of USP Atenolol RS per mL,  $J$  being the ratio of the labeled amount, in mg, of atenolol to the labeled amount, in mg, of chlorthalidone per Tablet.

*Assay preparation*—Transfer 10 Tablets to a volumetric flask of such capacity that when filled to volume, a concentration of about 0.5 mg of chlorthalidone per mL is obtained. Add a mixture of water and acetonitrile (1:1) to about half the capacity of the flask, and shake by mechanical means for not less than 15 minutes to disintegrate the Tablets. Dilute with a mixture of water and acetonitrile (1:1) to volume, and mix. Pass a portion of this stock solution through a filter having a 0.5- $\mu$ m or finer porosity. Transfer 25.0 mL of the clear filtrate to a 50-mL volumetric flask, dilute with water to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 275-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L1. The flow rate is about 1.7 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.8 for atenolol and 1.0 for chlorthalidone; the resolution,  $R$ , between the atenolol and chlorthalidone peaks is not less than 3.0; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Assay preparation* and the *Standard preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantities,

in mg, of atenolol ( $C_{14}H_{22}N_2O_3$ ) and chlorthalidone ( $C_{14}H_{11}ClN_2O_4S$ ) in each Tablet taken by the formula:

$$2C(V/10)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard preparation*;  $V$  is the volume, in mL, of the volumetric flask used to prepare the stock solution for the *Assay preparation*; and  $r_U$  and  $r_S$  are the responses for the corresponding analyte obtained from the *Assay preparation* and the *Standard preparation*, respectively.

NOTE—If a trailing peak or shoulder is observed on the chlorthalidone peak with a relative retention time of not more than 1.1 in the chromatograms of both the *Standard preparation* and the *Assay preparation*, sum the areas for the chlorthalidone peak with the trailing peak or shoulder to report the peak responses for chlorthalidone.

## Atorvastatin Calcium

$C_{66}H_{68}CaF_2N_4O_{10} \cdot 3H_2O$  1209.42

$C_{66}H_{68}CaF_2N_4O_{10}$  1155.34

1*H*-Pyrrole-1-heptanoic acid, 2-(4-fluorophenyl)- $\beta,\delta$ -dihydroxy-5-(1-methylethyl)-3-phenyl-4-[(phenylamino)carbonyl]-, calcium salt (2:1), trihydrate [ $R$ -( $R^*$ , $R^*$ )]-; Calcium ( $\beta R, \delta R$ )-2-( $p$ -fluorophenyl)- $\beta,\delta$ -dihydroxy-5-isopropyl-3-phenyl-4-(phenylcarbamoyl)pyrrole-1-heptanoate (1:2), trihydrate [344423-98-9].  
Anhydrous [134523-03-8].

### DEFINITION

Atorvastatin Calcium contains NLT 98.0% and NMT 102.0% of  $C_{66}H_{68}CaF_2N_4O_{10}$ , calculated on the anhydrous basis.

### IDENTIFICATION

#### • A. INFRARED ABSORPTION (197K)

#### • B. CALCIUM

**Diluent:** Methanol, water, and hydrochloric acid (75:25:2)

**Blank:** *Diluent*

**Sample solution:** 0.05 mg/mL of Atorvastatin Calcium in *Diluent*

#### Analysis

**Samples:** *Sample solution* and *Blank*

#### Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** Atomic absorption spectrophotometry

**Analytical wavelength:** Calcium emission line at 422.7 nm

**Flame:** Air-acetylene

**Acceptance criteria:** The *Sample solution* exhibits a significant absorption at the calcium emission line at 422.7 nm.

### ASSAY

#### • PROCEDURE

**Buffer:** 3.9 g/L of ammonium acetate in water. Adjust with glacial acetic acid to a pH of  $5.0 \pm 0.1$ .

**Solution A:** Acetonitrile, stabilizer-free tetrahydrofuran, and *Buffer* (21:12:67)

**Solution B:** Acetonitrile, stabilizer-free tetrahydrofuran, and *Buffer* (61:12:27)

**Diluent:** *N,N*-dimethylformamide

**Mobile phase:** See the gradient table below.

[NOTE—If necessary, adjust the *Mobile phase* by increasing or decreasing the percentage of acetonitrile or the pH of the ammonium acetate solution to achieve a retention time of 26–34 min for the atorvastatin peak.]

Time (min)	Solution A (%)	Solution B (%)
0	100	0
40	100	0
70	20	80
85	0	100
100	0	100
105	100	0
115	100	0

**System suitability solution:** 0.05 mg/mL of USP Atorvastatin Calcium RS and 0.06 mg/mL of USP Atorvastatin Related Compound B RS in *Diluent*

**Standard solution:** 0.4 mg/mL of USP Atorvastatin Calcium RS in *Diluent*. [NOTE—Use sonication if necessary.]

**Sample solution:** 0.4 mg/mL of Atorvastatin Calcium in *Diluent*. [NOTE—Use sonication if necessary.]

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

[NOTE—If significant fronting of the peaks for atorvastatin related compound B and atorvastatin is observed, use the following *Diluent* to prepare the *Sample solution*, *Standard solution*, and *System suitability solution*: acetonitrile, stabilizer-free tetrahydrofuran, and water (1:1:2).]

**Mode:** LC

**Detector:** UV 244 nm

**Column:** 4.6-mm  $\times$  25-cm; 5- $\mu$ m packing L7

**Column temperature:** 35°

**Flow rate:** 1.5 mL/min

**Injection size:** 20  $\mu$ L

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

#### Suitability requirements

**Resolution:** NLT 1.5 between the peaks for atorvastatin related compound B and atorvastatin, *System suitability solution*

**Tailing factor:** NMT 1.6, *Standard solution*

**Relative standard deviation:** NMT 0.6%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{66}H_{68}CaF_2N_4O_{10}$  in the portion of Atorvastatin Calcium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Atorvastatin Calcium RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Atorvastatin Calcium in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the anhydrous basis

**IMPURITIES****Inorganic Impurities****• HEAVY METALS****Diluent:** Methanol and water (9:1)**Sample solution:** Dissolve 250 mg of the sample in 30 mL of *Diluent*.**Standard lead solution:** Prepared as directed under *Heavy Metals* (231).**Reference solution:** Dilute 0.5 mL of the *Standard lead solution* with *Diluent* to 30 mL.**Blank solution:** 20 mL of *Diluent***Monitor solution:** Dissolve 250 mg of Atorvastatin Calcium in 0.5 mL of the *Standard lead solution*, and dilute with *Diluent* to 30 mL.**Analysis****Samples:** *Sample solution*, *Reference solution*, *Blank solution*, and *Monitor solution*

To each solution, add 2 mL of pH 3.5 Acetate Buffer, prepared as directed under *Heavy Metals* (231). Mix, add to 1.2 mL of thioacetamide–glycerin base TS, and mix immediately. Pass the solutions through a membrane filter of 0.45-μm pore size. Compare the spots on the filters obtained with the different solutions: the brown color of the spot from the *Sample solution* is not more intense than that of the spot from the *Reference solution*. The test is invalid if the *Reference solution* does not show a slight brown color compared to the *Blank solution*, or if the color of the *Monitor solution* is not at least as intense as the color of the *Reference solution*.

**Acceptance criteria:** NMT 20 ppm**Organic Impurities****• PROCEDURE****Buffer, Solution A, Solution B, Diluent, Mobile phase, System suitability solution, and Chromatographic system:** Proceed as directed for the *Assay*.**Standard solution:** 1.5 μg/mL each of USP Atorvastatin Related Compound A RS, USP Atorvastatin Related Compound B RS, USP Atorvastatin Related Compound C RS, and USP Atorvastatin Related Compound D RS in *Diluent***Sample solution:** 1 mg/mL of Atorvastatin Calcium in *Diluent*. [NOTE—Use sonication if necessary.]**Analysis****Samples:** *Standard solution* and *Sample solution*  
Chromatograph the *Standard solution*, and identify the components on the basis of their relative retention times, given in *Impurity Table 1*.

Calculate the percentage of each of the atorvastatin related compounds A, B, C, and D in the portion of Atorvastatin Calcium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 $r_U$  = peak response of the relevant atorvastatin related compound from the *Sample solution* $r_S$  = peak response of the relevant atorvastatin related compound from the *Standard solution* $C_S$  = concentration of the relevant atorvastatin related compound in the *Standard solution* (mg/mL) $C_U$  = concentration of Atorvastatin Calcium in the *Sample solution* (mg/mL)

Calculate the percentage of any other individual impurity in the portion of Atorvastatin Calcium taken:

$$\text{Result} = (r_U/r_T) \times 100$$

 $r_U$  = peak response of any other individual impurity from the *Sample solution* $r_T$  = sum of the responses of all the peaks from the *Sample solution*

[NOTE—Disregard any peak observed in the blank; the reporting level for impurities is 0.05%.]

**Acceptance criteria****Individual impurities:** See *Impurity Table 1*.**Total impurities:** NMT 1.0%. [NOTE—This total does not include atorvastatin related compound E, as determined in the test for *Enantiomeric Purity*.]**Impurity Table 1**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Atorvastatin related compound A <sup>a</sup>	0.8	0.3
Atorvastatin related compound B <sup>b</sup>	0.9	0.3
Atorvastatin	1.0	n/a
Atorvastatin related compound C <sup>c</sup>	1.2	0.3
Atorvastatin related compound D <sup>d, e</sup>	2.1	0.1
Any other individual impurity	—	0.1

<sup>a</sup> Desfluoro impurity.<sup>b</sup> 3S,5R isomer.<sup>c</sup> Difluoro impurity.<sup>d</sup> Epoxide impurity.<sup>e</sup> Atorvastatin related compound D may undergo a transformation equilibrium with its cyclic hemiketal form. The cyclic hemiketal of atorvastatin related compound D elutes about 1–2 min before atorvastatin related compound D. Use the sum of the areas of the two peaks as a peak response for atorvastatin related compound D in the *Standard solution* and the *Sample solution*.**SPECIFIC TESTS****• ENANTIOMERIC PURITY****Mobile phase:** Hexane, dehydrated alcohol, and trifluoroacetic acid (940:60:1)**System suitability stock solution:** 5 mg/mL of USP Atorvastatin Calcium RS and 37.5 μg/mL of USP Atorvastatin Related Compound E RS in methanol. [NOTE—Atorvastatin related compound E is the 3S,5S enantiomer of atorvastatin.]**System suitability solution:** Transfer 2.0 mL of the *System suitability stock solution* to a 10-mL volumetric flask, add 2.0 mL of dehydrated alcohol, and dilute with hexane to volume.**Sample solution:** Transfer 10 mg of Atorvastatin Calcium to a 10-mL volumetric flask, dissolve in 2.0 mL of methanol, add 2.0 mL of dehydrated alcohol, and dilute with hexane to volume.**Chromatographic system**(See *Chromatography* (621), *System Suitability*.)**Mode:** LC**Detector:** UV 244 nm**Column:** 4.6-mm × 25-cm; packing L51**Flow rate:** 1.0 mL/min**Injection size:** 20 μL**System suitability****Samples:** *System suitability solution*

[NOTE—The elution order of the peaks is atorvastatin related compound E followed by atorvastatin.]

  - USP Atorvastatin Related Compound E RS  
3*S*,5*S* Enantiomer, or (3*S*,5*S*)-7-[3-(phenylcarbamoyl)-5-(4-fluorophenyl)-2-isopropyl-4-phenyl-1*H*-pyrrol-1-yl]-3,5-dihydroxyheptanoic acid, calcium salt.  
 $C_{66}H_{68}CaF_2N_4O_{10}$  1155.34

## Atovaquone

$C_{22}H_{19}ClO_3$  366.84  
1,4-Naphthalenedione, 2-[4-(4-chlorophenyl)cyclohexyl]-3-hydroxy-, *trans*-.  
2-[*trans*-4-(*p*-Chlorophenyl)cyclohexyl]-3-hydroxy-1,4-naphthoquinone [95233-18-4].

» Atovaquone contains not less than 97.5 percent and not more than 101.5 percent of  $C_{22}H_{19}ClO_3$ , calculated on the anhydrous and organic solvent-free basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

#### USP Reference standards (11)—

USP Atovaquone RS  
USP Atovaquone Related Compound A RS  
*cis*-2[4-(4-Chlorophenyl)cyclohexyl]-3-hydroxy-1,4-naphthoquinone.

#### Identification—

**A:** *Infrared Absorption* (197M).

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Water, Method I** (921): not more than 1.0%.

**Residue on ignition** (281): not more than 0.1%.

#### Heavy metals—

**Test preparation**—Thoroughly mix 1.0 g of Atovaquone with 0.5 g of magnesium oxide in a silica crucible. Ignite to dull redness until a homogeneous white or grayish-white mass is obtained. If the mixture remains colored after 30 minutes, allow to cool, mix using a fine glass rod, and repeat the ignition. If necessary, repeat the operation. Heat the residue at 800° for about 1 hour. Cool, take up the residue in two 5-mL portions of 6 N hydrochloric acid, add 0.1 mL of phenolphthalein TS, and then add 13.5 N ammonium hydroxide until a pink color is obtained. Cool, add glacial acetic acid until the solution is decolorized, and add 0.5 mL in excess. Filter, if necessary, and wash the filter with water. Dilute with water to 20 mL.

**Standard preparation**—Add 1.0 mL of *Standard Lead Solution* (see *Special Reagents* under *Heavy Metals* (231)) to 0.5 g of magnesium oxide, and dry between 100° and 105°. Proceed as directed for *Test preparation*, starting with “Ignite to dull redness”.

**Blank preparation**—Proceed as directed for *Test preparation*, omitting the Atovaquone.

**Procedure**—Transfer 12.0 mL of the *Test preparation* to a 50-mL color-comparison tube, 10.0 mL of the *Standard preparation* to another, and 10.0 mL of the *Blank preparation* to a third. Then add 2.0 mL of the *Test preparation* to the *Standard preparation* as well as to the *Blank preparation*. Add 2 mL of pH 3.5 Acetate Buffer (see *Heavy Metals* (231)) to each of the three tubes, mix, add 1.2 mL of thioacetamide–glycerin base TS, and mix. Allow to stand for 2 minutes, and view downward over a white surface: the solution from the *Standard preparation* is slightly brown when compared with the solution from the *Blank preparation*, and the color of the solution from the *Test preparation* is not darker than that of the solution from the *Standard preparation* (10 µg per g).

#### Limit of residual organic solvents—

**Standard solution**—Transfer 1.0 mL of methanol and 1.0 mL of glacial acetic acid to a 100-mL volumetric flask, dilute with dimethylformamide to volume, and mix. Transfer 5.0 mL of this solution to a second 100-mL volumetric flask, dilute with dimethylformamide to volume, and mix.

**Test solution**—Transfer about 100 mg of Atovaquone, accurately weighed, to a 2-mL volumetric flask, dissolve in and dilute with dimethylformamide to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and a 4-mm × 2.8-m column that contains 10% liquid phase G16 on support S2. The carrier gas is nitrogen, flowing at a rate of about 42.5 mL per minute. The column temperature is maintained at about 180° and the detector block temperature is maintained at about 250°. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.4 for methanol and 1.0 for acetic acid; the resolution, *R*, between methanol and acetic acid is not less than 14; the column efficiency calculated from the acetic acid peak is not less than 700; and the tailing factor for acetic acid is not less than 0.8.

**Procedure**—Separately inject equal volumes (about 1 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak areas for methanol and acetic acid. Calculate the percentage, by weight, of methanol and acetic acid in the portion of Atovaquone taken by the formula:

$$0.1(G/W)(r_U / r_S)$$

in which *G* is either 0.79, the specific gravity of methanol, or 1.05, the specific gravity of glacial acetic acid, as appropriate; *W* is the weight, in mg, of Atovaquone taken to pre-

pare the *Test solution*; and  $r_U$  and  $r_S$  are the peak area responses of methanol or acetic acid, as appropriate, obtained from the *Test solution* and the *Standard solution*, respectively; not more than 0.2% of methanol or of acetic acid is found.

**Related compounds**—Using the chromatograms of the *Assay preparation* and the *Resolution solution* obtained in the *Assay*, calculate the percentage of atovaquone related compounds in the portion of Atovaquone taken by the formula:

$$100(r_i / r_S)$$

in which  $r_i$  is the individual peak response of a related compound, if any, in the chromatogram of the *Assay preparation*; and  $r_S$  is the sum of the responses of all the peaks in the chromatogram of the *Assay preparation*, including the atovaquone peak. Not more than 1.0% of any related compound with a retention time corresponding to that of atovaquone related compound A, as determined from the chromatogram of the *Resolution solution*, is found; not more than 0.5% of any related compound with a retention time of 0.63 or 1.8 relative to that of atovaquone is found; and not more than 0.3% of any related compound with a retention time of 0.89 relative to that of atovaquone is found. Not more than 0.2% of any other individual related compound is found; and the sum of all other such related compounds is not more than 1.0%. The sum of all related compounds is not more than 1.5%.

#### Assay—

**Mobile phase**—Prepare a mixture of acetonitrile, water, methanol, and phosphoric acid (525:300:175:5). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Diluent**—Prepare a mixture of acetonitrile and water (80:20).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Atovaquone RS in *Diluent*, and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.25 mg per mL.

**Resolution solution**—Prepare a solution in *Diluent* containing about 0.25 mg of USP Atovaquone RS and 0.02 mg of USP Atovaquone Related Compound A RS per mL. Store in a low-actinic glass container.

**Assay preparation**—Transfer about 25 mg of Atovaquone, accurately weighed, to a low-actinic, 100-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 3 mL per minute. Chromatograph the *Resolution solution*, and record the peak areas as directed for *Procedure*: the relative retention times are about 0.85 for atovaquone related compound A and 1.0 for atovaquone; and the resolution,  $R$ , between atovaquone related compound A and atovaquone is not less than 4. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 9000 theoretical plates; the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of  $C_{22}H_{19}ClO_3$  in the portion of Atovaquone taken by the formula:

$$100C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Atovaquone RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the atovaquone peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Atovaquone Oral Suspension

» Atovaquone Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of atovaquone ( $C_{22}H_{19}ClO_3$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

#### USP Reference standards (11)—

USP Atovaquone RS

USP Atovaquone Related Compound A RS

*cis*-2[4-(4-Chlorophenyl)cyclohexyl]-3-hydroxy-1,4-naphthoquinone.

#### Identification—

**A: Ultraviolet Absorption** (197U)—

**Medium:** a mixture of methanol and water (1:1).

**Solution**—Transfer 5.0 mL of the *Assay preparation* and 5.0 mL of the *Standard preparation*, prepared in the *Assay*, to separate 50-mL volumetric flasks, dilute with *Medium* to volume, and mix.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

#### Uniformity of dosage units (905)—

FOR ORAL SUSPENSION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

#### Deliverable volume (698)—

FOR ORAL SUSPENSION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

**pH** (791): between 3.5 and 7.0.

#### Sedimentation—

FOR ORAL SUSPENSION PACKAGED IN MULTIPLE-UNIT CONTAINERS—Transfer 50 mL of well-mixed Oral Suspension to a glass-stoppered graduated cylinder, and allow to stand for 16 hours. Measure the volume, if any, of clear liquid observed in the cylinder: not more than 1 mL of clear liquid is found.

**Related compounds**—Using the chromatograms of the *Resolution solution*, the *Standard preparation*, and the *Assay preparation* obtained in the *Assay*, calculate the percentage of atovaquone-related compounds, based on the labeled strength of atovaquone, by the formula:

$$\frac{(25,000/3)C(r_i / r_S)100D}{SF_i L}$$

in which  $C$  is the concentration, in mg per mL, of USP Atovaquone RS in the *Standard preparation*;  $D$  is the density of Oral Suspension, in g per mL (1.04 g per mL at 20° to 25°);  $S$  is the weight, in g, of Oral Suspension taken to prepare the *Assay preparation*;  $L$  is the labeled amount, in mg per mL, of atovaquone in the Oral Suspension;  $F_i$  is the response factor of an individual atovaquone related compound relative to the response of atovaquone, specifically, 1.08 for any peak observed at a relative retention time of about 0.65, 0.85 for any peak observed at a retention time corresponding to that of atovaquone related compound A, as determined from the chromatogram of the *Resolution solution*, and 1.0 for any other related compound peak;  $r_i$  is the individual peak response of an atovaquone related compound, if any, in the chromatogram of the *Assay preparation*; and  $r_S$  is the peak response of atovaquone in the chromatogram of the *Standard preparation*. Disregard any peak having a relative retention time of about 0.3, which is due to photodegradation during preparation of the *Assay preparation*. Not more than 0.5% of an atovaquone related com-

pound with a relative retention time of about 0.65 is found; not more than 1.0% of atovaquone related compound A is found; not more than 0.3% of an atovaquone related compound with a relative retention time of about 0.88 is found; not more than 0.2% of any other atovaquone related compound is found; and the sum of all related compounds is not more than 2.0%.

#### Assay—

**Mobile phase**—Prepare a mixture of acetonitrile, water, methanol, and phosphoric acid (480:360:160:5). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Resolution solution**—Prepare a solution in 0.1 M methanolic sodium hydroxide containing about 0.09 mg of USP Atovaquone RS and 0.01 mg of USP Atovaquone Related Compound A RS per mL. Store in a low-actinic glass container.

**Standard preparation**—Transfer about 30 mg of USP Atovaquone RS, accurately weighed, to a low-actinic 10-mL volumetric flask, and add 2 mL of water and 6 mL of 0.1 M methanolic sodium hydroxide. Sonicate for about 5 minutes or until the material has dissolved. Allow to cool, dilute with 0.1 M methanolic sodium hydroxide to volume, and mix. Transfer 3.0 mL of this solution to a low-actinic 100-mL volumetric flask, dilute with a mixture of methanol and water (1:1) to volume, and mix. [NOTE—Minimize exposure of this solution to light.]

**Assay preparation**—Transfer approximately 5.2 g of the well-mixed Oral Suspension, accurately weighed, to a low-actinic 250-mL volumetric flask. Add 50 mL of water, swirl for about 5 minutes, add 150 mL of 0.1 M methanolic sodium hydroxide, and sonicate for about 15 minutes. Allow to cool, dilute with 0.1 M methanolic sodium hydroxide to volume, and mix. Immediately filter a 20-mL portion, discarding the first 5 mL of the filtrate. Transfer 3.0 mL of the clear filtrate to a low-actinic 100-mL volumetric flask, dilute with a mixture of methanol and water (1:1) to volume, and mix. [NOTE—Minimize exposure of this solution to light.]

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 12.5-cm column that contains packing L1. The flow rate is about 3 mL per minute. Chromatograph the *Resolution solution*, and record the peak areas as directed for *Procedure*: the relative retention times are about 0.86 for atovaquone related compound A and 1.0 for atovaquone. Chromatograph the *Standard preparation*, and record the peak areas as directed for *Procedure*: the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation*, the *Resolution solution*, and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of atovaquone (C<sub>22</sub>H<sub>19</sub>ClO<sub>3</sub>) in each mL of the Oral Suspension taken by the formula:

$$(25,000/3)(C/V)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Atovaquone RS in the *Standard preparation*; V is the volume, in mL, of Oral Suspension taken to prepare the *Assay preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the atovaquone peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Atracurium Besylate

C<sub>65</sub>H<sub>82</sub>N<sub>2</sub>O<sub>18</sub>S<sub>2</sub> 1243.48  
 Isoquinolinium, 2,2'-[1,5-pentanediyldis[oxo(3-oxo-3,1-propanediyl)]]bis[1-[(3,4-dimethoxyphenyl)methyl]-1,2,3,4-tetrahydro-6,7-dimethoxy-2-methyl-, dibenzenesulfonate;  
 2-(2-Carboxyethyl)-1,2,3,4-tetrahydro-6,7-dimethoxy-2-methyl-1-veratrylisoquinolinium benzenesulfonate, pentamethylene ester [64228-81-5].

#### DEFINITION

Atracurium Besylate contains NLT 96.0% and NMT 102.0% of C<sub>65</sub>H<sub>82</sub>N<sub>2</sub>O<sub>18</sub>S<sub>2</sub>, calculated on the anhydrous basis. It contains NLT 5.0% and NMT 6.5% of the *trans-trans* isomer, NLT 34.5% and NMT 38.5% of the *cis-trans* isomer, and NLT 55.0% and NMT 60.0% of the *cis-cis* isomer.

#### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention times of the three main isomeric peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

#### ASSAY

##### • PROCEDURE

**Buffer:** 10.2 g of monobasic potassium phosphate in a 1000-mL volumetric flask. Dissolve in 950 mL of water. While stirring, adjust with phosphoric acid to a pH of 3.1, and dilute with water to volume.

**Solution A:** Acetonitrile, methanol, and *Buffer* (20:5:75)

**Solution B:** Acetonitrile, methanol, and *Buffer* (20:30:50)

**Mobile phase:** See *Table 1*.

**Table 1**

Time (min)	Solution A (%)	Solution B (%)
0	80	20
5	80	20
15	40	60
25	40	60
30	0	100
45	0	100
50	80	20

**Standard solution:** 1 mg/mL of USP Atracurium Besylate RS in *Solution A*

**Sample solution:** 1 mg/mL of Atracurium Besylate in *Solution A*

#### Chromatographic system

(See *Chromatography*, (621) *System Suitability*.)

**Mode:** LC

**Detector:** UV 280 nm

**Column:** 4.6-mm × 25-cm; 5-µm base-deactivated packing L1

Flow rate: 1 mL/min

Injection size: 20 µL

System suitability

Sample: Standard solution

[NOTE—Refer to Table 2 for relative retention times.]

Suitability requirements

**Resolution:** NLT 1.5 between the atracurium *trans-trans* isomer and the *cis-trans* isomer peaks; NLT 1.5 between the atracurium *cis-trans* isomer and the *cis-cis* isomer peaks

**Relative standard deviation:** NMT 2.0%, for the *cis-cis* isomer peak

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of atracurium besylate (C<sub>65</sub>H<sub>82</sub>N<sub>2</sub>O<sub>18</sub>S<sub>2</sub>) in the portion of Atracurium Besylate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = sum of the peak responses for the *trans-trans* isomer, the *trans-cis* isomer, and the *cis-cis* isomer from the Sample solution

$r_S$  = sum of the peak responses for the *trans-trans* isomer, the *trans-cis* isomer, and the *cis-cis* isomer from the Standard solution

$C_S$  = concentration of USP Atracurium Besylate RS in the Standard solution (mg/mL)

$C_U$  = concentration of Atracurium Besylate in the Sample solution (mg/mL)

**Acceptance criteria:** 96.0%–102.0%, calculated on the anhydrous basis. It contains NLT 5.0% and NMT 6.5% of the *trans-trans* isomer, NLT 34.5% and NMT 38.5% of the *cis-trans* isomer, and NLT 55.0% and NMT 60.0% of the *cis-cis* isomer.

## IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.2%
- **HEAVY METALS**, Method II (231): 20 ppm
- **ORGANIC IMPURITIES**

Buffer, Solution A, Solution B, Mobile phase, Chromatographic system, and Sample solution: Proceed as directed in the Assay.

**Standard solution:** 0.01 mg/mL of USP Atracurium Besylate RS in Solution A

**System suitability solution:** 1 mg/mL of USP Atracurium Besylate RS in Solution A

System suitability

Sample: System suitability solution

Suitability requirements

**Resolution:** NLT 1.5 between the atracurium *trans-trans* isomer and the *cis-trans* isomer peaks; NLT 1.5 between the atracurium *cis-trans* isomer and the *cis-cis* isomer peaks

Analysis

Samples: Standard solution and Sample solution

Record the chromatograms, and measure all of the peak responses, except the three main isomeric peaks.

Calculate the percentage of each impurity in the portion of Atracurium Besylate taken:

$$\text{Result} = (r_U/r_T) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response for each impurity from the Sample solution

$r_T$  = sum of peak responses due to the atracurium *cis-cis*, *trans-trans*, and *cis-trans* isomers from the Standard solution

$C_S$  = concentration of USP Atracurium Besylate RS in the Standard solution (mg/mL)

$C_U$  = concentration of Atracurium Besylate in the Sample solution (mg/mL)

$F$  = relative response factor (see Table 2)

**Acceptance criteria:** See Table 2. [NOTE—Disregard any peak less than 0.05%.]

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Impurity E <sup>a</sup>	0.2	1.0	1.5
Impurity F <sup>b</sup>	0.25	1.0	1.0
Impurity G (laudanidine) <sup>c</sup>	0.3	2.0	1.0

<sup>o</sup> *cis* Isomer of 1-(3,4-dimethoxybenzyl)-2-(3,11-dioxo-4,10-dioxatridec-12-enyl)-6,7-dimethoxy-2-methyl-1,2,3,4-tetrahydroisoquinolinium benzenesulfonate.

<sup>p</sup> Impurity consists of two isomers that are separated under these conditions; integrate both peaks for the impurity calculations.

## • LIMIT OF IMPURITY J (Methyl Benzenesulfonate)

Buffer, Solution A, and Solution B: Prepare as directed in the Assay.

**Standard stock solution:** 0.2 mg/mL of Impurity J (methyl benzenesulfonate) in acetonitrile

**Standard solution:** 1 µg/mL of Impurity J (methyl benzenesulfonate) in Solution A from Standard stock solution

**Sample solution:** 10 mg/mL of Atracurium Besylate in Solution A

Mobile phase: See Table 3.

Table 3

Time (min)	Solution A (%)	Solution B (%)
0	80	20
5	80	20
15	75	25
25	75	25
30	55	45
38	0	100
45	0	100

#### Chromatographic system

Mode: LC

Detector: UV 217 nm

Column: 4.6-mm × 25-cm; 5-μm base-deactivated packing L1

Flow rate: 1 mL/min

Injection size: 100 μL

#### Analysis

Samples: Standard solution and Sample solution

Measure the responses for the Impurity J (methyl benzenesulfonate) peaks.

Acceptance criteria: NMT 0.01%, the peak response of the Sample solution being NMT that of the Standard solution

#### SPECIFIC TESTS

- **WATER DETERMINATION**, Method I (921): NMT 5.0%

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, in a cold place. [NOTE—Atracurium Besylate is unstable at room temperature.]
- **USP REFERENCE STANDARDS** (11)  
USP Atracurium Besylate RS

## Atracurium Besylate Injection

#### DEFINITION

Atracurium Besylate Injection is a sterile solution containing NLT 90.0% and NMT 115.0% of the labeled amount of atracurium besylate ( $C_{65}H_{82}N_2O_{18}S_2$ ). It contains an amount of the *trans-trans* isomer equivalent to NLT 5.0% and NMT 6.5% of the labeled amount of atracurium besylate, an amount of the *cis-trans* isomer equivalent to NLT 34.5% and NMT 38.5% of the labeled amount of atracurium besylate, and an amount of the *cis-cis* isomer equivalent to NLT 55.0% and NMT 60.0% of the labeled amount of atracurium besylate.

[NOTE—The Injection is unstable at room temperature. Store all samples in the refrigerator. Analyze all preparations as soon as possible, or use a refrigerated injector.]

#### IDENTIFICATION

- **A.** The retention times of the peaks of the three atracurium besylate isomers from the Sample solution correspond to those from the Standard solution, as obtained in the Assay.

#### ASSAY

##### • PROCEDURE

Buffer: 10.2 g of monobasic potassium phosphate in a 1000-mL volumetric flask. Dissolve in 950 mL of water. While stirring, adjust with phosphoric acid to a pH of 3.1, and dilute with water to volume.

Solution A: Acetonitrile, methanol, and Buffer (20:5:75)

Solution B: Acetonitrile, methanol, and Buffer (20:30:50)

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	80	20
5	80	20
15	40	60
25	40	60
30	0	100
45	0	100
50	80	20

Standard solution: 1 mg/mL of USP Atracurium Besylate RS in Solution A

Sample solution: Nominally equivalent to 1 mg/mL of atracurium besylate from Injection in Solution A

#### Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm × 25-cm; 5-μm base-deactivated packing L1

Flow rate: 1 mL/min

Injection size: 20 μL

#### System suitability

Sample: Standard solution

[NOTE—Refer to Table 2 under Organic Impurities for relative retention times.]

#### Suitability requirements

Resolution: NLT 1.5 between the atracurium *trans-trans* isomer and the *cis-trans* isomer peaks; NLT 1.5 between the atracurium *cis-trans* isomer and the *cis-cis* isomer peaks

Relative standard deviation: NMT 2.0%, for the *cis-cis* isomer peak

#### Analysis

Samples: Standard solution and Sample solution

Measure the responses for the three atracurium besylate isomer peaks.

Calculate the percentage of the labeled amount of atracurium besylate ( $C_{65}H_{82}N_2O_{18}S_2$ ) in each mL of the Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = sum of the peak responses for the *trans-trans* isomer, the *trans-cis* isomer, and the *cis-cis* isomer from the Sample solution

$r_S$  = sum of the peak responses for the *trans-trans* isomer, the *trans-cis* isomer, and the *cis-cis* isomer from the Standard solution

$C_S$  = concentration of USP Atracurium Besylate RS in the Standard solution (mg/mL)

$C_U$  = nominal concentration of atracurium besylate in the Sample solution (mg/mL)

Acceptance criteria: 90.0%–115.0% of the labeled amount of atracurium besylate ( $C_{65}H_{82}N_2O_{18}S_2$ ). It contains NLT 5.0% and NMT 6.5% of the *trans-trans* isomer, NLT 34.5% and NMT 38.5% of the *cis-trans* isomer, and NLT 55.0% and NMT 60.0% of the *cis-cis* isomer.

#### IMPURITIES

##### • ORGANIC IMPURITIES

Buffer, Solution A, Solution B, Mobile phase, Sample solution, and Chromatographic system: Proceed as directed in the Assay.

Standard stock solution: 1 mg/mL of USP Atracurium Besylate RS in Solution A

**Standard solution:** 0.02 mg/mL of USP Atracurium Besylate RS in *Solution A*, from *Standard stock solution*

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Resolution:** NLT 1.5 between the atracurium *trans-trans* isomer and the *cis-trans* isomer peaks; NLT 1.5 between the atracurium *cis-trans* isomer and the *cis-cis* isomer peaks

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of each impurity in the portion of *Sample solution* taken:

$$\text{Result} = (r_U/r_T) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response for each impurity from the *Sample solution*

$r_T$  = sum of all the peak responses from the *Standard solution*

$C_S$  = concentration of USP Atracurium Besylate RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of atracurium besylate in the *Sample solution* (mg/mL)

$F$  = relative response factor (see *Table 2*)

**Acceptance criteria:** See *Table 2*.

**Table 2**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Benzenesulfonic acid <sup>a</sup>	0.08	—	—
Acidic compound	0.22	1.0	6.0
Impurity G (laudanosine)	0.29	2.0	3.0
<i>cis-</i> and <i>trans-</i> isomers of the hydroxy compound	0.44 <sup>b</sup> and 0.50 <sup>c</sup>	1.0	6.0 <sup>f</sup>
Atracurium <i>trans-trans</i> isomer	0.8	—	—
Atracurium <i>cis-trans</i> isomer	0.9	—	—
Atracurium <i>cis-cis</i> isomer	1.0	—	—
<i>cis-</i> and <i>trans-</i> isomers of the monoacrylate	1.28 <sup>d</sup> and 1.33 <sup>e</sup>	1.0	3.0 <sup>f</sup>
Any individual unspecified degradation product	—	1.0	0.1
Total impurities	—	—	15.0

<sup>a</sup> For identification purposes only.

<sup>b</sup> *cis* isomer of the hydroxy compound.

<sup>c</sup> *trans* isomer of the hydroxy compound.

<sup>d</sup> *cis* isomer of the monoacrylate.

<sup>e</sup> *trans* isomer of the monoacrylate.

<sup>f</sup> Impurity consists of two isomers that are separated under these conditions; integrate both peaks for the impurity calculations.

**SPECIFIC TESTS**

• **PH** (791): 3.00–3.65

• **STERILITY TESTS** (71): It meets the requirements when tested as directed for *Test for Sterility of the Product to Be Examined, Membrane Filtration*.

• **BACTERIAL ENDOTOXINS TEST** (85): It contains NMT 5.56 USP Endotoxin Units/mg of atracurium besylate.

• **INJECTIONS** (1): Meets the requirements

**ADDITIONAL REQUIREMENTS**

• **PACKAGING AND STORAGE:** Preserve in single-dose or multiple-dose containers, preferably of Type I glass, in a refrigerator, and protect from freezing. Protect from light.

• **USP REFERENCE STANDARDS** (11)

USP Atracurium Besylate RS

## Atropine

$C_{17}H_{23}NO_3$  289.37

Benzeneacetic acid,  $\alpha$ -(hydroxymethyl)-8-methyl-8-azabicyclo[3.2.1]oct-3-yl ester, *endo*-(±)-;

1 $\alpha$ H,5 $\alpha$ H-Tropan-3 $\alpha$ -ol (±)-tropate (ester) [51-55-8].

**DEFINITION**

Atropine contains NLT 99.0% and NMT 100.5% of atropine ( $C_{17}H_{23}NO_3$ ), calculated on the anhydrous basis.

[**CAUTION**—Handle Atropine with exceptional care, because it is highly potent.]

**IDENTIFICATION**

• **A.**

**Standard:** 36 mg of USP Atropine Sulfate RS

**Sample:** 30 mg

**Analysis:** Dissolve the *Standard* and *Sample* in individual 60-mL separators with the aid of 5-mL portions of water. To each separator add 1.5 mL of 1 N sodium hydroxide solution and 10 mL of chloroform. Shake for 1 min, allow the layers to separate, and pass the chloroform extracts through separate filters of 2 g of anhydrous granular sodium sulfate supported on pledgets of glass wool. Extract each aqueous layer with two additional 10-mL portions of chloroform, filtering and combining with the respective main extracts. Evaporate the chloroform solutions under reduced pressure to dryness, and dissolve each residue in 10 mL of carbon disulfide.

**Acceptance criteria:** The IR absorption spectrum, determined in a 1-mm cell, of the solution of the *Sample* exhibits maxima only at the same wavelengths as that of the solution of the *Standard*.

• **B.**

**Sample solution:** A solution (1 in 50) in 3 N hydrochloric acid

**Analysis:** Add gold chloride TS to the *Sample solution*.

**Acceptance criteria:** A lusterless precipitate is formed (distinction from hyoscyamine, which, similarly treated, yields a lustrous precipitate).

**ASSAY**

• **PROCEDURE**

**Sample:** 400 mg of Atropine

**Analysis:** Dissolve the *Sample* in 50 mL of glacial acetic acid. Titrate with 0.1 N perchloric acid VS to a green endpoint, using 1 drop of crystal violet TS. Perform a blank determination (see *Titrimetry* (541)). Each mL of 0.1 N perchloric acid is equivalent to 28.94 mg of atropine ( $C_{17}H_{23}NO_3$ ).

**Acceptance criteria:** 99.0%–100.5% on the anhydrous basis

**IMPURITIES**

- **RESIDUE ON IGNITION** (281): NMT 0.1%
- **LIMIT OF FOREIGN ALKALOIDS AND OTHER IMPURITIES**  
 Standard solution: 24 mg/mL of USP Atropine Sulfate RS in methanol  
 Sample solution A: 20 mg/mL of Atropine in methanol  
 Sample solution B: 1 mg/mL of Atropine in methanol  
**Chromatographic system**  
 (See *Chromatography* (621), *Thin-Layer Chromatography*.)  
**Mode:** TLC  
**Adsorbent:** 0.5-mm layer of chromatographic silica gel  
**Application volume:** See *Analysis*.  
**Developing solvent system:** Chloroform, acetone, and diethylamine (5:4:1)  
**Spray reagent:** Potassium iodoplatinate TS  
**Analysis**  
*Samples:* Standard solution, 5  $\mu$ L; Sample solution A, 25  $\mu$ L; Sample solution B, 1  $\mu$ L  
 Apply the *Samples* to the TLC plate. Allow the spots to dry, and develop the chromatogram in the *Developing solvent system* until the solvent front has moved three-fourths of the length of the plate. Allow the solvent to evaporate. Locate the spots on the plate by spraying with *Spray reagent*.  
**Acceptance criteria:** NMT 0.2%; the  $R_f$  value of the principal spot of each *Sample solution* corresponds to that of the *Standard solution*; no secondary spot of *Sample solution A* exhibits intensity equal to or greater than the principal spot of *Sample solution B*.
- **READILY CARBONIZABLE SUBSTANCES TEST** (271)  
 Sample solution: 200 mg in 5 mL of 2 N sulfuric acid  
**Acceptance criteria:** The solution has no more color than *Matching Fluid A*, and the solution is colored no more than light yellow upon the addition of 0.2 mL of nitric acid.

**SPECIFIC TESTS**

- **OPTICAL ROTATION, Angular Rotation** (781)  
 Sample solution: 1 g, previously dried at 105° for 1 h, in sufficient 50% alcohol (w/w) to obtain a volume of 20 mL at 25° (using a 200-mm tube)  
**Acceptance criteria:**  $-0.70^\circ$  to  $+0.05^\circ$  (limit of hyoscyamine)
- **MELTING RANGE OR TEMPERATURE** (741): 114°–118°
- **WATER DETERMINATION, Method I** (921): NMT 0.2%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **USP REFERENCE STANDARDS** (11)  
 USP Atropine Sulfate RS

**Atropine Sulfate**

( $C_{17}H_{23}NO_3$ )<sub>2</sub> · H<sub>2</sub>SO<sub>4</sub> · H<sub>2</sub>O 694.83  
 Benzeneacetic acid,  $\alpha$ -(hydroxymethyl)-, 8-methyl-8-azabicyclo[3.2.1]oct-3-yl ester, *endo*-(±)-, sulfate (2:1) (salt), monohydrate.  
 1 $\alpha$ H,5 $\alpha$ H-Tropan-3- $\alpha$ -ol (±)-tropate (ester), sulfate (2:1) (salt) monohydrate [5908-99-6].  
 Anhydrous 676.83 [55-48-1].

» Atropine Sulfate contains not less than 98.5 percent and not more than 101.0 percent of ( $C_{17}H_{23}NO_3$ )<sub>2</sub> · H<sub>2</sub>SO<sub>4</sub>, calculated on the anhydrous basis.

*Caution—Handle Atropine Sulfate with exceptional care, since it is highly potent.*

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Atropine Sulfate RS

**Identification**—

**A:** *Infrared Absorption* (197K).

**B:** A solution (1 in 20) meets the requirements of the tests for *Sulfate* (191).

**Melting temperature, Class Ia** (741): not lower than 187°, determined after drying at 120° for 4 hours. [NOTE—Since anhydrous Atropine Sulfate is hygroscopic, determine its melting temperature promptly on a specimen placed in the capillary tube immediately after drying.]

**Angular rotation** (781A)—The observed rotation, in degrees, multiplied by 200, and divided by the length, in mm, of the polarimeter tube used, is between  $-0.60^\circ$  and  $+0.05^\circ$  (limit of hyoscyamine).

*Test solution*—Dissolve 1 g, accurately weighed, in water to make a volume of 20 mL at 25°.

**Acidity**—Dissolve 1.0 g in 20 mL of water, add 1 drop of methyl red TS, and titrate with 0.020 N sodium hydroxide: not more than 0.30 mL is required to produce a yellow color.

**Water, Method I** (921): not more than 4.0%.

**Residue on ignition** (281): not more than 0.2%.

**Other alkaloids**—Dissolve 150 mg in 10 mL of water. To 5 mL of the solution add a few drops of platinic chloride TS: no precipitate is formed. To the remaining 5 mL of the solution add 2 mL of 6 N ammonium hydroxide, and shake vigorously: a slight opalescence may develop but no turbidity is produced.

**Assay**—Dissolve about 1 g of Atropine Sulfate, accurately weighed, in 50 mL of glacial acetic acid, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 67.68 mg of ( $C_{17}H_{23}NO_3$ )<sub>2</sub> · H<sub>2</sub>SO<sub>4</sub>.

**Atropine Sulfate Injection**

» Atropine Sulfate Injection is a sterile solution of Atropine Sulfate in Water for Injection. It contains not less than 93.0 percent and not more than 107.0 percent of the labeled amount of ( $C_{17}H_{23}NO_3$ )<sub>2</sub> · H<sub>2</sub>SO<sub>4</sub> · H<sub>2</sub>O.

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass.

**USP Reference standards** (11)—

USP Atropine Sulfate RS

USP Endotoxin RS

**Identification** (see *Thin-Layer Chromatographic Identification Test* (201))—

**Adsorbent:** chromatographic silica gel.

**Developing solvent:** mixture of chloroform and diethylamine (9:1).

*Test preparation*—Use undiluted. Apply 15  $\mu$ L.

*Detection reagent:* potassium iodoplatinate TS.

*Procedure*—Proceed as directed for *Procedure* under *Thin-Layer Chromatographic Identification Test* (201), the spots on the plate located by spraying with *Detection reagent*.

**Bacterial endotoxins** (85)—It contains not more than 55.6 USP Endotoxin Units per mg of atropine sulfate.

**pH** (791): between 3.0 and 6.5.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay—**

*Acetate buffer*—Prepare a solution in water containing in each L 0.05 mole of sodium acetate and 2.9 mL of glacial acetic acid.

*Mobile phase*—Transfer 5.1 g of tetrabutylammonium hydrogen sulfate to a 1-L volumetric flask, add 50 mL of acetonitrile, and dilute with *Acetate buffer* to volume. Adjust with 5 N sodium hydroxide to a pH of  $5.5 \pm 0.1$ .

*Standard preparation*—Dissolve an accurately weighed quantity of USP Atropine Sulfate RS in water, and dilute quantitatively with water to obtain a solution having a known concentration of about 80 µg per mL.

*Assay preparation*—Transfer an accurately measured volume of Injection, equivalent to about 2 mg of atropine sulfate, to a 25-mL volumetric flask, dilute with water to volume, and mix.

*Resolution solution*—Prepare a solution in water containing about 2.5 µg of *p*-hydroxybenzoic acid per mL. Dilute one volume of this solution with four volumes of the *Standard preparation*.

*Chromatographic system* (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and 30-cm  $\times$  3.9-mm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 1.5%. In a similar manner, chromatograph the *Resolution solution*: the retention time of *p*-hydroxybenzoic acid is about 1.6 relative to that of atropine, and the resolution, *R*, between the *p*-hydroxybenzoic acid and atropine peaks is not less than 2.2.

*Procedure*—Separately inject equal volumes (about 100 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of  $(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4 \cdot H_2O$  in each mL of the Injection taken by the formula:

$$(694.85/676.83)(25C/V)(r_U/r_S)$$

in which 694.85 and 676.83 are the molecular weights of atropine sulfate monohydrate and anhydrous atropine sulfate, respectively; *C* is the concentration, in mg per mL, of USP Atropine Sulfate RS in the *Standard preparation*; *V* is the volume, in mL, of Injection taken; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Atropine Sulfate Ophthalmic Ointment

**DEFINITION**

Atropine Sulfate Ophthalmic Ointment is Atropine Sulfate in a suitable ophthalmic ointment base. It contains NLT 90.0% and NMT 110.0% of the labeled amount of atropine sulfate monohydrate  $[(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4 \cdot H_2O]$ . It is sterile.

**IDENTIFICATION**

- A. IDENTIFICATION—ORGANIC NITROGENOUS BASES <181>**

**Sample solution:** Transfer a portion of Ophthalmic Ointment, equivalent to 50 mg of atropine sulfate, to a suitable separator, and dissolve in 25 mL of ether. Add 25 mL of 0.01 N hydrochloric acid, shake vigorously, allow the layers to separate, and discard the organic phase. Heat the aqueous phase gently on a steam bath while passing nitrogen through the solution to expel any residual ether.

**Analysis:** Proceed as directed in the chapter, beginning with "In a second separator dissolve 50 mg..."

**Acceptance criteria:** Meets the requirements

- B. IDENTIFICATION TESTS—GENERAL, Sulfate <191>**

**Sample solution:** Transfer 5 g of Ophthalmic Ointment to a separator, dissolve in 50 mL of ether, and extract with 20 mL of water.

**Acceptance criteria:** Meets the requirements

**ASSAY**

- PROCEDURE**

**Buffer:** 34.8 g of dibasic potassium phosphate in 900 mL of water. Adjust to a pH of 9.0 by the addition of 3 M hydrochloric acid or 1 M sodium hydroxide, as necessary.

**Internal standard solution:** 0.5 mg/mL of homatropine hydrobromide in water. [NOTE—Prepare fresh daily.]

**Standard stock solution:** 0.1 mg/mL of USP Atropine Sulfate RS in water

**Standard solution:** 0.5 mg/mL of atropine sulfate prepared as follows. Pipet 10 mL of *Standard stock solution* into a separator, add 2.0 mL of *Internal standard solution* and 5.0 mL of *Buffer*, and adjust the solution in the separator with 1 M sodium hydroxide to a pH of 9.0. Extract with two 10-mL portions of methylene chloride, filter the methylene chloride extracts through 1 g of anhydrous sodium sulfate supported by a small cotton plug in a funnel into a 50-mL beaker, and evaporate under a stream of nitrogen to near-dryness. Dissolve the residue in 2.0 mL of methylene chloride. [NOTE—Prepare fresh daily.]

**Sample solution:** Nominally 0.5 mg/mL of atropine sulfate prepared as follows. Transfer Ophthalmic Ointment, equivalent to 10 mg of atropine sulfate, to a separator containing 50 mL of ether. Shake to dissolve, extract with three 25-mL portions of 0.1 M sulfuric acid, collect the acid extracts in a 100-mL volumetric flask, and dilute with 0.1 M sulfuric acid to volume. Pipet 10 mL of this solution and treat as follows. Add 2.0 mL of *Internal standard solution* and 5.0 mL of *Buffer*, and adjust the solution in the separator with 1 M sodium hydroxide to a pH of 9.0. Extract with two 10-mL portions of methylene chloride, filter the methylene chloride extracts through 1 g of anhydrous sodium sulfate supported by a small cotton plug in a funnel into a 50-mL beaker, and evaporate under a stream of nitrogen to near-dryness. Dissolve the residue in 2.0 mL of methylene chloride.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 2-mm  $\times$  1.8-m glass; packed with a 3% phase G3 on support S1AB

**Temperatures**

**Column:** 225°

**Injection port:** 250°

**Detector:** 250°

**Flow rate:** 25 mL/min

**Carrier gas:** Nitrogen

**Injection volume:** 1 µL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Resolution:** NLT 4.0

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of atropine sulfate monohydrate  $[(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4 \cdot H_2O]$  in the portion of Ophthalmic Ointment taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

*R<sub>U</sub>* = peak area ratio of atropine to homatropine from the *Sample solution*

- $R_S$  = peak area ratio of atropine to homatropine from the *Standard solution*  
 $C_S$  = concentration of USP Atropine Sulfate RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of the *Sample solution* (mg/mL)  
 $M_{r1}$  = molecular weight of atropine sulfate monohydrate, 694.85  
 $M_{r2}$  = molecular weight of anhydrous atropine sulfate, 676.83  
**Acceptance criteria:** 90.0%–110.0%

**SPECIFIC TESTS**

- **STERILITY TESTS** <71>: Meets the requirements

USP Atropine Sulfate RS

## Atropine Sulfate Ophthalmic Solution

**DEFINITION**

Atropine Sulfate Ophthalmic Solution is a sterile, aqueous solution of Atropine Sulfate. It contains NLT 93.0% and NMT 107.0% of the labeled amount of atropine sulfate  $[(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4 \cdot H_2O]$ . It may contain suitable stabilizers and antimicrobial agents.

**IDENTIFICATION**

- **A. INFRARED ABSORPTION** <197M>  
**Standard:** 36 mg USP Atropine Sulfate RS  
**Sample:** Ophthalmic Solution, equivalent to 30 mg, evaporated to dryness  
**Analysis:** Dissolve the *Sample* and *Standard* in individual 60-mL separators with the aid of 5-mL portions of water. To each separator add 1.5 mL of 1 N sodium hydroxide solution and 10 mL of chloroform. Shake for 1 min, allow the layers to separate, and pass the chloroform extracts through separate filters of 2 g of anhydrous granular sodium sulfate supported on pledgets of glass wool. Extract each aqueous layer with two additional 10-mL portions of chloroform, filtering and combining with the respective main extracts. Evaporate the chloroform solutions under reduced pressure to dryness, and dissolve each residue in 10 mL of carbon disulfide.  
**Acceptance criteria:** The IR absorption spectrum, determined in a 1-mm cell, of the solution of the *Sample* exhibits maxima only at the same wavelengths as that of the solution of the *Standard*.
- **B. IDENTIFICATION TESTS—GENERAL, Sulfate** <191>  
**Sample solution:** Evaporate to dryness a quantity of Ophthalmic Solution. Prepare a solution from the residue that contains the equivalent of 50 mg of atropine sulfate/mL.  
**Acceptance criteria:** Meets the requirements

**ASSAY**• **PROCEDURE**

**Buffer:** 34.8 g of dibasic potassium phosphate in 900 mL of water. Adjust to a pH of 9.0 by the addition of 3 M hydrochloric acid or 1 M sodium hydroxide.  
**Internal standard solution:** 0.5 mg/mL of homatropine hydrobromide in water. [NOTE—Prepare fresh daily.]  
**Standard stock solution:** 0.1 mg/mL of USP Atropine Sulfate RS in water

**Standard solution:** 0.5 mg/mL of atropine sulfate prepared as follows. Pipet 10 mL of *Standard stock solution* into a separator, add 2.0 mL of *Internal standard solution* and 5.0 mL of *Buffer*, and adjust the solution in the separator with 1 M sodium hydroxide to a pH of 9.0. Extract with two 10-mL portions of methylene chloride, filter the methylene chloride extracts through 1 g of anhydrous sodium sulfate supported by a small cotton plug in a funnel into a 50-mL beaker, and evaporate under a stream of nitrogen to near-dryness. Dissolve the residue in 2.0 mL of methylene chloride. [NOTE—Prepare fresh daily.]

**Sample solution:** Nominally 0.5 mg/mL of atropine sulfate prepared as follows. Ophthalmic Solution, equivalent to 10 mg of atropine sulfate, in a 100-mL volumetric flask. Dilute with water to volume. Pipet 10 mL of this solution and treat as follows. Add 2.0 mL of *Internal standard solution* and 5.0 mL of *Buffer*, and adjust the solution in the separator with 1 M sodium hydroxide to a pH of 9.0. Extract with two 10-mL portions of methylene chloride, filter the methylene chloride extracts through 1 g of anhydrous sodium sulfate supported by a small cotton plug in a funnel into a 50-mL beaker, and evaporate under a stream of nitrogen to near-dryness. Dissolve the residue in 2.0 mL of methylene chloride.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 2-mm  $\times$  1.8-m glass; packed with a 3% phase G3 on support S1AB

**Temperatures**

**Column:** 225°

**Injection port:** 250°

**Detector:** 250°

**Flow rate:** 25 mL/min

**Carrier gas:** Nitrogen

**Injection volume:** 1  $\mu$ L

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Resolution:** NLT 4.0

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of atropine sulfate

$[(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4 \cdot H_2O]$  in each mL of Ophthalmic Solution taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$R_U$  = peak area ratio of atropine sulfate to homatropine hydrobromide from the *Sample solution*  
 $R_S$  = peak area ratio of atropine sulfate to homatropine hydrobromide from the *Standard solution*

$C_S$  = concentration of USP Atropine Sulfate RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of the *Sample solution* (mg/mL)  
 $M_{r1}$  = molecular weight of atropine sulfate monohydrate, 694.85  
 $M_{r2}$  = molecular weight of anhydrous atropine sulfate, 676.83

Acceptance criteria: 93.0%–107.0%

#### SPECIFIC TESTS

- **PH** (791): 3.5–6.0
- **STERILITY TESTS** (71): Meets the requirements

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS** (11)  
USP Atropine Sulfate RS

## Atropine Sulfate Tablets

#### DEFINITION

Atropine Sulfate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of atropine sulfate  $[(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4 \cdot H_2O]$ .

#### IDENTIFICATION

- **A. IDENTIFICATION—ORGANIC NITROGENOUS BASES** (181)  
**Sample:** A quantity of Tablets, equivalent to 5 mg of atropine sulfate  
**Analysis:** Triturate with 10 mL of water for a few min, and filter into a small separator. Render the solution alkaline with 6 N ammonium hydroxide, and extract with 50 mL of chloroform. Filter the chloroform layer, and evaporate to dryness.  
**Acceptance criteria:** The residue meets the requirements.
- **B. IDENTIFICATION TESTS—GENERAL, Sulfate** (191): A filtered solution of Tablets meets the requirements of the tests.

#### ASSAY

##### PROCEDURE

**Buffer:** 34.8 g of dibasic potassium phosphate in 900 mL of water. Adjust to a pH of 9.0 by the addition of 3 M hydrochloric acid or 1 M sodium hydroxide, as necessary.

**Internal standard solution:** 0.5 mg/mL of homatropine hydrobromide in water. [NOTE—Prepare fresh daily.]

**Standard solution:** 0.1 mg/mL of USP Atropine Sulfate RS in water. Pipet 10 mL of this solution into a separator, add 2.0 mL of *Internal standard solution* and 5.0 mL of *Buffer*, and adjust the solution in the separator with 1 M sodium hydroxide to a pH of 9.0. Extract with two 10-mL portions of methylene chloride, filter the methylene chloride extracts through 1 g of anhydrous sodium sulfate supported by a small cotton plug in a funnel into a 50-mL beaker, and evaporate under a stream of nitrogen to near-dryness. Dissolve the residue in 2.0 mL of methylene chloride. [NOTE—Prepare fresh daily.]

**Sample solution:** Transfer an equivalent to 1 mg of atropine sulfate, from NLT 20 finely powdered Tablets, to a separator. Add 2.0 mL of *Internal standard solution* and 5.0 mL of *Buffer*, and adjust the solution in the separator with 1 M sodium hydroxide to a pH of 9.0. Extract with two 10-mL portions of methylene chloride, filter the methylene chloride extracts through 1 g of anhydrous sodium sulfate supported by a small cotton plug in a funnel into a 50-mL beaker, and evaporate under a stream of nitrogen to near-dryness. Dissolve the residue in 2.0 mL of methylene chloride.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 2-mm  $\times$  1.8-m glass; packed with a 3% phase G3 on support S1AB

#### Temperatures

**Column:** 225°

**Injection port:** 250°

**Detector:** 250°

**Flow rate:** 25 mL/min

**Carrier gas:** Nitrogen

**Injection volume:** 1  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

**Suitability requirements**

**Resolution:** NLT 4.0

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of atropine sulfate  $[(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4 \cdot H_2O]$  in the portion of Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$R_U$  = peak area ratio of atropine sulfate to homatropine hydrobromide from the *Sample solution*

$R_S$  = peak area ratio of atropine sulfate to homatropine hydrobromide from the *Standard solution*

$C_S$  = concentration of USP Atropine Sulfate RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of atropine sulfate in the *Sample solution* (mg/mL)

$M_{r1}$  = molecular weight of atropine sulfate monohydrate, 694.85

$M_{r2}$  = molecular weight of anhydrous atropine sulfate, 676.83

**Acceptance criteria:** 90.0%–110.0%

#### PERFORMANCE TESTS

- **DISINTEGRATION** (701)  
**Time:** 15 min  
**Acceptance criteria:** Meet the requirements
- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** (11)  
USP Atropine Sulfate RS

## Activated Attapulgate

» Activated Attapulgate is a highly heat-treated, processed, native magnesium aluminum silicate.

**Packaging and storage**—Preserve in well-closed containers.

**Identification**—Activated Attapulgate responds to the *Identification* test for *Colloidal Activated Attapulgate*, the characteristic peak, however, being much less intense.

**Loss on drying** (731)—Dry it at 105° to constant weight: it loses not more than 4.0% of its weight.

**Loss on ignition** (733)—When ignited at 1000° for 1 hour, it loses between 4.0% and 12.0% of its weight.

**Volatile matter**—When ignited at 600° for 1 hour, it loses between 3.0% and 7.5% of its weight on the dried basis.

**Powder fineness**—Proceed as directed in the test for *Powder fineness* under *Colloidal Activated Attapulgate*. The dry weight of the residue is not more than 0.10% of the weight of the specimen taken.

**Acid-soluble matter**—Boil 2.0 g with 100 mL of 0.2 N hydrochloric acid for 5 minutes, and cool. Add water to adjust the volume to 100 mL, and filter. Evaporate 50 mL of the filtrate so obtained to dryness, and ignite the residue at 600°: not more than 0.25 g is found (25%).

**Other requirements**—It meets the requirements of the tests for *Microbial limits*, *pH*, *Carbonate*, *Arsenic and Lead*, and *Adsorptive capacity* under *Colloidal Activated Attapulgit*.

## Colloidal Activated Attapulgit

» Colloidal Activated Attapulgit is a purified native magnesium aluminum silicate.

**Packaging and storage**—Preserve in well-closed containers.

**Identification**—Add 2 g in small portions to 100 mL of water, with vigorous agitation. Allow to stand for at least 12 hours to ensure complete hydration. Place 2 mL of the resulting mixture on a suitable glass slide, and allow to air-dry at room temperature to produce a uniform film. Place the slide in a vacuum desiccator over a free surface of ethylene glycol. Evacuate the desiccator, and close the stopcock so that the ethylene glycol saturates the desiccator chamber. Allow to stand for 12 hours. Record the X-ray diffraction pattern (see *X-Ray Diffraction* <941>), and calculate the *d* values: several peaks are observed; the characteristic peak corresponds to a *d* value between 10.3 and 10.7 Angstrom units.

**Microbial enumeration tests** <61> and **Tests for specified microorganisms** <62>—It meets the requirements of the test for absence of *Escherichia coli*.

**pH** <791>—Disperse 1.0 g in 10 mL of carbon dioxide-free water, and mix: the pH of the mixed dispersion so obtained is between 7.0 and 9.5.

**Loss on drying** <731>—Dry it at 105° to constant weight: it loses between 5.0% and 17.0% of its weight.

**Loss on ignition** <733>—When ignited at 1000° for 1 hour, it loses between 17.0% and 27.0% of its weight.

**Volatile matter**—When ignited at 600° for 1 hour, it loses between 7.5% and 12.5% of its weight on the dried basis.

**Powder fineness**—Add 50 g to 450 mL of water containing 5 g of sodium pyrophosphate, and stir for 10 minutes. Pour the resulting dispersion slowly through a No. 325 standard sieve (see *Particle Size Distribution Estimation by Analytical Sieving* <786>), and carefully wash the residue until clean. Dry the residue at 105° to constant weight: the dry weight of the residue so obtained is not more than 0.30% of the weight of the specimen taken.

**Acid-soluble matter**—Boil 2.0 g with 100 mL of 0.2 N hydrochloric acid for 5 minutes, and cool. Add water to adjust the volume to 100 mL, and filter. Evaporate 50 mL of the filtrate so obtained to dryness, and ignite the residue at 600°: not more than 0.15 g is found (15%).

**Carbonate**—Mix 1.0 g with 15 mL of 0.5 N sulfuric acid: no effervescence occurs.

**Arsenic and Lead**—To 5.0 g add 50 mL of 1 N nitric acid, and boil for 30 minutes, adding 1 N nitric acid at times to maintain the volume. Filter into a 100-mL volumetric flask, wash the filter with water, and dilute the combined filtrate and washings with water to volume.

**Arsenic**—Determine the arsenic in the solution by atomic absorption spectrometry (see *Spectrophotometry and Light-scattering* <851>), using a graphite furnace to volatilize the arsenic, as directed by the manufacturer of the instrument used, and measuring the absorbance at 189.0 nm against a standard: not more than 2 ppm is found.

**Lead**—Determine the lead in the solution by atomic absorption spectrometry (see *Spectrophotometry and Light-scattering* <851>), using a graphite furnace to volatilize the lead, as directed by the manufacturer of the instrument used, and measuring the absorbance at 283.3 nm against a standard: not more than 0.001% is found.

**Adsorptive capacity**—To 10 mL of a 1 in 10 suspension of the specimen in water add 80 mL of methylene blue solution (1 in 1000), and shake. Add 10 mL of barium chloride solution (1 in 50), and shake. Allow to stand for 15 minutes. Transfer 40 mL of the supernatant to a 50-mL centrifuge tube, and centrifuge. To 5 mL of the clear supernatant add 495 mL of water, and mix: the color of the solution so obtained is not deeper than that of a solution containing 1.5 µg of methylene blue per mL.

## Aurothioglucose

$C_6H_{11}AuO_5S$  392.18  
Gold, (1-thio-D-glucopyranosato)-.  
(1-Thio-D-glucopyranosato)gold [12192-57-3].

» Aurothioglucose contains not less than 95.0 percent and not more than 105.0 percent of  $C_6H_{11}AuO_5S$ , calculated on the dried basis. It is stabilized by the addition of a small amount of Sodium Acetate.

**Packaging and storage**—Preserve in tight, light-resistant containers. Store at room temperature.

**USP Reference standards** <11>—

USP Aurothioglucose RS

**Identification**—

**A:** Dissolve a suitable quantity in water to obtain a solution containing 4 mg per mL. Apply 10 µL of this solution and 10 µL of an aqueous Standard solution of USP Aurothioglucose RS containing 4 mg per mL to a suitable thin-layer chromatographic glass microfilament sheet (see *Chromatography* <621>) impregnated with silicic acid and a suitable fluorescing substance. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of *n*-propyl alcohol, water, and ethyl acetate (3:3:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the sheet from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by examination under short-wavelength UV light: the *R<sub>F</sub>* value of the principal spot obtained from the solution under test corresponds to that obtained from the Standard solution.

**B:** To a portion of the filtrate obtained in the Assay add barium chloride TS: a heavy, white precipitate is formed.

**Specific rotation** <781S>: between +65° and +75°.

**Test solution:** 10 mg per mL, in water.

**Loss on drying** <731>—Dry it over phosphorus pentoxide for 24 hours: it loses not more than 1.0% of its weight.

**Assay**—Accurately weigh about 1 g of Aurothioglucose, and dissolve in 100 mL of water in a 300-mL Kjeldahl flask. Slowly add 10 mL of nitric acid, and when the reaction has subsided, boil the mixture for 5 minutes. Filter, wash well the separated gold with hot water, dry, and ignite to constant weight. The weight of the gold so obtained, multiplied by 1.991, represents the weight of  $C_6H_{11}AuO_5S$  in the portion of Aurothioglucose taken.

## Aurothioglucose Injectable Suspension

» Aurothioglucose Injectable Suspension is a sterile suspension of Aurothioglucose in a suitable vegetable oil. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_6H_{11}AuO_5S$ . It may contain suitable thickening agents.

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass. Protect from light.

**USP Reference standards** (11)—  
USP Aurothioglucose RS

**Identification**—Transfer a volume of Injectable Suspension, equivalent to about 200 mg of aurothioglucose, to a centrifuge separator containing 20 mL of ethyl acetate and 50 mL of water. Shake the mixture thoroughly, and centrifuge until the liquid phases have been clearly separated. Withdraw the lower, aqueous phase, and filter, discarding the first 10 mL of the filtrate. Collect the filtrate in a glass-stoppered vessel, and proceed as directed in *Identification* test A under *Aurothioglucose*, beginning with “apply 10  $\mu$ L of this solution.”

**Bacterial endotoxins** (85)—It contains not more than 7.14 USP Endotoxin Units per mg of aurothioglucose.

**Sterility** (71)—It meets the requirements.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—Transfer with a pipet, calibrated to contain rather than to deliver, an accurately measured volume of Injectable Suspension, equivalent to about 200 mg of aurothioglucose, to a beaker containing 400 mL of acetone. Wash the pipet into the beaker with a small quantity of acetone, mix, allow the solids to settle, and decant the supernatant through a filter. Wash the solids with another 400-mL portion of acetone, and repeat the decantation. Transfer the solids to the filter with the aid of acetone, then transfer the filter and its contents to a short-necked, 300-mL Kjeldahl flask, add 5 mL of water, and proceed as directed in the *Assay* under *Gold Sodium Thiomalate*, beginning with “add 20 mL of nitric acid.” The weight of gold so obtained, multiplied by 1.991, represents the weight of  $C_6H_{11}AuO_5S$  in the portion of Injectable Suspension taken.

## Avobenzone

$C_{20}H_{22}O_3$  310.39

1,3-Propanedione, 1-[4-(1,1-dimethylethyl)phenyl]-3-(4-methoxyphenyl)-.

1-(*p*-*tert*-Butylphenyl)-3-(*p*-methoxyphenyl)-1,3-propanedione [70356-09-1].

» Avobenzone contains not less than 95.0 percent and not more than 105.0 percent of  $C_{20}H_{22}O_3$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—  
USP Avobenzone RS

**Identification**—

**A:** *Infrared Absorption* (197K).

**B:** *Ultraviolet Absorption* (197U)—

*Solution:* 5  $\mu$ g per mL.

*Medium:* alcohol.

Absorptivities at 360 nm do not differ by more than 3.0%.

**Melting range**, *Class I* (741): between 81° and 86°.

**Loss on drying** (731)—Dry it in vacuum at 70° for 4 hours; it loses not more than 0.5% of its weight.

**Chromatographic purity**—

*Test solution*—Proceed as directed for *Assay preparation* in the *Assay*.

*Chromatographic system* (see *Chromatography* (621))—Proceed as directed in the *Assay*.

*Procedure*—Inject a volume (about 1  $\mu$ L) of *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each impurity in the portion of Avobenzone taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the response of each individual peak, other than the avobenzone peak, in the chromatogram of the *Test solution*; and  $r_s$  is the sum of the responses of all of the peaks in the chromatogram of the *Test solution*: not more than 3.0% of any individual impurity is found, and the sum of all of the impurities is not more than 4.5%.

**Assay**—

*Standard preparation*—Dilute an accurately measured quantity of USP Avobenzone RS in acetone, and dilute quantitatively, and stepwise if necessary, with acetone to obtain a solution having a known concentration of about 50 mg per mL.

*Assay preparation*—Transfer about 500 mg of Avobenzone, accurately weighed, to a 10-mL volumetric flask, dilute with acetone to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and a 0.32-mm  $\times$  25-m fused silica capillary column coated with phase G1. The column temperature is maintained at about 200° until the time of injection, then increased at a rate of 4° per minute to 280°. The injection port temperature is maintained at 200°, and the detector temperature is maintained at about 280°. Helium is used as the carrier gas. The split ratio is 50:1. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between avobenzone and any adjacent peak is not less than 1.0; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 1  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{20}H_{22}O_3$  in the portion of Avobenzone taken by the formula:

$$10C(r_u / r_s)$$

in which  $C$  is the concentration, in mg per mL, of USP Avobenzone RS in the *Standard preparation*; and  $r_u$  and  $r_s$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Azaperone

$C_{19}H_{22}FN_3O$  327.40

1-Butanone, 1-(4-fluorophenyl)-4-[4-(2-pyridinyl)-1-piperazinyl]-

4'-Fluoro-4-[4-(2-pyridyl)-1-piperazinyl]butyrophenone  
[1649-18-9].

» Azaperone contains not less than 98.0 percent and not more than 102.0 percent of  $C_{19}H_{22}FN_3O$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers, protected from light. Store at room temperature.

**Labeling**—Label it to indicate that it is for veterinary use only.

**USP Reference standards** (11)—

USP Azaperone RS

**Identification**, *Infrared Absorption* (197K): previously dried.

**Melting range** (741): between 92° and 95°.

**Loss on drying** (731)—Dry it in vacuum at 60° for 4 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Chromatographic purity**—Dissolve an accurately weighed quantity of USP Azaperone RS in a mixture of acetone and methylene chloride (5:1) to obtain a solution having a concentration of 0.50 mg per mL (*Standard solution A*). Quantitatively dilute a volume of *Standard solution A* with the same solvent mixture to obtain a solution having a concentration of 0.25 mg per mL (*Standard solution B*). Prepare a test solution by dissolving an accurately weighed quantity of Azaperone in a mixture of acetone and methylene chloride (5:1) to obtain a solution containing 50 mg per mL. Separately apply 1  $\mu$ L each of *Standard solution A*, *Standard solution B*, and the test solution to a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.2-mm layer of chromatographic silica gel mixture with chemically bonded amino groups, and allow the spots to dry. Develop the chromatograms in a solvent system consisting of a mixture of cyclohexane, acetone, and methanol (65:30:5) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chromatographic chamber, and allow the plate to air-dry. Examine the plate under short-wavelength UV light, and compare the intensities of any secondary spots, other than any spot at the origin, observed in the chromatogram of the test solution with those of the principal spots in the chromatograms of *Standard solution A* and *Standard solution B*: the sum of the intensities of the secondary spots obtained from the test solution corresponds to not more than the intensity of the principal spot in the chromatogram of *Standard solution A* (1.0%).

**Assay**—Dissolve about 120 mg of Azaperone, accurately weighed, in 50 mL of a mixture of methyl ethyl ketone and glacial acetic acid (7:1). Add 3 drops of *p*-naphtholbenzein TS, and titrate with 0.1 N perchloric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 16.37 mg of  $C_{19}H_{22}FN_3O$ .

## Azaperone Injection

» Azaperone Injection is a sterile solution of Azaperone in Water for Injection, prepared with the aid of Tartaric Acid. It may contain a suitable preservative and a stabilizing agent. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{19}H_{22}FN_3O$ .

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass, protected from light.

**Labeling**—Label it to indicate that it is for veterinary use only.

**USP Reference standards** (11)—

USP Azaperone RS

**Identification**—The chromatogram of the *Assay preparation* obtained as directed in the *Assay* exhibits a major peak for azaperone, the retention time of which corresponds to that exhibited in the chromatogram of the *Standard preparation*, obtained as directed in the *Assay*.

**pH** (791): between 4.0 and 5.6.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—

*Mobile phase*—Prepare a filtered and degassed mixture containing 6 volumes of acetonitrile and 4 volumes of 0.01 M dibasic potassium phosphate, and adjust by the addition of dilute phosphoric acid (1 in 10) to a pH of  $7.8 \pm 0.1$ . Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Internal standard solution*—Prepare a solution of benzophenone in methanol containing about 0.5 mg per mL.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Azaperone RS in methanol, and dilute quantitatively with methanol to obtain a solution having a known concentration of about 0.5 mg per mL. Combine 2.5 mL of this solution with 2.5 mL of *Internal standard solution*, dilute quantitatively with methanol to 10.0 mL, and mix.

*Assay preparation*—Dilute an accurately measured volume of Injection quantitatively with methanol to obtain a solution containing about 0.5 mg of azaperone per mL. Combine 2.5 mL of this solution with 2.5 mL of *Internal standard solution*, dilute quantitatively with methanol to 10.0 mL, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with 243-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between the azaperone and internal standard peaks is not less than 2.7; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of azaperone ( $C_{19}H_{22}FN_3O$ ) in each mL of the Injection taken by the formula:

$$(C/L/D)(R_U/R_S)$$

in which C is the concentration, in mg per mL, of USP Azaperone RS in the *Standard preparation*; L is the labeled quantity, in mg, of azaperone in each mL of the Injection; D is the concentration, in mg per mL, of azaperone in the *Assay preparation*, based on the volume of Injection taken

and the extent of dilution; and  $R_U$  and  $R_S$  are the ratios of the azaperone peak to the benzophenone peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Azatadine Maleate

$C_{20}H_{22}N_2 \cdot 2C_4H_4O_4$  522.55

5*H*-Benzo[5,6]cyclohepta[1,2-*b*]pyridine, 6,11-dihydro-11-(1-methyl-4-piperidylidene)-, (*Z*)-2-butenedioate (1:2).

6,11-Dihydro-11-(1-methyl-4-piperidylidene)-5*H*-benzo[5,6]cyclohepta[1,2-*b*]pyridine maleate (1:2) [3978-86-7].

» Azatadine Maleate contains not less than 98.0 percent and not more than 102.0 percent of  $C_{20}H_{22}N_2 \cdot 2C_4H_4O_4$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—  
USP Azatadine Maleate RS

**Identification**—

**A:** Infrared Absorption (197M).

**B:** Ultraviolet Absorption (197U)—

*Solution:* 40 µg per mL.

*Medium:* 0.25 N hydrochloric acid in methanol.

**Loss on drying** (731)—Dry it in vacuum at 60° for 3 hours; it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Chromatographic purity**—Dissolve an accurately weighed quantity in a solvent mixture consisting of toluene and methanol (1:1), to obtain a solution having a known concentration of about 7 mg of the test specimen per mL. Similarly prepare a Standard solution of USP Azatadine Maleate RS in the same medium having a known concentration of about 7 mg per mL. Apply 100-µL portions of the test solution and the Standard solution to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of toluene, isopropyl alcohol, and diethylamine (10:10:1), until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by visualization under short-wavelength UV light. Separately transfer the silica gel mixture containing the principal spot from each track to suitable stoppered centrifuge tubes. [NOTE—Take care to separate the principal spots from any adjacent spots.] Similarly transfer an equal amount of silica gel from a blank section of the plate to a separate, suitable stoppered centrifuge tube. To each of the three tubes add 15.0 mL of a solvent mixture consisting of methanol and 0.5 N hydrochloric acid (4:1), shake vigorously for about 15 minutes, and centrifuge. Concomitantly determine the absorbances of the supernatant test solution and the Standard solution in 1-cm cells at the wavelength of maximum absorbance at about 284 nm, with a suitable spectrophotometer, using the solution obtained

from the blank section of the plate as the blank. Calculate the chromatographic purity taken by the formula:

$$100(A_U / A_S)(C_S / C_U)$$

in which  $A_U$  and  $A_S$  are the absorbances of the test solution and the Standard solution, respectively; and  $C_S$  and  $C_U$  are the concentrations, in mg per mL, of the Standard solution and the test solution, respectively. The chromatographic purity is not less than 98.0%.

**Assay**—Dissolve about 650 mg of Azatadine Maleate, accurately weighed, in 50 mL of glacial acetic acid, add 2 drops of crystal violet TS, and titrate with 0.1 N perchloric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 26.13 mg of  $C_{20}H_{22}N_2 \cdot 2C_4H_4O_4$ .

## Azatadine Maleate Tablets

» Azatadine Maleate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{20}H_{22}N_2 \cdot 2C_4H_4O_4$ .

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—  
USP Azatadine Maleate RS

**Identification**—Transfer 15.0 mL of the *Standard preparation* and 15.0 mL of the *Assay preparation*, respectively, prepared as directed in the *Assay*, to separate 50-mL centrifuge tubes fitted with glass stoppers. To each centrifuge tube add 10.0 mL of 1.0 N sodium hydroxide and 20 mL of solvent hexane, insert the stoppers, rotate the centrifuge tubes for about 15 minutes, and centrifuge. Transfer the solvent hexane extracts (upper phase) from each centrifuge tube to separate 50-mL conical flasks fitted with glass stoppers. Evaporate the solvent hexane extracts on a steam bath under a stream of nitrogen to dryness, pipet 1 mL of solvent hexane into each flask, insert the stoppers, and mix by use of a vortex mixer (or equivalent) until the residues have dissolved. Use these solutions as the Standard solution and the test solution, respectively. Apply separately 100 µL each of the test solution and the Standard solution to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of toluene, isopropyl alcohol, and diethylamine (10:10:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the plate to air-dry. Examine the plate under short-wavelength UV light: the  $R_f$  value and intensity of the principal spot in the chromatogram of the test solution correspond to those obtained from the chromatogram of the Standard solution.

**Dissolution** (711)—

*Medium:* 0.01 N hydrochloric acid; 500 mL.

*Apparatus 2:* 50 rpm.

*Time:* 30 minutes.

**Procedure**—Determine the amount of  $C_{20}H_{22}N_2 \cdot 2C_4H_4O_4$  dissolved by employing UV absorption at the wavelength of maximum absorbance at about 283 nm on filtered portions of the solution under test, diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Azatadine Maleate RS in the same *Medium*.

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_{20}H_{22}N_2 \cdot 2C_4H_4O_4$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay—**

**Standard preparation**—Dissolve an accurately weighed quantity of USP Azatadine Maleate RS in 0.1 N hydrochloric acid, and dilute quantitatively, and stepwise if necessary, with 0.1 N hydrochloric acid to obtain a solution having a known concentration of about 0.06 mg per mL.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 1.5 mg of azatadine maleate, to a 50-mL flask fitted with a glass stopper. Add 25.0 mL of 0.1 N hydrochloric acid, insert the stopper, and shake the mixture by mechanical means for about 30 minutes. Filter the mixture into a suitable glass-stoppered vessel, discarding the first 5 mL of the filtrate.

**Procedure**—Separately transfer 15.0 mL of the *Standard preparation*, 15.0 mL of the *Assay preparation*, and 15.0 mL of 0.1 N hydrochloric acid to provide the reagent blank to three 50-mL centrifuge tubes fitted with glass stoppers. To each centrifuge tube add 10.0 mL of 1.0 N sodium hydroxide and 20 mL of solvent hexane, insert the stoppers, rotate the centrifuge tubes for about 15 minutes, and centrifuge until the supernatants (solvent hexane phase) are clear. With the aid of separate syringes, transfer the supernatants to separate 50-mL centrifuge tubes fitted with glass stoppers. Rinse each syringe with 10 mL of solvent hexane, and add the rinse to the aqueous phase from which the respective supernatant was removed. Insert the stoppers, rotate each tube for about 10 minutes, and centrifuge. Transfer each supernatant to the respective supernatant previously collected. Pipet 15 mL of 0.1 N hydrochloric acid into each centrifuge tube containing the combined supernatants, insert the stoppers, rotate each tube for about 15 minutes, and centrifuge. Remove and discard the supernatants. Concomitantly determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 283 nm, with a suitable spectrophotometer zeroed with 0.1 N hydrochloric acid, using the prepared reagent blank. Calculate the quantity, in mg, of  $C_{20}H_{22}N_2 \cdot 2C_4H_4O_4$  in the portion of Tablets taken by the formula:

$$25C(A_U / A_S)$$

in which C is the concentration, in mg per mL, of USP Azatadine Maleate RS in the *Standard preparation*; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

## Azathioprine

$C_9H_7N_7O_2S$  277.26

1*H*-Purine, 6-[(1-methyl-4-nitro-1*H*-imidazol-5-yl)thio]-. 6-[(1-Methyl-4-nitroimidazol-5-yl)thio]purine [446-86-6].

» Azathioprine contains not less than 98.0 percent and not more than 101.5 percent of  $C_9H_7N_7O_2S$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Azathioprine RS

USP Mercaptopurine RS

**Identification—**

**A:** *Infrared Absorption* (197K).

**B:** The principal spot in the test preparation chromatogram in the test for *Limit of mercaptopurine* shows the same  $R_f$  value as that obtained with the solution of USP Azathioprine RS.

**Acidity or alkalinity**—Shake 2.0 g with 100 mL of water for 15 minutes, and filter: 20.0 mL of the filtrate requires for neutralization not more than 0.10 mL of 0.020 N hydrochloric acid or not more than 0.10 mL of 0.020 N sodium hydroxide, methyl red TS being used as the indicator.

**Loss on drying** (731)—Dry it in vacuum at 105° for 5 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Limit of mercaptopurine**—Prepare three solutions in 6 N ammonium hydroxide containing, respectively, 20 mg of Azathioprine per mL, 20 mg of USP Azathioprine RS per mL, and 200 µg of USP Mercaptopurine RS, on the anhydrous basis, per mL. Apply 5-µL volumes of the solutions at points about 2 cm from the bottom edge of a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of microcrystalline cellulose. Allow the spots to dry, and develop the chromatogram in a suitable chamber, using butyl alcohol, previously saturated with 6 N ammonium hydroxide, as the solvent, until the solvent front has moved about 15 cm from the point of application. Remove the plate, air-dry, and locate the spots by viewing under short- and long-wavelength UV light: any spot in the chromatogram from Azathioprine, other than the principal spot, is not more intense than the spot in the chromatogram obtained with USP Mercaptopurine RS (1.0%).

**Assay**—Dissolve about 300 mg of Azathioprine, accurately weighed, in 80 mL of dimethylformamide. Add 5 drops of a 1 in 100 solution of thymol blue in dimethylformamide, and titrate with 0.1 N tetrabutylammonium hydroxide VS, using a magnetic stirrer, and taking precautions to prevent absorption of atmospheric carbon dioxide. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N tetrabutylammonium hydroxide is equivalent to 27.73 mg of  $C_9H_7N_7O_2S$ .

## Azathioprine Oral Suspension

**DEFINITION**

Azathioprine Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of azathioprine ( $C_9H_7N_7O_2S$ ).

Prepare Azathioprine Oral Suspension of 50 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Azathioprine	5 g
Vehicle: a mixture of Vehicle for Oral Solution, (regular or sugar-free), <i>NF</i> and Vehicle for Oral Suspension, <i>NF</i> (1:1), a sufficient quantity to make	100 mL

If using tablets, comminute them to a fine powder in a suitable mortar, or add *Azathioprine* powder to the mortar. Add about 10 mL of the *Vehicle*, and mix to a uniform paste. Add the *Vehicle* in small portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add sufficient *Vehicle* to bring to final volume, and mix well.

**[CAUTION]**—Avoid skin contact or inhalation of azathioprine by using protective gloves and a fume hood or surgical mask.]

**ASSAY****• PROCEDURE**

**Mobile phase:** Dissolve 1.1 g of sodium-1-heptanesulfonate in 700 mL of water, and add 300 mL of methanol. Adjust with 1 N hydrochloric acid to a pH of 3.5.

**Standard solution:** 25 mg of USP Azathioprine RS, in a 50-mL volumetric flask. Add 1.5 mL of methanol and 0.5 mL of ammonium hydroxide to the flask, swirl, and sonicate for 2 min. Dilute with methanol to volume. Transfer 10 mL of this solution to a 50-mL volumetric flask, and dilute with water to volume.

**Sample solution:** Agitate the container of Oral Suspension for 30 min on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at  $-70^{\circ}$  until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix with a vortex mixer for 30 s. Pipet 1.0 mL of the Sample into a 100-mL volumetric flask, and dilute with Mobile phase to volume.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm  $\times$  25-cm; 5- $\mu$ m packing L1

**Flow rate:** 2 mL/min

**Injection size:** 20  $\mu$ L

**System suitability**

**Sample:** Standard solution

[NOTE—The retention time for the azathioprine peak is about 4 min.]

**Suitability requirements**

**Relative standard deviation:** NMT 1.3% for replicate injections

**Analysis**

**Samples:** Standard solution and Sample solution  
Calculate the percentage of the labeled amount of azathioprine ( $C_9H_7N_7O_2S$ ) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the Sample solution

$r_S$  = peak response from the Standard solution

$C_S$  = concentration of azathioprine in the Standard solution ( $\mu$ g/mL)

$C_U$  = nominal concentration of azathioprine in the Sample solution ( $\mu$ g/mL)

**Acceptance criteria:** 90.0%–110.0%

**SPECIFIC TESTS**

**• pH** <791>: 3.8–4.8

**ADDITIONAL REQUIREMENTS**

**• PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at room temperature, or in a cold place.

**• LABELING:** Label it to state that it is to be well shaken before use, and to state the *Beyond-Use Date*.

**• BEYOND-USE DATE:** NMT 60 days after the day on which it was compounded

**• USP REFERENCE STANDARDS** <11>  
USP Azathioprine RS

**Azathioprine Tablets**

» Azathioprine Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of azathioprine ( $C_9H_7N_7O_2S$ ).

**Packaging and storage**—Protect from light.

**USP Reference standards** <11>—

USP Azathioprine RS

**Identification**—Tablets meet the requirement of the *Thin-layer Chromatographic Identification Test* <201>, the test solution being the filtrate obtained by shaking a quantity of powdered Tablets, equivalent to about 200 mg of azathioprine, with 10 mL of 6 N ammonium hydroxide, the Standard solution being a solution of USP Azathioprine RS in 6 N ammonium hydroxide containing 20 mg per mL, and 5- $\mu$ L portions of each solution being spotted on a thin-layer chromatographic plate coated with a 0.25-mm layer of microcrystalline cellulose, and butyl alcohol, previously saturated with 6 N ammonium hydroxide, being used for developing.

**Dissolution** <711>—

**Medium:** water; 900 mL.

**Apparatus 2:** 50 rpm.

**Time:** 30 minutes.

**Procedure**—Determine the amount of  $C_9H_7N_7O_2S$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 280 nm of filtered portions of the solution under test, suitably diluted with Medium, if necessary, in comparison with a Standard solution having a known concentration of USP Azathioprine RS in the same medium.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_9H_7N_7O_2S$  is dissolved in 30 minutes.

**Uniformity of dosage units** <905>: meet the requirements.

**Assay**—

**Mobile phase**—Dissolve 1.1 g of sodium 1-heptanesulfonate in 700 mL of water, add 300 mL of methanol, and mix. Adjust the solution with 1 N hydrochloric acid to a pH of 3.5. Filter the solution through a 0.8- $\mu$ m solvent-resistant membrane, and degas, making adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Transfer about 25 mg of USP Azathioprine RS, accurately weighed, to a 50-mL volumetric flask. Add about 1.5 mL of methanol and 0.5 mL of ammonium hydroxide to the flask, swirl, and sonicate for 2 minutes. Dilute with methanol to volume, and mix. Transfer 10.0 mL of this solution to a 50-mL volumetric flask, dilute with water to volume, and mix.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Accurately weigh a portion of the powder, equivalent to about 50 mg of azathioprine, and transfer to a 100-mL volumetric flask. Add 25 mL of methanol and 1.0 mL of ammonium hydroxide to the flask, swirl, and sonicate for 2 minutes. Dilute with methanol to volume, and mix. Allow the excipients to settle, transfer 10.0 mL of the supernatant to a 50-mL volumetric flask, dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the Standard preparation, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 800 theoretical plates, the tailing factor for the azathioprine peak is not more than 1.5, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of azathioprine ( $C_9H_7N_7O_2S$ ) in the portion of Tablets taken by the formula:

$$500(C)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Azathioprine RS in the Standard preparation, and  $r_U$  and  $r_S$  are the peak responses for azathioprine obtained from the Assay preparation and the Standard preparation, respectively.

## Azathioprine Sodium for Injection

» Azathioprine Sodium for Injection is a sterile solid prepared by the freeze-drying of an aqueous solution of Azathioprine and Sodium Hydroxide. It contains not less than 93.0 percent and not more than 107.0 percent of the labeled amount of azathioprine ( $C_9H_7N_7O_2S$ ).

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* (1), at controlled room temperature.

### USP Reference standards (11)—

USP Azathioprine RS  
USP Mercaptopurine RS  
USP Endotoxin RS

**Completeness of solution** (641)—The contents of 1 container are soluble in 10 mL of water, to give a clear, bright yellow solution, essentially free from foreign matter.

**Identification**—The principal spot in the chromatogram of the specimen under examination obtained in the test for *Limit of mercaptopurine* shows the same  $R_f$  value as that obtained with the solution of USP Azathioprine RS.

**Bacterial endotoxins** (85)—It contains not more than 1.0 USP Endotoxin Unit per mg of azathioprine.

**pH** (791): between 9.8 and 11.0, the contents of 1 container being dissolved in 10 mL of water.

**Water, Method I** (921): not more than 7.0%, the *Test Preparation* being prepared as directed for a hygroscopic specimen.

**Limit of mercaptopurine**—Prepare solutions in dimethylformamide containing, respectively, 10 mg of Azathioprine Sodium for Injection per mL, 10 mg of USP Azathioprine RS per mL, and 100  $\mu$ g of USP Mercaptopurine RS per mL. Apply 15  $\mu$ L of the USP Mercaptopurine RS solution and 5- $\mu$ L portions of the other two solutions at points about 2 cm from the bottom edge of a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 250- $\mu$ m layer of microcrystalline cellulose. Allow the spots to dry, and develop the chromatogram in a suitable chamber, using butyl alcohol, previously saturated with 5 N ammonium hydroxide, as the solvent, until the solvent front has moved about 15 cm from the point of application. Remove the plate, air-dry, and locate the spots by viewing under short- and long-wavelength UV light: any spot in the chromatogram from azathioprine, other than the principal spot, is not more intense than the spot in the chromatogram obtained with USP Mercaptopurine RS (3.0%).

**Other requirements**—It meets the requirements under *Injections* (1) and *Uniformity of Dosage Units* (905).

### Assay—

**Standard preparation**—Transfer 25 mg of USP Azathioprine RS, accurately weighed, to a 50-mL volumetric flask, dissolve in 2.5 mL of 0.1 N sodium hydroxide, dilute with water to volume, and mix. Pipet 10.0 mL of this solution into a 50-mL volumetric flask, dilute with 0.1 N sulfuric acid to volume, and mix.

**Assay preparation**—Transfer the contents of 1 vial of Azathioprine Sodium for Injection with the aid of water to a 100-mL volumetric flask, dilute with water to volume, and mix. Pipet 10 mL of this solution into another 100-mL volumetric flask, dilute with 0.1 N sulfuric acid to volume, and mix.

**Procedure**—Transfer 20 mL each of the *Standard preparation* and the *Assay preparation*, separately, to polarographic cells, and deaerate for 10 minutes with nitrogen that previously has been saturated with 0.1 N sulfuric acid. Blanket the solution with saturated nitrogen, insert the dropping mercury electrode of a suitable polarograph, and record the

polarogram from  $-0.60$  volt to  $-1.00$  volt, using a saturated calomel electrode as the reference electrode. Determine the height of the diffusion current as the difference between the residual current and diffusion current plateau. Calculate the quantity, in mg, of azathioprine ( $C_9H_7N_7O_2S$ ) in the volume of solution from the vial used for the *Assay preparation* taken by the formula:

$$0.1 C(i_d)_U / (i_d)_S$$

in which  $C$  is the concentration, in  $\mu$ g per mL, of USP Azathioprine RS in the *Standard preparation*; and  $(i_d)_U$  and  $(i_d)_S$  are the diffusion currents of the *Assay preparation* and the *Standard preparation*, respectively.

## Azithromycin

$C_{38}H_{72}N_2O_{12}$  748.98

$C_{38}H_{72}N_2O_{12} \cdot H_2O$  767.00

$C_{38}H_{72}N_2O_{12} \cdot 2H_2O$  785.02

1-Oxa-6-azacyclopentadecan-15-one, 13-[(2,6-dideoxy-3-C-methyl-3-O-methyl- $\alpha$ -L-ribo-hexopyranosyl)oxy]-2-ethyl-3,4,10-trihydroxy-3,5,6,8,10,12,14-heptamethyl-11-[[3,4,6-trideoxy-3-(dimethylamino)- $\beta$ -D-xylo-hexopyranosyl]oxy]-, [2R(2R\*,3S\*,4R\*,5R\*,8R\*,10R\*,11R\*,12S\*,13S\*,14R\*)];

(2R,3S,4R,5R,8R,10R,11R,12S,13S,14R)-13-[(2,6-Dideoxy-3-C-methyl-3-O-methyl- $\alpha$ -L-ribo-hexopyranosyl)oxy]-2-ethyl-3,4,10-trihydroxy-3,5,6,8,10,12,14-heptamethyl-11-[[3,4,6-trideoxy-3-(dimethylamino)- $\beta$ -D-xylo-hexopyranosyl]oxy]-1-oxa-6-azacyclopentadecan-15-one;

9-Deoxo-9a-aza-9a-methyl-9a-homoerythromycin A

Anhydrous [83905-01-5].

Monohydrate [121470-24-4].

Dihydrate [117772-70-0].

### DEFINITION

Azithromycin is anhydrous or contains one or two molecules of water of hydration. It contains the equivalent of NLT 945  $\mu$ g and NMT 1030  $\mu$ g of azithromycin ( $C_{38}H_{72}N_2O_{12}$ ) per mg, calculated on the anhydrous basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K): If a difference appears in the IR spectra of the analyte and the standard, dissolve equal portions of the test specimen and the Reference Standard in equal volumes of methanol. Evaporate the solutions to dryness on a water bath, and dry at  $80^\circ$  for 30 min under vacuum. Perform the test on the residues.
- **B.** The retention time of the azithromycin peak in the *Sample solution* corresponds to that in the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### • PROCEDURE

[NOTE—Use water that has a resistivity of NLT 18 Mohm-cm.]

**Mobile phase:** Dissolve 5.8 g of monobasic potassium phosphate in 2130 mL of water, and add 870 mL of

acetonitrile. Adjust with 6 mL of 10 N potassium hydroxide to a pH of  $11.0 \pm 0.1$ , and filter.

**Standard stock solution:** 0.165 mg/mL of USP Azithromycin RS in acetonitrile. [NOTE—Sonicate as necessary.]

**Standard solution:** 3.3 µg/mL of USP Azithromycin RS from the *Standard stock solution* in *Mobile phase*

**Sample stock solution:** 0.165 mg/mL of Azithromycin in acetonitrile. [NOTE—Sonicate as necessary.]

**Sample solution:** 3.3 µg/mL of azithromycin from the *Sample stock solution* in *Mobile phase*

**System suitability stock solution:** 0.16 mg/mL of USP Azaerythromycin A RS in acetonitrile and *Mobile phase* (1:9). [NOTE—Dissolve in acetonitrile, using 10% of the final volume. Swirl and sonicate to dissolve. Dilute with *Mobile phase* to volume.]

**System suitability solution:** 3.3 µg/mL of azithromycin from the *Sample stock solution* and 3.2 µg/mL of azaerythromycin A from the *System suitability stock solution* in *Mobile phase*

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** Amperometric electrochemical detector

**Detector type:** Dual glassy carbon electrodes

**Detector mode:** Oxidative screen mode

**Detector settings:** Electrode 1 set at  $+0.70 \pm 0.05$  V, electrode 2 set at  $+0.82 \pm 0.05$  V, background current optimized to  $85 \pm 15$  nanoamperes

#### Column

**Guard column:** 4.6-mm × 5-cm; 5-µm packing L29

**Analytical column:** 4.6-mm × 15-cm; 5-µm packing L29 or 3-µm packing L49 without the guard column

**Flow rate:** 1.5 mL/min

**Injection size:** 50 µL

#### System suitability

**Samples:** *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for azaerythromycin A and azithromycin with the L29 column are 0.7 and 1.0, respectively. The relative retention times for azaerythromycin A and azithromycin with the L49 column are 0.8 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 2.5 between azaerythromycin A and azithromycin, *System suitability solution*

**Column efficiency:** NLT 1000 theoretical plates, *Standard solution*

**Tailing factor range:** 0.9–1.5 for azithromycin, *Standard solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the quantity, in µg, of  $C_{38}H_{72}N_2O_{12}$  in each mg of Azithromycin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Azithromycin RS in the *Standard solution*

$C_U$  = concentration of Azithromycin in the *Sample solution*

$P$  = potency of USP Azithromycin RS (µg/mg of azithromycin)

**Acceptance criteria:** 945–1030 µg/mg on the anhydrous basis

#### IMPURITIES

##### Inorganic Impurities

- **RESIDUE ON IGNITION** (281): NMT 0.3%, the charred residue being moistened with 2 mL of nitric acid and 5 drops of sulfuric acid

- **HEAVY METALS, Method II** (231): NMT 25 ppm

#### Organic Impurities

- **PROCEDURE 1** [NOTE— Use *Organic Impurities, Procedure 2* when the impurity profile includes azithromycin related compound F.]

[NOTE— Use water that has a resistivity of NLT 18 Mohm-cm.]

**Mobile phase:** Proceed as directed in the *Assay*.

**Solution A:** 2.7 mg/mL of monobasic potassium phosphate in water. Adjust with 10 N potassium hydroxide to a pH of  $7.5 \pm 0.1$ .

**Diluent:** Acetonitrile and *Solution A* (1:3)

**Standard stock solution:** 45 µg/mL of USP Desosaminylazithromycin RS, 105 µg/mL of USP *N*-Demethylazithromycin RS, and 160 µg/mL of USP Azithromycin RS in acetonitrile

**Standard solution:** 0.9 µg/mL of USP Desosaminylazithromycin RS, 2.1 µg/mL of USP *N*-Demethylazithromycin RS, and 3.2 µg/mL of USP Azithromycin RS from the *Standard stock solution* in *Diluent*

**Sample solution:** 33 mg of Azithromycin in a 100-mL volumetric flask. Add 5 mL of acetonitrile, and sonicate for about 20 s to dissolve. Dilute with *Diluent* to volume.

[NOTE—Use this solution within 6 h.]

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** Amperometric electrochemical detector

**Detector type:** Dual glassy carbon electrodes

**Detector mode:** Oxidative screen mode

**Detector settings:** Electrode 1 set at  $+0.70 \pm 0.05$  V, electrode 2 set at  $+0.85 \pm 0.05$  V, background current optimized to  $95 \pm 25$  nanoamperes

[NOTE— In general, maintain electrode 1 at 0.12 V less than electrode 2, and maintain the electrodes at a constant temperature of about 26°.]

#### Column

**Guard column:** 4.6-mm × 5-cm; 5-µm packing L29

**Analytical column:** 4.6-mm × 15-cm; 5-µm packing L29 or 3-µm packing L49 without the guard column.

**Flow rate:** 0.4 mL/min

**Injection size:** 50 µL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Column efficiency:** NLT 1500 theoretical plates for the azithromycin peak

**Tailing factor:** NMT 1.5 for each peak

**Relative standard deviation:** NMT 5% for each of these compounds

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

[NOTE— Record the *Sample solution* chromatograms for NLT 3.3 times the retention time of the azithromycin peak.]

Calculate the percentages of desosaminylazithromycin and *N*-demethylazithromycin in the portion of Azithromycin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

$r_U$  = peak area for the relevant analyte from the *Sample solution*

$r_S$  = peak area for the relevant analyte from the *Standard solution*

$C_S$  = concentration of the appropriate USP Reference Standard in the *Standard solution* (µg/mL)

$C_U$  = concentration of the *Sample solution* (mg/mL)

$F$  = unit conversion (0.001 mg/µg)

Calculate the percentages of other related substances in the portion of Azithromycin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

- $r_U$  = peak area of each additional impurity from the *Sample solution*  
 $r_S$  = peak area of the azithromycin peak from the *Standard solution*  
 $C_S$  = concentration of USP Azithromycin RS in the *Standard solution* ( $\mu\text{g/mL}$ )  
 $C_U$  = concentration of the *Sample solution* ( $\text{mg/mL}$ )  
 $F$  = unit conversion ( $0.001 \text{ mg}/\mu\text{g}$ )

**Acceptance criteria:** See *Impurity Table 1*.

**Impurity Table 1**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Desosaminylazithromycin	0.38	0.3
N-demethylazithromycin	0.54	0.7
Total impurities	—	3.0

- PROCEDURE 2** [NOTE— Use *Organic Impurities, Procedure 2* when the impurity profile includes azithromycin related compound F.]

**Solution A:** 1.8 mg/mL of anhydrous dibasic sodium phosphate in water. Adjust with 1 N sodium hydroxide or 10% phosphoric acid to a pH of 8.9.

**Solution B:** Acetonitrile and methanol (3:1)

**Mobile phase:** See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	50	50
25	45	55
30	40	60
80	25	75
81	50	50
93	50	50

**Solution C:** 1.73 mg/mL of monobasic ammonium phosphate. Adjust with ammonia TS to a pH of  $10.0 \pm 0.05$ .

**Solution D:** Methanol, acetonitrile, and *Solution C* (7:6:7)

**System suitability solution:** 0.0165 mg/mL of USP Azithromycin Related Compound F RS and 0.027 mg/mL of USP Desosaminylazithromycin RS in *Solution D*

**Standard solution:** 86  $\mu\text{g/mL}$  of USP Azithromycin RS in *Solution D*

**Sample solution:** 8.6 mg/mL of Azithromycin in *Solution D*

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.6-mm  $\times$  25-cm; 5- $\mu\text{m}$  packing L1

**Column temperature:** 60°

**Flow rate:** 1 mL/min

**Injection size:** 50  $\mu\text{L}$

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

#### Suitability requirements

**Peak-to-valley ratio:** NLT 1.4, *System suitability solution*

[NOTE— The calculation formula for peak-to-valley ratio is:

$$\text{Result} = H_P/H_V$$

$H_P$  = height above the baseline of the desosaminylazithromycin peak

$H_V$  = height above the baseline of the lowest point of the curve separating the desosaminylazithromycin and azithromycin related compound F peaks.]

**Tailing factor:** 0.8–1.5, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

[NOTE— Disregard peaks eluting before azithromycin 3'-N-oxide and after 3-deoxyazithromycin (azithromycin B). Disregard peaks with a response less than 0.1 times the response of the azithromycin peak in the *Standard solution* (0.1%).]

Calculate the percentage of each related compound in the portion of Azithromycin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F_1 \times 100/F_2$$

$r_U$  = peak response for each impurity from the *Sample solution*

$r_S$  = peak response of azithromycin from the *Standard solution*

$C_S$  = concentration of USP Azithromycin RS in the *Standard solution* ( $\mu\text{g/mL}$ )

$C_U$  = nominal concentration of azithromycin in the *Sample solution* ( $\text{mg/mL}$ )

$F_1$  = unit conversion factor ( $0.001 \text{ mg}/\mu\text{g}$ )

$F_2$  = relative response factor (see *Impurity Table 1*)

**Acceptance criteria:** See *Impurity Table 2*.

#### SPECIFIC TESTS

- OPTICAL ROTATION, Specific Rotation <781S>:**  $-45^\circ$  to  $-49^\circ$ , at 20°

**Sample solution:** 20 mg/mL, in dehydrated alcohol

- CRYSTALLINITY <695>:** Meets the requirements except, where it is labeled as amorphous, most of the particles do not exhibit birefringence and extinction positions

- pH <791>:** 9.0–11.0

**Sample stock solution:** 4 mg/mL in methanol

**Sample solution:** 2 mg/mL from the *Sample stock solution* in a mixture of methanol and water (1:1)

- WATER DETERMINATION, Method I <921>**

Where it is labeled as **anhydrous**: NMT 2.0%

Where it is labeled as the **dihydrate**: 4.0%–5.0%

Where it is labeled as the **monohydrate**: 1.8%–4.0%, except that it may be 4.0%–6.5% when the requirements of the *Loss on Drying* test are met

- LOSS ON DRYING:** Where it is labeled as Azithromycin monohydrate and has a water content of 4.0%–6.5% (see *Thermal Analysis* <891>).

[NOTE—The quantity taken for this procedure may be adjusted, if necessary, for instrument sensitivity.]

**Analysis:** Determine the percentage of volatile substances by thermogravimetric analysis in an appropriately calibrated instrument, using about 10 mg of Azithromycin. Heat the specimen at the rate of 10°/min between ambient temperature and 150° in an atmosphere of nitrogen at a constant flow rate of about 35 mL/min. From the thermogram plot the derivatives of the loss on drying (percent loss/min), identify the inflection points of the two weight loss steps at about 70° and 130°.

**Acceptance criteria:** It loses NMT 4.5% of its weight between ambient temperature and the inflection point at about 70°, and 1.8%–2.6% between the inflection point at about 70° and the inflection point at about 130°.

Impurity Table 2

Name	Relative Retention Time	Relative Response Factor (F <sub>2</sub> )	Acceptance Criteria, NMT (%)
Azithromycin <i>N</i> -oxide <sup>a</sup>	0.29	0.43	0.5

<sup>m</sup> (2*R*,3*R*,4*S*,5*R*,8*R*,10*R*,11*R*,12*S*,13*S*,14*R*)-13-[(2,6-Dideoxy-3-*C*-methyl-3-*O*-methyl- $\alpha$ -*L*-ribo-hexopyranosyl)oxy]-2-ethyl-4,10-dihydroxy-3,5,6,8,10,12,14-heptamethyl-11-[[3,4,6-trideoxy-3-(dimethylamino)- $\beta$ -D-xylo-hexopyranosyl]oxy]-1-oxa-6-azacyclotetradecan-15-one.

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
  - **LABELING:** Label it to indicate whether it is anhydrous, or the monohydrate or the dihydrate. The amorphous form is so labeled. Where the quantity of azithromycin is indicated in the labeling of any preparation containing Azithromycin, this shall be understood to be in terms of anhydrous azithromycin (C<sub>38</sub>H<sub>72</sub>N<sub>2</sub>O<sub>12</sub>). The labeling states with which *Organic Impurities* procedure the article complies, if other than *Procedure 1*.
  - **USP REFERENCE STANDARDS** (11)
    - USP Azithromycin RS
    - USP Azaerythromycin A RS
    - USP Azithromycin Identity RS

A mixture of azithromycin, 3'-(*N,N*-dimethyl-3'-*N*-formylazithromycin, 3'-*N*-demethyl-3'-*N*-formylazithromycin (Rotamer 1), 3'-*N*-demethyl-3'-*N*-formylazithromycin (Rotamer 2), 3'-de(dimethylamino)-3'-oxoazithromycin, 2-desethyl-2-propylazithromycin, 3-deoxyazithromycin and 3'-*N*-demethyl-3'-*N*-[(4-methylphenyl)sulfonyl]azithromycin.

  - USP Desosaminylazithromycin RS
  - USP *N*-Demethylazithromycin RS
- (2*R*,3*S*,4*R*,5*R*,8*R*,10*R*,11*R*,12*S*,13*S*,14*R*)-13-[(2,6-Dideoxy-3-*C*-methyl-3-*O*-methyl- $\alpha$ -*L*-ribo-hexopyranosyl)oxy]-2-ethyl-3,4,10-trihydroxy-3,5,6,8,10,12,

14-heptamethyl-11-[[3,4,6-trideoxy-3-methylamino- $\beta$ -D-xylo-hexopyranosyl]oxy]-1-oxa-6-azacyclopentadecan-15-one.

$C_{37}H_{70}N_2O_{12}$  734.96

USP Azithromycin Related Compound F RS

(2R,3S,4R,5R,8R,10R,11R,12S,13S,14R)-13-[(2,6-Dideoxy-3-C-methyl-3-O-methyl- $\alpha$ -L-ribo-hexopyranosyl)oxy]-2-ethyl-3,4,10-trihydroxy-3,5,6,8,10,12,14-heptamethyl-11-[[3-(N-methyl)formamido-3,4,6-trideoxy- $\beta$ -D-xylo-hexopyranosyl]oxy]-1-oxa-6-azacyclopentadecan-15-one.

$C_{38}H_{70}N_2O_{13}$  762.97

## Azithromycin Capsules

### DEFINITION

Azithromycin Capsules contain the equivalent of NLT 90.0% and NMT 110.0% of the labeled amount of azithromycin ( $C_{38}H_{72}N_2O_{12}$ ).

### IDENTIFICATION

- A.** The retention time of the azithromycin peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

[NOTE—Use water that has a resistivity of NLT 18 Mohm-cm.]

**Mobile phase:** Dissolve 5.8 g of monobasic potassium phosphate in 2130 mL of water, and add 870 mL of acetonitrile. Adjust with about 6 mL of 10 N potassium hydroxide to a pH of  $11.0 \pm 0.1$ , and pass through a suitable filter.

**Standard stock solution:** 0.165 mg/mL of USP Azithromycin RS in acetonitrile. Swirl, and sonicate as necessary.

**Standard solution:** 3.3  $\mu$ g/mL of USP Azithromycin RS from the *Standard stock solution* in *Mobile phase*

**System suitability stock solution:** 0.16 mg/mL of USP Azaerythromycin A RS in acetonitrile and *Mobile phase* (1:9). Dissolve first in acetonitrile, using 10% of the final volume. Swirl, and sonicate to dissolve. Dilute with *Mobile phase* to volume.

**System suitability solution:** 3.2  $\mu$ g/mL of azaerythromycin A from the *System suitability stock solution* and 3.3  $\mu$ g/mL of azithromycin from the *Standard stock solution* in *Mobile phase*

**Sample stock solution:** Remove, as completely as possible, the contents of NLT 20 Capsules. Prepare a 1-mg/mL solution of anhydrous azithromycin in acetonitrile. Dissolve a portion of the mixed Capsule contents first in 70% of the final volume of acetonitrile, and shake by mechanical means for 30 min. Dilute with acetonitrile to volume. Place 40 mL of the resulting suspension in a centrifuge tube, and centrifuge. Use the supernatant to prepare the *Sample solution*.

**Sample solution:** 3.2  $\mu$ g/mL of azithromycin from the *Sample stock solution* in *Mobile phase*

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** Amperometric electrochemical detector

**Electrode:** Dual glassy carbon electrodes

**Mode:** Oxidative screen mode

**Electrode 1:**  $+0.70 \pm 0.05$  V

**Electrode 2:**  $+0.82 \pm 0.05$  V

**Background current:**  $85 \pm 15$  nanoamperes

#### Columns

**Guard:** 4.6-mm  $\times$  5-cm; 5- $\mu$ m packing L29

**Analytical:** 4.6-mm  $\times$  15-cm; 5- $\mu$ m packing L29 or 3- $\mu$ m packing L49 without the guard column

**Flow rate:** 1.5 mL/min

**Injection size:** 50  $\mu$ L

#### System suitability

**Samples:** *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for azaerythromycin A and azithromycin with the L29 column are 0.7 and 1.0, respectively; the relative retention times for azaerythromycin A and azithromycin with the L49 column are 0.8 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 2.5 between azaerythromycin A and azithromycin, *System suitability solution*

**Column efficiency:** NLT 1000 theoretical plates, *Standard solution*

**Tailing factor:** 0.9–1.5, *Standard solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of azithromycin ( $C_{38}H_{72}N_2O_{12}$ ) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Azithromycin RS in the *Standard solution* ( $\mu$ g/mL)

$C_U$  = nominal concentration of azithromycin in the *Sample solution* ( $\mu$ g/mL)

$P$  = potency of azithromycin in USP Azithromycin RS ( $\mu$ g/mg)

$F$  = conversion factor, 0.001 mg/ $\mu$ g

**Acceptance criteria:** 90.0%–110.0%

### PERFORMANCE TESTS

#### DISSOLUTION <711>

[NOTE—Use water that has a resistivity of NLT 18 Mohm-cm.]

**Medium:** pH 6.0 sodium phosphate buffer (Prepare 6 L of 0.1 M dibasic sodium phosphate. Adjust with about 40 mL of hydrochloric acid to a pH of  $6.0 \pm 0.05$ , and add 600 mg of trypsin); 900 mL

**Apparatus 2:** 100 rpm

**Time:** 45 min

**Mobile phase, Chromatographic system, and System suitability:** Proceed as directed in the *Assay*.

**Standard stock solution:** 0.3 mg/mL of USP Azithromycin RS in *Medium*. Sonicate briefly to dissolve.

**Standard solution:** 3.84  $\mu$ g/mL of azithromycin from the *Standard stock solution* in *Mobile phase*

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.5- $\mu$ m or finer pore size. Transfer 2.0 mL of the filtrate to a 25-mL volumetric flask, and dilute with *Mobile phase* to volume. Transfer 4.0 mL of this solution to a second 25-mL volumetric flask, and dilute with *Mobile phase* to volume.

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Determine the amount of azithromycin ( $C_{38}H_{72}N_2O_{12}$ ) dissolved using the procedure in the *Assay*, making any necessary modifications.

Calculate the percentage of azithromycin ( $C_{38}H_{72}N_2O_{12}$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times D \times V \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Azithromycin RS in the *Standard solution* (mg/mL)

$L$  = label claim (mg/Capsule)

$D$  = dilution factor of the *Sample solution*

$V$  = volume of *Medium*, 900 mL

**Tolerances:** NLT 75% (Q) of the labeled amount of azithromycin ( $C_{38}H_{72}N_2O_{12}$ ) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

## SPECIFIC TESTS

- **WATER DETERMINATION**, *Method I* (921): NMT 5.0%

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Where packaged in unit-of-use containers, each container contains six 250-mg Capsules, and the label indicates the intended sequential day of use for each Capsule.
- **USP REFERENCE STANDARDS** (11)
  - USP Azaerythromycin A RS
  - USP Azithromycin RS

# Azithromycin for Injection

## DEFINITION

Azithromycin for Injection is a sterile, dry mixture of azithromycin and a suitable stabilizing agent. It contains NLT 90.0% and NMT 110.0% of the labeled amount of azithromycin ( $C_{38}H_{72}N_2O_{12}$ ).

## IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

## ASSAY

### PROCEDURE

**Buffer:** 6.7 mg/mL of dibasic potassium phosphate in water

**Mobile phase:** Acetonitrile and *Buffer* (52:48). Adjust with 10 N potassium hydroxide to a pH of  $11.0 \pm 0.1$ .

**Diluent:** Acetonitrile and water (52:48)

**System suitability solution:** 1 mg/mL each of USP Azaerythromycin A RS and USP Azithromycin RS in a mixture of acetonitrile and water (52:48). Dissolve first in acetonitrile, and then dilute with water to volume.

**Standard solution:** 1 mg/mL of USP Azithromycin RS in a mixture of acetonitrile and water (52:48). Dissolve first in acetonitrile, and dilute with water to volume.

**Sample solution:** Equivalent to 1 mg/mL of azithromycin from Azithromycin for Injection in *Diluent* prepared as follows. Reconstitute 3 vials individually as directed in the labeling. Mix the contents of all the reconstituted vials. Dilute a portion of the mixture with *Diluent*.

### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 215 nm

**Columns**

**Guard:** 4.6-mm  $\times$  1-cm; 5- $\mu$ m packing L67

**Analytical:** 4.6-mm  $\times$  15-cm; 5- $\mu$ m packing L67

**Temperature**

**Column:** 40°

**Autosampler:** 15°

**Flow rate:** 1 mL/min

**Injection size:** 15  $\mu$ L

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for azaerythromycin A and azithromycin are 0.68 and 1.0, respectively.]

## Suitability requirements

**Resolution:** NLT 2.5 between azaerythromycin A and azithromycin, *System suitability solution*

**Tailing factor:** NLT 0.9 and NMT 1.5, *Standard solution*

**Relative standard deviation:** NMT 2%, *Standard solution*

## Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of azithromycin ( $C_{38}H_{72}N_2O_{12}$ ) in the portion of Azithromycin for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Azithromycin RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of azithromycin in the *Sample solution* (mg/mL)

$P$  = potency of USP Azithromycin RS ( $\mu$ g/mg)

$F$  = conversion factor, 0.001 mg/ $\mu$ g

**Acceptance criteria:** 90.0%–110.0%

## PERFORMANCE TESTS

- **UNIFORMITY OF DOSAGE UNITS** (905): Meets the requirements

## IMPURITIES

[NOTE—The test for *Limit of Azithromycin N-Oxide*, *Desosaminylazithromycin*, and *N-Demethylazithromycin* does not quantify aminoazithromycin, formamido analog, methylformamido analog, and 3'-de(dimethylamino)-3'-oxoazithromycin. If these impurities are part of the impurity profile, the *Limit of Aminoazithromycin*, *Formamido Analog*, *Methylformamido Analog*, and *3'-De(dimethylamino)-3'-oxoazithromycin* test is recommended in addition to the test for *Limit of Azithromycin N-Oxide*, *Desosaminylazithromycin*, and *N-Demethylazithromycin*.]

- **LIMIT OF AZITHROMYCIN N-OXIDE, DESOSAMINYLAZITHROMYCIN, AND N-DEMETHYLAZITHROMYCIN**

**Buffer:** 3.5 g/L of dibasic potassium phosphate

**Mobile phase:** Acetonitrile and *Buffer* (23:77). Adjust with 5 N potassium hydroxide to a pH of  $10.55 \pm 0.05$ .

**Standard stock solution:** 50  $\mu$ g/mL of USP Azithromycin N-oxide RS, 45  $\mu$ g/mL of USP Desosaminylazithromycin RS, and 160  $\mu$ g/mL each of USP N-Demethylazithromycin RS and USP Azithromycin RS in acetonitrile. Sonicate if necessary to dissolve.

**Standard solution:** 1  $\mu$ g/mL of azithromycin N-oxide, 0.9  $\mu$ g/mL of desosaminylazithromycin, 3.2  $\mu$ g/mL each of N-demethylazithromycin and azithromycin from *Standard stock solution* in *Mobile phase*

**Sample solution:** Equivalent to 0.3 mg/mL of azithromycin in *Mobile phase* from Azithromycin for Injection

### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** Amperometric electrochemical detector

**Electrode:** Dual series glassy carbon electrodes

**Mode:** Oxidative screen mode

**Electrode 1:**  $+0.70 \pm 0.05V$

**Electrode 2:**  $+0.82 \pm 0.05V$

**Background current:**  $95 \pm 25$  nanoamperes

**Column:** 4.6-mm  $\times$  15-cm; 3- $\mu$ m packing L49

**Flow rate:** 1 mL/min

**Injection size:** 50  $\mu$ L

**Autosampler temperature:** 5°

**System suitability**

**Sample:** *Standard solution*

[NOTE—See *Table 1* for relative retention times.]

## Suitability requirements

**Tailing factor:** NMT 2.0 for azithromycin and NMT 2.6 for N-demethylazithromycin

**Relative standard deviation:** NMT 10.0% for azithromycin *N*-oxide, desosaminylazithromycin, *N*-demethylazithromycin, and azithromycin

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each specified impurity in the portion of Azithromycin for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

$r_U$  = peak response of each specified impurity from the *Sample solution*

$r_S$  = peak response of each specified impurity from the *Standard solution*

$C_S$  = concentration of the relevant impurity USP RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of azithromycin in the *Sample solution* (mg/mL)

$P$  = potency of relevant USP RS (mg/mg)

**Acceptance criteria:** See Table 1. The reporting level for impurities is 0.05%.

**Table 1**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Azithromycin <i>N</i> -oxide <sup>a</sup>	0.17	1.0
Desosaminylazithromycin <sup>b</sup>	0.27	0.3
Erythromycin A oxime <sup>c,d</sup>	0.35	—
<i>N</i> -Demethylazithromycin <sup>e</sup>	0.50	1.0
Azaerythromycin A <sup>c,f</sup>	0.85	—
Azithromycin	1.00	—

<sup>a</sup> (2*R*,3*S*,4*R*,5*R*,8*R*,10*R*,11*R*,12*S*,13*S*,14*R*)-13-[(2,6-Dideoxy-3-*C*-methyl-3-*O*-methyl- $\alpha$ -*L*-ribo-hexopyranosyl)oxy]-2-ethyl-3,4,10-trihydroxy-3,5,6,8,10,12,14-heptamethyl-11-[[[3,4,6-trideoxy-3-(dimethylazinoyl)- $\beta$ -D-xylo-hexopyranosyl]oxy]-1-oxa-6-azacyclopentadecan-15-one.

<sup>b</sup> (2*R*,3*S*,4*R*,5*R*,8*R*,10*R*,11*R*,12*S*,13*S*,14*R*)-2-Ethyl-3,4,10,13-tetrahydroxy-3,5,6,8,10,12,14-heptamethyl-11-[[[3,4,6-trideoxy-3-dimethylamino- $\beta$ -D-xylo-hexopyranosyl]oxy]-1-oxa-6-azacyclopentadecan-15-one.

<sup>c</sup> Process impurities that are controlled in the drug substance are not to be reported. They are listed here for information only.

<sup>d</sup> (3*R*,4*S*,5*S*,6*R*,7*R*,9*R*,11*S*,12*R*,13*S*,14*R*)-6-[[[3,4,6-Trideoxy-3-(dimethylamino)- $\beta$ -D-xylo-hexopyranosyl]oxy]-14-ethyl-7,12,13-trihydroxy-4-[(2,6-dideoxy-3-*C*-methyl-3-*O*-methyl- $\alpha$ -*L*-ribo-hexopyranosyl)oxy]-10-(hydroxyimino)-3,5,7,9,11,13-hexamethylloxacyclotetradecan-2-one.

<sup>e</sup> (2*R*,3*S*,4*R*,5*R*,8*R*,10*R*,11*R*,12*S*,13*S*,14*R*)-13-[(2,6-Dideoxy-3-*C*-methyl-3-*O*-methyl- $\alpha$ -*L*-ribo-hexopyranosyl)oxy]-2-ethyl-3,4,10-trihydroxy-3,5,6,8,10,12,14-heptamethyl-11-[[[3,4,6-trideoxy-3-methylamino- $\beta$ -D-xylo-hexopyranosyl]oxy]-1-oxa-6-azacyclopentadecan-15-one.

<sup>f</sup> 9-Deoxy-9a-aza-9a-homoerythromycin A.

#### • LIMIT OF AMINOAZITHROMYCIN, FORMAMIDO ANALOG, METHYLFORMAMIDO ANALOG, AND 3'-DE(DIMETHYLAMINO)-3'-OXOAZITHROMYCIN (if present)

**Buffer:** 3.5 g/mL of dibasic potassium phosphate in water

**Mobile phase:** Acetonitrile and *Buffer* (46:54). Adjust with 10 N potassium hydroxide to a pH of 11.0  $\pm$  0.1.

**Diluent:** Acetonitrile and water (46:54)

**Blank:** Use the *Diluent*.

**Standard stock solution:** 0.09 mg/mL of USP Desosaminylazithromycin RS, 0.21 mg/mL of USP *N*-

Demethylazithromycin RS, and 0.30 mg/mL of USP Azithromycin RS in acetonitrile

**Standard solution:** 0.0018 mg/mL of desosaminylazithromycin, 0.0042 mg/mL of *N*-demethylazithromycin, and 0.006 mg/mL of azithromycin in *Diluent*

**Sample solution:** Equivalent to 0.6 mg/mL of azithromycin from Azithromycin for Injection in *Diluent*. Reconstitute 3 vials individually, as directed in the labeling. Mix the contents of all the reconstituted vials. Dilute a portion of the mixture with *Diluent*. The *Sample solution* must be injected immediately after preparation.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** Amperometric electrochemical detector

**Electrode:** Dual series glassy carbon electrodes

**Mode:** Oxidative screen mode

**Electrode 1:** +0.70  $\pm$  0.05V

**Electrode 2:** +0.82  $\pm$  0.05V

**Background current:** 95  $\pm$  25 nanoamperes

#### Columns

**Guard:** 4.6-mm  $\times$  1-cm; 5- $\mu$ m packing L67

**Analytical:** 4.6-mm  $\times$  25-cm; 5- $\mu$ m packing L67

#### Temperature

**Column:** 40°

**Autosampler:** 15°

**Flow rate:** 1 mL/min

**Injection size:** 25  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

[NOTE—See Table 2 for relative retention times.]

#### Suitability requirements

**Resolution:** NLT 1.5 between desosaminylazithromycin and *N*-demethylazithromycin

**Tailing factor:** NMT 1.5 for azithromycin

**Relative standard deviation:** NMT 5% for azithromycin

#### Analysis

**Samples:** *Blank*, *Standard solution*, and *Sample solution*

Disregard any peaks corresponding to those obtained from the *Blank*.

Calculate the percentage of each impurity in the portion of Azithromycin for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_S$  = peak response of azithromycin from the *Standard solution*

$C_S$  = concentration of USP Azithromycin RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of azithromycin in the *Sample solution* (mg/mL)

$P$  = potency of USP Azithromycin RS ( $\mu$ g/mg)

$F$  = conversion factor, 0.001 mg/ $\mu$ g

**Acceptance criteria:** See Table 2.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Erythromycin A iminoether <sup>a,b</sup>	0.20	—

<sup>o</sup> Total impurities includes desosaminylazithromycin and *N*-demethylazithromycin.

## SPECIFIC TESTS

- **BACTERIAL ENDOTOXINS TEST (85):** It contains NMT 0.7 USP Endotoxin Units/mg of azithromycin.
- **STERILITY TESTS (71):** It meets the requirements when tested as directed for *Test for Sterility of the Product to Be Examined, Membrane Filtration*.
- **PARTICULATE MATTER IN INJECTIONS (788):** Meets the requirements
- **PH (791):** 6.4–6.8, determined in a solution constituted as directed in the labeling
- **WATER DETERMINATION, Method I (921):** NMT 2.0%
- **OTHER REQUIREMENTS:** It meets the requirements under *Injections (1)*.

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve as described under *Injections (1)*, *Containers for Sterile Solids*. Store at controlled room temperature.
- **LABELING:** It meets the requirements for *Injections (1)*, *Labeling*.

## Azithromycin for Oral Suspension

### DEFINITION

Azithromycin for Oral Suspension is a dry mixture of Azithromycin and one or more buffers, sweeteners, diluents, anticaking agents, and flavors. It contains NLT 90.0% and NMT 110.0% of the labeled amount of azithromycin ( $C_{38}H_{72}N_2O_{12}$ ).

### IDENTIFICATION

- **A.** The retention time of the azithromycin peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

### ASSAY

#### PROCEDURE

[NOTE—Use water that has a resistivity of NLT 18 Mohm-cm.]

**Mobile phase:** Dissolve 5.8 g of monobasic potassium phosphate in 2130 mL of water, and add 870 mL of acetonitrile. Adjust with about 6 mL of 10 N potassium hydroxide to a pH of  $11.0 \pm 0.1$ , and pass through a suitable filter.

**Diluent:** Dissolve 2.2 g of monobasic potassium phosphate in 1590 mL of water, and add 600 mL of isopropyl alcohol, 480 mL of alcohol, and 330 mL of acetonitrile. Adjust with 10 N potassium hydroxide to a pH of  $8.4 \pm 0.1$ , and shake by mechanical means for 30 min.

**Standard stock solution:** 0.165 mg/mL of USP Azithromycin RS in acetonitrile. Swirl, and sonicate as necessary.

**Standard solution:** 3.3  $\mu$ g/mL of USP Azithromycin RS from the *Standard stock solution* in *Mobile phase*

**System suitability stock solution:** 0.16 mg/mL of USP Azaerythromycin A RS in acetonitrile and *Mobile phase* (1:9). Dissolve first in acetonitrile using 10% of the final volume. Swirl, and sonicate to dissolve. Dilute with *Mobile phase* to volume.

**System suitability solution:** 3.2  $\mu$ g/mL of azaerythromycin A from the *System suitability stock solution* and 3.3  $\mu$ g/mL of azithromycin from the *Standard stock solution* in *Mobile phase*

**Sample stock solution 1** (where packaged in a single-unit container): 2 mg/mL of azithromycin from Azithromycin for Oral Suspension in *Diluent*. Transfer the contents of a container of Azithromycin for Oral Suspension to a suitable volumetric flask. Add *Diluent* equal to 70% of the volume of the flask, and shake by mechanical means for 30 min. Dilute with *Diluent* to volume. Transfer 40 mL of this suspension to a stoppered centrifuge tube, and centrifuge for 20 min. Use the supernatant to prepare *Sample solution 1*.

**Sample stock solution 2** (where packaged in a multiple-unit container): 0.4 mg/mL of azithromycin from Azithromycin for Oral Suspension in *Diluent*. Constitute Azithromycin for Oral Suspension as directed in the labeling. Transfer a suitable aliquot of the suspension so obtained, freshly mixed and free from air bubbles to a suitable volumetric flask to obtain to obtain a final concentration of 0.4 mg/mL. Add *Diluent* equal to 70% of the final volume, shake by mechanical means for 30 min, and dilute with *Diluent* to volume. Transfer 40 mL of the suspension so obtained to a stoppered centrifuge tube, and centrifuge for 20 min. Use the supernatant to prepare *Sample solution 2*.

**Sample solution 1:** 3.2  $\mu$ g/mL of azithromycin from *Sample stock solution 1* in *Mobile phase*

**Sample solution 2:** 4  $\mu$ g/mL of azithromycin from *Sample stock solution 2* in *Mobile phase*

### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** Amperometric electrochemical detector

**Electrode:** Dual glassy carbon electrodes

**Mode:** Oxidative screen mode

**Electrode 1:**  $+0.70 \pm 0.05$  V

**Electrode 2:**  $+0.82 \pm 0.05$  V

**Background current:**  $85 \pm 15$  nanoamperes

### Column

**Guard:** 4.6-mm  $\times$  5-cm; 5- $\mu$ m packing L29

**Analytical:** 4.6-mm  $\times$  15-cm; 5- $\mu$ m packing L29 or 3- $\mu$ m packing L49 without the guard column

**Flow rate:** 1.5 mL/min

**Injection size:** 50  $\mu$ L

### System suitability

**Samples:** *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for azaerythromycin A and azithromycin with the L29 column are 0.7 and 1.0, respectively; the relative retention times for azaerythromycin A and azithromycin with the L49 column are 0.8 and 1.0, respectively.]

### Suitability requirements

**Resolution:** NLT 2.5 between azaerythromycin A and azithromycin, *System suitability solution*

**Column efficiency:** NLT 1000 theoretical plates, *Standard solution*

**Tailing factor:** 0.9–1.5, *Standard solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

### Analysis

**Samples:** *Standard solution* and *Sample solution*

**Where packaged in a single-unit container**

Calculate the percentage of the labeled amount of azithromycin ( $C_{38}H_{72}N_2O_{12}$ ) in the portion of Azithromycin for Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

$r_U$  = peak response from *Sample solution 1*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Azithromycin RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of azithromycin in *Sample solution 1* (mg/mL)

$P$  = potency of azithromycin in USP Azithromycin RS ( $\mu$ g/mg)

$F$  = conversion factor, 0.001 mg/ $\mu$ g

**Where packaged in a multiple-unit container**

Calculate the percentage of the labeled amount of azithromycin ( $C_{38}H_{72}N_2O_{12}$ ) in the portion of Azithromycin for Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

$r_U$  = peak response from *Sample solution 2*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Azithromycin RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of azithromycin in *Sample solution 2* (mg/mL)

$P$  = potency of azithromycin in USP Azithromycin RS ( $\mu$ g/mg)

$F$  = conversion factor, 0.001 mg/ $\mu$ g

**Acceptance criteria:** 90.0%–110.0%

**PERFORMANCE TESTS**

- **DELIVERABLE VOLUME** (698): Meets the requirements
- **UNIFORMITY OF DOSAGE UNITS** (905): Meets the requirements for a solid packaged in single-unit containers

**SPECIFIC TESTS**

• **pH** (791)

For a solid packaged in single-unit containers: 9.0–11.0, in the suspension constituted as directed in the labeling

For a solid packaged in multiple-unit containers: 8.5–11.0, in the suspension constituted as directed in the labeling

- **WATER DETERMINATION, Method I** (921): NMT 1.5%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS** (11)  
USP Azithromycin RS  
USP Azaerythromycin RS

## Azithromycin Tablets

**DEFINITION**

Azithromycin Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of azithromycin ( $C_{38}H_{72}N_2O_{12}$ ).

**IDENTIFICATION**

- The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY**

• **PROCEDURE**

**Solution A:** A solution containing 4.4 mg/mL of dibasic potassium phosphate and 0.5 mg/mL of sodium 1-oc-tanesulfonate. Adjust with phosphoric acid to a pH of  $8.20 \pm 0.05$ .

**Mobile phase:** Acetonitrile, methanol, and *Solution A* (9:3:8)

**Solution B:** 1.7 mg/mL of monobasic ammonium phosphate. Adjust with ammonium hydroxide to a pH of  $10.00 \pm 0.05$ .

**Diluent A:** Methanol, acetonitrile, and *Solution B* (7:6:7)

**Standard solution:** Dissolve USP Azithromycin RS in *Diluent A* using about 75% of the final volume, sonicate to dissolve, dilute with *Diluent A* to volume, and mix to obtain a solution having a known concentration of 0.4 mg/mL of azithromycin.

**System suitability stock solution:** 0.2 mg/mL of USP Azaerythromycin A RS in acetonitrile. [NOTE—Sonicate if necessary to dissolve.]

**System suitability solution:** 0.02 mg/mL of azaerythromycin A from the *System suitability stock solution* and

0.02 mg/mL of azithromycin from the *Standard solution* in *Diluent A*

**Sample stock solution:** Weigh and finely powder NLT 20 Tablets. Transfer an equivalent to 667 mg of azithromycin to a 200-mL volumetric flask. Add 75 mL of *Diluent A*, and sonicate for NLT 15 min. Shake by mechanical means for NLT 15 min. Allow the solution to equilibrate to room temperature, dilute with *Diluent A* to volume, and mix.

**Sample solution:** 0.4 mg/mL of azithromycin from the *Sample stock solution* in *Diluent A*. Pass through a filter of 0.45- $\mu$ m pore size.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.6-mm  $\times$  25-cm; 5- $\mu$ m packing L1

**Column temperature:** 50°

**Flow rate:** 1.5 mL/min

**Injection size:** 50  $\mu$ L

**System suitability**

**Samples:** *Standard solution* and *System suitability solution*

[NOTE—Identify the peaks by their relative retention times, which are 0.64 and 1.0 for azaerythromycin A and azithromycin, respectively.]

**Suitability requirements**

**Resolution:** NLT 2.5 between azaerythromycin A and azithromycin, *System suitability solution*

**Column efficiency:** NLT 1000 theoretical plates, *Standard solution*

**Tailing factor:** NMT 2.0, *Standard solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{38}H_{72}N_2O_{12}$  in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

$r_U$  = peak response of azithromycin from the *Sample solution*

$r_S$  = peak response of azithromycin from the *Standard solution*

$C_S$  = concentration of USP Azithromycin RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of azithromycin in the *Sample solution* (mg/mL)

$P$  = potency of USP Azithromycin RS ( $\mu$ g/mg)

$F$  = unit conversion factor, 0.001 mg/ $\mu$ g

**Acceptance criteria:** 90.0%–110.0%

**PERFORMANCE TESTS**

• **DISSOLUTION** (711)

**Medium:** pH 6.0 phosphate buffer; 900 mL

**Apparatus 2:** 75 rpm

**Time:** 30 min

**Solution A and Mobile phase:** Proceed as directed in the *Assay*.

**Diluent:** 17.5 mg/mL of dibasic potassium phosphate. Adjust with phosphoric acid to a pH of  $8.00 \pm 0.05$ . Prepare a mixture of this solution and acetonitrile (80:20).

**Standard stock solution:** Dissolve USP Azithromycin RS in *Medium* to obtain a solution having a known concentration of about (L/1000) mg/mL, where L is the Tablet label claim, in mg.

**Standard solution:** Dilute the *Standard stock solution* with *Diluent* to obtain a solution having a known concentration of about (L/2000) mg/mL, where L is the Tablet label claim, in mg.

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45- $\mu$ m pore size. Dilute a portion of the filtrate with *Diluent* to obtain a

solution having a theoretical concentration of about (L/2000) mg/mL, where L is the Tablet label claim, in mg, assuming complete dissolution.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.6-mm × 15-cm; 5-μm packing L1

**Column temperature:** 50°

**Flow rate:** 1.5 mL/min

**Injection size:** 50 μL

#### System suitability

**Sample:** *Standard solution*

**Suitability requirements:**

**Column efficiency:** NLT 1000 theoretical plates

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Determine the amount of C<sub>38</sub>H<sub>72</sub>N<sub>2</sub>O<sub>12</sub> dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_U$  = peak response of azithromycin from the *Sample solution*

$r_S$  = peak response of azithromycin from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$L$  = Tablet label claim (mg)

$V$  = volume of *Medium*, 900 mL

**Tolerances:** NLT 80% (Q) of the labeled amount of C<sub>38</sub>H<sub>72</sub>N<sub>2</sub>O<sub>12</sub> is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

#### IMPURITIES

##### Organic Impurities

##### PROCEDURE

[NOTE— Use low-actinic glassware. Refrigerate the *Standard solution* and the *Sample solution* after preparation and during analysis, using a refrigerated autosampler set at 4°. The solutions must be analyzed within 24 h of preparation.]

**Solution B, Diluent A, and System suitability solution:** Proceed as directed in the *Assay*.

**Solution C:** 1.8 mg/mL of dibasic sodium phosphate in water

**Solution D:** Acetonitrile and methanol (3:1)

**Mobile phase:** See the gradient table below.

Time (min)	Solution C (%)	Solution D (%)
0	50	50
25	50	50
30	45	55
40	40	60
55	35	65
60	35	65
61	50	50
70	50	50

**Diluent B:** Methanol and *Solution B* (1:1)

**Blank:** Use *Diluent A*.

**Standard stock solution:** Use the *Standard solution* as directed in the *Assay*.

**Standard solution:** 0.02 mg/mL of azithromycin from the *Standard stock solution* in *Diluent A*

**Sensitivity solution:** 0.004 mg/mL of azithromycin from the *Standard solution* in *Diluent A*

**Sample stock solution:** Weigh and finely powder NLT 20 Tablets. Transfer an equivalent to 1335 mg of azithromycin to a 100-mL volumetric flask. Add 75 mL of acetonitrile, and sonicate for NLT 15 min. Shake by

mechanical means for NLT 15 min. Allow the solution to equilibrate to room temperature, dilute with acetonitrile to volume, and mix.

**Sample solution:** Centrifuge an aliquot of the *Sample stock solution* for 15 min. Transfer 3.0 mL of the supernatant to a 10-mL volumetric flask, dilute with *Diluent B* to volume, and mix to obtain a solution having a nominal concentration of about 4 mg/mL of azithromycin. Pass through a filter of 0.45-μm pore size.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.6-mm × 25-cm; 5-μm packing L1

**Column temperature:** 60°

**Flow rate:** 0.8 mL/min

**Autosampler temperature:** 4°

**Injection size:** 100 μL

#### System suitability

**Samples:** *System suitability solution*, *Standard solution*, and *Sensitivity solution*

**Suitability requirements**

**Signal-to-noise ratio:** NLT 10, *Sensitivity solution*

**Resolution:** NLT 2.5 between azaerythromycin A and azithromycin, *System suitability solution*

**Relative standard deviation:** NMT 10.0%, *Standard solution*

#### Analysis

**Samples:** *Blank* and *Sample solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F_1 \times (1/F_2) \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_S$  = peak response of azithromycin from the *Standard solution*

$C_S$  = concentration of USP Azithromycin RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of azithromycin in the *Sample solution* (mg/mL)

$P$  = potency of USP Azithromycin RS (μg/mg)

$F_1$  = unit conversion factor, 0.001 mg/μg

$F_2$  = relative response factor (see *Impurity Table 1*)

#### Acceptance criteria

[NOTE—The reporting level for impurities is 0.1%. Disregard any peaks in the *Sample solution* that correspond to peaks in the *Blank*.]

**Individual impurities:** See *Impurity Table 1*.

**Total impurities:** See *Impurity Table 1*.

**Impurity Table 1**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Azithromycin 3'-N-oxide	0.28	0.45	1.0
3'-(N,N-Didemethyl)-3'-N-formylazithromycin	0.38	1.9	1.0
3'-(N,N-Didemethyl) azithromycin (aminoazithromycin)	0.40	0.52	0.5
Desosaminylazithromycin	0.47	1.1	0.5

<sup>a</sup> 3'-(N-Demethyl)-3'-N-formylazithromycin.

<sup>b</sup> These compounds are synthetic process impurities of azithromycin. They are controlled in the drug substance and are listed here for information only. The total impurities specification does not include these impurities.

Impurity Table 1 (Continued)

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Azithromycin related compound F <sup>a</sup>	0.53	4.8	1.0
3'-N-Demethyl-azithromycin	0.57	0.53	0.7
3'-De(dimethyl-amino)-3'-oxo-azithromycin	0.78	1.6	1.0
6-Demethylazithromycin (azaerythromycin A) <sup>b</sup>	0.82	—	—
Azithromycin	1.0	—	—
3-Deoxyazithromycin (azithromycin B) <sup>b</sup>	1.3	—	—
3'-N-Demethyl-3'-N-[(4-methylphenyl)sulfonyl]azithromycin <sup>b</sup>	1.4	—	—

Total impurities <sup>b</sup>	—	—	5.0

<sup>a</sup> 3'-(N-Demethyl)-3'-N-formylazithromycin.

<sup>b</sup> These compounds are synthetic process impurities of azithromycin. They are controlled in the drug substance and are listed here for information only. The total impurities specification does not include these impurities.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store at controlled room temperature.
- **USP REFERENCE STANDARDS** <11>  
USP Azaerythromycin A RS  
USP Azithromycin RS

### Aztreonam

$C_{13}H_{17}N_5O_8S_2$  435.43  
Propanoic acid, 2-[[[1-(2-amino-4-thiazolyl)-2-[(2-methyl-4-oxo-1-sulfo-3-azetidinyl)amino]-2-oxoethylidene]amino]oxy]-2-methyl-, [2S-[2 $\alpha$ ,3 $\beta$ (Z)]]-;  
(Z)-2-[[[1-(2-Amino-4-thiazolyl)[[(2S,3S)-2-methyl-4-oxo-1-sulfo-3-azetidinyl]carbamoyl]methylene]amino]oxy]-2-methylpropanoic acid [78110-38-0].

#### DEFINITION

Aztreonam, which may be anhydrous or hydrated, contains NLT 92.0% and NMT 105.0% of  $C_{13}H_{17}N_5O_8S_2$ , calculated on the anhydrous and solvent-free basis.

#### IDENTIFICATION

- **INFRARED ABSORPTION** <197K>: If a difference appears in the IR spectra of the analyte and the standard, dissolve equal portions of the test specimen and the reference

standard in equal volumes of methanol. [NOTE—To achieve a complete dissolution, it is suggested to use about 25 mL of methanol for each 50 mg of material, and stir the mixture for 40 min at room temperature.] Evaporate the solutions to dryness under vacuum, and dry at 40° for 4 h under vacuum. Perform the test on the residues.

#### ASSAY

##### • PROCEDURE

[NOTE—Store the *System suitability solution*, *Standard solution*, and *Sample solution* at 5°, and protect from light to prevent isomerization of aztreonam Z-isomer to aztreonam E-isomer.]

**Buffer:** 6.8 mg/mL of monobasic potassium phosphate in water. Adjust with 1 M phosphoric acid to a pH of 3.0.

**Mobile phase:** Methanol and *Buffer* (1:4)

**System suitability solution:** 1 mg/mL of USP Aztreonam RS and 1 mg/mL of USP Aztreonam E-Isomer RS in *Mobile phase*

**Standard solution:** 1 mg/mL of USP Aztreonam RS in *Mobile phase*

**Sample solution:** 1 mg/mL of Aztreonam in *Mobile phase*

##### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 3.9-mm  $\times$  30-cm; 10- $\mu$ m packing L1

**Flow rate:** 1.5 mL/min

**Injection size:** 10  $\mu$ L

##### System suitability

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for aztreonam and aztreonam E-isomer are 1.0 and 1.8, respectively.]

##### Suitability requirements

**Resolution:** NLT 2.0 between aztreonam and aztreonam E-isomer, *System suitability solution*

**Tailing factor:** NMT 2 for aztreonam, *System suitability solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

##### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of aztreonam ( $C_{13}H_{17}N_5O_8S_2$ ) in the portion of Aztreonam taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Aztreonam RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Aztreonam in the *Sample solution* (mg/mL)

$P$  = potency of USP Aztreonam RS ( $\mu$ g/mg)

$F$  = unit conversion factor, 0.001 mg/ $\mu$ g

**Acceptance criteria:** 92.0%–105.0% on the anhydrous and solvent-free basis

#### IMPURITIES

##### Inorganic Impurities

- **RESIDUE ON IGNITION** <281>: NMT 0.1%, the charred residue being moistened with 2 mL of nitric acid and 5 drops of sulfuric acid

- **HEAVY METALS, Method II** <231>: NMT 30 ppm

##### Organic Impurities

##### • PROCEDURE

[NOTE— Store the *System suitability solution*, *Standard solution*, and *Sample solution* at 5°, and protect from light to

prevent isomerization of aztreonam Z-isomer to aztreonam E-isomer.]

**Mobile phase, System suitability solution, Standard solution, Sample solution, Chromatographic system, and System suitability:** Proceed as directed in the Assay.

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of each impurity in the portion of Aztreonam taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

- $r_U$  = peak response of each impurity from the *Sample solution*  
 $r_S$  = peak response of aztreonam from the *Standard solution*  
 $C_S$  = concentration of USP Aztreonam RS in the *Standard solution* (mg/mL)  
 $C_U$  = concentration of Aztreonam in the *Sample solution* (mg/mL)  
 $P$  = potency of USP Aztreonam RS ( $\mu\text{g}/\text{mg}$ )  
 $F$  = unit conversion factor, 0.001  $\text{mg}/\mu\text{g}$

#### Acceptance criteria

Individual impurities: See Table 1.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Open-ring aztreonam <sup>a</sup> and open-ring desulfated aztreonam <sup>b,c</sup>	0.55	1.0
Aztreonam (Z-isomer)	1.0	—
Desulfated aztreonam <sup>d</sup>	1.6	1.5
Aztreonam E-isomer <sup>e</sup>	1.8	0.5
Aztreonam ethyl ester <sup>f</sup>	3.9	1.5
Any individual unspecified impurity	—	0.1
Total impurities	—	3.0

<sup>a</sup> (2S,3S)-2-[(Z)-2-[2-Aminothiazol-4-yl]-2-[2-carboxypropan-2-yloxyimino]acetamido]-3-(sulfoamino)butanoic acid.

<sup>b</sup> (2S,3S)-3-Amino-2-[(Z)-2-[2-aminothiazol-4-yl]-2-[2-carboxypropan-2-yloxyimino]acetamido]butanoic acid.

<sup>c</sup> Open-ring aztreonam and open-ring desulfated aztreonam coelute. The limit is for the sum of these two impurities.

<sup>d</sup> (Z)-2-[[[(2-Amino-4-thiazolyl){[(2S,3S)-2-methyl-4-oxo-3-azetidinyl]carbamoyl}methylene]amino]oxy]-2-methylpropionic acid.

<sup>e</sup> (E)-2-[[[(2-Amino-4-thiazolyl){[(2S,3S)-2-methyl-4-oxo-1-sulfo-3-azetidinyl]carbamoyl}methylene]amino]oxy]-2-methylpropionic acid.

<sup>f</sup> Ethyl (Z)-2-[[[(2-amino-4-thiazolyl){[(2S,3S)-2-methyl-4-oxo-1-sulfo-3-azetidinyl]carbamoyl}methylene]amino]oxy]-2-methylpropionate.

#### SPECIFIC TESTS

- STERILITY TESTS (71):** Where the label states that Aztreonam is sterile, it meets the requirements for *Test for Sterility of the Product to Be Examined—Membrane Filtration*, using Fluid A, to which 23.4 g of sterile arginine has been added to each 1000 mL.
- WATER DETERMINATION, Method I (921):** NMT 2.0%; if labeled as the hydrated form: 12.0%–18.0%. [NOTE—The term hydrated form refers to the  $\alpha$ -form of Aztreonam, which is not a stoichiometric hydrate.]
- BACTERIAL ENDOTOXINS TEST (85):** Where the label states that aztreonam is sterile or must be subjected to further processing during the preparation of injectable dosage forms, it contains NMT 0.17 USP Endotoxin Unit/mg of aztreonam.
- LIMIT OF ALCOHOL**

[NOTE—This test is to be performed if alcohol is used while manufacturing Aztreonam.]

**Standard solution:** 0.004 mL/mL of alcohol from USP Alcohol Determination—Alcohol RS and 0.004 mL/mL of acetonitrile from USP Alcohol Determination—Aceto-

nitrile RS in dimethylformamide. [NOTE—The *Standard solution* contains 0.4% alcohol and 0.4% acetonitrile.]

**Sample solution:** 80 mg/mL of Aztreonam and 0.004 mL/mL of acetonitrile in dimethylformamide.

[NOTE—Dissolve Aztreonam in dimethylformamide using 20% of the final volume. Add a suitable aliquot of USP Alcohol Determination—Acetonitrile RS, and dilute with dimethylformamide to volume. The concentration of acetonitrile in the *Sample solution* is 0.4%.]

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 0.53-mm  $\times$  30-m; phase G43

**Film thickness:** 3.0  $\mu\text{m}$

**Temperature**

**Injector:** 210°

**Detector:** 280°

**Column:** See Table 2.

Table 2

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
50	0	50	5
50	10	200	4

**Carrier gas:** He

**Linear velocity:** 35 cm/s

**Injection mode:** Split

**Split ratio:** 5:1

**Injection size:** 0.5  $\mu\text{L}$

#### System suitability

[NOTE—The relative retention times for alcohol and acetonitrile are 1.0 and 1.3, respectively.]

**Sample:** *Standard solution*

#### Suitability requirements

**Resolution:** NLT 2.0 between alcohol and acetonitrile

**Tailing factor:** NMT 1.5

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of alcohol in the portion of Aztreonam taken:

$$\text{Result} = (R_U/R_S) \times (C_S \times D/C_U) \times F \times 100$$

$R_U$  = peak response ratio of alcohol to acetonitrile from the *Sample solution*

$R_S$  = peak response ratio of alcohol to acetonitrile from the *Standard solution*

$C_S$  = concentration of alcohol in the *Standard solution* (mL/mL)

$D$  = density of alcohol (g/mL)

$C_U$  = concentration of Aztreonam in the *Sample solution* (mg/mL)

$F$  = unit conversion factor, 1000 mg/g

**Acceptance criteria:** NMT 4%

#### ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight containers.
- LABELING:** Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms. Where it is the hydrated form, the label so indicates.

## Aztreonam Injection

### DEFINITION

Aztreonam Injection is a sterile solution of Aztreonam and Arginine and a suitable osmolality adjusting substance in Water for Injection. It contains NLT 90.0% and NMT 120.0% of the labeled amount of aztreonam ( $C_{13}H_{17}N_5O_8S_2$ ).

### IDENTIFICATION

- A.** The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

**Buffer:** 1.15 g/L of monobasic ammonium phosphate in water. Before final dilution, adjust with phosphoric acid to a pH of  $2.0 \pm 0.1$ .

**Mobile phase:** Acetonitrile and *Buffer* (75:25).

**System suitability solution:** 0.2 mg/mL of each of USP Aztreonam RS and USP Open Ring Aztreonam RS in *Mobile phase*

**Standard solution:** 0.2 mg/mL each of USP Aztreonam RS and USP L-Arginine RS in *Mobile phase*

**Sample solution:** Equivalent to 0.2 mg/mL of aztreonam from Injection in *Mobile phase*

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 206 nm

**Pre-column:** 4.6-mm  $\times$  5- to 10-cm saturator precolumn containing packing L27

**Column:** 4-mm  $\times$  25-cm analytical column containing packing L20

**Flow rate:** 1 mL/min

**Injection size:** 20  $\mu$ L

#### System suitability

**Sample:** *System suitability solution*

[NOTE—The relative retention times for aztreonam and open ring aztreonam are 0.8 and 1.0, respectively. The relative retention times for aztreonam and arginine are 0.3 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 2.0 between aztreonam and open ring aztreonam

**Column efficiency:** NLT 1000 theoretical plates determined from the aztreonam peak

**Tailing factor:** NMT 2.0 for the aztreonam peak

**Relative standard deviation:** NMT 2.0% for the aztreonam peak

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
 Calculate the percentage of aztreonam ( $C_{13}H_{17}N_5O_8S_2$ ) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

$r_U$  = peak response of aztreonam from the *Sample solution*

$r_S$  = peak response of aztreonam from the *Standard solution*

$C_S$  = concentration of USP Aztreonam RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of aztreonam in the *Sample solution* (mg/mL)

$P$  = potency of aztreonam in USP Aztreonam RS ( $\mu$ g/mg)

$F$  = conversion factor (0.001 mg/ $\mu$ g)

**Acceptance criteria:** 90.0%–120.0%

### SPECIFIC TESTS

- PYROGEN TEST** <151>: It meets the requirements, the test dose being a measured volume of Injection sufficient to provide 50 mg/kg of aztreonam.
- STERILITY TESTS** <71>: It meets the requirements when tested as directed for *Test for Sterility of the Product to be Examined, Membrane Filtration*.
- pH** <791>: 4.5–7.5
- PARTICULATE MATTER IN INJECTIONS** <788>: It meets the requirements for small-volume injections.

### ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve as described under *Injections* <1>, *Containers for Sterile Solids*. Maintain in the frozen state.
- LABELING:** It meets the requirements for *Injections* <1>, *Labels and Labeling*. The label states that it is to be thawed just prior to use, describes conditions for proper storage of the resultant solution, and directs that the solution is not to be refrozen.
- USP REFERENCE STANDARDS** <11>  
 USP L-Arginine RS  
 USP Aztreonam RS  
 USP Open Ring Aztreonam RS  
 $C_{13}H_{19}N_5O_9S_2$  453.45

## Aztreonam for Injection

### DEFINITION

Aztreonam for Injection is a dry mixture of sterile Aztreonam and Arginine. It contains NLT 90.0% and NMT 105.0% of aztreonam ( $C_{13}H_{17}N_5O_8S_2$ ), calculated on the anhydrous and arginine-free basis. Each container contains NLT 90.0% and NMT 120.0% of the labeled amount of aztreonam ( $C_{13}H_{17}N_5O_8S_2$ ).

### IDENTIFICATION

- A.** The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

**Buffer:** 1.15 g/L of monobasic ammonium phosphate in water. Before final dilution, adjust with phosphoric acid to a pH of  $2.0 \pm 0.1$ .

**Mobile phase:** Acetonitrile and *Buffer* (75:25)

**System suitability solution:** 0.2 mg/mL each of USP Aztreonam RS and USP Open Ring Aztreonam RS in *Mobile phase*

**Standard solution:** 0.2 mg/mL each of USP Aztreonam RS and USP L-Arginine RS in *Mobile phase*

**Sample solution 1:** Equivalent to 0.2 mg/mL of aztreonam in *Mobile phase* from Aztreonam for Injection. Weigh 1 container of Aztreonam for Injection, transfer the contents to a suitable container and dilute with *Mobile phase* to the appropriate volume. Weigh the empty container and calculate the weight, in mg, of Aztreonam for Injection used.

**Sample solution 2:** Equivalent to 0.2 mg/mL of aztreonam from Aztreonam for Injection constituted as directed below and diluted with *Mobile phase*. Where the vial has a capacity of less than 100 mL, constitute with water using the volume of solvent specified in the labeling.

Where the vial capacity is equal to or greater than 100 mL, constitute with 10 mL of water and dilute the entire withdrawable contents of the container with *Mobile phase* to obtain the final concentration.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 206 nm

**Pre-column:** 4.6-mm × 5- to 10-cm saturator precolumn containing packing L27

**Column:** 4-mm × 25-cm analytical column containing packing L20

**Flow rate:** 1 mL/min

**Injection size:** 20 µL

#### System suitability

**Sample:** *System suitability solution*

[NOTE—The relative retention times for aztreonam and open ring aztreonam are about 0.8 and 1.0, respectively. The relative retention times for aztreonam and arginine are 0.3 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 2.0 between aztreonam and open ring aztreonam

**Column efficiency:** NLT 1000 theoretical plates determined from the aztreonam peak

**Tailing factor:** NMT 2.0 for the aztreonam peak

**Relative standard deviation:** NMT 2.0% for the aztreonam peak

#### Analysis

**Samples:** *Standard solution*, *Sample solution 1*, and *Sample solution 2*

Calculate the percentage of aztreonam ( $C_{13}H_{17}N_5O_8S_2$ ) in the portion of Aztreonam for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

$r_U$  = peak response for aztreonam from *Sample solution 1*

$r_S$  = peak response for aztreonam from the *Standard solution*

$C_S$  = concentration of USP Aztreonam RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Aztreonam for Injection in *Sample solution 1* (mg/mL), corrected for water and arginine content (see *Content of Arginine*)

$P$  = potency of aztreonam in USP Aztreonam RS (µg/mg)

$F$  = conversion factor (0.001 mg/µg)

**Acceptance criteria:** 90.0%–105.0% on the anhydrous and arginine-free basis

Calculate the percentage of aztreonam ( $C_{13}H_{17}N_5O_8S_2$ ) in each container of Aztreonam for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

$r_U$  = peak response for aztreonam from *Sample solution 2*

$r_S$  = peak response for aztreonam from the *Standard solution*

$C_S$  = concentration of USP Aztreonam RS in the *Standard solution* (mg/mL).

$C_U$  = nominal concentration of aztreonam in *Sample solution 2* (mg/mL)

$P$  = potency of aztreonam in USP Aztreonam RS (µg/mg)

$F$  = conversion factor (0.001 mg/µg)

**Acceptance criteria:** 90.0%–120.0% of the labeled content of aztreonam

#### OTHER COMPONENTS

• **CONTENT OF ARGININE:** Use the result of this test to calculate, on the anhydrous and arginine-free basis, the *Assay* result from *Sample solution 1*, obtained as directed in the *Assay*.

**Buffer, Mobile phase, System suitability solution, Standard solution, Sample solution 1, Chromatographic system, and System suitability:** Proceed as directed in the *Assay*.

#### Analysis

**Sample:** *Sample solution 1*

Calculate the percentage of arginine ( $C_6H_{14}N_4O_2$ ) in the portion of Aztreonam for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response for arginine from *Sample solution 1*

$r_S$  = peak response for arginine from the *Standard solution*

$C_S$  = concentration of USP L-Arginine RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Aztreonam for Injection in *Sample solution 1*

#### PERFORMANCE TESTS

• **UNIFORMITY OF DOSAGE UNITS** <905>: Meets the requirements

#### SPECIFIC TESTS

• **CONSTITUTED SOLUTION:** At the time of use, it meets the requirements for *Injections* <1>, *Constituted Solutions*.

• **BACTERIAL ENDOTOXINS TEST** <85>: It contains NMT 0.17 USP Endotoxin Unit/mg of aztreonam.

• **STERILITY TESTS** <71>: It meets the requirements when tested as directed for *Test for Sterility of the Product to be Examined*, *Membrane Filtration*.

• **pH** <791>

**Sample solution:** 100 mg/mL of aztreonam

**Acceptance criteria:** 4.5–7.5

• **WATER DETERMINATION, Method I** <921>: NMT 2.0%

• **PARTICULATE MATTER IN INJECTIONS** <788>: Meets the requirements for small-volume injections

• **OTHER REQUIREMENTS:** It meets the requirements for *Injections* <1>, *Labeling*.

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve as described in *Injections* <1>, *Containers for Sterile Solids*.

• **USP REFERENCE STANDARDS** <11>

USP L-Arginine RS

USP Aztreonam RS

USP Endotoxin RS

USP Open Ring Aztreonam RS

## Bacampicillin Hydrochloride

$C_{21}H_{27}N_3O_7S \cdot HCl$  501.98

4-Thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid, 6-[(aminophenylacetyl)amino]-3,3-dimethyl-7-oxo-, 1-[(ethoxycarbonyl)oxyethyl ester, monohydrochloride, [2S-[2 $\alpha$ ,5 $\alpha$ ,6 $\beta$ (S\*)]]]- (2S,5R,6R)-6-[(R)-(2-Amino-2-phenylacetamido)]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid ester with ethyl 1-hydroxyethyl carbonate, monohydrochloride [37661-08-8].

» Bacampicillin Hydrochloride has a potency of not less than 623  $\mu$ g and not more than 727  $\mu$ g of ampicillin ( $C_{16}H_{19}N_3O_4S$ ) per mg.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Bacampicillin Hydrochloride RS

**Identification**—Prepare a test solution of it in alcohol containing 2 mg per mL. Prepare a Standard solution of USP Bacampicillin Hydrochloride RS in alcohol containing 2 mg per mL. Apply two 5- $\mu$ L portions of the test solution 4.0 cm apart to a thin-layer chromatographic plate coated with a 0.25-mm layer of chromatographic silica gel mixture (see *Chromatography* (621)). After the spots dry, apply two 5- $\mu$ L portions of the Standard solution, one midway between the test solution spots and the other to one of the test solution spots. Allow the spots to dry, place the plate in a suitable chromatographic chamber, and develop the chromatogram in a solvent system consisting of a mixture of methylene chloride, chloroform, and alcohol (10:1:1). When the solvent front has moved about three-fourths of the length of the plate, remove the plate from the chamber, and allow to dry. Spray the plate with a spray reagent containing 1 g of ninhydrin and 1 mL of pyridine in each 100 mL of solution in butyl alcohol, and heat at 100° for 10 minutes: bacampicillin appears as a purple spot, and the  $R_F$  values of the spots from the test solution and from the combined test solution and Standard solution, respectively, correspond to the  $R_F$  value of the spot obtained from the Standard solution.

**pH** (791): between 3.0 and 4.5, in a solution containing 20 mg per mL.

**Water**, Method I (921): not more than 1.0%.

**Dimethylaniline** (223): meets the requirement, the *Test Preparation* being prepared using 2 N sodium hydroxide instead of 1 N sodium hydroxide.

**Assay**—

*Mobile phase*—To 500 mL of 0.02 M dibasic sodium phosphate add portions of 0.02 M monobasic sodium phosphate until a pH of  $6.8 \pm 0.05$  is reached. Prepare a suitable filtered mixture of this pH 6.8 buffer and acetonitrile (500:500). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Prepare a solution of USP Bacampicillin Hydrochloride RS, accurately weighed, in water having a known concentration of about 0.8 mg per mL, sonicating for about 20 minutes to achieve complete dissolution. Pass through a filter of 0.5- $\mu$ m or finer porosity.

*Assay preparation*—Transfer about 80 mg of Bacampicillin Hydrochloride, accurately weighed, to a 100-mL volumetric flask, add 90 mL of water, and sonicate for about 20 minutes. Dilute with water to volume, mix, and pass through a filter of 0.5- $\mu$ m or finer porosity.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  15-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the responses as directed for *Procedure*: the column efficiency determined from the analyte peak is not less than 3000 theoretical plates, and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the quantity, in  $\mu$ g, of ampicillin ( $C_{16}H_{19}N_3O_4S$ ) equivalent in each mg of the Bacampicillin Hydrochloride taken by the formula:

$$(349.41/501.99)(100,000C/W)(r_U/r_S)$$

in which 349.41 and 501.99 are the molecular weights of anhydrous ampicillin and bacampicillin hydrochloride, respectively, C is the concentration, in mg per mL, of USP Bacampicillin Hydrochloride RS in the *Standard preparation*, W is the weight, in mg, of the portion of Bacampicillin Hydrochloride taken, and  $r_U$  and  $r_S$  are the bacampicillin peak area responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Bacampicillin Hydrochloride for Oral Suspension

» Bacampicillin Hydrochloride for Oral Suspension contains an amount of Bacampicillin Hydrochloride equivalent to not less than 90.0 percent and not more than 125.0 percent of the labeled amount of ampicillin ( $C_{16}H_{19}N_3O_4S$ ) when constituted as directed. It contains one or more suitable buffers, colors, flavors, suspending agents, and sweetening ingredients.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Ampicillin RS

USP Bacampicillin Hydrochloride RS

**Identification**—Constitute Bacampicillin Hydrochloride for Oral Suspension as directed in the labeling. Transfer a portion of the resulting suspension, equivalent to about 140 mg of ampicillin, to a 100-mL volumetric flask, add 70 mL of alcohol, shake by mechanical means for 30 minutes, dilute with alcohol to volume, and mix: the solution so obtained responds to the *Identification* test under *Bacampicillin Hydrochloride*.

**Uniformity of dosage units** (905)—

FOR SOLID PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** (698): meets the requirements.

**pH** (791): between 6.5 and 8.0, in the suspension constituted as directed in the labeling.

**Loss on drying** (731)—Dry about 100 mg, accurately weighed, in a capillary-stoppered bottle in vacuum at 60° for 3 hours: it loses not more than 2.0% of its weight.

**Assay**—

*Standard preparation*—Using USP Ampicillin RS, prepare as directed for *Standard preparation* under *Iodometric Assay—Antibiotics* (425).

*Assay preparation*—Transfer an accurately measured volume of Bacampicillin Hydrochloride for Oral Suspension,

constituted as directed in the labeling and free from bubbles, equivalent to about 87.5 mg of ampicillin, to a 250-mL volumetric flask. Add 200 mL of a solvent mixture consisting of alcohol and 0.1 M phosphoric acid (4:1). Shake by mechanical means for 30 minutes, dilute with the same solvent mixture to volume, and mix. Centrifuge a portion of the resulting suspension. Pipet 4.0 mL of the clear solution so obtained into each of two glass-stoppered, 125-mL conical flasks.

**Procedure**—Proceed as directed for *Procedure under Iodometric Assay—Antibiotics* (425). Calculate the quantity, in mg, of  $C_{16}H_{19}N_3O_4S$  in each mL of the constituted Bacampicillin Hydrochloride for Oral Suspension taken by the formula:

$$(0.0625F)(B - I) / V$$

in which  $V$  is the volume, in mL, of constituted Bacampicillin Hydrochloride for Oral Suspension taken, and the other terms are as defined therein.

## Bacampicillin Hydrochloride Tablets

» Bacampicillin Hydrochloride Tablets contain the equivalent of not less than 90.0 percent and not more than 125.0 percent of the labeled amount of ampicillin ( $C_{16}H_{19}N_3O_4S$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Ampicillin RS

USP Bacampicillin Hydrochloride RS

**Identification**—To a portion of powdered Tablets add alcohol to obtain a solution containing the equivalent of 2 mg of ampicillin per mL: the solution so obtained responds to the *Identification* test under *Bacampicillin Hydrochloride*.

**Dissolution** (711)—

*Medium:* water; 900 mL.

*Apparatus 2:* 75 rpm.

*Time:* 30 minutes.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Ampicillin RS in water to obtain a solution having a known concentration of about 0.3 mg per mL.

**Procedure**—Determine the amount of ampicillin ( $C_{16}H_{19}N_3O_4S$ ) dissolved as directed for *Procedure* in the section *Antibiotics—Hydroxylamine Assay* under *Automated Methods of Analysis* (16).

**Tolerances**—Not less than 85% (Q) of the labeled amount of  $C_{16}H_{19}N_3O_4S$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Water, Method I** (921): not more than 2.5%.

**Assay**—

**Mobile phase, Standard preparation, and Chromatographic system**—Proceed as directed in the *Assay* under *Bacampicillin Hydrochloride*.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 56 mg of ampicillin ( $C_{16}H_{19}N_3O_4S$ ), to a 100-mL volumetric flask, add 90 mL of water, and sonicate for about 20 minutes. Dilute with water to volume, mix, and filter through a filter of 0.5- $\mu$ m or finer porosity.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Bacampicillin Hydrochloride*. Calculate the quantity, in

mg, of ampicillin ( $C_{16}H_{19}N_3O_4S$ ) equivalent to the portion of Tablets taken by the formula:

$$(349.41/501.99)(100C)(r_U / r_S)$$

in which the terms are as defined therein.

## Bacitracin

Bacitracin [1405-87-4].

» Bacitracin is a mixture of polypeptides produced by the growth of an organism of the *licheniformis* group of *Bacillus subtilis* (Fam. Bacillaceae), the main components being bacitracins A, B1, B2, and B3. It has a potency of not less than 65 Bacitracin Units per mg, calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers, and store in a cool place.

**Labeling**—Where it is packaged for prescription compounding, label it to indicate that it is not sterile and that the potency cannot be assured for longer than 60 days after opening, and to state the number of Bacitracin Units per milligram. Where it is intended for use in preparing injectable or other sterile dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable or other sterile dosage forms.

**USP Reference standards** (11)—

USP Bacitracin Zinc RS

USP Endotoxin RS

**Identification**—

**A:** *Thin-Layer Chromatographic Identification Test* (201BNP): meets the requirements.

**B:** It meets the requirements of the liquid chromatographic procedure in the test for *Composition*.

**pH** (791): between 5.5 and 7.5, in a solution containing 10,000 Bacitracin Units per mL.

**Loss on drying** (731)—Dry about 100 mg in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 5.0% of its weight.

**Residue on ignition** (281): not more than 0.5%.

**Composition**—

**Buffer**—Dissolve 34.8 g of dibasic potassium phosphate in 1 L of water. Adjust with 27.2 g of monobasic potassium phosphate dissolved in 1 L of water to a pH of 6.0.

**Mobile phase**—Prepare a mixture of methanol, water, *Buffer*, and acetonitrile (26:15:5:2), mix well, and degas.

**System suitability solution**—Dissolve an accurately weighed quantity of USP Bacitracin Zinc RS in water, add diluted hydrochloric acid, using about 2% of the final volume, and dilute with water to obtain a solution with a nominal concentration of about 2.0 mg per mL.

**Reporting threshold solution**—Dilute quantitatively, with *Mobile phase*, a suitable volume of *System suitability solution* to obtain a solution having a known concentration of 0.01 mg per mL. This solution is used to determine the reporting threshold.

**Peak identification solution**—Dissolve a suitable quantity of USP Bacitracin Zinc RS in a suitable volume of a 40 g per L solution of edetate disodium (pH adjusted to 7.0 with dilute sodium hydroxide), to obtain a solution having a nominal concentration of about 2.0 mg per mL. Heat in a boiling water bath for 30 minutes. Cool to room temperature.

**Test solution**—Dissolve an accurately weighed quantity of Bacitracin in *Mobile phase* to obtain a solution having a known concentration of about 2.0 mg per mL.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with an absorbance detector and an end-capped, 4.6-mm × 25-cm column that contains 5-μm packing L1. The flow rate is 1.0 mL per minute. Set the wavelength of the detector at 300 nm. Inject about 100 μL of the *Peak identification solution*, and identify the location of bacitracin F, which is a known impurity, using the relative retention time given in *Table 1*. Change the wavelength of the detector and set it to 254 nm. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: identify the peaks of the most active components of bacitracin (bacitracins A, B1, B2, and B3), early eluting peptides (those eluting before the peak due to bacitracin B1) and the impurity, bacitracin F, using the relative retention time values given in *Table 1*. Calculate the peak-to-valley ratio by the formula:

$$H_p / H_v$$

where  $H_p$  is the height above the baseline of the peak due to bacitracin B1 and  $H_v$  is the height above the baseline of the lowest point of the curve separating bacitracin B1 peak from the peak due to bacitracin B2. The peak-to-valley ratio is not less than 1.2.

**Procedure**—Separately inject equal volumes (about 100 μL) of the *Mobile phase*, the *Test solution*, and the *Reporting threshold solution*. Record the chromatograms for about 3 times the retention time of bacitracin A. Identify the peaks using the relative retention time values given in *Table 1*. Measure the peak areas of all peaks in the *Test solution*.

Table 1

Component Name	Relative Retention Time (approximate)
Bacitracin C1	0.5
Bacitracin C2	0.6
Bacitracin C3	0.6
Bacitracin B1	0.7
Bacitracin B2	0.7
Bacitracin B3	0.8
Bacitracin A	1.0
Bacitracin F	2.4

[NOTE—Disregard any peak in the *Test solution* having an area less than the area of bacitracin A in the *Reporting threshold solution*; and disregard any peak observed in the blank run.]

*Total area* in the following calculations is defined as the area of all peaks except the reporting threshold.

**CONTENT OF BACITRACIN A**—

Calculate the percentage of bacitracin A, by the formula:

$$(r_A / \text{Total area}) \times 100$$

where  $r_A$  is the area response from bacitracin A. The bacitracin A content is not less than 40.0% of the *Total area*.

**CONTENT OF ACTIVE BACITRACIN**—

Calculate the percentage of active bacitracin (bacitracin A, B1, B2, and B3) by the formula:

$$((r_A + r_{B1} + r_{B2} + r_{B3}) / \text{Total area}) \times 100$$

where  $r_A$ ,  $r_{B1}$ ,  $r_{B2}$ , and  $r_{B3}$  are the area responses from bacitracin A, B1, B2, and B3, respectively. The sum of bacitracins A, B1, B2, and B3 is not less than 70.0% of the *Total area*.

**LIMIT OF EARLY ELUTING PEPTIDES**—

Calculate the percentage of all peaks eluting before the peak due to bacitracin B1, by the formula:

$$(r_{\text{PreB1}} / \text{Total area}) \times 100$$

where  $r_{\text{PreB1}}$  is the sum of the responses of all peaks eluting before the peak for bacitracin B1. The limit of early eluting peptides (those eluting before the peak due to bacitracin B1) is not more than 20.0%.

**LIMIT OF BACITRACIN F**—

Calculate the percentage of bacitracin F by the formula:

$$100 \times (r_F / r_A)$$

where  $r_F$  is the response of bacitracin F from the *Test solution* and  $r_A$  is the response of bacitracin A from the *Test solution*. The limit of bacitracin F, a known impurity, is not more than 6.0%.

**Other requirements**—Where the label states that Bacitracin is sterile, it meets the requirements for *Sterility Tests* <71> and, where intended for injectable dosage forms, for *Bacterial endotoxins* under *Bacitracin for Injection*. Where the label states that Bacitracin must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Bacitracin for Injection*.

**Assay**—Proceed with Bacitracin as directed under *Antibiotics—Microbial Assays* <81>.

## Bacitracin for Injection

» Bacitracin for Injection has a potency of not less than 50 Bacitracin Units per mg. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of bacitracin.

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* <1>, and store in a cool place.

**USP Reference standards** <11>—

USP Bacitracin Zinc RS

USP Endotoxin RS

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* <1>.

**Thin-layer chromatographic identification test** <201BNP>: meets the requirements.

**Bacterial endotoxins** <85>—It contains not more than 0.01 USP Endotoxin Unit per Bacitracin Unit.

**Sterility** <71>—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**Residue on ignition** <281>: not more than 3.0%, the charred residue being moistened with 2 mL of nitric acid and 5 drops of sulfuric acid.

**Heavy metals, Method II** <231>: not more than 0.003%.

**Other requirements**—It meets the requirements of the tests for *pH* and *Loss on drying* under *Bacitracin*. It meets the

requirements under *Injections* (1) and *Uniformity of Dosage Units* (905).

#### Assay—

**Assay preparation 1**—Constitute 1 container of Bacitracin for Injection as directed in the labeling. Using a suitable hypodermic needle and syringe, withdraw the contents of the container, and dilute quantitatively with *Buffer No. 1* to obtain a solution containing about 100 Bacitracin Units per mL.

**Assay preparation 2** (where the label states the number of Bacitracin Units in a given volume of constituted solution)—Constitute 1 container of Bacitracin for Injection as directed in the labeling. Quantitatively dilute an accurately measured volume of the constituted solution with *Buffer No. 1* to obtain a solution containing about 100 Bacitracin Units per mL.

**Procedure**—Proceed as directed under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of *Assay preparation*. Add sufficient 0.01 N hydrochloric acid to the *Assay preparation* so that the amount of hydrochloric acid in the *Test Dilution* will be the same as in the median dose level of the Standard, and dilute quantitatively with *Buffer No. 1* to obtain a *Test Dilution* having a bacitracin concentration assumed to be equal to the median dose level of the Standard.

---

### Bacitracin Ointment

---

» Bacitracin Ointment is Bacitracin in an anhydrous ointment base. It contains not less than 90.0 percent and not more than 140.0 percent of the labeled amount of bacitracin. It may contain a suitable anesthetic.

**Packaging and storage**—Preserve in well-closed containers containing not more than 60 g, unless labeled solely for hospital use, preferably at controlled room temperature.

#### USP Reference standards (11)—

USP Bacitracin Zinc RS

#### Thin-layer chromatographic identification test

(201BNP): meets the requirements.

**Minimum fill** (755): meets the requirements.

**Water, Method I** (921): not more than 0.5%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

**Assay**—Proceed as directed under *Antibiotics—Microbial Assays* (81), using an accurately weighed portion of Ointment shaken with about 50 mL of ether in a separator, and extracted with four 20-mL portions of *Buffer No. 1*. Combine the buffer extracts, and dilute with *Buffer No. 1* to an appropriate volume to obtain a stock solution. Add sufficient 0.01 N hydrochloric acid to an accurately measured portion of the stock solution so that the amount of hydrochloric acid in the *Test Dilution* will be the same as in the median dose level of the Standard, and quantitatively dilute with *Buffer No. 1* to obtain a *Test Dilution* having a bacitracin concentration assumed to be equal to the median dose level of the Standard.

---

### Bacitracin Ophthalmic Ointment

---

» Bacitracin Ophthalmic Ointment is a sterile preparation of Bacitracin in an anhydrous ointment base. It contains not less than 90.0 percent

and not more than 140.0 percent of the labeled amount of bacitracin.

**Packaging and storage**—Preserve in collapsible ophthalmic ointment tubes.

#### USP Reference standards (11)—

USP Bacitracin Zinc RS

#### Thin-layer chromatographic identification test

(201BNP): meets the requirements.

**Sterility** (71): meets the requirements.

**Water, Method I** (921): not more than 0.5%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

**Metal particles** (751): It meets the requirements.

**Assay**—Proceed with Ophthalmic Ointment as directed in the *Assay* under *Bacitracin Ointment*.

---

### Bacitracin and Polymyxin B Sulfate Topical Aerosol

---

» Bacitracin and Polymyxin B Sulfate Topical Aerosol is a suspension of Bacitracin and Polymyxin B Sulfate in a suitable vehicle, packaged in a pressurized container with a suitable inert propellant. It contains not less than 90.0 percent and not more than 130.0 percent of the labeled amounts of bacitracin and polymyxin B. It may contain a suitable local anesthetic.

**Packaging and storage**—Preserve in pressurized containers, and avoid exposure to excessive heat.

#### USP Reference standards (11)—

USP Bacitracin Zinc RS

USP Polymyxin B Sulfate RS

[NOTE—Prepare the specimen for the following tests and assays as follows. Maintain the container in the inverted position throughout this procedure. Store the container in a freezer at  $-70^{\circ}$  for 16 to 24 hours. Remove the container from the freezer, promptly puncture the container, and allow the propellant to volatilize. Open the container, and mix the contents.]

#### Thin-layer chromatographic identification test

(201BNP)—A portion of the contents of 1 container prepared as directed above and tested as directed for *Creams, Lotions, and Ointments* meets the requirements.

**Water, Method I** (921): not more than 0.5%, an accurately weighed portion of the contents of 1 container, prepared as directed above, being used, and 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

**Other requirements**—It meets the requirements for *Pressure Test*, *Minimum Fill*, and *Leakage Test* under *Aerosols*, *Nasal Sprays*, *Metered-Dose Inhalers*, and *Dry Powder Inhalers* (601).

**Assay for bacitracin**—Proceed as directed for bacitracin under *Antibiotics—Microbial Assays* (81), using an accurately weighed portion of the contents of 1 container, prepared as directed above, equivalent to about 500 USP Bacitracin Units. Transfer to a suitable separator containing about 50 mL of ether, and extract with three 25-mL portions of *Buffer No. 1*. Combine the buffer extracts in a 100-mL volumetric flask, dilute with *Buffer No. 1* to volume, and mix. Add sufficient 0.01 N hydrochloric acid to an accurately measured volume of this solution so that the amount of hydrochloric acid in the *Test Dilution* will be the same as in the median dose level of the Standard, and quantitatively dilute with *Buffer No. 1* to obtain a *Test Dilution* having a

bacitracin concentration assumed to be equal to the median dose level of the Standard.

**Assay for polymyxin B**—Proceed as directed for polymyxin B under *Antibiotics—Microbial Assays* (81). Transfer an accurately weighed portion of the contents of 1 container, prepared as directed above, equivalent to about 5000 USP Polymyxin B Units, to a suitable separator containing about 50 mL of ether, and extract with three 25-mL portions of *Buffer No. 6*. Combine the buffer extracts in a 100-mL volumetric flask, dilute with *Buffer No. 6* to volume, and mix. Dilute an accurately measured volume of this solution, quantitatively and stepwise, with *Buffer No. 6* to obtain a *Test Dilution* having a concentration of polymyxin B assumed to be equal to the median dose level of the Standard.

## Soluble Bacitracin Methylenedisalicylate

### DEFINITION

Soluble Bacitracin Methylenedisalicylate is a mixture of Bacitracin Methylenedisalicylate and Sodium Bicarbonate. It has a potency of NLT 8 Bacitracin Units/mg, calculated on the dried basis.

### ASSAY

#### • ANTIBIOTICS—MICROBIAL ASSAYS (81)

**Diluent:** 20 g/L of sodium bicarbonate

**Sample stock solution:** Transfer a suitable amount of Soluble Bacitracin Methylenedisalicylate to a high-speed glass blender jar, add 99.0 mL of *Diluent* and 1.0 mL of polysorbate 80, and blend for 3 min.

**Test dilution:** To a suitable aliquot of the *Sample stock solution*, add a suitable volume of 0.01 N hydrochloric acid, and dilute with *Buffer No. 1* to obtain a concentration of bacitracin assumed to be equal to the median dose level of the Standard. [NOTE—The amount of hydrochloric acid in the *Test dilution* should be the same as that in the median dose level of the Standard.]

**Analysis:** Proceed as directed for Bacitracin in *Antibiotics—Microbial Assays* (81).

**Acceptance criteria:** NLT 8 Bacitracin Units/mg on the dried basis

### SPECIFIC TESTS

- **PH (791):** 8.0–9.5, in a 25 mg/mL solution
- **LOSS ON DRYING (731):** Dry 100 mg in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 h: it loses NMT 8.5% of its weight.

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **LABELING:** Label it to indicate that it is for veterinary use only.
- **USP REFERENCE STANDARDS (11)**  
USP Bacitracin Zinc RS

## Bacitracin Methylenedisalicylate Soluble Powder

### DEFINITION

Bacitracin Methylenedisalicylate Soluble Powder contains NLT 90.0% and NMT 120.0% of the labeled amount of bacitracin.

### ASSAY

#### • ANTIBIOTICS—MICROBIAL ASSAYS (81)

**Diluent:** 20 g/L of sodium bicarbonate

**Sample stock solution:** Transfer a suitable amount of Bacitracin Methylenedisalicylate Soluble Powder to a high-speed glass blender jar, add 99.0 mL of *Diluent* and 1.0 mL of polysorbate 80, and blend for 3 min.

**Test dilution:** To a suitable aliquot of the *Sample stock solution*, add a suitable volume of 0.01 N hydrochloric acid and dilute with *Buffer No. 1* to obtain a concentration of bacitracin assumed to be equal to the median dose level of the Standard. [NOTE—The amount of hydrochloric acid in the *Test dilution* should be the same as that in the median dose level of the Standard.]

**Analysis:** Proceed as directed for Bacitracin in *Antibiotics—Microbial Assays* (81).

**Acceptance criteria:** 90.0%–120.0%

### SPECIFIC TESTS

- **PH (791):** 8.0–9.5 in a 50 mg/mL solution
- **LOSS ON DRYING (731):** Dry 100 mg in a capillary-stoppered bottle in a vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 h: it loses NMT 8.5% of its weight.

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Label it to indicate that it is for veterinary use only. Label it to state the content of bacitracin in terms of grams per pound, each gram of bacitracin being equivalent to 42,000 Bacitracin Units.
- **USP REFERENCE STANDARDS (11)**  
USP Bacitracin Zinc RS

## Bacitracin Zinc

Bacitracins, zinc complex.

Bacitracins zinc complex [1405-89-6].

» Bacitracin Zinc is the zinc complex of bacitracin, which consists of a mixture of antimicrobial polypeptides, the main components being bacitracins A, B1, B2, and B3. It has a potency of not less than 65 Bacitracin Units per mg, calculated on the dried basis. It contains not less than 4.0 percent and not more than 6.0 percent of zinc (Zn), calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers, and store in a cool place.

**Labeling**—Label it to indicate that it is to be used in the manufacture of nonparenteral drugs only. Where it is packaged for prescription compounding, label it to indicate that it is not sterile and that the potency cannot be assured for longer than 60 days after opening, and to state the number of Bacitracin Units per milligram. Where it is intended for use in preparing sterile dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of sterile dosage forms.

**USP Reference standards (11)**—

USP Bacitracin Zinc RS

**Identification**—

**A:** *Thin-Layer Chromatographic Identification Test* (201BNP): meets the requirements.

**B:** It meets the requirements of the liquid chromatographic procedure in the test for *Composition*.

**Sterility (71)**—Where the label states that it is sterile, it meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be*

*Examined*, except to use *Fluid A* to each L of which has been added 20 g of edetate disodium.

**pH** (791): between 6.0 and 7.5, in a (saturated) solution containing approximately 100 mg per mL.

**Loss on drying** (731)—Dry about 100 mg in a capillary-stoppered bottle in vacuum at 60° for 3 hours: it loses not more than 5.0% of its weight.

**Zinc content**—[NOTE—The *Standard preparations* and the *Test preparation* may be quantitatively diluted with 0.001 N hydrochloric acid, if necessary, to obtain solutions of suitable concentrations, adaptable to the linear or working range of the instrument.]

*Standard preparations*—Transfer 3.11 g of zinc oxide, accurately weighed, to a 250-mL volumetric flask, add 80 mL of 1 N hydrochloric acid, warm to dissolve, cool, dilute with water to volume, and mix. This solution contains 10 mg of zinc per mL. Further dilute this solution with 0.001 N hydrochloric acid to obtain *Standard preparations* containing 0.5, 1.5, and 2.5 µg of zinc per mL, respectively.

*Test preparation*—Transfer about 200 mg of Bacitracin Zinc, accurately weighed, to a 100-mL volumetric flask. Dissolve in 0.01 N hydrochloric acid, dilute with the same solvent to volume, and mix. Pipet 2 mL of this solution into a 200-mL volumetric flask, dilute with 0.001 N hydrochloric acid to volume, and mix.

*Procedure*—Concomitantly determine the absorbances of the *Standard preparations* and the *Test preparation* at the zinc resonance line of 213.8 nm, with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-scattering* (851)), equipped with a zinc hollow-cathode lamp and an air-acetylene flame, using 0.001 N hydrochloric acid as the blank. Plot the absorbances of the *Standard preparations* versus concentration, in µg per mL, of zinc, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration, in µg per mL, of zinc in the *Test preparation*. Calculate the content of zinc, in percent, in the portion of Bacitracin Zinc taken by the formula:

$$1000C / W$$

in which *C* is the concentration in µg per mL, of zinc in the *Test preparation*; and *W* is the weight, in mg, of the portion of Bacitracin Zinc taken.

#### Composition—

*Buffer*—Dissolve 34.8 g of potassium phosphate, dibasic, in 1 L of water. Adjust with 27.2 g of potassium phosphate, monobasic, dissolved in 1 L of water, to a pH of 6.0.

*Mobile Phase*—Prepare a mixture of methanol, water, *Buffer*, and acetonitrile (26:15:5:2). Mix well, and degas.

*Diluent*—Dissolve 40 g of edetate disodium in 1 L of water. Adjust with dilute sodium hydroxide to a pH of 7.0.

*System suitability solution*—Dissolve an accurately weighed quantity of USP Bacitracin Zinc RS in *Diluent* to obtain a solution with a nominal concentration of about 2.0 mg per mL.

*Reporting threshold solution*—Dilute quantitatively, with water, a suitable volume of *System suitability solution* to obtain a solution with a known concentration of 0.01 mg per mL.

*Peak identification solution*—Dissolve a weighed quantity of USP Bacitracin Zinc RS in a suitable volume of *Diluent* to obtain a solution with a nominal concentration of about 2.0 mg per mL. Heat in boiling water bath for 30 minutes. Cool to room temperature.

*Test solution*—Dissolve an accurately weighed quantity of Bacitracin Zinc in *Diluent* to obtain a solution with a nominal concentration of about 2.0 mg per mL.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with an absorbance detector and an end-capped 4.6- × 250-mm column that con-

tains 5-µm packing L1. The flow rate is 1.0 mL per minute. Set the wavelength of the detector at 300 nm. Inject about 100 µL of the *Peak identification solution*, and identify the location of bacitracin F, which is a known impurity, using the relative retention time shown in *Table 1*.

Table 1

Component Name	Relative Retention Time (approximate)
Bacitracin C1	0.5
Bacitracin C2	0.6
Bacitracin C3	0.6
Bacitracin B1	0.7
Bacitracin B2	0.7
Bacitracin B3	0.8
Bacitracin A	1.0
Bacitracin F	2.4

Change the wavelength of the detector and set it to 254 nm. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: identify the peaks of the most active components of bacitracin (bacitracins A, B1, B2 and B3), early eluting peptides (those eluting before the peak due to bacitracin B1) and the impurity, bacitracin F, using the relative retention time values given in *Table 1*. Calculate the peak-to-valley ratio using the formula:

$$H_p / H_v$$

in which *H<sub>p</sub>* is the height above the baseline of the peak due to bacitracin B1; and *H<sub>v</sub>* is the height above the baseline of the lowest point of the curve separating the bacitracin B1 peak from the peak due to bacitracin B2. The peak-to-valley ratio is not less than 1.2.

*Procedure*—Separately inject equal volumes (100 µL) of *Diluent*, *Test solution*, and *Reporting threshold solution*. Record the chromatograms for about three times the retention time of bacitracin A. Identify the peaks using the relative retention times shown in *Table 1*. Measure the peak areas of all peaks in the *Test solution*. [NOTE—Disregard any peak in the *Test solution* having an area less than the area of the bacitracin A peak in the *Reporting threshold solution*; disregard any peak observed in the *Diluent*.]

NOTE—*Total area* in the following calculations is defined as the area of all peaks except the reporting threshold.

CONTENT OF BACITRACIN A—Calculate the percentage of bacitracin A using the formula:

$$(r_A / \text{Total area}) \times 100$$

in which *r<sub>A</sub>* is the area response from bacitracin A. Bacitracin A content is not less than 40.0% of the *Total area*.

CONTENT OF ACTIVE BACITRACIN—Calculate the percentage of active bacitracin (bacitracin A, B1, B2, and B3) using the formula:

$$(r_A + r_{B1} + r_{B2} + r_{B3} / \text{Total area}) \times 100$$

in which *r<sub>A</sub>*, *r<sub>B1</sub>*, *r<sub>B2</sub>*, and *r<sub>B3</sub>* are the area responses from bacitracin A, B1, B2, and B3, respectively. The sum of bacitracin A, B1, B2, and B3 is not less than 70.0% of the *Total area*.

LIMIT OF EARLY ELUTING PEPTIDES—Calculate the percentage of all peaks eluting before the peak due to bacitracin B1 using the formula:

$$(r_{\text{preB1}} / \text{Total area}) \times 100$$

in which *r<sub>preB1</sub>* is the sum of the responses of all peaks eluting before the peak for bacitracin B1. The limit of early eluting peptides (those eluting before the peak due to bacitracin B1) is not more than 20.0%.

LIMIT OF BACITRACIN F—Calculate the percentage of bacitracin F using the formula:

$$100 \times (r_F / r_A)$$

in which  $r_F$  is the response of bacitracin F from the *Test solution*; and  $r_A$  is the response of bacitracin A from the *Test solution*. The limit of bacitracin F, a known impurity, is not more than 6.0%.

**Assay**—Proceed with Bacitracin Zinc as directed under *Antibiotics—Microbial Assays* (81).

---

### Bacitracin Zinc Ointment

---

» Bacitracin Zinc Ointment is Bacitracin Zinc in an anhydrous ointment base. It contains not less than 90.0 percent and not more than 140.0 percent of the labeled amount of bacitracin.

**Packaging and storage**—Preserve in well-closed containers containing not more than 60 g, unless labeled solely for hospital use, preferably at controlled room temperature.

**USP Reference standards** (11)—

USP Bacitracin Zinc RS

**Thin-layer chromatographic identification test**

(201BNP): meets the requirements.

**Minimum fill** (755): meets the requirements.

**Water, Method I** (921): not more than 0.5%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

**Assay**—Proceed as directed under *Antibiotics—Microbial Assays* (81), using an accurately weighed portion of Ointment shaken with about 50 mL of ether in a separator, and extracted with four 20-mL portions of 0.01 N hydrochloric acid. Combine the acid extracts, and dilute with 0.01 N hydrochloric acid to an appropriate volume to obtain a stock solution. Dilute this stock solution quantitatively and stepwise with *Buffer No. 1* to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard, adding additional hydrochloric acid to each test dilution of the Standard to obtain the same concentration of hydrochloric acid as in the *Test Dilution*.

---

### Bacitracin Zinc Soluble Powder

---

» Bacitracin Zinc Soluble Powder is a mixture of Bacitracin Zinc and zinc proteinates. It contains not less than 90.0 percent and not more than 120.0 percent of the labeled amount of bacitracin.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Label it to indicate that it is for veterinary use only. Label it to state the content of bacitracin in terms of grams per pound, each gram of bacitracin being equivalent to 42,000 Bacitracin Units.

**USP Reference standards** (11)—

USP Bacitracin Zinc RS

**Loss on drying** (731)—Dry about 100 mg, accurately weighed, in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours; it loses not more than 5.0% of its weight.

**Zinc content**—Using Powder, proceed as directed for *Zinc content* under *Bacitracin Zinc*. Calculate the zinc content, in

g, in relation to each 42,000 Bacitracin Units in the specimen taken by the formula:

$$280,000C / WA$$

in which  $A$  is the bacitracin content of the specimen, in Bacitracin Units per g, and the other terms are as defined therein: it contains not more than 2.0 g for each 42,000 Bacitracin Units.

**Assay**—Dissolve an accurately weighed quantity of Powder quantitatively in 0.01 N hydrochloric acid to obtain a stock solution containing about 100 Bacitracin Units per mL. Proceed as directed under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of this stock solution diluted quantitatively and stepwise with *Buffer No. 1* to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard. In preparing each test dilution of the Standard, add additional hydrochloric acid to each to obtain the same concentration of hydrochloric acid as in the *Test Dilution*.

---

### Bacitracin Zinc and Polymyxin B Sulfate Ointment

---

» Bacitracin Zinc and Polymyxin B Sulfate Ointment contains the equivalent of not less than 90.0 percent and not more than 130.0 percent of the labeled amounts of bacitracin and polymyxin B. It may contain a suitable local anesthetic.

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

**USP Reference standards** (11)—

USP Bacitracin Zinc RS

USP Polymyxin B Sulfate RS

**Thin-layer chromatographic identification test**

(201BNP): meets the requirements.

**Minimum fill** (755): meets the requirements.

**Water, Method I** (921): not more than 0.5%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

**Assay for bacitracin**—Proceed with Ointment as directed in the *Assay* under *Bacitracin Zinc Ointment*.

**Assay for polymyxin B**—Proceed as directed for polymyxin B under *Antibiotics—Microbial Assays* (81), using an accurately weighed portion of Ointment shaken with about 50 mL of ether in a separator, and extracted with four 20-mL portions of *Buffer No. 6*. Combine the aqueous extracts, and dilute with *Buffer No. 6* to an appropriate volume to obtain a stock solution. Dilute this stock solution quantitatively and stepwise with *Buffer No. 6* to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

---

### Bacitracin Zinc and Polymyxin B Sulfate Ophthalmic Ointment

---

» Bacitracin Zinc and Polymyxin B Sulfate Ophthalmic Ointment contains the equivalent of not less than 90.0 percent and not more than 130.0 percent of the labeled amounts of bacitracin and polymyxin B.

**Packaging and storage**—Preserve in collapsible ophthalmic ointment tubes.

**USP Reference standards** (11)—

USP Bacitracin Zinc RS

USP Polymyxin B Sulfate RS

**Thin-layer chromatographic identification test**

(201BNP): meets the requirements.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**Minimum fill** (755): meets the requirements.

**Water, Method I** (921): not more than 0.5%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

**Metal particles** (751): meets the requirements.

**Assay for bacitracin**—Proceed with Ophthalmic Ointment as directed in the Assay under *Bacitracin Zinc Ointment*.

**Assay for polymyxin B**—Proceed as directed for polymyxin B under *Antibiotics—Microbial Assays* (81), using an accurately weighed portion of Ophthalmic Ointment shaken with about 50 mL of ether in a separator and extracted with four 20-mL portions of *Buffer No. 6*. Combine the aqueous extracts, and dilute with *Buffer No. 6* to an appropriate volume to obtain a stock solution. Dilute this stock solution quantitatively and stepwise with *Buffer No. 6* to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

## Baclofen

$C_{10}H_{12}ClNO_2$  213.66

Butanoic acid, 4-amino-3-(4-chlorophenyl)-

$\beta$ -(Aminomethyl)-*p*-chlorohydrocinnamic acid [1134-47-0].

» Baclofen contains not less than 99.0 percent and not more than 101.0 percent of  $C_{10}H_{12}ClNO_2$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Baclofen RS

USP Baclofen Related Compound A RS  
4-(4-Chlorophenyl)-2-pyrrolidinone.

$C_{10}H_{10}ClNO$  195.65

**Identification, Infrared Absorption** (197M).

**Water, Method I** (921): not more than 3.0%.

**Residue on ignition** (281): not more than 0.3%.

**Heavy metals, Method II** (231): 0.001%.

**Related compounds**—[Caution: Avoid contact with *o*-tolidine when performing this test, and conduct the test in a well-ventilated hood.]

**Detection reagent**—Dissolve 200 mg of *o*-tolidine in 2.0 mL of glacial acetic acid with the aid of a hot water bath. Dilute with water to 100.0 mL, and filter. Mix one volume of this solution with an equal volume of potassium iodide solution (0.83 in 100).

**Diluting solution**—Prepare a mixture of alcohol and glacial acetic acid (4:1).

**Standard preparations**—Dissolve USP Baclofen RS in *Diluting solution* to obtain a *Standard stock solution* having a known concentration of 0.1 mg per mL. Dilute portions of

this *Standard stock solution* quantitatively with *Diluting solution* to obtain solutions having concentrations of 0.05 mg per mL (*Standard preparation A*) and 0.03 mg per mL (*Standard preparation B*), respectively.

**Identification preparation**—Dissolve USP Baclofen Related Compound A RS in *Diluting solution* to obtain a solution having a known concentration of 0.1 mg per mL.

**Test preparation**—Prepare a solution in *Diluting solution* containing 10.0 mg of Baclofen per mL.

**Procedure**—Apply separately 10  $\mu$ L of the *Test preparation*, *Identification preparation*, *Standard preparation A*, and *Standard preparation B* to a suitable thin-layer chromatographic plate (see *Chromatography* (621)), coated with a 0.25-mm layer of chromatographic silica gel mixture. Place the plate in a chromatographic chamber, and develop the chromatograms in a solvent system consisting of a mixture of butyl alcohol, glacial acetic acid, and water (4:1:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, and dry under a current of warm air. Transfer the dry plate to another chromatographic chamber containing a beaker with 1 g of potassium permanganate. Add 10 mL of dilute hydrochloric acid (4 in 10) to the beaker. Cover the chamber, and allow the chamber to become saturated with chlorine gas. Expose the plate to the chlorine gas for 8 minutes. Remove the plate and expose to the air for 2 minutes, then spray with freshly prepared *Detection reagent*: the intensity of the secondary spot from the *Test preparation*, corresponding in  $R_f$  value to the principal spot from the *Identification preparation*, is not greater than that of the principal spot from the *Identification preparation* (1.0%), and no other secondary spot from the *Test preparation* is greater in intensity than the principal spot from *Standard preparation A* (0.5%). The sum of all secondary spots from the *Test preparation* is not more than 2.0%.

**Assay**—Dissolve about 200 mg of Baclofen, accurately weighed, in a suitable volume of glacial acetic acid, sufficient to immerse the electrodes. Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically, using a glass electrode and a calomel electrode containing a saturated solution of lithium chloride in glacial acetic acid (see *Titrimetry* (541)). Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 21.37 mg of  $C_{10}H_{12}ClNO_2$ .

## Baclofen Oral Suspension

### DEFINITION

Baclofen Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of baclofen ( $C_{10}H_{12}ClNO_2$ ). Prepare Baclofen Oral Suspension 5 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Baclofen	500 mg
Vehicle: a mixture of Vehicle for Oral Solution (regular or sugar-free), NF, and Vehicle for Oral Suspension, NF (1:1), a sufficient quantity to make	100 mL

If using Baclofen Tablets, place the Tablets in a suitable mortar and comminute to a fine powder, or add *Baclofen* powder. Add 5 mL of the *Vehicle* to wet the powder, and triturate the powder to form a fine paste. Add the *Vehicle* in small portions almost to volume, and mix thoroughly after each addition. Transfer, stepwise and quantitatively, the contents of the mortar to a calibrated bottle. Add sufficient *Vehicle* to bring to final volume, and mix well.

**ASSAY****• PROCEDURE**

**Mobile phase:** Acetonitrile and 0.05 M monobasic sodium phosphate (20:80). Adjust with phosphoric acid to a pH of 3.5.

**Standard solution:** 5 µg/mL of USP Baclofen RS in water

**Sample solution:** Shake thoroughly by hand each bottle of Oral Suspension. Pipet 0.5 mL of Oral Suspension from each bottle to a 500-mL volumetric flask, dilute with water to volume to obtain a concentration of 5 µg/mL, and pass through a 0.22-µm polyvinylidene fluoride (PVDF) filter.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 220 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L1

**Flow rate:** 1 mL/min

**Injection size:** 15 µL

**System suitability**

**Sample:** *Standard solution*

[NOTE—The retention time of baclofen is about 5.5 min.]

**Suitability requirements**

**Relative standard deviation:** NMT 2.0% for replicate injections

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of baclofen (C<sub>10</sub>H<sub>12</sub>ClNO<sub>2</sub>) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of baclofen in the *Standard solution* (µg/mL)

$C_U$  = nominal concentration of baclofen in the *Sample solution* (µg/mL)

**Acceptance criteria:** 90.0%–110.0%

**SPECIFIC TESTS**

**• pH <791>:** 4.2–5.2

**ADDITIONAL REQUIREMENTS**

**• PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store in a cold place.

**• LABELING:** Label it to state that it is to be well shaken, and to state the *Beyond-Use Date*.

**• BEYOND-USE DATE:** NMT 35 days after the day on which it was compounded

**• USP REFERENCE STANDARDS <11>**

USP Baclofen RS

**Baclofen Tablets**

» Baclofen Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of C<sub>10</sub>H<sub>12</sub>ClNO<sub>2</sub>.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards <11>—**

USP Baclofen RS

USP Baclofen Related Compound A RS

4-(4-Chlorophenyl)-2-pyrrolidinone.

C<sub>10</sub>H<sub>10</sub>ClNO 195.65

**Identification—**

**A:** Transfer a portion of powdered Tablets, equivalent to about 50 mg of baclofen, to a glass-stoppered 40-mL centrifuge tube. Add 10.0 mL of a mixture of dehydrated alcohol and glacial acetic acid (4:1), shake by mechanical means for 30 minutes, and centrifuge. Apply 20 µL of this solution and 20 µL of a Standard solution containing 5 mg of USP Baclofen RS per mL in a mixture of dehydrated alcohol and glacial acetic acid (4:1) to a thin-layer chromatographic plate coated with a 0.25-mm layer of chromatographic silica gel. Place the plate in a chromatographic chamber (see *Chromatography* <621>) containing a solvent system consisting of a mixture of butyl alcohol, glacial acetic acid, and water (4:1:1), and develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, and dry in a current of warm air. Spray with a detecting reagent consisting of 0.4 g of ninhydrin in 95 mL of butyl alcohol and 5 mL of dilute glacial acetic acid (1 in 10) until the plate is slightly wet. Place the plate in an oven maintained at 100° for 10 minutes: the  $R_f$  value of the principal orange-red spot obtained from the solution from the Tablets corresponds to that obtained from the Standard solution.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Dissolution, Procedure for a Pooled Sample <711>—**

**Medium:** 0.01 N hydrochloric acid; 500 mL for Tablets containing 10 mg or less of drug and 1000 mL for Tablets containing more than 10 mg of drug.

**Apparatus 2:** 50 rpm.

**Time:** 30 minutes.

Determine the amount of C<sub>10</sub>H<sub>12</sub>ClNO<sub>2</sub> dissolved by employing the following method.

**Mobile phase and Chromatographic system**—Proceed as directed in the *Assay*.

**Procedure**—Inject an accurately measured volume (about 190 µL) of a filtered portion of the solution under test into the chromatograph by means of a microsyringe or a sampling valve, record the chromatogram, and measure the response for the major peak. Calculate the quantity of C<sub>10</sub>H<sub>12</sub>ClNO<sub>2</sub> dissolved in comparison with a Standard solution having a known concentration of USP Baclofen RS in the same *Medium* and similarly chromatographed.

**Tolerances**—Not less than 75% (Q) of the labeled amount of C<sub>10</sub>H<sub>12</sub>ClNO<sub>2</sub> is dissolved in 30 minutes.

**Uniformity of dosage units <905>:** meet the requirements.

**Related compounds—**

**Diluting solution, Mobile phase, and Chromatographic system**—Proceed as directed in the *Assay*.

**Standard preparation**—Transfer about 10 mg of USP Baclofen Related Compound A RS, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix. Transfer 4.0 mL of this solution to a 25-mL volumetric flask, dilute with *Diluting solution* to volume, and mix.

**Test preparation**—Use the *Assay preparation*.

**Procedure**—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Test preparation* into the chromatograph, and proceed as directed in the *Procedure* under *Assay*. Calculate the percentage of baclofen related compound A in the portion of Tablets taken by the formula:

$$1000(C/W)(r_U/r_S)$$

in which C is the concentration of USP Baclofen Related Compound A RS, in mg per mL, in the *Standard preparation*; W is the weight of baclofen in the *Test preparation*; and  $r_U$

and  $r_s$  are the peak responses due to baclofen related compound A in the chromatograms of the *Test preparation* and the *Standard preparation*, respectively. Not more than 4.0% is found.

#### Assay—

*Diluting solution*—Transfer 75 mL of methanol and 10 mL of glacial acetic acid to a 250-mL volumetric flask. Dilute with water to volume, and mix.

*Mobile phase*—Prepare a filtered and degassed mixture of 0.3 N acetic acid, methanol, and 0.36 N sodium 1-pentane-sulfonate (550:440:20). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Baclofen RS in *Diluting solution* to obtain a solution having a known concentration of about 4 mg per mL.

*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 40 mg of baclofen, to a 50-mL flask. Transfer 10.0 mL of *Diluting solution* to the flask, sonicate to disperse, and shake by mechanical means for 30 minutes. Centrifuge a portion of this solution for 5 minutes, and filter.

*Chromatographic system* (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 265-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 0.6 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, and allow the *Assay preparation* to elute for not less than three times the retention time of baclofen. Record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{10}H_{12}ClNO_2$  in the portion of Tablets taken by the formula:

$$10C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Baclofen RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the baclofen peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Balsalazide Disodium

$C_{17}H_{13}N_3Na_2O_6 \cdot 2H_2O$  437.31  
Benzoic acid, 5-[[4-[(2-carboxyethyl)amino]carbonyl]phenyl]azo]-2-hydroxy-, disodium salt, dihydrate, (E)-; (E)-5-[[p-[(2-Carboxyethyl)carbamoyl]phenyl]azo]salicylic acid, disodium salt, dihydrate [150399-21-6].

#### DEFINITION

Balsalazide Disodium contains NLT 98.0% and NMT 102.0% of  $C_{17}H_{13}N_3Na_2O_6 \cdot 2H_2O$ , calculated on the as-is basis.

#### IDENTIFICATION

- **A. INFRARED ABSORPTION** <197K>
- **B. ULTRAVIOLET ABSORPTION** <197U>  
Sample solution: 10 µg/mL in water
- **C. IDENTIFICATION TESTS—GENERAL**, Sodium <191>

#### ASSAY

##### PROCEDURE

Sample: 219 mg

Analysis: Add 80 mL of glacial acetic acid to the *Sample*, sonicate to dissolve, and titrate with 0.1 N perchloric acid VS. Perform a blank determination, and make any necessary correction (see *Titrimetry* <541>). Each mL of 0.1 N perchloric acid is equivalent to 21.87 mg of  $C_{17}H_{13}N_3Na_2O_6 \cdot 2H_2O$ .

Acceptance criteria: 98.0%–102.0% on the as-is basis

#### IMPURITIES

##### Inorganic Impurities

- **HEAVY METALS**, *Method II* <231>: NMT 20 ppm

##### Organic Impurities

[NOTE—On the basis of the synthetic route, perform either *Procedure 1* or *Procedure 2*. *Procedure 2* is recommended when impurities 1, 2, and 3 listed in *Impurity Table 2* may be present.]

##### PROCEDURE 1

**Solution A:** Dissolve 2.7 g of monobasic potassium phosphate in 1000 mL of water, and adjust with 10% potassium hydroxide solution to a pH of  $6.00 \pm 0.1$ .

**Diluent:** Use *Solution A*.

**Solution B:** Use acetonitrile.

**Standard solution:** 0.5 µg/mL of USP Balsalazide Disodium RS, 0.5 µg/mL of USP Balsalazide Related Compound A RS, 0.5 µg/mL of USP Balsalazide Related Compound B RS, and 0.5 µg/mL of USP Salicylic Acid RS in *Diluent*. If needed, a small amount of acetonitrile may be added to facilitate dissolution. [NOTE—USP Balsalazide Related Compound A RS is the disodium salt of (E)-5-[(p-carboxyphenyl)azo]-2-salicylic acid. Use the correction factor stated on the label of the USP Reference Standard to calculate the concentration, as appropriate.]

**Sample solution:** 1 mg/mL of Balsalazide Disodium in *Diluent*

**Mobile phase:** See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	90	10
4	90	10
40	75	25
47	75	25
55	50	50
60	50	50
60.1	90	10
70	90	10

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 238 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L1

**Column temperature:** 45°

**Flow rate:** 1 mL/min

**Injection size:** 30 µL

#### System suitability

**Sample:** *Standard solution*

**Suitability requirements**

**Resolution:** NLT 5 between balsalazide and balsalazide related compound B

**Relative standard deviation:** NMT 5% for each peak

**Tailing factor:** NMT 1.8 for the balsalazide peak

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each individual impurity in the portion of Balsalazide Disodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response for each individual impurity from the *Sample solution*  
 $r_S$  = peak response for the corresponding impurity from the *Standard solution*. [NOTE—For unspecified impurities,  $r_S$  is the peak response for the balsalazide peak from the *Standard solution*.]  
 $C_S$  = concentration of the corresponding impurity in the *Standard solution* (mg/mL). [NOTE—For unspecified impurities,  $C_S$  is the concentration of balsalazide disodium in the *Standard solution*.]  
 $C_U$  = concentration of Balsalazide Disodium in the *Sample solution* (mg/mL)

#### Acceptance criteria

**Individual impurities:** See *Impurity Table 1*.

**Reporting level for impurities:** 0.03%

**Total impurities:** NMT 1.0%

**Impurity Table 1**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Salicylic acid	0.37	0.05
Balsalazide related compound A <sup>a</sup>	0.70	0.05
Balsalazide	1.00	—
Balsalazide related compound B <sup>b</sup>	1.2	0.05
Any other individual unspecified impurity	—	0.05

<sup>a</sup> (E)-5-[(p-Carboxyphenyl)azo]-2-salicylic acid.

<sup>b</sup> (E)-5-[(m-[(2-Carboxyethyl)carbamoyl]phenyl)azo]-2-salicylic acid.

#### PROCEDURE 2

**Solution A:** Prepare 50 mM monobasic potassium phosphate buffer as follows: Dissolve 6.8 g of monobasic potassium phosphate in 1000 mL of water, and adjust with 2 N potassium hydroxide solution to a pH of 6.8–7.0. [NOTE—To ensure proper identification of impurity 1, the pH must be maintained between 6.8 and 7.0.]

**Solution B:** Acetonitrile, methanol and *Solution A* (5:1:14)

**Solution C:** Acetonitrile, methanol and *Solution A* (9:1:10)

**Diluent:** Use *Solution B*.

**Mobile phase:** See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)	Solution C (%)
0	100	0	0
37	0	100	0
60	0	0	100
75	100	0	0
85	100	0	0

**Standard solution:** 0.075 mg/mL of USP Balsalazide Disodium RS in *Diluent*. [NOTE—Use sonication to dissolve.]

**Sensitivity solution:** 0.375 µg/mL in *Diluent*, from *Standard solution*

**System suitability solution:** 1.5 mg/mL of USP Balsalazide Disodium RS and 1.5 µg/mL of USP Balsalazide Related Compound A RS in *Diluent*

**Sample solution:** 1.5 mg/mL of Balsalazide Disodium in *Diluent*. [NOTE—Use sonication to dissolve.]

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 300 nm

**Column:** 4.6-mm × 15-cm; 3-µm packing L1

**Column temperature:** 25°–27°. [NOTE—To ensure proper identification of impurity 1, the column temperature must be maintained between 25° and 27°.]

**Flow rate:** 1 mL/min

**Injection size:** 10 µL

#### System suitability

**Samples:** *Standard solution*, *Sensitivity solution*, and *System suitability solution*

#### Suitability requirements

**Resolution:** NLT 8.5 between balsalazide related compound A and balsalazide, from the *System suitability solution*

**Tailing factor:** NMT 3.4 for the balsalazide peak, from the *System suitability solution*

**Signal-to-noise ratio:** NLT 10, from the *Sensitivity solution*

**Relative standard deviation:** NMT 2.0%, from the *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each individual impurity in the portion of Balsalazide Disodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

- $r_U$  = peak response for each individual impurity from the *Sample solution*  
 $r_S$  = peak response for balsalazide from the *Standard solution*  
 $C_S$  = concentration of USP Balsalazide Disodium RS in the *Standard solution*  
 $C_U$  = concentration of Balsalazide Disodium in the *Sample solution* (mg/mL)  
 $F$  = relative response factor (see *Impurity Table 2*)

#### Acceptance criteria

**Individual impurities:** See *Impurity Table 2*.

**Reporting level for impurities:** 0.03%

**Total impurities:** NMT 0.50%

**Impurity Table 2**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
N-(4-Aminobenzoyl)-β-alanine <sup>a</sup>	0.29	1.8	0.05
Salicylic acid	0.55	1.4	0.05
Balsalazide related compound A <sup>b</sup>	0.88	1.4	0.05
Impurity 1 <sup>c</sup>	0.91	1.9	0.05
Impurity 2 <sup>d</sup>	0.92	1.4	0.05
Impurity 3 <sup>e</sup>	0.94	0.83	0.05

<sup>a</sup> This impurity may be present as two peaks. Use the sum of the two peaks to determine compliance.

<sup>b</sup> (E)-5-[(p-Carboxyphenyl)azo]-2-salicylic acid.

<sup>c</sup> (E,E)-3,5-di-[4-(2-Carboxyethylcarbamoyl) phenylazo]-salicylic acid.

<sup>d</sup> (E)-3-[4-(2-Carboxyethylcarbamoyl) phenylazo]-salicylic acid.

<sup>e</sup> (E,E)-5-[(2-[4-(2-Carboxyethylcarbamoyl)phenylazo]-4-[2-carboxyethylcarbamoyl])phenylazo]-salicylic acid.

<sup>f</sup> (E)-2-[4-(2-Carboxyethylcarbamoyl)phenoxy]-5-[[4-(2-carboxyethylcarbamoyl)phenylazo]-benzoic acid

<sup>g</sup> (E)-2-Hydroxy-5-[[4-[(3-isopropoxy-3-oxopropyl)amino]carbonyl]phenylazo]benzoic acid

**Impurity Table 2** (Continued)

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Balsalazide	1.00	—	—
Impurity 4 <sup>f</sup>	1.35	2.1	0.05
Impurity 5 <sup>g</sup>	1.77	0.91	0.05
Any other individual unspecified impurity	—	—	0.05

<sup>a</sup> This impurity may be present as two peaks. Use the sum of the two peaks to determine compliance.

<sup>b</sup> (*E*)-5-[(*p*-Carboxyphenyl)azo]-2-salicylic acid.

<sup>c</sup> (*E*)-3,5-di-[4-(2-Carboxyethylcarbamoyl) phenylazo]-salicylic acid.

<sup>d</sup> (*E*)-3-[4-(2-Carboxyethylcarbamoyl) phenylazo]-salicylic acid.

<sup>e</sup> (*E*)-5-[(2-[4-(2-Carboxyethylcarbamoyl)phenylazo]-4-[2-carboxyethylcarbamoyl])phenylazo]-salicylic acid.

<sup>f</sup> (*E*)-2-[4-(2-Carboxyethylcarbamoyl)phenoxy]-5-[4-(2-carboxyethylcarbamoyl)phenylazo]-benzoic acid

<sup>g</sup> (*E*)-2-Hydroxy-5-[4-[(3-isopropoxy-3-oxopropyl)amino]carbonyl]phenylazo]benzoic acid

**SPECIFIC TESTS**

- **WATER DETERMINATION**, *Method 1a* (921): 7.8%–9.0%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store at controlled room temperature.
- **LABELING:** If a test for *Organic Impurities* other than *Test 1* is used, the labeling states the test with which the article complies.
- **USP REFERENCE STANDARDS** (11)
  - USP Balsalazide Disodium RS
  - USP Balsalazide Related Compound A RS
  - (*E*)-5-[(*p*-Carboxyphenyl)azo]-2-salicylic acid, disodium salt.
   
C<sub>14</sub>H<sub>8</sub>N<sub>2</sub>O<sub>5</sub>Na<sub>2</sub> 330.12
  - USP Balsalazide Related Compound B RS
  - (*E*)-5-[(*m*-[(2-Carboxyethyl)carbamoyl]phenyl)azo]-2-salicylic acid.
   
C<sub>17</sub>H<sub>15</sub>N<sub>3</sub>O<sub>6</sub> 357.17
  - USP Salicylic Acid RS

**Balsalazide Disodium Capsules****DEFINITION**

Balsalazide Disodium Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of balsalazide disodium (C<sub>17</sub>H<sub>13</sub>N<sub>3</sub>Na<sub>2</sub>O<sub>6</sub> · 2H<sub>2</sub>O).

**IDENTIFICATION**

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B. ULTRAVIOLET ABSORPTION**

Using a 0.2-cm cell, record the UV spectrum of the *Sample solution*, obtained in the *Assay*, in the range of 200–400 nm: it exhibits maxima at about 261 nm and 357 nm.

**ASSAY**• **PROCEDURE**

**Buffer:** Add 5 mL of triethylamine to 1000 mL of water, and adjust with phosphoric acid to a pH of 6.00 ± 0.1.  
**Mobile phase:** Acetonitrile and *Buffer* (1:4)  
**Diluent:** Water  
**Standard solution:** 60 µg/mL of USP Balsalazide Disodium RS in *Diluent*. [NOTE—Use sonication as necessary.]  
**Sample stock solution:** Transfer an equivalent to 150 mg of balsalazide disodium, from the Capsules con-

tents, to a 100-mL volumetric flask, add 70 mL of *Diluent*, sonicate for 5 min, and dilute with *Diluent* to volume.

**Sample solution:** 60 µg/mL of balsalazide disodium, from the *Sample stock solution*, in *Diluent*. Pass a portion of this solution through a suitable filter, discarding the first 3 mL.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 360 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L1

**Column temperature:** 30°

**Flow rate:** 1 mL/min

**Injection size:** 10 µL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Column efficiency:** NLT 10,000 theoretical plates

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Sample:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of C<sub>17</sub>H<sub>13</sub>N<sub>3</sub>Na<sub>2</sub>O<sub>6</sub> · 2H<sub>2</sub>O in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Balsalazide Disodium RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of balsalazide disodium in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

**IMPURITIES****Organic Impurities**• **PROCEDURE**

**Buffer:** Dissolve 2.7 g of monobasic potassium phosphate in 1000 mL of water, and adjust with 10% potassium hydroxide solution to a pH of 6.00 ± 0.1.

**Diluent:** Water

**Solution A:** *Buffer*

**Solution B:** Acetonitrile

**Sample solution:** Transfer an amount of finely crushed powder equivalent to 100 mg of balsalazide disodium to a 100-mL volumetric flask, add 70 mL of *Diluent*, sonicate for 5 min, and dilute with *Diluent* to volume. Pass a portion of this solution through a PVDF filter of 0.45-µm pore size.

**Standard solution:** 1.0 µg/mL of USP Balsalazide Disodium RS in *Diluent*

**System suitability solution:** 1.0 µg/mL of USP Balsalazide Disodium RS, 1.5 µg/mL of USP Balsalazide Related Compound A RS, 0.5 µg/mL of USP Balsalazide Related Compound B RS, and 0.5 µg/mL of USP Salicylic Acid RS in *Diluent*

**Mobile phase:** See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	90	10
4	90	10
40	75	25
47	75	25
55	50	50
60	50	50
60.1	90	10
70	90	10
